A NEW

SYSTEM

OF

MODERN GEOGRAPHY:

OR, A

Geographical, Hiſtorical, and Commercial Grammar;

AND

PRESENT STATE

OF THE SEVERAL

KINGDOMS OF THE WORLD.

CONTAINING

I. The Figures, Motions, and Diſtances of the Planets, according to the Newtonian Syſtem and the lateſt Obſervations.
II. A general View of the Earth conſidered as a Planet; with ſeveral uſeful Geographical Definitions and Problems.
III. The grand Diviſions of the Globe into Land and Water, Continents and Iſlands.
IV. The Situation and Extent of Empires, Kingdoms, States, Provinces, and Colonies.
V. Their Climates, Air, Soil, Vegetable Productions, Metals, Minerals, natural Curioſities, Seas, Rivers, Bays, Capes, Promontories, and Lakes.
VI. The Birds and Beaſts peculiar to each Country.
VII. Obſervations on the Changes that have been any where obſerved upon the Face of Nature ſince the moſt early Periods of Hiſtory.
VIII. The Hiſtory and Origin of Nations; their Forms of Government, Religion, Laws, Revenues, Taxes, Naval and Military Strength.
IX. The Genius, Manners, Cuſtoms, and Habits of the People.
X. Their Language, Learning, Arts, Sciences, Manufactures, and Commerce.
XI. The chief Cities, Structures, Ruins, and artificial Curioſities.
XII. The Longitude, Latitude, Bearings, and Diſtances of principal Places from London.

TO WHICH ARE ADDED,

I. A GEOGRAPHICAL INDEX, with the Names and Places alphabetically arranged.
II. A TABLE of the COINS of all Nations, and their Value in ENGLISH MONEY.
III. A CHRONOLOGICAL TABLE of remarkable Events from the Creation to the preſent Time.

By WILLIAM GUTHRIE, Eſq.
The ASTRONOMICAL Part by JAMES FERGUSON, F.R.S.

To which have been added,

The late DISCOVERIES of Dr. HERSCHELL, and other eminent ASTRONOMERS.

THE FIFTH EDITION, CORRECTED, IMPROVED, AND GREATLY ENLARGED:
WITH A COPIOUS INDEX.

LONDON,
PRINTED FOR C. DILLY, IN THE POULTRY; AND G. G. J. AND J. ROBINSON, PATER NOSTER ROW. MDCCXCII.

ADVERTISEMENT.

THE nature, deſign, and general plan of this work being particularly pointed out in the original Preface, which follows this Advertiſement, it will only be neceſſary to inform the public of what has been done in this enlarged and improved edition.

It would not be eaſy, though only in a general way, to ſpecify the various additions which have been made to the Civil and Natural Hiſtory of the reſpective kingdoms and ſtates, to the deſcriptions of the Manners and Cuſtoms of the people, their different governments, trade, and commerce, &c. The augmentation of *one hundred and eighty quarto pages*, more than in the laſt Edition, of important information, derived from the moſt authentic travels and voyages, muſt conſiderably increaſe the value of that which is now ſubmitted to the public. From theſe ſources, which have greatly added to the ſtock of our geographical and political knowledge, many intereſting particulars are now added to the deſcriptions of Ruſſia, Sweden, Denmark, Poland, Spain, Switzerland, and the Two Sicilies. The hiſtorical narrative throughout has been brought down to the preſent time, and attention has been paid to the important occurrences which, in this "eventful period," have ariſen upon the continent of Europe.

The account of Aſia has been conſiderably enlarged. The hiſtory, government, laws, religion, literature and commerce of India, have been given from Dr. Robertſon's Hiſtorical Diſquiſitions concerning that country: and Major Rennell, by his ſplendid and accurate Map of Hindoſtan, with his Memoir of that Map, has afforded ample materials for enlarging our geographical knowledge of an immenſe region, which is now become an intereſting object of popular curioſity.

An accurate knowledge of Africa, ſtill continues to be a great deſideratum in geographical ſcience. The interior parts of that immenſe continent remain at the end of the eighteenth century in a great meaſure unknown. However every publication, which could remove our ignorance has been attended to. The five ponderous quarto's of Mr. Bruce, the Travels of Vaillant, the Proceedings of the African Aſſociation, and Major Rennell's Memoir and Map of the northern parts of this quarter of the globe, have been carefully peruſed, and have each furniſhed their ſhare of information.

Mr. Morſe, an American gentleman, has publiſhed a large account of the geography of the United States. From which have been given their reſpective diviſions into diſtricts, counties, towns, &c. a view of the newly-formed ſtates of Kentucke and Vermont, with ſeveral other particulars.

From a variety of other authentic publications the preſent Edition has been greatly enriched, and not only the ideas but the language of the writers has ſometimes been uſed, although the reader has not been always appriſed of it.

Great attention has been paid to the Maps. They have all undergone a very accurate reviſion, they have received many improvements, and of themſelves form a complete Atlas. Beſides the ſeven new plates which were given in the laſt Edition, two improved maps of Poland and Africa make their appearance in this.—Upon the whole, it is hoped that the public will receive the moſt ample conviction that neither labour or expence have been ſpared to render the preſent Edition worthy of a juſt and continued claim to general notice and approbation.

THE

THE

PREFACE.

TO a man ſincerely intereſted in the welfare of ſociety and of his country, it muſt be particularly agreeable to reflect on the rapid progreſs and general diffuſion of learning and civility, which, within the preſent age, have taken place in Great Britain. Whatever may be the caſe in ſome other kingdoms of Europe, we, in this iſland, may boaſt of our ſuperiority to thoſe illiberal prejudices, which not only cramp the genius, but ſour the temper of man, and diſturb all the agreeable intercourſe of ſociety. Among us, learning is no longer confined within the ſchools of the philoſophers, or the courts of the great; but, like all the greateſt advantages which Heaven has beſtowed on mankind, it is become as univerſal as it is uſeful.

This general diffuſion of knowledge is one effect of that happy conſtitution of government, which, towards the cloſe of the laſt century, was confirmed to us, and which conſtitutes the peculiar glory of this nation. In other countries, the great body of the people poſſeſs little wealth, have little power, and conſequently meet with little reſpect; in Great Britain, the people are opulent, have great influence, and claim, of courſe, a proper ſhare of attention. To their improvement, therefore, men of letters have lately directed their ſtudies; as the great body of the people, no leſs than the dignified, the learned, or the wealthy few, have an acknowledged title to be amuſed and inſtructed. Books have been diveſted of the terms of the ſchools, reduced from that ſize which ſuited only the purſes of the rich, and the avocations of the ſtudious; and adapted to perſons of more ordinary fortunes, whoſe attachment to other purſuits admitted of little leiſure for thoſe of knowledge. It is to books of this kind, more than to the works of our Bacons, our Lockes, and our Newtons, that the generality of our countrymen owe that ſuperior improvement, which diſtinguiſhes them from the lower ranks of men in all other countries. To promote and advance this improvement, is the principal deſign of our preſent undertaking. No ſubject appears more intereſting than that which we have choſen, and none ſeems capable of being treated in a manner that may render it more generally uſeful.

The knowledge of the world, and of its inhabitants, though not the ſubliméſt purſuit of mankind, is that which moſt nearly intereſts them, and to which their abilities are beſt adapted. And books of Geography, which deſcribe the ſituation, extent, ſoil, and productions of kingdoms; the genius, manners, religion, government, commerce, ſciences, and arts of all the inhabitants upon the earth, promiſe the beſt aſſiſtance for attaining this knowledge.

The Compendium of Geography, now offered to the public, differs in many particulars from other books on that ſubject. Beſides exhibiting an eaſy, diſtinct, and ſyſtematic account of the theory and practice of what may be called Natural Geography, the Author has attempted to render the following performance an inſtructive, though compendious, detail of the general hiſtory of the world. The character of nations depends on a combination of many circumſtances, which reciprocally affect each other. There is a nearer connection between the learning, the commerce, the government, &c. of a ſtate, than moſt people ſeem to apprehend. In a work of this kind, which pretends to include moral or political, as well as natural geography, no one of thoſe objects ſhould paſs unnoticed. The omiſſion of any one of them would, in reality, deprive us of a branch of knowledge, not only intereſting in itſelf, but abſolutely neceſſary for enabling us to form an adequate and comprehenſive notion of the ſubject in general. We have thought it neceſſary, therefore, to add a new article to this work, which comprehends the hiſtory and preſent ſtate of learning in the ſeveral countries we deſcribe, with the characters of ſuch perſons as have been moſt eminent in the various departments of letters and philoſophy. This ſubject will, on a little reflection, appear altogether requiſite, when we conſider the powerful influence of learning upon the manners, government, and general character of nations. Theſe objects, indeed, till of late, ſeldom found a place in geographical performances; and, even when occaſionally introduced, are by no means handled in an entertaining or inſtructive manner. Neither is this to be altogether imputed to the fault of geographical writers. The greater part of travellers, acting ſolely under the influence of avarice, the paſſion which firſt induced them to quit their native land, were at little pains, and were indeed ill-qualified to collect ſuch materials as are proper for gratifying curioſity, or affording inſtruction. The geographer, then, who could only employ the materials put into his hands, was not enabled to give us any important information In the courſe of the preſent century, however, men have begun to travel from different motives. A thirſt for knowledge, as well as for gold, has led many into diſtant lands. Theſe they have explored with a philoſophic attention; and by laying open the internal ſprings of action, by which the inhabitants of different regions are actuated, exhibit to us a natural

and

and ſtriking picture of human manners, under the various ſtages of barbarity and refinement. Without manifeſt impropriety, we could not but avail ourſelves of their labours, by means of which, we have been enabled to give a more copious, and a more perfect detail of what is called Political Geography, than has hitherto appeared.

In conſidering the preſent ſtate of nations, few circumſtances are of more importance than their mutual intercourſe. This is chiefly brought about by commerce, the prime mover in the œconomy of modern ſtates, and of which, therefore, we have never loſt ſight in the preſent undertaking.

We are ſenſible, that a reader could not examine the preſent ſtate of nations with much entertainment or inſtruction, unleſs he was alſo made acquainted with their ancient ſituation, and with the various revolutions and events, by the operation of which they have aſſumed their preſent form and appearance. This conſtitutes the hiſtorical part of our Work; a department which we have endeavoured to execute in a manner entirely new. Inſtead of fatiguing the reader with a dry detail of news-paper occurrences, occurrences no way connected with one another, or with the general plan of the whole, we have mentioned only ſuch facts as are intereſting, either in themſelves or from their relation to objects of importance. Inſtead of a meagre index of incoherent incidents we have drawn up a regular and connected epitome of the hiſtory of each country, ſuch an epitome as may be read, we hope, with pleaſure and advantage, and which may by conſidered as a proper introduction to more copious accounts.

Having, through the whole of the work, mentioned the ancient names of countries, and, in treating of their particular hiſtory, ſometimes carried our reſearches beyond the limits of modern times, we have thought it neceſſary, for the ſatisfaction of ſuch readers as are unacquainted with claſſical learning, to begin our hiſtorical Introduction with the remote ages of antiquity. By inſerting an account of the ancient world in a book of geography, we afford an opportunity to the reader, of comparing together not only the manners, government, and arts of different nations, as they now appear, but as they ſubſiſted in ancient ages; which exhibiting a general map, as it were, of the hiſtory of mankind, renders our work more complete than any geographical treatiſe extant.

In the execution of our deſign, we have all along endeavoured to obſerve order and perſpicuity. Elegance we have ſacrificed to brevity. Happy to catch the leading features which diſtinguiſh the characters of nations, and by a

few ſtrokes to hit off, though not completely to finiſh, the picture of mankind in ancient and modern times.

What has enabled us to compriſe ſo many ſubjects within the narrow bounds of this work, is the omiſſion of many immaterial circumſtances, which are recorded in other performances of the ſame kind, and of all thoſe fabulous accounts or deſcriptions, which, to the diſgrace of the human underſtanding, ſwell the works of geographers; though the falſity of them, both from their own nature and the concurring teſtimony of the moſt enlightened and beſt-informed travellers and hiſtorians, be long ſince detected.

As to particular parts of the work, we have treated them more or leſs diffuſely, in proportion to their importance to us as men, and as ſubjects of Great Britain. Our own country, in both reſpects, deſerved the greateſt ſhare of our attention. Great Britain, though ſhe cannot boaſt of a more luxuriant ſoil or happier climate than many other countries, has advantages of another and ſuperior kind, which have made her the delight and envy of the world: theſe are the equity of her laws, the freedom of her political conſtitution, and the moderation of her religious ſyſtem. With regard to the Britiſh empire we have therefore been ſingularly copious.

Next to Great Britain, we have examined moſt extenſively the other ſtates of Europe; and always in proportion as they preſent us with the largeſt field for uſeful reflection. By comparing together our accounts of the European nations, an important ſyſtem of practical knowledge is inculcated; and a thouſand arguments will appear in favour of a free government, religious toleration, and an extended, unreſtrained commerce.

Europe having occupied ſo large a part of our volume, Aſia next claims our attention; which, though in ſome reſpects the moſt famous quarter of the world, offers, when compared to Europe, extremely little for our entertainment or inſtruction. In Aſia, a ſtrong attachment to ancient cuſtoms, and the weight of tyrannical power, bear down the active genius of the inhabitants, and prevent that variety in manners and character, which diſtinguiſhes the European nations.

In Africa, the human mind ſeems degraded below its natural ſtate. To dwell long upon the manners of this country, a country immerſed in rudeneſs and barbarity, beſides that it could afford little inſtruction, would be diſguſting to every lover of mankind. Add to this, that the inhabitants of Africa, deprived of all arts and ſciences, without which the human mind remains tor-

pid and inactive, diſcover no great variety in manners or character. A gloomy ſameneſs almoſt every where prevails; and the trifling diſtinctions which are diſcovered among them, ſeem rather to ariſe from an exceſs of brutality on the one hand, than from any perceptible approaches towards refinement on the other. But though theſe quarters of the globe are treated leſs extenſively than Europe, there is no diſtrict of them, however barren or ſavage, entirely omitted.

America, whether conſidered as an immenſe continent, inhabited by an endleſs variety of different people, or as a country intimately connected with Europe by the ties of commerce and and government, deſerves very particular attention. The bold diſcovery, and barbarous conqueſt of this New World, and the manners and prejudices of the original inhabitants, are objects, which, together with the deſcription of the country, deſervedly occupy no ſmall ſhare of this performance.

In treating ſuch a variety of ſubjects, ſome leſs obvious particulars, no doubt, muſt eſcape our notice. But if our general plan be good, and the outlines and chief figures ſketched with truth and judgment, the candour of the learned, we hope, will excuſe imperfections which are unavoidable in a work of this extenſive kind.

We cannot, without exceeding the bounds of a Preface, inſiſt upon the other parts of our plan. The ſcience of natural geography, for want of proper encouragement from thoſe who are alone capable of giving it, ſtill remains in an imperfect ſtate; and the exact diviſions and extent of countries, for want of geometrical ſurveys, are far from being well aſcertained. This conſideration has induced us to adopt the moſt unexceptionable of Templeman's Tables; which if they give not an account ſtrictly accurate, afford at leaſt a general idea of this ſubject; which is all indeed that we can attain, until the geographical ſcience arrives at greater perfection.

INTRODUCTION.

PART I.

OF ASTRONOMICAL GEOGRAPHY.

SECT. I.

Of the PLANETS, the COMETS, the FIXED STARS, and the different SYSTEMS of the WORLD.

THE ſcience of GEOGRAPHY cannot be underſtood without conſidering the earth as a planet, or as a body moving round another at a conſiderable diſtance from it. The ſcience which treats of the planets, and other heavenly bodies, is called ASTRONOMY: hence the neceſſity of beginning this work with an account of the heavenly bodies. Of theſe, the moſt conſpicuous is the Sun, the fountain of light and heat to the planets that move round it; and which, together with the ſun, compoſe what is called the Solar Syſtem. The path in which the planets move round the ſun, is called their Orbit; and it is now proved by aſtronomers, that there are ſeven planets which move round the ſun, each in its own orbit. The names of theſe, according to their nearneſs to the centre, or middle point of the ſun, are Mercury, Venus, the Earth, Mars, Jupiter, Saturn, and the Georgium Sidus. The two firſt, becauſe they move within the orbit of the earth (being nearer the ſun), are called *inferior* planets, or, perhaps more properly, *interior* or *inner* planets; the four laſt, moving without the orbit of the earth, are called *ſuperior*, or, perhaps more properly, *exterior* or *outer* planets. If we can form a notion of the manner in which any one of theſe planets, ſuppoſe the earth, moves round the ſun, we can eaſily conceive the manner in which all the reſt perform it. We ſhall only therefore particularly conſider the motion of the earth, leaving that of the others to be collected from a table, which we ſhall deliver, with ſuch explanations as may render it intelligible to the meaneſt capacity.

The earth was long conſidered as one extenſive plane, of no remarkable thickneſs, and the regions below it were ſuppoſed to be the habitations of ſpirits. The heavens, in which the ſun, moon, and ſtars appeared to move daily from eaſt to weſt, were conceived to be at no great diſtance from it, and to be only deſigned for the uſe or ornament of our earth: ſeveral reaſons, however, occurred, which rendered this opinion improbable; and we have now a ſufficient proof of the figure of the earth, from the voyages of many navigators who have ſailed round it, particularly from that of Magellan's ſhip, which was the firſt that ſurrounded the globe, ſailing eaſt from a port in Europe in 1519, and returning to the ſame, after a voyage of 1124 days, without apparently altering his direction, any more than a fly would appear to do in moving round a ball of wax.

The roundneſs of the earth being eſtabliſhed, a way was naturally opened for the diſcovery of its motion; for while it was conſidered as a plane, mankind had an obſcure notion of its being ſupported, like a ſcaffolding, on pillars, though they could not conceive what ſupported theſe. But the figure of a globe is much better adapted to motion. This is confirmed by conſidering, that, if the earth did not move round

the ſun, not only the ſun, but all the ſtars and planets, muſt move round the earth. Now, as philoſophers, by reckonings founded on the ſureſt obſervations, have been able to judge pretty nearly of the diſtances of the heavenly bodies from the earth, and from each other, juſt as every one that knows the firſt elements of mathematics can meaſure the height of a ſteeple or any object placed on it; it appeared that if we conceived the heavenly bodies to move round the earth, we muſt ſuppoſe them endowed with a motion or velocity ſo immenſe as to exceed all conception; whereas all the appearances in nature may be as well explained by imagining the earth to move round the ſun in the ſpace of a year, and to turn on its own axis once in the twenty-four hours.

To form a conception of theſe two motions of the earth, we may imagine a ball moving on a bowling green: the ball proceeds forwards upon the green, not by ſliding along like a plane upon wood, or a ſlate upon ice, but by turning round its own axis, which is an imaginary line drawn through the centre of the ball, and ending on its ſurface in two points called its poles. Conceiving the matter then in this way; and that the earth, in the ſpace of 24 hours, moves from weſt to eaſt, the inhabitants on the ſurface, like men on the deck of a ſhip, who are inſenſible of their own motion, and think that the banks move from them in a contrary direction, will conceive that the ſun and ſtars move from eaſt to weſt in the ſame time, in which they, with the earth, move from weſt to eaſt. This diurnal motion of the earth being once clearly conceived, will enable us to form a notion of its annual motion round the ſun; for as that luminary ſeems to have a daily motion round our earth, which is really occaſioned by the daily motion of the earth round its axis, ſo, in the courſe of a year, he ſeems to have an annual motion in the heavens, and to riſe and ſet in different points of them, which is really occaſioned by the daily motion of the earth in its orbit or path round the ſun, which it completes in a year. Now as to the firſt of theſe motions we owe the difference of day and night, ſo to the ſecond we are indebted for the difference in the length of the days and nights, and in the ſeaſons of the year.

THE PLANETS.] Thus much being premiſed with regard to the motion of the earth, which the ſmalleſt reflection may lead us to apply to the other planets, we muſt obſerve, before exhibiting our table, that, beſide the ſeven planets already mentioned, which move round the ſun, there are thirteen other bodies which move round four of theſe, in the ſame manner as they do round the ſun; and of theſe our earth has one, called the moon; Jupiter has four, Saturn has ſix (one of theſe having been lately diſcovered by Dr. Herſchel), and the Georgium Sidus has two, as that excellent aſtronomer has ſhewn. Theſe are called moons, from their agreeing with our moon, which was firſt attended to: and ſometimes they are called *ſecondary* planets, becauſe they ſeem to be attendants of the Earth, Jupiter, Saturn, and the Georgium Sidus, about which they move, and which are called *primary*.

There are but two obſervations more, neceſſary for underſtanding the following table. They are theſe: we have already ſaid that the annual motion of the earth occaſioned the diverſity of ſeaſons. But this would not happen, were the axis of the earth exactly parallel, or in a line with the axis of its orbit; becauſe then the ſame parts of the earth would be turned towards the ſun in every diurnal revolution; which would deprive mankind of the grateful viciſſitudes of the ſeaſons, ariſing from the difference in length of the days and nights. This, therefore, is not the caſe—the axis of the earth is inclined to the plane of the earth's orbit, which we may conceive by ſuppoſing a ſpindle put through a ball, with one end of it touching the ground; if we move the ball directly forwards, while one end of the ſpindle continues to touch the ground, and the other points towards ſome quarter of the heavens, we may form a notion of the inclination of the earth's axis to its orbit, from the inclination of the ſpindle to the ground. The ſame obſervation applies to ſome of the other planets, as may be ſeen from the table. It now remains, to conſider what is meant by the *mean diſtances* of the planets from

from the ſun. In order to underſtand this, we muſt learn that the path which a planet deſcribes, were it to be marked out, would not be quite round or circular, but in the ſhape of a figure called an ellipſis, which, though reſembling a circle, is longer than broad. Hence the ſame planet is not always at the ſame diſtance from the ſun, and the mean diſtance of it is that which is exactly betwixt its greateſt and leaſt diſtance. Here follows the table.

A TABLE of the Diameters, Periods, &c. of the ſeveral Planets in the Solar Syſtem.

Names of the planets.	Diameters in Engliſh Miles.	Mean diſtances from the ſun determined from obſervations of the tranſit of Venus in 1761.	Annual periods round the ſun.	Diurnal rotation on its axis.	Hourly motion in its orbit.	Hourly motion of its equator.	Inclination of axis to orbit.
				d. h. m.			
Sun	890,000		y. d. h.	25 6 0		3,818	8° 0′

The Georgian planet (or Georgium Sidus) having greatly excited the attention of the learned world, it would be unpardonable in a work of this nature to omit giving the reader a brief account of it; which we ſhall draw from the beſt authority. It was diſcovered by Dr. William Herſchel, in the year 1781; for which he obtained from the Royal Society the honorary recompence of ſir Godfrey Copley's medal. The name given to it is in honour of his majeſty King George III. who has taken Dr. Herſchel into his patronage, and granted to him an annual ſalary. The editor of the laſt edition of Chambers's Dictionary (the Rev. Dr. Rees) having been favoured with an account of this planet from the ingenious diſcoverer, we give an extract from that work. "From many calculations of our beſt aſtronomers, and mathematicians, ſays Dr. Herſchel, I have collected the following particulars, as moſt to be depended upon.

Place of the node	— — —	2ˢ 11ᵈ 49′ 30″
Inclination of the orbit	— — —	43′ 35″
Place of the perihelion	— — —	172ᵈ 13′ 17″
Time of the perihelion paſſage	— —	Sept. 7, 1799
Eccentricity of the orbit	.82034	
Half the greater axis	19.07904	
Revolution —	83.3364	ſiderial ſtars.

"From my own obſervations on this planet's apparent diameter, which I have found cannot well be leſs than 4″, nor indeed much greater, we infer that its real diameter is to that of the earth, as 4.454 to 1; and hence it appears to be of very conſiderable bulk, and, except Saturn and Jupiter, by far the largeſt of the remaining planets. Its light is of a bluiſh-white colour, and its brilliancy between that of the moon and of Venus. With a teleſcope which magnifies about three hundred times, it appears to have a very well defined viſible diſk; but with inſtruments of a ſmall power, it can hardly be diſtinguiſhed from a fixed ſtar of between the ſixth and ſeventh magnitude. In a very fine clear night, when the moon is abſent, it may alſo be ſeen by the naked eye."

On the 11th January, 1787, Dr. Herſchel diſcovered two ſatellites belonging to this planet.

THE COMETS.] The reader having obtained an idea of the Planets from the table in the foregoing page and the previous obſervations neceſſary for underſtanding it, muſt next turn his reflection to the Comets, which, as they revolve round our Sun, are a part of the ſolar ſyſtem. Theſe, deſcending from the far diſtant parts of the ſyſtem with great rapidity, ſurpriſe us with the ſingular appearance of a train, or tail, which accompanies them; become viſible to us in the lower parts of their orbits, and, after a ſhort ſtay, go off again to vaſt diſtances, and diſappear. Though ſome of the ancients had more juſt notions of them, yet the opinion having prevailed, that they were only meteors generated in the air, like to thoſe we ſee in it every night, and in a few moments vaniſhing, no care was taken to record their phænomena accurately, till of late. Hence this part of aſtronomy is very imperfect. The general doctrine is, that they are ſolid, compact bodies, like other planets, and regulated by the ſame laws of gravity, ſo as to deſcribe equal areas in proportional times by radii drawn to the common centre. They move about the ſun in very eccentric ellipſes, and are of a much greater denſity than the earth; for ſome of them are heated in every period to ſuch a degree as would vitrify any ſubſtance known to us. Sir Iſaac Newton computed the heat of the comet that appeared in the year 1680, when neareſt the ſun, to be 2000 times hotter than red-hot iron, and that, being thus heated, it muſt retain its heat till it comes round again, although its period ſhould be more than 20,000 years; and it is computed to be only 575. It is believed that there are at leaſt 21 comets belonging to our ſyſtem, moving in all directions; and all thoſe which have been obſerved have moved through the etherial regions and the orbits of the planets, without ſuffering any ſenſible reſiſtance in their motions, which proves that the planets do not move in ſolid orbs. Of all the comets, the periods of three only are known with any degree of certainty, being found to return at intervals of 75, 129, and 575 years: that which appeared in 1680 is the moſt remarkable; its greateſt diſtance is about 11 thouſand 200 millions of miles from the ſun, while its leaſt diſtance from the centre of the ſun is about 490 thouſand miles; within leſs than one third part of the ſun's ſemidiameter from his ſurface. In that part of its orbit, which is neareſt to the ſun, it flies with the amazing velocity of 880,000 miles in an hour; and the ſun, as ſeen from it, appears 100 degrees in breadth, conſequently 40,000 times as large as he appears to us. The aſtoniſhing diſtance that this comet runs out into empty ſpace, naturally ſuggeſts to our imagination, the vaſt diſtance between our ſun, and the neareſt of the fixed ſtars, of whoſe attractions all the comets muſt keep clear, to return periodically and go round the ſun. Dr. Halley, to whom every part of aſtronomy, but this in a particular manner, is highly indebted, has joined his labours to thoſe of ſir Iſaac Newton on this ſubject. Our earth was out of the way, when this comet laſt paſſed near her orbit; but it requires a more perfect knowledge of the motion of the comet, to be able to judge if it will always paſs by us with ſo little effect; for it may be obſerved, that the comet, in one part of its orbit, approaches very near to the orbit of our earth: ſo that, in ſome revolutions, it may approach near enough to have very conſiderable, if not fatal effects upon it. See Newton, Halley, Gregory, Keill, M'Laurin, Derham, Ferguſon, and Whiſton.

THE FIXED STARS.] Having thus briefly ſurveyed the ſolar ſyſtem, which, though great in itſelf, is ſmall in compariſon with the immenſity of the univerſe, we next proceed to the contemplation of thoſe other vaſt bodies called the *fixed Stars*; which being of infinite uſe in the practice of geography, claim a particular notice in this work. Theſe fixed ſtars are diſtinguiſhed by the naked eye from the planets, by being leſs bright and luminous, and by continually exhibiting that appearance which we call the twinkling of the ſtars. This ariſes from their being ſo ſmall, that the interpoſition

interpoſition of the leaſt body, of which there are many conſtantly floating in the air, deprives us of the ſight of them; when the interpoſed body changes its place, we again ſee the ſtar, and this ſucceſſion being perpetual, occaſions the twinkling. But a more remarkable property of the fixed ſtars, and that from which they have obtained their name, is their never changing their ſituation, with regard to each other, as the planets, from what we have already ſaid, muſt evidently be always changing their's. The ſtars which are neareſt to us ſeem largeſt, and are therefore called of the firſt magnitude. Thoſe of the ſecond magnitude appear leſs, being at a greater diſtance; and ſo proceeding on to the ſixth magnitude, which includes all the fixed ſtars that are viſible without a teleſcope. As to their number, though in a clear winter's night, without moonſhine, they ſeem to be innumerable, which is owing to their ſtrong ſparkling, and our looking at them in a confuſed manner; yet when the whole firmament is divided, as it has been done by the ancients, into ſigns and conſtellations, the number that can be ſeen at a time, by the bare eye, is not above a thouſand. Since the introduction of teleſcopes, indeed, the number of the fixed ſtars has been juſtly conſidered as amazing; becauſe the greater perfection we arrive at in our glaſſes, the more ſtars always appear to us. Mr. Flamſtead, late royal aſtronomer at Greenwich, has given us a catalogue of about 3000 ſtars. Theſe are called teleſcopic ſtars, from their being inviſible without the aſſiſtance of that inſtrument. Dr. Herſchel, to whoſe ingenuity and aſſiduity the aſtronomical world is ſo much indebted, has evinced what great diſcoveries may be made by improvements in the inſtruments of obſervation. In ſpeaking here of his diſcoveries, I ſhall uſe the words of M. de la Lande. "In paſſing rapidly over the heavens with his new teleſcope, the univerſe increaſed under his eye; 44,000 ſtars, ſeen in the ſpace of a few degrees, ſeem to indicate that there were ſeventy-five millions in the heavens." But what are all theſe, when compared to thoſe that fill the whole expanſe, the boundleſs fields of æther. Indeed the immenſity of the univerſe muſt contain ſuch numbers, as would exceed the utmoſt ſtretch of the human imagination; for who can ſay how far the univerſe extends, or point out thoſe limits, where the Creator ſtayed "his rapid wheels" or where he "fixed the golden compaſſes!"

The immenſe diſtance of the fixed ſtars from our earth, and one another, is of all conſiderations the moſt proper for raiſing our ideas of the works of God. For notwithſtanding the great extent of the earth's orbit or path (which is at leaſt 162 millions of miles in diameter) round the ſun, the diſtance of a fixed ſtar is not ſenſibly affected by it; ſo that the ſtar does not appear to be any nearer us when the earth is in that part of its orbit neareſt the ſtar, than it ſeemed to be when the earth was at the moſt diſtant part of its orbit, or 162 millions of miles farther removed from the ſame ſtar. The ſtar neareſt us, and conſtantly the largeſt in appearance, is the dog-ſtar, or Sirius. Modern diſcoveries make it probable that each of theſe fixed ſtars is a ſun, having planets and comets revolving round it, as our ſun has the earth and other planets revolving round him. Now the dog-ſtar appears 27,000 times leſs than the ſun; and as the diſtance of the ſtars muſt be greater in proportion as they ſeem leſs, mathematicians have computed the diſtance of Sirius from us to be two billions and two hundred thouſand millions of miles. The motion of light, therefore, which though ſo quick as to be commonly thought inſtantaneous, takes up more time in travelling from the ſtars to us, than we do in making a Weſt-India voyage. A ſound would not arrive to us from thence in 50,000 years; which, next to light, is conſidered as the quickeſt body we are acquainted with. And a cannon ball, flying at the rate of 480 miles an hour, would not reach us in 700,000 years.

The ſtars, being at ſuch immenſe diſtances from the ſun, cannot poſſibly receive from him ſo ſtrong a light as they ſeem to have; nor any brightneſs ſufficient to make them viſible to us; for the ſun's rays muſt be ſo ſcattered and diſſipated before they reach ſuch remote objects, that they can never be tranſmitted back to our eyes, ſo as

to render theſe objects viſible by reflection. The ſtars therefore ſhine with their own native and unborrowed luſtre, as the ſun does; and ſince each ſtar, as well as the ſun, is confined to a particular portion of ſpace, it is plain that the ſtars are of the ſame nature with the ſun.

It is not probable that the Almighty, who always acts with infinite wiſdom, ſhould create ſo many glorious ſuns, fit for ſo many important purpoſes, and place them at ſuch diſtances from one another, without proper objects near enough to be benefited by their influences. Whoever imagines that they were created only to give a faint glimmering light to the inhabitants of this globe, muſt have a very ſuperficial knowledge of aſtronomy*, and a mean opinion of the Divine Wiſdom; ſince, by an infinitely leſs exertion of creating power, the Deity could have given our earth much more light by one ſingle additional moon.

Inſtead then of one ſun and one world only in the univerſe, as the unſkilful in aſtronomy imagine, *that* ſcience diſcovers to us ſuch an inconceivable number of ſuns, ſyſtems, and worlds, diſperſed through boundleſs ſpace, that if our ſun, with all the planets, moons, and comets belonging to it, were annihilated, they would be no more miſſed, by an eye that could take in the whole creation, than a grain of ſand from the ſea-ſhore. The ſpace they poſſeſs being comparatively ſo ſmall, that it would ſcarcely be a ſenſible blank in the univerſe, although the Georgium Sidus, the outermoſt of our planets, revolves about the ſun in an orbit of 10,830 millions of miles in circumference, and ſome of our comets make excurſions many thouſand millions of miles beyond the orbit of the Georgium Sidus; and yet, at that amazing diſtance, they are incomparably nearer to the ſun than to any of the ſtars; as is evident from their keeping clear of the attracting power of all the ſtars, and returning periodically by virtue of the ſun's attraction.

From what we know of our own ſyſtem, it may be reaſonably concluded, that all the reſt are with equal wiſdom provided with accommodations for rational inhabitants; for although there is almoſt an infinite variety in the parts of the creation which we have opportunities of examining, yet there is a general analogy connecting all the parts into one ſcheme, one deſign, one whole!

Since the fixed ſtars are prodigious ſpheres of fire, like our ſun, and at inconceivable diſtances from one another, as well as from us, it is reaſonable to conclude they are made for the ſame purpoſes that the ſun is; each to beſtow light, heat, and vegetation on a certain number of inhabited planets, kept by gravitation within the ſphere of its activity.

What an auguſt! what an amazing conception, if human imagination can conceive it, does this give of the works of the Creator! Thouſands of thouſands of ſuns, multiplied without end, and ranged all around us, at immenſe diſtances from each other, attended by ten thouſand times ten thouſand worlds, all in rapid motion, yet calm, regular, and harmonious, invariably keeping the paths preſcribed them; and theſe worlds peopled with myriads of intelligent beings, formed for endleſs progreſſion in perfection and felicity.

If ſo much power, wiſdom, goodneſs, and magnificence is diſplayed in the material creation, which is the leaſt conſiderable part of the univerſe, how great, how wiſe, how good muſt HE be, who made and governs the whole.

THE CONSTELLATIONS.] The *firſt people* who paid much attention to the fixed ſtars, were the *ſhepherds* in the beautiful plains of Egypt and Babylon; who, partly from amuſement, and partly with a view to direct them in their travelling during the night, obſerved the ſituation of theſe celeſtial bodies. Endowed with a lively fancy, they divided the ſtars into different companies or conſtellations, each of which

* Eſpecially ſince there are many ſtars which are not viſible without the aſſiſtance of a good teleſcope; and, therefore, inſtead of giving light to this world they can only be ſeen by a few aſtronomers.

they

they ſuppoſed to repreſent the image of ſome animal, or other terreſtrial object. The peaſants in our own country do the ſame; for they diſtinguiſh that great northern conſtellation, which philoſophers call the Urſa Major, by the name of the Plough, the figure of which it certainly may repreſent with a very little help from the fancy. But the conſtellations in general have preſerved the names which were given them by the ancients; and they are reckoned 21 *northern*, and 12 *ſouthern:* but the moderns have increaſed the number of the northern to 36, and of the ſouthern to 32. Beſide theſe, there are the 12 *ſigns* or conſtellations in the Zodiac, as it is called from a Greek word ſignifying an animal, becauſe each of theſe 12 repreſents ſome animal. This is a great circle which divides the heavens into two equal parts, of which we ſhall ſpeak hereafter. In the mean time, we ſhall conclude this ſection with an account of the riſe, progreſs, and revolutions in aſtronomy.

Mankind muſt have made a very conſiderable improvement in obſerving the motions of the heavenly bodies, before they could ſo far diſengage themſelves from the prejudices of popular opinion, as to believe that the earth upon which we live was not immoveable. We find accordingly, that Thales, the Mileſian, who, about 580 years before Chriſt, firſt taught aſtronomy in Europe, had calculated eclipſes, or interpoſitions of the moon between the earth and the ſun, or of the earth between the ſun and the moon (the nature of which may be eaſily underſtood, from what we have already obſerved.) Pythagoras, a Greek philoſopher, flouriſhed about 50 years after Thales, and was equally well acquainted with the motion of the heavenly bodies. This led Pythagoras to conceive an idea, which there is no reaſon to believe had ever been thought of before, namely, that the earth itſelf was in motion, and that the ſun was at reſt. He found that it was impoſſible, in any other way, to give a conſiſtent account of the heavenly motions. This ſyſtem, however, was ſo extremely oppoſite to common prejudices, that it never made great progreſs, nor was ever widely diffuſed. The philoſophers of antiquity, deſpairing of being able to overcome ignorance by reaſon, endeavoured to adapt the one to the other, and to form a reconciliation between them. This was the caſe with Ptolemy, an Egyptian philoſopher, who flouriſhed 138 years before Chriſt. He ſuppoſed, with the vulgar, that the earth was fixed immoveably in the centre of the univerſe, and that the ſeven planets, conſidering the moon as one of the primaries, were placed near to it; above them was the firmament of fixed ſtars, then the cryſtalline orbs, then the primum mobile, and, laſtly, the cœlum empyrium, or heaven of heavens. All theſe orbs he ſuppoſed to move round the earth once in 24 hours; beſides moving in certain ſtated or periodical times. To account for theſe motions, he ſuppoſed a number of circles, called excentrics and epicycles, croſſing and interfering with one another. This ſyſtem was univerſally maintained by the Peripatetic philoſophers, who were the moſt conſiderable ſect in Europe from the time of Ptolemy to the revival of learning in the ſixteenth century.

At length, Copernicus, a native of Poland, a bold and original genius, adopted the Pythagorean, or true ſyſtem of the univerſe; and publiſhed it to the world in the year 1530. This doctrine had been ſo long in obſcurity, that the reſtorer of it was conſidered as the inventor; and the ſyſtem obtained the name of the Copernican philoſophy, though only revived by that great man.

Europe was ſtill immerſed in ignorance; and the general ideas of the world were not able to keep pace with thoſe of a refined philoſophy. This occaſioned Copernicus to have many opponents. Tycho Brahe, in particular, a noble Dane, ſenſible of the defects of the Ptolemaic ſyſtem, but unwilling to acknowledge the motion of the earth, endeavoured, about 1586, to eſtabliſh a new ſyſtem, which was ſtill more perplexed and embarraſſed than that of Ptolemy. It allows a monthly motion to the moon round the earth, as the centre of its orbit; and it makes the ſun to be the centre of the orbits of Mercury, Venus, Mars, Jupiter, and Saturn. The ſun, how-

ever, with all the planets, is ſuppoſed to be whirled round the earth in a year, and even once in the twenty-four hours. This ſyſtem, notwithſtanding its abſurdity, met with its advocates. Longomontanus, and others, ſo far refined upon it, as to admit the diurnal motion of the earth, though they inſiſted that it had no annual motion.

About this time, after a darkneſs of many ages, the dawn of learning and taſte appeared in Europe. Learned men in different countries began to cultivate aſtronomy. Galileo, a Florentine, about the year 1610, introduced the uſe of teleſcopes, which afforded new arguments in ſupport of the motion of the earth, and confirmed the old ones. The fury and bigotry of the clergy had almoſt checked this flouriſhing bud: Galileo was obliged to renounce the Copernican ſyſtem, as a damnable hereſy. The Reformation, however, placed a great part of Europe beyond the reach of the papal thunder. It taught mankind that the ſcriptures were not given for explaining ſyſtems of natural philoſophy, but for a nobler purpoſe, to make us virtuous and humane: that inſtead of oppoſing the word of God, which in ſpeaking of natural things ſuits itſelf to the prejudices of weak mortals, we employed our faculties in a manner highly agreeable to God, in tracing the nature of his works, which, the more they are conſidered, afford us the greater reaſon to admire his glorious attributes of power, wiſdom, and goodneſs. From this time, therefore, noble diſcoveries were made in all the branches of aſtronomy. The motions of the heavenly bodies were not only clearly explained, but the general law of nature, according to which they moved, was diſcovered and illuſtrated by the immortal Newton. This law is called *Gravity*, or *Attraction*, and is the ſame by which any body falls to the ground, when diſengaged from what ſupported it. It has been demonſtrated, that this ſame law which keeps the ſea in its channel, and the various bodies which cover the ſurface of this earth from flying off into the air, operates throughout the univerſe, keeps the planets in their orbits, and preſerves the fabric of nature from confuſion and diſorder.

SECT. II.

Of the Doctrine of the SPHERE.

HAVING, in the foregoing Section, treated of the UNIVERSE in general, in which the earth has been conſidered as a planet, we now proceed to the Doctrine of the SPHERE, which ought always to be premiſed before that of the Globe or earth, as we ſhall ſee in the next Section. In diſcuſſing this ſubject, we ſhall conſider the earth as at reſt, and the heavenly bodies, as performing their revolutions round it. This method cannot lead the reader into any miſtake, ſince we have previouſly explained the true ſyſtem of the univerſe, from which it appears that it is the *real* motion of the earth which occaſions the *apparent* motion of the heavenly bodies. It is beſides attended with this advantage, that it perfectly agrees with the information of our ſenſes. The imagination, therefore, is not put on the ſtretch; the idea is eaſy and familiar, and, in delivering the elements of ſcience, this object cannot be too much attended to *.

The ancients obſerved, that all the ſtars turned (in appearance) round the earth, from eaſt to weſt, in twenty-four hours; that the circles, which they deſcribed in thoſe revolutions, were parallel to each other, but not of the ſame magnitude; thoſe paſſing over the middle of the earth, being the largeſt, while the reſt diminiſhed in proportion to their diſtance from it. They alſo obſerved that there were two points in the heavens, which always preſerved the ſame ſituation. Theſe points they termed celeſtial poles, becauſe the heavens ſeemed to turn round them. In order to imitate

* N. B. In order more clearly to comprehend what follows, the reader may occaſionally turn his eye to the figure of the artificial ſphere.

theſe motions, they invented what is called the *Artificial Sphere*, through the centre of which they drew a wire or iron rod, called an *Axis*, whoſe extremities were fixed to the immoveable points called *Poles*. They farther obſerved, that on the 20th of March, and 23d of September, the circle deſcribed by the ſun was at an equal diſtance from both of the poles. This circle, therefore, muſt divide the earth into two equal parts, and on this account was called the *Equator* or *Equaller*. It was alſo called the *Equinoctial Line*, becauſe the ſun, when moving in it, makes the days and nights of equal length all over the world. Having alſo obſerved that from the 21ſt of June to the 22d of December, the ſun advanced every day towards a certain point, and having arrived there, returned towards that from whence he ſet out, from the 22d of December to the 21ſt of June: they fixed *theſe points*, which they called *Solſtices*, becauſe the direct motion of the ſun was ſtopped at them and repreſented the bounds of the ſun's motion, by two circles, which they named *Tropics*, becauſe the ſun no ſooner arrived there than he turned back. Aſtronomers obſerving the motion of the ſun, found its quantity, at a mean rate, to be nearly a degree (or the 360th part) of a great circle in the heavens, every 24 hours. This great circle is called the *Ecliptic*, and it paſſes through certain conſtellations, diſtinguiſhed by the names of animals, in a *zone* called the *Zodiac*. It touches the tropic of Cancer on one ſide, and that of Capricorn on the other, and cuts the equator obliquely at an angle of 23 degrees 29 minutes, the ſun's greateſt declination. To expreſs this motion, they ſuppoſed two points in the heavens, equally diſtant from, and parallel to, this circle, which they call the *Poles* of the Zodiac, which, turning with the heavens, by means of their axis, deſcribe the *two polar circles*. In the artificial ſphere, the equinoctial, the two tropics, and two polar circles, are cut at right angles, by two other circles called *Colures*, which ſerve to mark the points of the ſolſtices, equinoxes, and poles of the zodiac. The ancients alſo obſerved, that when the ſun was in any point of his courſe, the people inhabiting directly north and ſouth, as far as the poles, have noon at the ſame time. This gave occaſion to imagine a circle paſſing through the poles of the world which they called a *Meridian*, and is immoveable in the artificial ſphere, as well as the horizon; which is another circle repreſenting the bounds betwixt the two hemiſpheres, or half ſpheres, viz. that which is above it, and that which is below it.

SECT. III.

The Doctrine of the GLOBE naturally follows that of the SPHERE.

BY the Doctrine of the GLOBE is meant the repreſentation of the different places and countries of the earth, upon an artificial globe. The manner in which geographers have repreſented the ſituation of one place with regard to another, or to the earth in general, has been by transferring the circles of the ſphere to the artificial globe; and this is the only method they could employ. This will be obvious from an example. After that circle in the heavens, which is called the equator, was known to aſtronomers, there was nothing more eaſy than to transfer it to the earth, by which the ſituation of places was determined, according as they lay on one ſide of the equator or another. The ſame may be obſerved of the other circles of the ſphere. The reader having obtained an idea of the principle upon which the Doctrine of the Globe is founded, may proceed to conſider this doctrine itſelf, or, in other words, the deſcription of our earth, as repreſented by the *artificial globe*.

FIGURE OF THE EARTH.] Though in ſpeaking of the earth, along with the other planets, it was ſufficient to conſider it as a ſpherical or globular body; yet it has been diſcovered, that this is not its true figure, and that the earth, though nearly a ſphere or ball, is not perfectly ſo. This occaſioned great diſpute between the philoſophers of the laſt age, among whom ſir Iſaac Newton, and Caſſini, a French

aſtronomer, were the heads of two parties. Sir Iſaac demonſtrated, from mathematical principles, that the earth was an *oblate ſphere*, or that it was flatted at the poles, and jutted out towards the equator; ſo that a line, drawn through the centre of the earth, and paſſing through the poles, which is called a *Diameter*, would not be ſo long as a line drawn through the ſame centre, and paſſing through the eaſt and weſt points. The French philoſopher aſſerted the contrary. But the diſpute was terminated by the French king, in 1736, who ſent out a company of philoſophers towards the north pole, and likewiſe towards the equator, in order to meaſure a degree, or the three hundred and ſixtieth part of a great circle in theſe different parts; and from their report, the opinion of ſir Iſaac Newton was confirmed beyond diſpute. Since that time, therefore, the earth has always been conſidered as more flat towards the poles than the equator. The reaſon of this figure may be eaſily underſtood, if the reader comprehends what we obſerved, with regard to the earth's motion; for if we fix a ball of clay on a ſpindle, and whirl it round, we ſhall find that it will project towards the middle, and flatten towards the poles. This is exactly the caſe with regard to our earth, only that its axis, repreſented by the ſpindle, is imaginary. But though the earth be not perfectly ſpherical, the difference from that figure is ſo ſmall, that it may be repreſented by a globe, without any ſenſible error.

CIRCUMFERENCE AND DIAMETER OF THE EARTH.] In the table which we have exhibited, the diameter of the globe is given, according to the beſt obſervations: ſo that its circumference is 25,038 Engliſh miles. This circumference is conceived, for the conveniency of meaſuring, to be divided into three hundred and ſixty parts or degrees, each degree containing ſixty geographical miles, or ſixty-nine Engliſh miles and an half. Theſe degrees are in the ſame manner conceived to be divided each into ſixty minutes.

AXIS AND POLES OF THE EARTH.] The Axis of the Earth is that imaginary line paſſing through its centre, on which it is ſuppoſed to turn round once in twenty-four hours. The extreme points of this line are called the Poles of the Earth; one in the north, and the other in the ſouth, which are exactly under the two points of the heavens called the North and South Poles. The knowledge of theſe poles is of great uſe to the geographer in determining the diſtance and ſituation of places; for the poles mark the ends of the earth, which is divided in the middle by the equator; ſo that the nearer one approaches to the poles, the farther he removes from the equator; and, in removing from the poles, he approaches the equator.

CIRCLES OF THE GLOBE.] Theſe are commonly divided into the *greater* and *leſſer*. A great circle is that whoſe plane paſſes through the centre of the earth, and divides it into two equal parts or hemiſpheres. A leſſer circle is that which, being parallel to a greater, cannot paſs through the centre of the earth, nor divide it into two equal parts. The greater circles are *ſix* in number, the leſſer *four*.

EQUATOR.] The firſt *great circle* we ſhall ſpeak of is the *Equator*, which we have had occaſion to hint at already. It is called ſometimes the *Equinoctial*, the reaſon of which we have explained; and by navigators it is alſo called the *Line*, becauſe, according to their rude notions, they believed it to be a great Line drawn upon the ſea from eaſt to weſt, dividing the earth into the northern and ſouthern hemiſpheres, and which they were actually to paſs in ſailing from the one into the other. The poles of this circle are the ſame with thoſe of the world. It paſſes through the eaſt and weſt points of the world, and, as has been already mentioned, divides it into the northern and ſouthern hemiſpheres. It is divided it into three hundred and ſixty degrees, the uſe of which will ſoon appear.

HORIZON.] *This great circle* is repreſented by a broad circular piece of wood, encompaſſing the globe, and dividing it into the upper and lower hemiſpheres. Geographers properly diſtinguiſh the horizon into the *ſenſible* and *rational*. The firſt is that

that which bounds the utmoſt proſpect of our ſight, when we view the heavens around us *apparently* touching the earth or ſea.

This circle determines the riſing or ſetting of the ſun and ſtars, in any particular place; for when they begin to appear above the eaſtern edge, we ſay they riſe, and when they go beneath the weſtern, we ſay they are ſet. It appears then that each place has its own *ſenſible* horizon. The other horizon, called the *rational*, encompaſſes the globe exactly in the middle. Its poles (that is two points in its axis, each ninety degrees diſtant from its plane, as thoſe of all circles are) are called the *Zenith* and *Nadir*; the firſt exactly above our heads, and the other directly under our feet. The broad wooden circle, which repreſents it on the globe, has ſeveral circles drawn upon it: of theſe the innermoſt is that exhibiting the number of degrees of the twelve ſigns of the Zodiac, viz. thirty to each ſign. Next to this, you have the names of theſe ſigns, with the days of the month, according to the old and new ſtyle. Beſides theſe, there is a circle repreſenting the thirty-two rhumbs, or points of the mariner's compaſs.

MERIDIAN.] *This circle* is repreſented by the *braſs ring*, on which the globe hangs and turns. It is divided into three hundred and ſixty degrees, and cuts the equator at right angles; ſo that counting from the equator each way to the poles of the world, it contains four times ninety degrees, and divides the earth into the eaſtern and weſtern hemiſpheres. This circle is called the *meridian*, becauſe when the ſun comes to the ſouth part of it, it is then mid-day, and the ſun has its greateſt altitude for that day, which is therefore called its meridian altitude. Now as the ſun is never in its meridian altitude at two places eaſt or weſt of one another at the ſame time, each of theſe places muſt have its own meridian. There are commonly marked on the globe twenty-four meridians, one through every fifteen degrees of the equator.

ZODIAC.] The Zodiac is a *broad circle*, which cuts the equator obliquely; in which the twelve ſigns above mentioned are repreſented. In the middle of this circle is ſuppoſed the *Ecliptic*, from which the ſun never deviates in his annual courſe, and in which he advances thirty degrees every month. The twelve ſigns are,

1. Aries ♈ — — March	7. Libra ♎ — — September
2. Taurus ♉ — — April	8. Scorpio ♏ — — October
3. Gemini ♊ — — May	9. Sagittarius ♐ — — November
4. Cancer ♋ — — June	10. Capricorn ♑ — — December
5. Leo ♌ — — July	11. Aquarius ♒ — — January
6. Virgo ♍ — — Auguſt	12. Piſces ♓ — — February.

COLURES.] If you imagine *two great circles* paſſing both through the poles of the world, and one of them through the equinoctial points Aries and Libra, and the other through the ſolſtitial points Cancer and Capricorn, theſe are called the Colures, the one the Equinoctial, the other the Solſtitial Colure. Theſe divide the ecliptic into four equal parts or quarters, which are denominated according to the points which theſe paſs through, viz. the four cardinal points, and are the firſt points of Aries, Libra, Cancer, and Capricorn; and theſe are all the *great circles*.

TROPICS.] If you ſuppoſe two circles drawn parallel to the equinoctial, at twenty-three degrees thirty minutes diſtance from it, meaſured on the brazen meridian, and one towards the north, the other towards the ſouth, theſe are called Tropics, becauſe the ſun appears, when in them, to turn backwards from his former courſe. The one is called the Tropic of Cancer, the other of Capricorn, becauſe they paſs through theſe points.

POLAR CIRCLES.] If two other circles are ſuppoſed to be drawn at the like diſtance of twenty-three degrees thirty minutes, reckoned on the meridian from the polar points, theſe are called the Polar Circles. The *northern* is called the *Arctic*, becauſe the north pole is near the conſtellation of the Bear; the *ſouthern* the *Ant-*

arctic, becauſe oppoſite to the former. And theſe are the *four leſſer circles*. Beſides theſe ten circles now deſcribed, which are always drawn on the globe, there are ſeveral others, which are only ſuppoſed to be drawn on it. Theſe will be explained as they become neceſſary, leſt the reader ſhould be diſguſted with too many definitions at the ſame time, without ſeeing the purpoſe for which they ſerve. The main deſign of all theſe circles being to exhibit the reſpective ſituation of places on the earth, we ſhall proceed to conſider more particularly how that is effected by them. It was found eaſier to diſtinguiſh places by the quarters of the earth in which they lay, than by their diſtance from any one point. Thus, after it was diſcovered, that the equator divided the earth into two parts, called the Northern and Southern hemiſpheres, it was eaſy to ſee that all places on the globe might be diſtinguiſhed, according as they lay on the north or ſouth ſide of the equator.

ZONES.] After the four leſſer circles we have mentioned came to be known, it was found that the earth by means of them, might be divided into five portions, and conſequently that the places on its ſurface might be diſtinguiſhed according as they lay in one or other of theſe portions, which are called Zones, from the Greek word ζωνη, which ſignifies a girdle; being broad ſpaces, like ſwathes, girding the earth about.

The *torrid zone* is that portion of the earth between the tropics, and called by the ancients *torrid* becauſe they conceived, that, being continually expoſed to the perpendicular or direct rays of the ſun, it was rendered uninhabitable, and contained nothing but parched and ſandy deſarts. This notion, however, has long ſince been refuted. It is found that the long nights, great dews, regular rains and breezes, which prevail almoſt throughout the torrid zone, render the earth not only habitable, but ſo fruitful, that in many places they have two harveſts in a year; all ſorts of ſpices and drugs are almoſt ſolely produced there; and it furniſhes more perfect metals, precious ſtones, and pearls than all the reſt of the earth. This Zone comprehends the Eaſt and Weſt Indies, Philippine Iſlands, thoſe of Borneo, Sumatra, Java, Madagaſcar, greater part of South America and Africa, and almoſt all captain Cook's diſcoveries, including the northern parts of New Holland.

The *frigid zones* are thoſe regions round the pole, where the ſun does not riſe for ſome days in the winter, nor ſet for ſome days in the ſummer. The two poles are the centres of theſe zones, which extend from theſe points to twenty three degrees, and a half nearly; that is, they are bounded by the northern and ſouthern parallels of latitude of ſixty-ſix degrees and a half. The part that lies in the northern hemiſphere is called the north frigid zone, and is bounded by a parallel, called the arctic or polar circle; and that in the ſouthern hemiſphere, the ſouth frigid zone, and the parallel of latitude which bounds it, is called the antarctic, or polar circle.

The northern *frigid zone* comprehends Nova Zembla, Lapland, part of Norway, Baffin's Bay, part of Greenland, and part of Siberia. The ſouthern *frigid zone* has no land known to us; and from the obſervations of captain Cook, who in the years 1772, 1773, 1774, and 1775, reſolved the great problem of a ſouthern continent, we have reaſon to think that there is no land belonging to the ſouthern frigid zone. That great navigator having traverſed the ſouthern hemiſphere between the latitudes of 40° and 70°, in ſuch a manner as not to leave a poſſibility of the exiſtence of any continent, unleſs near the pole, and out of the reach of navigation.

The *two temperate zones* are the ſpaces contained between the tropics and polar circles.

The *northern* temperate zone contains almoſt all Europe, the greater part of Aſia, part of Africa, the united States of America, and the Britiſh Colonies.

The *ſouthern* temperate zone comprehends the ſouth part of New Holland (including Botany Bay) Cape of Good Hope, and Cape Horn.

CLIMATES.] The diviſions of the earth into hemiſpheres and zones, though it may

be of advantage in letting us know in what quarter of the earth any place lies, is not ſufficiently minute for giving us a notion of the diſtances between one place and another. This, however, is ſtill more neceſſary; becauſe it is of more importance to mankind, to know the ſituation of places, with regard to one another, than with regard to the earth itſelf. The firſt ſtep taken for determining this matter, was to divide the earth into what are called Climates. It was obſerved, that the day was always twelve hours long on the equator, and that the longeſt day increaſed in proportion as we advanced north or ſouth on either ſide of it. The ancients therefore determined how far any place was north or ſouth of the equator, or what is called the *Latitude* of the place, from the greateſt length of the day from the place. This made them conceive a number of circles parallel to the equator, which bounded the length of the day at different diſtances from the equator. And as they called the ſpace contained between theſe circles, Climates, becauſe they declined from the equator towards the pole, ſo the circles themſelves may be called *Climatical parallels*. This therefore was a new diviſion of the earth, more minute than that of zones, and ſtill continues in uſe; though, as we ſhall ſhew, the deſign which firſt introduced it, may be better anſwered in another way. There are 30 climates between the equator and either pole. In the firſt 24, the days increaſe by half hours; but in the remaining ſix, between the polar circle and the poles, the days increaſe by months. This the reader will be convinced of, when he becomes acquainted with the uſe of the globe: in the mean time we ſhall inſert a table which will ſerve to ſhew in what climate any country lies, ſuppoſing the length of the day, and the diſtance of the place from the equator to be known.

Cli.	Latitude. D.	M.	Breadth. D.	M.	Long. Day. H.	M.	Names of Countries and remarkable Places ſituated in every Climate, north of the Equator.
1	8	25	8	25	12	30	I. Within the firſt Climate lie the Gold and Silver Coaſts in Africa; Malacca in the Eaſt-Indies; Cayenne and Surinam in Terra Firma, S. America.
2	16	25	8		13		II. Here lie Abyſſinia in Africa; Siam, Madras, and Pondicherry, in the Eaſt Indies; Straits of Darien, between N. and S. America; Tobago, the Granades, St. Vincent and Barbadoes in the W. Indies.
3	23	50	7	25	13	30	III. Contains Mecca in Arabia; Bombay, part of Bengal in the Eaſt-Indies; Canton in China; Mexico, Bay of Campeachy, in North America; Jamaica, Hiſpaniola, St. Chriſtopher's, Antigua, Martinico, and Guadaloupe, in the Weſt-Indies.
4	30	25	6	30	14		IV. Egypt, and the Canary Iſlands, in Africa; Delly, capital of the Mogul Empire in Aſia; Gulf of Mexico, and Eaſt Florida, in North America; the Havanna, in the Weſt Indies,
5	36	28	6	8	14	30	V. Gibraltar, in Spain; part of the Mediterranean ſea; the Barbary coaſt, in Africa; Jeruſalem; Iſpahan, capital of Perſia; Nankin, in China; California, New Mexico, Weſt Florida, Georgia, and the Carolinas, in North America.
6	41	22	4	54	15		VI. Liſbon in Portugal; Madrid in Spain; Minorca, Sardinia, and part of Greece, in the Mediterranean; Aſia Minor; part of the Caſpian Sea; Samarcand, in Great Tartary; Pekin in China; Corea and Japan; Williamſburgh, in Virginia; Maryland, and Philadelphia, in North America.
7	45	29	4	7	15	30	VII. Northern provinces of Spain; Southern ditto of France: Turin, Genoa, and Rome, in Italy; Conſtantinople, and the Black Sea, in Turkey; the Caſpian Sea, and part of Tartary; New York, Boſton in New England, North America.
8	49	01	3	32	16		VIII. Paris, Vienna capital of Germany; New-Scotland, Newfoundland, and Canada, in North America.
9	52	00	2	57	16	30	IX. London, Flanders, Prague, Dreſden; Cracow in Poland; ſouthern provinces of Ruſſia; part of Tartary; North part of Newfoundland.
10	54	27	2	29	17		X. Dublin, York, Holland, Hanover, and Tartary; Warſaw, in Poland; Labrador, and New South-Wales, in North America.
11	56	37	2	10	17	30	XI. Edinburgh, Copenhagen, Moſcow capital of Ruſſia.
12	58	29	1	52	18		XII. South part of Sweden; Tobolſki, capital of Siberia.
13	59	58	1	29	18	30	XIII. Orkney Iſles, Stockholm, capital of Sweden.

14	61	18	1 20	19		XIV. Bergen in Norway; Peterſburgh in Ruſſia.
15	62	25	1 7	19	30	XV. Hudſon's Straits, North America.
16	63	22	57	20		XVI. Siberia, and the ſouth part of Weſt Greenland.
17	64	06	44	20	30	XVII. Drontheim, in Norway.
18	64	49	43	21		XVIII. Part of Finland, in Ruſſia.
19	65	21	32	21	30	XIX. Archangel on the White Sea, Ruſſia.
20	65	47	22	22		XX. Hecla in Iceland.
21	66	06	19	22	30	XXI. Northern parts of Ruſſia and Siberia.
22	66	20	14	23		XXII. New North Wales, in North America.
23	66	28	8	23	30	XXIII. Davis's Straits, in North America.
24	66	31	3	24		XXIV. Samoieda.
25	67	21		1	Month	XXV. South part of Lapland.
26	69	48		2	Months	XXVI. Weſt-Greenland.
27	73	37		3	Months	XXVII. Zembla Auſtralis.
28	78	30		4	Months	XXVIII. Zembla Borealis.
29	84	05		5	Months	XXIX. Spitzbergen or Eaſt Greenland.
30	90			6	Months	XXX. Unknown.

LATITUDE.] The diſtance of places from the equator, or what is called their *Latitude*, is eaſily meaſured on the globe by means of the meridian above deſcribed. As latitude is reckoned from the equator towards the poles, a place on the northern ſide of the equator is ſaid to be in north latitude, and a place on the ſouthern ſide is in ſouth latitude. The nearer the poles the greater the latitude; and no place can have more than 90 degrees of latitude, becauſe the poles where they terminate, are at that diſtance from the equator.

PARALLELS OF LATITUDE.] Through every degree of latitude, or more properly through every particular place on the earth, geographers ſuppoſe a circle to be drawn, which they call a parallel of latitude. The interſection of this circle, with the meridian of any place, ſhews the true ſituation of that place.

LONGITUDE.] The *longitude* of a place is its ſituation with regard to its meridian, and conſequently reckoned towards the eaſt or weſt: in reckoning the longitude there is no particular ſpot from which we ought to ſet out preferably to another; but for the advantage of a general rule, the meridian of Ferro, the moſt weſterly of the Canary Iſlands, was conſidered as the firſt meridian in moſt of the globes and maps, and the longitude of places was reckoned to be ſo many degrees eaſt or weſt of the meridian of Ferro. The modern globes fix the firſt meridian, from which the degrees of longitude are reckoned, in the capital city of the different kingdoms where they are made, viz. the Engliſh globes date the firſt meridian from London or Greenwich, the French globes from Paris, &c. The degrees of longitude are marked on the equator. No place can have more than 180 degrees of longitude, becauſe, the circumference of the globe being 360 degrees, no place can be moved from another above half that diſtance; but many foreign geographers very improperly reckon the longitude quite round the globe. The degrees of longitude are not equal like thoſe of latitude, but diminiſh in proportion as the meridians incline, or their diſtance contracts in approaching the pole. Hence in 60 degrees of latitude, a degree of longitude is but half the quantity of a degree on the equator, and ſo of the reſt. The number of miles contained in a degree of longitude, in each parallel of latitude, are exhibited in the following table.

A TABLE

A TABLE ſhewing the Number of Miles contained in a Degree of Longitude, in each Parallel of Latitude from the Equator.

Degrees of Latitude.	Miles.	100th Parts of a Mile.	Degrees of Latitude.	Miles.	100th Parts of a Mile.	Degrees of Latitude.	Miles.	100th Parts of a Mile.	Degrees of Latitude. LONGITUDE AND LATITUDE ON THE ARTIFICIAL GLOBE FOUND.] To find the Longitude and Latitude of any place, we need only bring that place to the brazen meridian, and we ſhall find the degree of longitude marked on the equator, and the degree of latitude on the meridian. So that, to find the difference between the latitude or longitude of two places, we have only to compare the degrees of either, thus found, with one another, and the reduction of theſe degrees into miles, according to the table above given, and, remembering that every degree of longitude at the equator, and every degree of latitude all over the globe, is equal to 60 geographic miles, or 69½ Engliſh, we ſhall be able to determine the diſtance between any places on the globe.

DISTANCE OF PLACES MEASURED.] The diſtances of places which lie in an oblique direction, i. e. neither directly ſouth, north, eaſt, nor weſt, from one another, may be meaſured in a readier way, by extending the compaſſes from the one to the other, and then applying them to the equator. For inſtance, extend the compaſſes from Guinea in Africa, to Brazil in America, and then apply them to the equator, and you will find the diſtance to be 25 degrees, which at 60 miles to a degree, makes the diſtance 1500 miles.

QUADRANT OF ALTITUDE.] In order to ſupply the place of the compaſſes in this operation, there is commonly a pliant narrow plate of braſs, ſcrewed on the brazen meridian, which contains 90 degrees, or one quarter of the circumference of the globe, by means of which the diſtances and bearings of places are meaſured without the trouble of firſt extending the compaſſes between them, and then applying the ſame to the equator. This plate is called the Quadrant of Altitude.

HOUR CIRCLE.] This is a ſmall braſs circle fixed on the brazen meridian, divided into 24 hours, and having an index moveable round the axis of the globe.

PROBLEMS PERFORMED BY THE GLOBE.

PROB. 1. *THE diameter of an artificial globe being given, to find its ſurface in ſquare, and its ſolidity in cubic meaſure.*

Multiply the diameter by the circumference, which is a great circle dividing the globe into two equal parts, and the product will give the firſt: then multiply the

ſaid product by one ſixth of the diameter, and the product of that will give the ſecond. After the ſame manner we may find the ſurface and ſolidity of the natural globe, as alſo the whole body of the atmoſphere ſurrounding the ſame, provided it be always and every where at the ſame height; for having found the perpendicular height thereof, by that common experiment of the aſcent of mercury at the foot and top of a mountain, then double the ſaid height, and add the ſame to the diameter of the earth; then multiply the whole, as a new diameter by its proper circumference, and from the product ſubtract the ſolidity of the earth, it will leave that of the atmoſphere.

PROB. 2. *To rectify the globe.*

The globe being ſet upon a true plane, raiſe the pole according to the given latitude, then fix the quadrant of altitude in the zenith, and if there be any mariner's compaſs upon the pedeſtal, let the globe be ſo ſituated, as that the brazen meridian may ſtand due ſouth and north, according to the two extremities of the needle, allowing their variation.

PROB. 3. *To find the longitude and latitude of any place.*

For this, ſee above.

PROB. 4. *The longitude and latitude of any place being given, to find that place on the globe.*

Bring the degree of longitude to the brazen meridian; reckon upon the ſame meridian the degree of latitude, whether ſouth or north, and make a mark with chalk where the reckoning ends; the point exactly under the chalk is the place deſired.

PROB. 5. *The latitude of any place being given, to find all thoſe places that have the ſame latitude.*

The globe being rectified (*a*) according to the latitude of the given place, and that place being brought to the brazen meridian, make a mark exactly above the ſame, and turning the globe round, all thoſe places paſſing under the ſaid mark have the ſame latitude with the given place.

(*a*) PROB. 2.

PROB. 6. *To find the Sun's place in the Ecliptic at any time.*

The month and day being given, look for the ſame upon the wooden horizon, and over-againſt the day you will find the particular ſign and degree in which the Sun is at that time, which ſign and degree being noted on the ecliptic, the ſame is the Sun's place, or nearly, at the time deſired.

PROB. 7. *The month and day being given, as alſo the particular time of that day, to find thoſe places of the globe to which the Sun is in the meridian at that particular time.*

The pole being elevated according to the latitude of the place where you are, bring the ſaid place to the brazen meridian, and ſetting the index of the horary circle at the hour of the day, in the given place, or where you are, turn the globe till the index points at the upper figure of XII. which done, fix the globe at that ſituation, and obſerve what places are exactly under the upper hemiſphere of the brazen meridian, for thoſe are the places deſired.

PROB. 8. *To know the length of the day and night in any place of the earth at any time.*

Elevate the pole (*b*) according to the latitude of the given place; find the Sun's place in the ecliptic (*c*) at that time, which being brought to the eaſt ſide of the horizon, ſet the index of the horary circle at noon, or the upper figure XII. and turning the globe about till the aforeſaid place of the ecliptic touch the weſtern ſide of the horizon, look upon the horary circle, and whereſoever the index points, reckon the number of hours between the ſame and the upper figure of XII. for that is the length of the day, the compliment whereof to 24 hours is the length of the night.

(*b*) PROB. 2.
(*c*) PROB. 6.

PROB. 9.

PROB. 9. *To know what o'clock it is by the globe in any part of the world, and at any time, provided you know the hour of the day where you are at the ſame time.*

Bring the place in which you are to the brazen meridian, the pole being raiſed (*a*) according to the latitude thereof, and ſet the index of the horary circle to the hour of the day at that time. Then bring the deſired place to the brazen meridian, and the index will point out the preſent hour at that place wherever it is.

(*a*) PROB. 3.

PROB. 10. *A place being given in the Torrid Zone, to find thoſe two days of the year in which the ſun ſhall be vertical to the ſame.*

Bring the given place to the brazen meridian, and mark what degree of latitude is exactly above it. Move the globe round, and obſerve the two points of the ecliptic that paſs through the ſaid degree of latitude. Search upon the wooden horizon (or by proper tables of the ſun's annual motion) on what days he paſſeth through the aforeſaid points of the ecliptic, for thoſe are the days required in which the ſun is vertical to the given place.

PROB. 11. *The month and the day being given, to find by the globe thoſe places of the North Frigid Zone, where the ſun begins then to ſhine conſtantly without ſetting: as alſo thoſe places of the South Frigid Zone, where he then begins to be totally abſent.*

The day given (which muſt always be one of thoſe either between the vernal equinox and the ſummer ſolſtice, or between the autumnal equinox and winter ſolſtice), find (*b*) the ſun's place in the ecliptic, and marking the ſame, bring it to the brazen meridian, and reckon the like number of degrees from the north pole towards the equator, as there is between the equator and the ſun's place in the ecliptic, ſetting a mark with chalk where the reckoning ends. This done, turn the globe round, and all the places paſſing under the ſaid chalk are thoſe in which the ſun begins to ſhine conſtantly without ſetting upon the given day. For ſolution of the latter part of the problem, ſet off the ſame diſtance from the ſouth pole upon the brazen meridian towards the equator, as was formerly ſet off from the north, then marking with chalk, and turning the globe round, all places paſſing under the mark are thoſe where the ſun begins his total diſappearance from the given day.

(*b*) PRO. 6.

PROB. 12. *A place being given in the North Frigid Zone, to find by the globe what number of days the ſun conſtantly ſhines upon that place, and what days he is abſent, as alſo the firſt and laſt day of his appearance.*

Bring the given place to the brazen meridian, and obſerving its latitude (*c*) elevate the globe accordingly; count the ſame number of degrees upon the meridian from each ſide of the equator as the place is diſtant from the pole; and making marks where the reckonings end, turn the globe, and carefully obſerve what two degrees of the ecliptic paſs exactly under the two points marked in the meridian; firſt for the northern arch of the circle, namely that comprehended between the two degrees marked, being reduced to time, will give the number of days that the ſun conſtantly ſhines above the horizon of the given place; and the oppoſite arch of that circle will give the number of days in which he is totally abſent, and alſo will point out which days thoſe are. In the interval he will riſe and ſet.

(*c*) PRO. 2.

PROB. 13. *The month and day being given, to find thoſe places on the globe, to which the ſun, when on the meridian, ſhall be vertical on that day.*

The ſun's place in the ecliptic being (*d*) found, bring the ſame to the brazen meridian, in which make a ſmall mark with chalk, exactly above the ſun's place. Which done, turn the globe, and thoſe places which have the ſun vertical in the meridian will ſucceſſively paſs under the ſaid mark.

(*d*) PROB. 6.

PROB. 14. *The month and day being given, to find upon what point of the compaſs the ſun then riſes and ſets in any place.*

Elevate the pole according to the latitude of the deſired place, and, finding the ſun's place in the ecliptic at the given time, bring the ſame to the eaſtern ſide of the horizon, and you may there clearly ſee the point of the compaſs upon which he then riſes. By turning the globe till his place coincide with the weſtern ſide of the horizon, you may alſo ſee upon that circle the exact point of his ſetting.

PROB. 15. *To know by the globe the length of the longeſt and ſhorteſt days and nights in any part of the world.*

Elevate the pole according to the latitude of the given place, and bring the firſt degree of Cancer if in the northern, or Capricorn if in the ſouthern hemiſphere, to the eaſt ſide of the horizon; and ſetting the index of the horary circle at noon, turn the globe till the ſide of Cancer touch the weſtern ſide of the horizon, and then obſerve upon the horary circle the number of hours between the index and the upper figure of XII. reckoning them according to the motion of the index, for that is the length of the longeſt day, the complement whereof is the extent of the ſhorteſt night. The ſhorteſt day and longeſt night are only the reverſe of the former.

PROB. 16. *The hour of the day being given in any place, to find thoſe places of the earth where it is either noon or midnight, or any other particular hour at the ſame time.*

Bring the given place to the brazen meridian, and ſet the index of the horary circle at the hour of the day in that place. Then turn the globe till the index point at the upper figure of XII. and obſerve what places are exactly under the upper ſemicircle of the brazen meridian, for in them it is mid-day at the time given. Which done, turn the globe till the index point at the lower figure of XII. and what places are then in the lower ſemicircle of the meridian, in them it is midnight at the given time. After the ſame manner we may find thoſe places that have any other particular hour at the time given, by moving the globe till the index point at the hour deſired, and obſerving the places then under the brazen meridian.

PROB. 17. *The day and hour being given, to find by the globe that particular place of the earth to which the ſun is vertical at that time.*

The ſun's place in the ecliptic *(a)* being found and brought to the brazen meridian, make a mark above the ſame with chalk; then *(b)* find thoſe places of the earth in whoſe meridian the ſun is at that inſtant, and bring them to the brazen meridian; which done, obſerve narrowly that individual part of the earth which falls exactly under the aforeſaid mark in the brazen meridian; for that is the particular place to which the ſun is vertical at that time.

(a) PROB. 9.
(b) PROB. 16.

PROB. 18. *The day and hour at any place being given, to find all thoſe places where the ſun is then riſing, or ſetting, or on the meridian; conſequently, all thoſe places which are enlightened at that time, and thoſe which are in the dark.*

This problem cannot be ſolved by any globe fitted up in the common way, with the hour-circle fixed upon the braſs-meridian; unleſs the ſun be on or near ſome of the tropics on the given day. But by a globe fitted up according to Mr. Joſeph Harris's invention, where the hour-circle lies on the ſurface of the globe, below the meridian, it may be ſolved for any day in the year, according to his method; which is as follows.

Having found the place to which the ſun is vertical at the given hour, if the place be in the northern hemiſphere, elevate the north pole as many degrees above the horizon, as are equal to the latitude of that place; if the place be in the

ſouthern hemiſphere, elevate the ſouth pole accordingly; and bring the place to the brazen meridian. Then, all thoſe places which are in the weſtern ſemicircle of the horizon have the ſun riſing to them at that time; and thoſe in the eaſtern ſemicircle have it ſetting: to thoſe under the upper ſemicircle of the braſs meridian, it is noon; and to thoſe under the lower ſemicircle, it is midnight. All thoſe places which are above the horizon, are enlightened by the ſun, and have the ſun juſt as many degrees above them, as they themſelves are above the horizon; and this height may be known, by fixing the quadrant of altitude on the brazen meridian over the place to which the ſun is vertical; and then, laying it over any other place, obſerve what number of degrees on the quadrant are intercepted between the ſaid place and the horizon. In all thoſe places that are 18 degrees below the weſtern ſemicircle of the horizon, the morning twilight is juſt beginning; in all thoſe that are 18 degrees below the ſemicircle of the horizon, the evening twilight is ending; and all thoſe that are lower than 18 degrees, have dark night.

If any place be brought to the upper ſemicircle of the brazen meridian, and the hour-index be ſet to the upper XII. or noon, and then the globe be turned eaſtward on its axis; when the place comes to the weſtern ſemicircle of the horizon, the index will ſhew the time of ſun-riſing at that place; and when the ſame place comes to the eaſtern ſemicircle of the horizon, the index will ſhew the time of ſun-ſet.

To thoſe places which do not go under the horizon, the ſun ſets not on that day; and to thoſe which do not come above it the ſun does not riſe.

PROB. 19. *The month and day being given, with the place of the moon in the zodiac and her true latitude, to find thereby the exact hour when ſhe ſhall riſe and ſet, together with her ſouthing, or coming to the meridian of the place.*

The moon's place in the zodiac may be found readily at any time by an almanac; and her latitude, which is her diſtance from the ecliptic, by applying the ſemicircle of poſition to her place in the zodiac. For the ſolution of the problem (*a*), elevate the pole according to the latitude of the given place, and the ſun's place in the ecliptic at that time being (*b*) found and marked with chalk, as alſo the moon's place at the ſame, bring the ſun's place to the brazen meridian, and ſet the index of the horary circle at noon, then turn the globe till the moon's place ſucceſſively meet with the eaſtern and weſtern ſide of the horizon, as alſo the brazen meridian, and the index will point at thoſe times, the particular hours of her riſing, ſetting, and ſouthing.

(*a*) PROB. 2.
(*b*) PROB. 6.

PROB. 20. *Two places being given on the globe, to find the true diſtance between them.*

Lay the graduated edge of the quadrant of altitude over both the places, and the number of degrees intercepted between them will be their true diſtance from each other, reckoning every degree to be 69½ Engliſh miles.

PROB. 21. *A place being given on the globe, and its true diſtance from a ſecond place, to find thereby all other places of the earth of the ſame diſtance from the given place.*

Bring the given place to the brazen meridian, and elevate the pole according to the latitude of that place; then fix the quadrant of altitude in the zenith, and reckon upon that quadrant the given diſtance between the firſt and ſecond place, provided the ſame be under 90 degrees, otherwiſe you muſt uſe the ſemicircle of poſition, and marking where the reckoning ends, and moving the quadrant round upon the ſurface of the globe, all places paſſing under that mark are thoſe deſired.

Methods for finding the LATITUDES *and* LONGITUDES *of Places from* CELESTIAL OBSERVATIONS.

It being a matter of vaſt importance to Navigators to know the ſituation of any unknown place they may touch at, or in whatever part of the ocean they may be, and this being only to be diſcovered by aſcertaining the latitude and longitude of the ſaid place, the methods of finding them are here pointed out.

I. OF FINDING THE LATITUDE.] As the latitude of a place is an arch of the meridian intercepted between the zenith and the equinoctial, which is always equal to the height of the viſible pole above the horizon, it follows that if the meridional altitude, or its complement, the zenith diſtance of any celeſtial object, whoſe place in the heavens is known, can be found, the latitude is eaſily diſcovered. Thus if the heavenly object be in the equinoctial, the zenith diſtance will be equal to the latitude, which will be either north or ſouth, according as the obſerver is ſituated either to the northward or ſouthward of the object. But if the ſun or ſtar hath either north or ſouth declination, that is, if its apparent diurnal motion be either to the northward or ſouthward of the equinoctial, the declination muſt either be ſubtracted from, or added to the zenith diſtance, according as the zenith diſtance and declination are of the ſame or different denominations. The method is this.

1. Obſerve by a quadrant the meridional diſtance of the ſun from the zenith, which is always the complement of his meridian altitude; correct for the DIP of the horizon, and REFRACTION; and add to this the ſun's declination, when the ſun and the place are on the ſame ſide of the equator; or ſubtract the declination, when they are of different ſides; the ſum in the former caſe, and the difference in the latter, will be the *latitude* required. But when the declination of the ſun is greater than the latitude of the place, which is known from the ſun's being nearer to the elevated pole, than the zenith of the place is, as it frequently happens in the torrid zone, then the difference between the ſun's declination, and his zenith diſtance, is the *latitude* of the place.

If the ſun or ſtar have no declination, but move in the equinoctial that day, then the elevation of the equator will be equal to his meridional altitude, and conſequently his meridional altitude is the complement of the *latitude* to 90. This method is beſt accommodated to the uſes of navigation, as being practicable at ſea; but for obſervations at land, another method may be pointed out.

2. The altitude of the pole, it has been already ſhewn, is always equal to the *latitude*; for which reaſon the *latitude* might be beſt found by obſerving the pole's height; but as the pole is only a mathematical point, and no ways to be obſerved by our ſenſes, its height cannot be determined in the ſame manner as that of the ſun and ſtars, &c. for which reaſon another manner has been contrived.

In order to this, a meridian line is firſt drawn. Place a quadrant on this line, ſo that its plane may be in the plane of the meridian; then take ſome ſtar near the pole, v. gr. the pole-ſtar (which never ſets), and obſerve both its greateſt, and leaſt altitude: half of the difference deducted from the greateſt altitude, or added to the leaſt, will give the altitude of the pole above the horizon, which is equal to the latitude of the place.

II. OF FINDING THE LONGITUDE.] To diſcover an exact method of finding the *longitude* at ſea, is a problem that has extremely perplexed the mathematicians of theſe two laſt ages; and for the ſolution of which, great rewards have been publicly offered by the Engliſh, French, Dutch, and other nations, this being almoſt the only thing wanting to render navigation perfect.

In the year 1598, Philip the Third, King of Spain, offered a reward of 1000 crowns for the ſolution of this problem; this noble example was followed by the States

States General, who offered 10,000 florins. In 1635, John Morrin, profeſſor of mathematics at Paris, propoſed a method of reſolving it to Cardinal Richlieu; though the commiſſioners, who were appointed to examine this method, judged it inſufficient, on account of the imperfection of the lunar tables. Cardinal Mazarin, in 1645, procured for him a penſion of 2000 livres. In 1714 an act was paſſed by the Britiſh parliament, appointing and impowering certain commiſſioners to make out a bill for a ſum not exceeding 2000l. towards making neceſſary experiments; and alſo granting a reward of 10,000l. to the perſon who ſhould determine the *longitude* at ſea, to one degree of a great circle, or 60 geographical miles; 15,000l. if the longitude be determined to two-thirds of that diſtance; and 20,000l. if it be determined to half that diſtance.

It ſhould be obſerved that the difference of longitude between any two places, might be determined, by knowing the difference between the times that any remarkable appearance in the heavens was ſeen in thoſe places. For ſince the ſun and fixed ſtars appear to move round the earth, or, which is the ſame thing, the earth revolves about its axis in twenty-four hours; it follows, that in every hour there paſſes over the meridian one twenty-fourth part of 360 degrees, or of the whole circumference of the equator, equal to 15 degrees; and a proportional part in a greater or leſſer time.

The heavenly bodies afford frequent opportunies of making obſervations of this kind. For as theſe appearances conſiſt in the appulſes, that is, the approaches of the heavenly bodies to one another, or their paſſing by one another; and theſe appulſes, when they happen, are ſeen at the ſame inſtant of abſolute time in all parts of the earth where they are viſible: therefore by knowing the relative times of the day, when ſuch appearances are ſeen in two diſtant places, the difference between thoſe times is known, and conſequently the difference of longitude between thoſe two places; always obſerving that for every hour of time you muſt allow 15 degrees of longitude either eaſt or weſt, according as the time is either ſooner or later than the time marked out for ſuch appearances to happen at Greenwich, for inſtance, from whence the firſt meridian commences.

Several ephemerides or almanacs are annually publiſhed, in which the times when the eclipſes of the ſun, moon, and Jupiter's ſatellites; the riſing, ſetting and ſouthing of the planets; the appulſes of the moon to certain fixed ſtars; and other celeſtial appearances, are determined with regard to ſome meridian. By the help of one of theſe books, and a careful obſervation of theſe appearances, the longitude may be determined.

Eclipſes of the moon, when they happen, afford one method of finding the difference of longitude. For as theſe eclipſes are occaſioned by an interpoſition of the earth between her and the ſun, and conſequently ſhe is immerſed in the earth's ſhadow, the moment any part of her body is deprived of the ſolar rays, it is viſible to all thoſe people who can ſee her, at the ſame inſtant of abſolute time. Hence, by obſerving the beginning, middle, or end of the eclipſe of the moon in any part of the world, noting the apparent time of theſe phænomena, and comparing it with the calculations of the ſame eclipſe adapted to ſome other meridian, the difference of time, and conſequently difference of longitude between thoſe two places, will be known.

Suppoſe for inſtance the beginning of an eclipſe of the moon happened at London ſixteen minutes after two in the morning, and at thirty-four minutes, twenty ſeconds after nine in the evening at Boſton in New England; then will the difference of time be four hours, forty-one minutes, forty ſeconds, equal to ſeventy degrees, twenty-five minutes, the difference of longitude; and becauſe the time is leſs at Boſton, than at London, the difference of longitude will be weſt. Conſequently if the longitude be reckoned from the meridian of London, the longitude of Boſton will be ſeventy degrees twenty-five minutes weſt.—See Ferguſon's Aſtronomy, ſixth edit. p. 122. Alſo White's Ephemeris for 1791. p. 37.

The

The longitude of places may alſo be obtained from the obſervations of ſolar eclipſes, but theſe being incumbered with the conſideration of parallaxes, are much leſs adapted to that purpoſe than thoſe of the moon.

But as the eclipſes of the ſun and moon happen but ſeldom, another expedient offers, viz. the eclipſes of Jupiter's ſatellites. That planet has four moons or ſatellites, moving round him at different diſtances, and in different intervals of time; one or more of which is eclipſed almoſt every night: for they diſappear either in going behind Jupiter, or in paſſing before him: and the inſtant of ſuch immerſions may be ſeen by a refracting teleſcope of about eight or nine feet long, or a reflecting one of nine inches focal length.

The paſſage of the moon, or the ſuperior planets over the meridian, affords another method of diſcovering the longitude; for by having the time in an ephemeris, when the moon or any of the planets paſs the meridian of ſome place, and finding by obſervation the time when the object paſſes the meridian of another place, the longitude will be determined; for the difference of time converted into degrees, &c. will give the difference of longitude.

There is ſtill another method, equally expeditious and certain, namely, the appulſes of the moon to certain fixed ſtars, and their occultations by reaſon of her body. For the moon finiſhing her revolution in twenty-ſeven days, ſeven hours, forty-three minutes, there are but few clear nights, when the moon does not paſs over, or ſo near ſome fixed ſtar, that the time of the neareſt approach or the viſible conjunction may be eaſily obſerved. Marking exactly the apparent time of theſe obſervations, and comparing that with the time of the place for which meridian they are calculated, will give you the difference of longitude between the two places.

It will be obvious to every reflecting reader, that many of the above obſervations being to be made by a teleſcope, the conſtant motion of a ſhip under ſail, will render it impoſſible to make them at ſea, with any ſufficient accuracy. To remedy this inconvenience Mr. Chriſtopher Irvin invented what he calls a marine chair. This chair was tried by Mr. Maſkelyne, in his voyage to Barbadoes, who found it totally impracticable to derive any advantage from it. And beſides, ſince all methods, which depend upon the phænomena of the heavens, have alſo this other defect, that they cannot be obſerved at all times, it became a great deſideratum in navigation to diſcover ſome other method of aſcertaining the longitude at ſea.

It is well known that if a time-keeper could be made with ſufficient accuracy, ſo as to keep exact time, by having ſuch a clock or watch on board, the longitude might be eaſily determined; for by finding the time of the day at any other place, and comparing it with the time then ſhewn by ſuch a machine, the difference of longitude between thoſe places will be determined. The ingenious Mr. Harriſon a few years ſince completed ſuch a time-keeper, which was found upon trial to anſwer even beyond the moſt ſanguine expectations; and he accordingly received ten thouſand pounds from the government, as a reward for his diſcovery; but for ſome reaſons, not generally known, the time-keeper has been hitherto kept from the public.

GEOGRAPHICAL OBSERVATIONS.

1. The latitude of any place is equal to the elevation of the pole above the horizon of that place, and the elevation of the equator is equal to the complement of the latitude, that is, to what the latitude wants of 90 degrees.

2. Thoſe places which lie on the equator, have no latitude, it being there that the

the latitude begins; and thoſe places which lie on the firſt meridian have no longitude, it being there that the longitude begins. Conſequently, *that* particular place of the earth where the firſt meridian interſects the equator, has neither longitude nor latitude.

3. All places of the earth equally enjoy the benefit of the ſun, in reſpect of time, and are equally deprived of it.

4. All places upon the equator have their days and nights equally long, that is, 12 hours each, at all times of the year; for although the ſun declines alternately, from the equator towards the north and towards the ſouth, yet, as the horizon of the equator cuts all the parallels of latitude and declination in halves, the ſun muſt always continue above the horizon for one half a diurnal revolution about the earth, and for the other half below it.

5. In all places of the earth between the equator and poles, the days and nights are equally long, viz. 12 hours each, when the ſun is in the equinoctial; for, in all the elevations of the pole, ſhort of 90 degrees (which is the greateſt), one half of the equator will be above the horizon, and the other half below it.

6. The days and nights are never of an equal length at any place between the equator and polar circles, but when the ſun enters the ſigns ♈ Aries and ♎ Libra; for, in every other part of the ecliptic, the circle of the ſun's daily motion is divided into two unequal parts by the horizon.

7. The nearer any place is to the equator, the leſs is the difference between the length of the days and nights in that place; and the more remote, the contrary; the circles which the ſun deſcribes in the heaven every 24 hours, being cut more nearly equal in the former caſe, and more unequal in the latter.

8. In all places lying upon any given parallel of latitude, however long or ſhort the day and night be at any one of theſe places, at any time of the year, it is then of the ſame length at all the reſt; for, in turning the globe round its axis (when rectified according to the ſun's declination), all theſe places will keep equally long above or below the horizon.

9. The ſun is vertical twice a year to every place between the tropics; to thoſe under the tropics, once a year, but never any where elſe. For, there can be no place between the tropics, but that there will be two points in the ecliptic, whoſe declination from the equator is equal to the latitude of that place; and but one point of the ecliptic which has a declination equal to the latitude of places on the tropic which that point of the ecliptic touches, and as the ſun never goes without the tropics, he can never be vertical to any place that lies without them.

10. In all places lying exactly under the polar circles, the ſun, when he is in the neareſt tropic, continues 24 hours above the horizon, without ſetting; becauſe no part of that tropic is below their horizon. And when the ſun is in the fartheſt tropic, he is for the ſame length of time without riſing; becauſe no part of that tropic is above the horizon. At all other times of the year he riſes and ſets there, as in other places; becauſe of all the circles that can be drawn parallel to the equator, between the tropics, are more or leſs cut by the horizon, as they are farther from, or nearer to, that tropic which is all above the horizon: and when the ſun is not in either of the tropics, his diurnal courſe muſt be in one or other of theſe circles.

11. To all places in the northern hemiſphere, from the equator to the polar circle, the longeſt day and ſhorteſt night is when the ſun is in the northern tropic; and the ſhorteſt day and longeſt night is when the ſun is in the ſouthern tropic; becauſe no circle of the ſun's daily motion is ſo much above the horizon, and ſo little below it, as the northern tropic; aud none ſo little above it, and ſo much below it, as the ſouthern. In the ſouthern hemiſphere, the contrary.

12. In all places between the polar circles and poles, the ſun appears for ſome

number of days (or rather diurnal revolutions) without ſetting; and at the oppoſite time of the year without riſing; becauſe ſome part of the ecliptic never ſets in the former caſe, and as much of the oppoſite part never riſes in the latter. And the nearer unto, or the more remote from the pole, theſe places are, the longer or ſhorter is the ſun's continuing preſence or abſence.

13. If a ſhip ſets out from any port, and ſails round the earth eaſtward to the ſame port again, let her take what time ſhe will to do it in, the people in that ſhip, in reckoning their time, will gain one complete day at their return, or count one day more than thoſe who reſide at the ſame port; becauſe, by going contrary to the ſun's diurnal motion, and being forwarder every evening than they were in the morning, their horizon will get ſo much the ſooner above the ſetting ſun than if they had kept for a whole day at any particular place. And thus, by cutting off a part proportionable to their own motion, from the length of every day they will gain a complete day of that ſort at their return; without gaining one moment of abſolute time more than is elapſed during their courſe, to the people at the port. If they ſail weſtward they will reckon one day leſs than the people do who reſide at the ſaid port; becauſe, by gradually following the apparent diurnal motion of the ſun, they will keep him each particular day ſo much longer above their horizon as anſwers to that day's courſe; and thereby they cut off a whole day in reckoning, at their return, without loſing one moment of abſolute time.

Hence, if two ſhips ſhould ſet out at the ſame time from any port, and ſail round the globe, one eaſtward and the other weſtward, ſo as to meet at the ſame port on any day whatever, they will differ two days in reckoning their time, at their return. If they ſail twice round the earth, they will differ four days; if thrice, then ſix, &c.

OF THE NATURAL DIVISIONS OF THE EARTH.

THE conſtituent parts of the Earth are two, the *land* and *water*. The parts of the land are continents, iſlands, peninſulas, iſthmuſes, promontories, capes, coaſts, mountains, &c. This land is divided into two great continents (beſides the iſlands) viz. the *eaſtern* and *weſtern* continent. The eaſtern is ſubdivided into three parts, viz. Europe, on the north-weſt; Aſia, on the north-eaſt; and Africa (which is joined to Aſia by the iſthmus of Suez, 60 miles over), on the ſouth. The weſtern continent conſiſts of North and South America, joined by the iſthmus of Darien, 60 or 70 miles broad.

A *continent* is a large portion of land, containing ſeveral countries or kingdoms, without any entire ſeparation of its parts by water, as Europe. An *iſland* is a ſmaller part of land, ſurrounded by water, as Great-Britain. A *peninſula* is a tract of land ſurrounded by water, except at one narrow neck, by which it joins the neighbouring continent; as the Morea in Greece: and that neck of land which ſo joins it, is called an *iſthmus*: as the iſthmus of Suez which joins Africa to Aſia, and the iſthmus of Darien which joins North and South America. A *promontory* is a hill, or point of land, ſtretching itſelf into the ſea, the end of which is called a *cape*; as the Cape of Good-hope. A *coaſt* or *ſhore* is that part of a country which borders on the ſea-ſide. Mountains, vallies, woods, deſerts, plains, &c. need no deſcription. The moſt remarkable are taken notice of in the body of this work.

The parts of the water are oceans, ſeas, lakes, ſtraits, gulphs, bays, or creeks, rivers, &c. The waters are divided into three extenſive oceans (beſides leſſer ſeas, which are only branches of theſe), viz. the *Atlantic*, the *Pacific*, and the *Indian* Ocean. The Atlantic Ocean divides the eaſtern and weſtern continents, and is

3000 miles wide. The Pacific divides America from Aſia, and is 10,000 miles over. The Indian Ocean lies between the Eaſt Indies and Africa, being 3000 miles wide.

The *ocean* is a great and ſpacious collection of water, without any entire ſeparation of its parts by land; as the Atlantic Ocean. The *ſea* is a ſmaller collection of water which communicates with the ocean, confined by the land; as the Mediterranean and the Red Sea. A *lake* is a large collection of water, entirely ſurrounded by land; as the lake of Geneva, and the lakes in Canada. A *ſtrait* is a narrow part of the ſea, reſtrained or lying between two ſhores, and opening a paſſage out of one ſea into another; as the ſtrait of Gibraltar, or that of Magellan. This is ſometimes called a *ſound*: as the ſtrait into the Baltic. A *gulf* is a part of the ſea running up into the land, and ſurrounded by it, except at the paſſage whereby it is communicated with the ſea or ocean. If a gulph be very large it is called an inland ſea; as the Mediterranean; if it do not go far into the land, it is called a *bay*, as the Bay of Biſcay: if it be very ſmall, a *creek*, *haven*, *ſtation*, or *road* for ſhips, as Milford Haven. Rivers, canals, brooks, &c. need no deſcription; for theſe leſſer diviſions of water, like thoſe of land, are to be met with in moſt countries, and every one has a clear idea of what is meant by them. But in order to ſtrengthen the remembrance of the great parts of land and water we have deſcribed, it is proper to obſerve, that there is a ſtrong analogy or reſemblance between them.

The deſcription of a continent reſembles that of an ocean. An iſland encompaſſed with water reſembles a lake encompaſſed with land. A peninſula of land is like a gulf or inland ſea. A promontory, or cape of land, is like a bay or creek of ſea. And an iſthmus, whereby two lands are joined, reſembles a ſtrait which unites one ſea to another.

To this deſcription of the diviſions of the earth, rather than add an enumeration of the various parts of land and water, which correſpond to them, and which the reader will find in the body of the work, we ſhall ſubjoin a table, exhibiting the ſuperficial contents of the whole globe in ſquare miles, ſixty to a degree, and alſo of the ſeas and unknown parts, the habitable earth, the four quarters or continents; likewiſe of the great empires and principal iſlands, which ſhall be placed as they are ſubordinate to one another in magnitude.

We cannot finifh the doctrine of the earth, without confidering Winds and Tides, from which the changes that happen on its furface principally arife.

WINDS.] The earth is every where furrounded by a fine invifible fluid, which extends to feveral miles above its furface, and is called *Air*. It is found by experiments, that a fmall quantity of air is capable of being expanded, fo as to fill a very large fpace, or to be compreffed into a much fmaller compafs than it occupied before. The general caufe of the expanfion of air is heat, the general caufe of its compreffion is cold. Hence if any part of the air or atmofphere receive a greater degree of cold or heat than it had before, its parts will be put in motion, and expanded or compreffed. But when air is put in motion, we call it *wind* in general; and a breeze, gale, or ftorm, according to the quickneſs or velocity of that motion. Winds, therefore, which are commonly confidered as things extremely variable and uncer-

* The number of inhabitants computed at prefent to be in the known world at a medium, taken from the beft calculations, are about 953 millions.

Europe contains	153 Millions.

Total	953 Millions.

tain,

tain, depend on a general cauſe, and act with more or leſs uniformity in proportion as the action of this cauſe is more or leſs conſtant. It is found by obſervations made at ſea, that from thirty degrees north latitude to thirty degrees ſouth, there is a conſtant eaſt wind throughout the year, blowing on the Atlantic and Pacific oceans, and called the *Trade Wind*. This is occaſioned by the action of the ſun, which, in moving from eaſt to weſt, heats, and conſequently expands the air immediately under him; by which means a ſtream or tide of air, always accompanies him in his courſe, and occaſions a perpetual eaſt wind within theſe limits. This general cauſe is modified by a number of particulars, the explication of which would be too tedious and complicated for our preſent plan; which is to mention facts rather than theories.

It is likewiſe found, that in ſome parts of the Indian ocean, which are not more than two hundred leagues from land, there are periodical winds, called *Monſoons*, which blow half the year one way, and half the year another way. At the change of theſe monſoons, which always happens at the equinoxes, there are terrible ſtorms of thunder, lightning, wind, and rain. It is diſcovered alſo, that in the ſame latitudes, there is another kind of periodical winds, which blow from the land in the night and good part of the morning, and from the ſea about noon, till midnight: theſe, however, do not extend above two or three leagues from ſhore. Near the coaſt of Guinea in Africa, the wind blows always from the weſt, ſouth-weſt, or ſouth. On the coaſt of Peru in South America, the winds blow conſtantly from the ſouth-weſt. Beyond the latitude of thirty north and ſouth, the winds, as we daily perceive in Great-Britain, are more variable, though they blow oftener from the weſt than any other point. Between the fourth and tenth degrees of north latitude, and between the longitude of Cape Verd and the eaſternmoſt of the Cape de Verd iſlands, there is a tract of ſea condemned to perpetual calms, attended with terrible thunder and lightning, and ſuch rains, that this ſea has acquired the name of *the Rains*.

TIDES.] By the *tides* are meant the regular motion of the ſea, according to which it ebbs and flows twice in twenty-four hours. The doctrine of the Tides remained in obſcurity till ſir Iſaac Newton explained it by his great principle of gravity or attraction; for having demonſtrated that there is a principle in all bodies, within the ſolar ſyſtem, by which they mutually draw or attract one another, in proportion to their diſtance; it follows, that thoſe parts of the ſea which are immediately below the moon, muſt be drawn towards it, and conſequently wherever the moon is nearly vertical, the ſea will be raiſed, which occaſions the flowing of the tide there. A ſimilar reaſon occaſions the flowing of the tide likewiſe in thoſe places where the moon is in the nadir, and which muſt be diametrically oppoſite to the former; for, in the hemiſphere fartheſt from the moon, the parts in the nadir being leſs attracted by her than the other parts which are nearer to her, gravitate leſs towards the earth's center, and conſequently muſt be higher than the reſt. Thoſe parts of the earth, on the contrary, where the moon appears on the horizon, or ninety degrees diſtant from the zenith and nadir, will have low water; for as the waters in the zenith and nadir riſe at the ſame time, the waters in their neighbourhood will preſs towards thoſe places, to maintain the equilibrium; to ſupply the places of theſe, others will move the ſame way, and ſo on to the places ninety degrees diſtant from the zenith and nadir, where the water will be loweſt. By combining this doctrine with the diurnal motion of the earth, we ſhall be ſenſible of the reaſon why the tides ebb and flow, twice in twenty-four hours, in every place on this globe.

The tides are higher than ordinary, twice every month, that is, about the times of new and full moon, and are called *Spring Tides*: for at theſe times the actions of both the ſun and moon are united, and draw in the ſame ſtraight line, and conſequently the ſea muſt be more elevated. At the conjunction, or when the ſun and moon are on the ſame ſide of the earth, they both conſpire to raiſe the waters in the

zenith, and conſequently in the nadir; and at the oppoſition, or when the earth is between the ſun and moon, while one occaſions high water in the zenith and nadir, the other does the ſame. The tides are leſs than ordinary twice every month, about the firſt and laſt quarters of the moon, and are called *Neap Tides:* for in the quarters the ſun raiſes the waters where the moon depreſſes them, and depreſſes where the moon raiſes them; ſo that the tides are only occaſioned by the difference by which the action of the moon, which is neareſt us, prevails over that of the ſun. Theſe things would happen uniformly, were the whole ſurface of the earth covered with water; but ſince there are a multitude of iſlands, and continents, which interrupt the natural courſe of the water, a variety of appearances are to be met with in different places, which cannot be explained without regarding the ſituation of ſhores, ſtraits, and other objects, which have a ſhare in producing them.

CURRENTS.] There are frequently ſtreams or currents in the Ocean, which ſet ſhips a great way beyond their intended courſe. There is a current between Florida and the Bahama Iſlands, which always runs from north to ſouth.

This is called the *Gulph-ſtream*, which is probably generated by the great accumulation of water on the eaſtern coaſt of America between the tropics, by the trade winds which conſtantly blow there. This vaſt quantity of water runs down in a ſtrong current through the Weſt India Iſlands into the bay of Mexico, and from thence iſſuing through the gulph of Florida, proceeds along the coaſts to the banks of Newfoundland, where it turns off towards, and runs down through the weſtern iſlands. From the thermometer it appears that it is always warmer than the ſea on each ſide of it. Nor is it to be wondered at, that ſo vaſt a body of deep warm water, ſeveral leagues wide, coming from between the tropics, and iſſuing thence into the northern ſeas, ſhould retain its warmth longer than the twenty or thirty days required to its paſſing the banks of Newfoundland. The quantity is too great, and it is too deep to be ſuddenly cooled by paſſing under a cooler air. The air immediately over it, however, may receive ſo much warmth from it as to be rarefied and riſe, being rendered lighter than the air on each ſide of the ſtream; hence thoſe airs muſt flow in to ſupply the place of the riſing warm air, and meeting with each other, form thoſe tornadoes and water-ſpouts frequently met with, and ſeen near and over the ſtream; and as the vapour from a cup of tea in a warm room, and the breath of an animal in the ſame room, are hardly viſible, but become ſenſible immediately when out in the cold air, ſo the vapour from the gulph-ſtream, in warm latitudes, is ſcarcely viſible, but when it comes into the cool air from Newfoundland, it is condenſed into the fogs for which thoſe parts are ſo remarkable.

The power of wind to raiſe water above its common level in the ſea, is known in America, by the high tides occaſioned in all their ſea-ports, when a ſtrong north-eaſter blows againſt the gulph-ſtream.

The concluſion from theſe remarks is, that as it muſt greatly impede a ſhip, which through ignorance is ſtemming this current that is againſt her to the value of three miles an hour, ſo a veſſel from Europe to North America may ſhorten her paſſage by avoiding to ſtem the ſtream, in which the thermometer will be uſeful: and a veſſel from America to Europe may do the ſame, by the ſame means of keeping in it *.

A current runs conſtantly from the Atlantic, through the ſtraits of Gibraltar, into the Mediterranean. A current ſets out of the Baltic ſea, through the Sound or ſtrait between Sweden and Denmark, into the Britiſh channel; ſo that there are no tides in the Baltic. About ſmall iſlands and head-lands in the middle of the ocean,

* The reader may ſee more upon this ſubject (extremely intereſting to mariners) in Dr. Franklin's Philoſophical Papers, where he will find a chart of this ſtream.

the

the tides riſe very little; but in ſome bays, and about the mouths of rivers, they riſe from 12 to 50 feet.

MAPS.] A map is the repreſentation of the earth, or a part of it, on a plane ſurface. Maps differ from the globe in the ſame manner as a picture does from a ſtatue. The globe truly repreſents the earth, but a map no more than a plane ſurface can repreſent one that is ſpherical. But although the earth can never be exhibited exactly by one map, yet, by means of ſeveral, each containing about ten or twenty degrees of latitude, the repreſentation will not fall much ſhort of the globe for exactneſs; becauſe ſuch maps, if joined together, would form a ſpherical convex nearly as round as the globe.

CARDINAL POINTS.] The north is conſidered as the upper part of the map; the ſouth is at the bottom, oppoſite to the north; the eaſt is on the right hand, the face being turned to the north; and the weſt on the left hand, oppoſite to the eaſt. From the top to the bottom are drawn meridians, or *lines of longitude*; and from ſide to ſide, *parallels of latitude*. The outermoſt of the meridians and parallels are marked with degrees of latitude or longitude, by means of which, and the ſcale of miles commonly placed in the corner of the map, the ſituation, diſtance, &c. of places, may be found, as on the artificial globe. Thus, to find the diſtance of two places, ſuppoſe London and Paris, by the map, we have only to meaſure the ſpace between them with the compaſſes, or a bit of thread, and to apply this diſtance to the ſcale of miles, which ſhows that London is 210 miles diſtant from Paris. If the places lie directly north or ſouth, eaſt or weſt, from one another, we have only to obſerve the degrees on the meridian and parallels, and by turning theſe into miles, we obtain the diſtance without meaſuring. Rivers are deſcribed in maps by black lines, and are wider towards the mouth than towards the head or ſpring. Mountains are ſketched on maps as on a picture. Foreſts and woods are repreſented by a kind of ſhrub; bogs and moraſſes, by ſhades; ſands and ſhallows are deſcribed by ſmall dots; and roads uſually by double lines. Near harbours, the depth of the water is expreſſed by figures repreſenting fathoms.

LENGTH OF MILES IN DIFFERENT COUNTRIES.] There is ſcarcely a greater variety in any thing than in this ſort of meaſure; not only thoſe of ſeparate countries differ, as the French from the Engliſh, but thoſe of the ſame country vary, in the different provinces, and all commonly from the ſtandard. Thus the common Engliſh mile differs from the ſtatute mile, and the French have three ſorts of leagues. We ſhall here give the miles of ſeveral countries compared with the Engliſh by Dr. Halley.

The Engliſh ſtatute mile conſiſts of 5280 feet, 1760 yards, or 8 furlongs.
The Ruſſian vorſt is little more than $\frac{3}{4}$ Engliſh.
The Turkiſh, Italian, and old Roman leſſer mile is nearly 1 Engliſh.
The Arabian, ancient and modern, is about $1\frac{1}{4}$ Engliſh.
The Scotch and Iriſh mile is about $1\frac{1}{2}$ Engliſh.
The Indian is almoſt three Engliſh.
The Dutch, Spaniſh, and Poliſh, is about $3\frac{1}{2}$ Engliſh.
The German is more than 4 Engliſh.
The Swediſh, Daniſh, and Hungarian is from 5 to 6 Engliſh.
The French common league is near 3 Engliſh, and
The Engliſh marine league is 3 Engliſh miles.

PART II.

Of the Origin of NATIONS, LAWS, GOVERNMENT, and COMMERCE.

HAVING, in the following work, mentioned the ancient names of countries, and even ſometimes, in ſpeaking of theſe countries, carried our hiſtorical reſearches beyond modern times; it was thought neceſſary, in order to prepare the reader for entering upon the particular hiſtory of each country we deſcribe, to place before his eye a general view of the hiſtory of mankind, from the firſt ages of the world, to the reformation in religion during the 16th century. By a hiſtory of the world, we do not mean a mere liſt of dates, which, when taken by itſelf, is a thing extremely inſignificant; but an account of the moſt intereſting and important events which have happened among mankind; with the cauſes which have produced, and the effects which have followed from them. This we judge to be a matter of high importance in itſelf, and indiſpenſibly requiſite to the underſtanding of the preſent ſtate of commerce, government, arts, and manners, in any particular country; which may be called commercial and political geography, and which, undoubtedly, conſtitutes the moſt uſeful branch of that ſcience.

It appears in general, from the firſt chapters in Geneſis, that the world, before the flood, was extremely populous, that mankind had made conſiderable improvement in the arts, and were become extremely vicious both in their ſentiments and manners. Their wickedneſs gave occaſion to a memorable cataſtrophe, by which the whole human race, except Noah and his family, were deſtroyed. The deluge took place in the 1656th year of the world, and produced a very great change on the ſoil and atmoſphere of this globe, and gave them a form leſs friendly to the frame and texture of the human body. Hence the abridgment of the life of man, and that formidable train of diſeaſes which hath ever ſince made ſuch havock in the world. A curious part of hiſtory follows that of the deluge, the repeopling of the world, and the riſing of a new generation from the ruins of the former. The memory of the three ſons of Noah, the firſt founders of nations, was long preſerved among their ſeveral deſcendants. Japhet continued famous among the weſtern nations, under the celebrated name of Japetus; the Hebrews paid an equal veneration to Shem, who was the founder of their race; and among the Egyptians, Ham was long revered as a divinity, under the name of Jupiter-Hammon. It appears that hunting was the principal occupation ſome centuries after the deluge. The world teemed with wild beaſts; and the great heroiſm of thoſe times conſiſted in deſtroying them. Hence Nimrod acquired immortal renown; and by the admiration which his courage and dexterity excited, was enabled to acquire an authority over his fellow-creatures, and to found at Babylon the firſt monarchy whoſe origin is particularly mentioned in hiſtory. Not long after, the foundation of Nineveh was laid by Aſſur; and in Egypt, the four governments of Thebis, Theri, Memphis, and Tanis, began to aſſume ſome appearance of form and regularity. That theſe events ſhould have happened ſo ſoon after the deluge, whatever ſurpriſe it may have occaſioned to the learned ſome centuries ago, need not excite the wonder of the preſent age. We have ſeen, from many inſtances, the powerful effects of the principles of population, and how ſpeedily mankind increaſe when the generative faculty lies under no reſtraint. The kingdoms of Mexico and Peru were incomparably more

Before Chriſt, 2348.

B. C. 2247.

extenſive than thoſe of Babylon, Nineveh, and Egypt, during this early age; and yet theſe kingdoms are not ſuppoſed to have exiſted four centuries before the diſcovery of America by Columbus. As mankind continued to multiply on the earth, and to ſeparate from each other, the tradition concerning the true God was obliterated or obſcured. This occaſioned the calling of Abraham to be the father of a choſen people. From this period the hiſtory of ancient nations begins a little to expand itſelf; and we learn ſeveral particulars of importance. B. C. 1921.

Mankind had not long been united into ſocieties before they diſcovered an inclination to oppreſs and deſtroy one another. Chaderlaomer king of the Elamites, or Perſians, ſoon became a robber and a conqueror. His force, however, muſt not have been very great, ſince, in one of theſe expeditions, Abraham, aſſiſted only by his houſehold, ſet upon him in his retreat, and, after a fierce engagement, recovered all the ſpoil that had been taken. Abraham was ſoon after obliged by a famine to leave Canaan, the country where God had commanded him to ſettle, and to go into Egypt. This journey gives occaſion to Moſes to mention ſome particulars with regard to the Egyptians, which plainly diſcover the characters of an improved and powerful nation. The court of the Egyptian monarch is deſcribed in the moſt brilliant colours. He is ſurrounded with a croud of courtiers, ſolely occupied in gratifying his paſſions. The particular governments into which this country was divided, are now united under one powerful prince; and Ham, who led the colony into Egypt, is become the founder of a mighty empire. We are not, however, to imagine that all the laws which took place in Egypt, and which have been ſo juſtly admired for their wiſdom, were the work of this early age. Diodorus Siculus, a Greek writer, mentions many ſucceſſive princes, who laboured for their eſtabliſhment and perfection. But in the time of Jacob, two centuries after, the firſt principles of civil order and regular government ſeem to have been tolerably underſtood among the Egyptians. The country was divided into ſeveral diſtricts or ſeparate departments; councils, compoſed of experienced and ſelect perſons, were eſtabliſhed for the management of public affairs; granaries for preſerving corn were erected; and, in fine, the Egyptians, in this age, enjoyed a commerce far from inconſiderable. Theſe facts, though of an ancient date deſerve our particular attention. It is from the Egyptians that many of the arts, both of elegance and utility, have been handed down in an uninterrupted chain to the modern nations of Europe. The Egyptians communicated their arts to the Greeks; the Greeks taught the Romans many improvements both in the arts of peace and war; and to the Romans the preſent inhabitants of Europe are indebted for their civility and refinement. The kingdoms of Babylon and Nineveh remained ſeparate for ſeveral centuries; but we know not even the names of the kings who governed them, unleſs it be Ninus, the ſucceſſor of Aſſur, who fired by the ſpirit of conqueſt, extends the bounds of his kingdom, adds Babylon to his dominions, and lays the foundation of that monarchy, aſſiſted by his enterpriſing ſucceſſor Semiramis, which, under the name of the Aſſyrian empire, kept Aſia under the yoke for many ages.

Javan, ſon of Japhet, and grand-ſon of Noah, is the ſtock from whom all the people known by the name of Greeks are deſcended. Javan eſtabliſhed himſelf in the iſlands in the weſtern coaſt of Aſia Minor, from whence it was impoſſible that ſome wanderers ſhould not paſs over into Europe. The kingdom of Sicyon near Corinth, founded by the Pelaſgi, is generally ſuppoſed to have commenced in the year before Chriſt 2090. To theſe firſt inhabitants ſucceeded a colony from Egypt, who about 2000 years before the Chriſtian æra, penetrated into Greece, and under the name of Titans, endeavoured to eſtabliſh monarchy in this country, and to introduce into it the laws and civil policy of the Egyptians. But the empire of the Titans was ſoon diſſolved, and the ancient Greeks, who ſeem at this time to have been as rude and barbarous as any people in the world, again fell back into their

lawleſs

lawleſs and ſavage manner of life. Several colonies, however, ſoon after paſſed over from Aſia into Greece, and by remaining in that country, produced a more conſiderable alteration in the manner of its inhabitants. The moſt ancient of theſe were the colonies of Inachus and Ogyges; of whom the former ſettled in Argos, and the latter in Attica. We know very little of Ogyges or his ſucceſſors. Thoſe of Inachus endeavoured to unite the diſperſed and wandering Greeks; and their endeavours for this purpoſe were not altogether unſucceſsful.

B. C. 1850

But the hiſtory of God's choſen people, the Iſraelities, is the only one with which we are much acquainted during thoſe ages. The train of curious events, which occaſioned the ſettling of Jacob and his family in that part of Egypt of which Tanis was the capital, are univerſally known. That patriarch died, according to the Septuagint verſion, 1794 years before Chriſt, but according to the Hebrew Chronology, only 1689 years, and in the year of the World 2315. This is a remarkable æra with reſpect to the nations of heathen antiquity, and concludes that period of time which the Greeks conſidered as altogether unknown, and which they have greatly disfigured by their fabulous narrations. Let us regard this period then in another point of view, and conſider what we can learn from the ſacred writings, with reſpect to the arts, manners, and laws of ancient nations.

B. C. 1689.

It is a common error among writers on this ſubject, to conſider all the nations of antiquity as being on the ſame footing. They find ſome nations extremely rude and barbarous, and hence they conclude, that all were in that ſituation. They diſcover others acquinted with many arts, and hence they infer the wiſdom of the firſt ages. There appears, however, to have been as much difference between the inhabitants of the ancient world, in point of art and refinement, as between the civilized kingdoms of modern Europe and the Indians in America, or the Negroes on the coaſt of Africa. Noah was undoubtedly acquainted with all the arts of the antediluvian world: theſe he would communicate to his children, and they again would hand them down to their poſterity. Thoſe nations therefore who ſettled neareſt the original ſeat of mankind, and who had the beſt opportunities to avail themſelves of the knowledge which their great anceſtor was poſſeſſed of, early formed themſelves into regular ſocieties, and made improvements in the arts which are moſt ſubſervient to human life. Agriculture appears to have been known in the firſt ages of the world. Noah cultivated the vine; in the time of Jacob, the fig-tree and the almond were well known in the land of Canaan; and the inſtruments of huſbandry, long before the diſcovery of them in Greece, are often mentioned in the ſacred writings. It is hardly to be ſuppoſed, that the ancient cities, both in Aſia and Egypt, whoſe foundation, as we have already mentioned, aſcends to the remoteſt antiquity, could have been built, unleſs the culture of the ground had been practiſed at that time. Nations who live by hunting or paſturage only, lead a wandering life, and ſeldom fix their reſidence in cities. Commerce naturally follows agriculture: and though we cannot trace the ſteps by which it was introduced among the ancient nations, we may, from detached paſſages in ſacred writ, aſcertain the progreſs which had been made in it during the patriarchal times. We know, from the hiſtory of civil ſociety, that the commercial intercourſe between men muſt be pretty conſiderable, before the metals come to be conſidered as the medium of trade; and yet this was the caſe even in the days of Abraham. It appears, however, from the relations which eſtabliſh this fact, that the uſe of money had not been of an ancient date; it had no mark to aſcertain its weight or fineneſs; and in a contract for a burying-place, in exchange for which Abraham gave ſilver, the metal is weighed in preſence of all the people. As commerce improved, and bargains of this ſort became more common, this practice was laid aſide, and the quantity of ſilver was aſcertained by a particular mark, which ſaved the trouble of weighing

weighing it. But this does not appear to have taken place till the time of Jacob, the ſecond from Abraham. The *reſilah*, of which we read in his time, was a piece of money, ſtamped with the figure of a lamb, and of a preciſe and ſtated value. It appears, from the hiſtory of Joſeph, that the commerce between different nations was by this time regularly carried on. The Iſhmaelites and Midianites, who bought him of his brethren, were travelling merchants, who carried ſpices, perfumes, and other rich commodities, from their own country into Egypt. The ſame obſervations may be made from the book of Job, who, according to the beſt writers, was a native of Arabia Felix, and alſo a contemporary with Jacob. He ſpeaks of the roads of Thema and Saba, i. e. of the caravans which ſet out from thoſe cities of Arabia. If we reflect, that the commodities of this country were rather the luxuries than the conveniences of life, we ſhall have reaſon to conclude, that the countries into which they were ſent for ſale, and particularly Egypt, were much improved in arts and refinement: for people do not think of luxuries, until the uſeful arts have made high advancement among them.

In ſpeaking of commerce, we ought to diſtinguiſh between the ſpecies of it which is carried on by land, or inland commerce, and that which is carried on by ſea: which laſt kind of traffic is both later in its origin, and ſlower in its progreſs. Had the deſcendants of Noah been left to their own ingenuity, and received no tincture of the antediluvian knowledge from their wiſe anceſtors, it is improbable that they ſhould have ventured on navigating the open ſeas ſo ſoon as we find they did. That branch of his poſterity, who ſettled on the coaſts of Paleſtine, were the firſt people of the world among whom navigation was made ſubſervient to commerce: they were diſtinguiſhed by a word, which, in the Hebrew tongue, ſignifies *merchants*, and are the ſame nation afterwards known to the Greeks by the name of Phœnicians. Inhabiting a barren and ungrateful ſoil, they ſet themſelves to improve their ſituation by cultivating the arts. Commerce was their capital object: and, with all the writers of pagan antiquity, they paſs for the inventors of whatever is ſubſervient to it. At the time of Abraham they were regarded as a powerful nation; their maritime commerce is mentioned by Jacob in his laſt words to his children: and, if we may believe Herodotus in a matter of ſuch remote antiquity, the Phœnicians had by this time navigated the coaſts of Greece, and carried off the daughter of Inachus.

The arts of agriculture, commerce, and navigation, ſuppoſe the knowledge of ſeveral others; aſtronomy, for inſtance, or a knowledge of the ſituation and revolutions of the heavenly bodies, is neceſſary both to agriculture and navigation; that of working metals to commerce; and ſo of other arts. In fact, we find that before the death of Jacob, ſeveral nations were ſo well acquainted with the revolutions of the moon, as to meaſure by them the duration of their year. It had been an univerſal cuſtom among all the nations of antiquity, as well as the Jews, to divide time into the portion of a week, or ſeven days: this undoubtedly aroſe from the tradition with regard to the origin of the world. It was natural for thoſe nations who led a paſtoral life, or who lived under a ſerene ſky, to obſerve that the various appearances of the moon were completed nearly in four weeks: hence the diviſion of a month. Thoſe people who lived by agriculture, and who were acquainted with the diviſion of the month, would naturally remark, that twelve of theſe brought back the ſame temperature of the air, or the ſame ſeaſons: hence the origin of what is called the *lunar year*, which has every where taken place in the infancy of ſcience. This, together with the obſervation of the fixed ſtars, which, as we learn from the book of Job, muſt have been very ancient, naturally paved the way for the diſcovery of the *ſolar year*, which at that time would be thought an amazing improvement in aſtronomy. But with regard to thoſe branches of knowledge which we have mentioned, it is to be remembered, that they were peculiar to the Egyp-

tians, and a few nations of Aſia. Europe offers a frightful ſpectacle during this period. Who could believe that the Greeks, who in later ages became the patterns of politeneſs and every elegant art, were deſcended from a ſavage race of men, traverſing the woods and wilds, inhabiting the rocks and caverns, a wretched prey to wild animals, and ſometimes to one another? This, however, is no more than what was to be expected. Thoſe deſcendants of Noah, who had removed to a great diſtance from the plains of Shinar, loſt all connection with the civiliſed part of mankind. Their poſterity became ſtill more ignorant; and the human mind was at length ſunk into an abyſs of miſery and wretchedneſs.

We might naturally expect, that from the death of Jacob, and, as we advance forward in time, the hiſtory of the great empires of Egypt and Aſſyria would emerge from their obſcurity. But this is far from being the caſe: we only get a glimpſe of them, and they diſappear entirely for many ages. After the reign of Ni-
B. C. 1965. nias, who ſucceeded Semiramis and Ninus in the Aſſyrian throne, we find an aſtoniſhing blank in the hiſtory of this empire, for no leſs than eight hundred years. The ſilence of ancient hiſtory on this ſubject is commonly attributed to the ſoftneſs and effeminacy of the ſucceſſors of Ninus, whoſe lives afforded no events worthy of narration. Wars and commotions are the great themes of the hiſtorian, while the gentle and happy reigns of wiſe princes paſs unobſerved and unrecorded. Seſoſtris, a prince of wonderful abilities, is ſuppoſed to have mounted the throne of Egypt after Amenophis, who was ſwallowed up in the Red Sea about the year before Chriſt 1492; by his aſſiduity and attention, the civil and military eſtabliſhments of the Egyptians received very great improvements. Egypt, in the time of Seſoſtris and his immediate ſucceſſors, was in all probability the moſt powerful kingdom upon earth, and, according to the beſt calculation, is ſuppoſed to have contained twenty-ſeven millions of inhabitants. But ancient hiſtory often excites without gratifying our curioſity: for, from the reign of Seſoſtris to that of Bocchoris, in the year before Chriſt 781, we have little knowledge of even the names of the intermediate princes. If we judge, however, from collateral circumſtances, the country muſt ſtill have continued in a very flouriſhing condition; for Egypt continued to pour forth her colonies into diſtant nations. Athens, that ſeat of learning and po-
B. C. 1556. liteneſs, that ſchool for all who aſpire after wiſdom, owes its foundation to Cecrops, who landed in Greece with an Egyptian colony, and endeavoured to civilize the rough manners of the original inhabitants. From the inſtitutions which Cecrops eſtabliſhed among the Athenians, it is eaſy to infer in what ſituations they muſt have lived before his arrival. The laws of marriage, which few nations are ſo barbarous as to be altogether unacquainted with, were not known in Greece. Mankind, like the beaſts of the field, were propagated by accidental rencounters, and with little knowledge of thoſe to whom they owed their generation.

B. C. 1506. Cranaus, who ſucceeded Cecrops in the kingdom of Attica, purſued the ſame beneficial plan, and endeavoured, by wiſe inſtitutions, to bridle the keen paſſions of a rude people.

Whilſt theſe princes uſed their endeavours for civiliſing this corner of Greece, the other kingdoms, into which this country by the natural boundaries of rocks, mountains, and rivers, is divided, and which had been already peopled by colonies from Egypt and the Eaſt, began to aſſume ſome appearance of form and re-
B. C. 1496. gularity. This engaged Amphictyon, one of thoſe uncommon geniuſes who appear in the world for the benefit of the age in which they live, and the admiration of poſterity, to think of ſome expedient by which he might unite in one plan of politics the ſeveral independent kingdoms of Greece, and thereby deliver them from thoſe inteſtine diviſions, which muſt render them a prey to one another, or to the firſt enemy who might think proper to invade them. Theſe reflections he communicated to the kings, or leaders of the different territories; and by his elo-

quence and addreſs engaged twelve cities to unite together for their mutual preſervation. Two deputies from each of theſe cities aſſembled twice a year at Thermopylæ, and formed what, after the name of its founder, was called the Amphictyonic Council. In this aſſembly, whatever related to the general intereſt of the confederacy was diſcuſſed, and finally determined. Amphictyon likewiſe, ſenſible that thoſe political connections are the moſt laſting which are ſtrengthened by religion, committed to the Amphictyons the care of the temple at Delphi, and of the riches which, from the dedications of thoſe who conſulted the oracle, had been amaſſed. This aſſembly, conſtituted on ſuch ſolid foundations, was the great ſpring of action in Greece, while that country preſerved its independence; and, by the union which it inſpired among the Greeks, enabled them to defend their liberties againſt all the force of the Perſian empire.

Conſidering the circumſtances of the age in which it was inſtituted, the Amphictyonic council is perhaps the moſt remarkable political eſtabliſhment which ever took place among mankind. In the year before Chriſt 1322, the Iſthmian games were celebrated at Corinth, and 1303, the famous Olympic games by Pelops; which games, together with the Pythian and Nemean, have been rendered immortal by the genius of Pindar. The Greek ſtates, which formerly had no connection with one another, except by mutual inroads and hoſtilities, ſoon began to act with concert, and to undertake diſtant expeditions for the general intereſt of the community. The firſt of theſe was the obſcure expedition of the Argonauts, in which all Greece appears to have been concerned. The object of the Argonauts was to open the commerce of the Euxine ſea, and to eſtabliſh colonies in the adjacent country of Colchis. The ſhip Argo, which was the admiral of the fleet, is the only one particularly taken notice of; though we learn from Homer, and other ancient writers, that ſeveral were employed in this expedition. The fleet of the Argonauts was, from the ignorance of thoſe who conducted it, long toſſed about on different coaſts. The rocks, at ſome diſtance from the mouth of the Euxine ſea, occaſioned great labour: they ſent forward a light veſſel, which paſſed through, but returned with the loſs of her rudder. This is expreſſed in the fabulous language of antiquity, by their ſending out a bird which returned with the loſs of its tail, and may give us an idea of the allegorical obſcurity in which the other events of this expedition are involved. The fleet at length arrived at Æon, the capital of Colchis, after performing a voyage, which, conſidering the condition of the naval art during this age, was not leſs important than the circumnavigation of the world by our modern diſcoverers. From this expedition to that againſt Troy, which was undertaken to recover the fair Helena, a queen of Sparta, who had been carried off by Paris, ſon of the Trojan king, the Greeks muſt have made a wonderful progreſs in arts, in power, and opulence: no leſs than twelve hundred veſſels were employed in this voyage, each of which, at a medium, contained upwards of a hundred men. But theſe veſſels were but half decked; and it does not appear that iron entered at all into their conſtruction. If we add to theſe circumſtances, that the Greeks had not the uſe of the ſaw, an inſtrument ſo neceſſary to the carpenter, a modern muſt form but a mean notion of the ſtrength or elegance of this fleet.

B. C. 1263.

B. C. 1184.

Having thus conſidered the ſtate of Greece as a whole, let us examine the circumſtances of the particular countries into which it was divided. This is of great importance to our preſent undertaking, becauſe it is in this country only that we can trace the origin and progreſs of government, arts, and manners, which compoſe ſo great a part of the preſent work. There appears originally to have been a very remarkable reſemblance between the political ſituation of the different kingdoms of Greece. They were governed each by a king, or rather by a chieftain, who was their leader in time of war, their judge in time of peace, and who preſided

ſided in the adminiſtration of their religious ceremonies. This prince, however, was far from being abſolute. In each ſociety there were a number of other leaders, whoſe influence over their particular clans or tribes was not leſs conſiderable than that of the king over his immediate followers. Theſe captains were often at war with one another, and ſometimes with their ſovereign. Such a ſituation was in all reſpects extremely unfavourable: each particular ſtate was in miniature what the whole country had been before the time of Amphictyon. They required the hand of another delicate painter to ſhade the oppoſite colours, and to enable them to produce one powerful effect. The hiſtory of Athens affords us an example of the manner in which theſe ſtates, that, for want of union, were weak and inſignificant, became, by being cemented together, important and powerful. Theſeus king of Attica, about the year B. C. 1234, had acquired a great reputation by his exploits of valour and ability. He ſaw the inconveniences to which his country, from being divided into twelve diſtricts, was expoſed; and conceived, that by means of the influence which his perſonal character, united to the royal authority with which he was inveſted, had univerſally procured him, he might be able to remove them. For this purpoſe he endeavoured to maintain, and even to increaſe his popularity among the peaſants and artiſans: he detached, as much as poſſible, the different tribes from the leaders who commanded them: he aboliſhed the courts which had been eſtabliſhed in different parts of Attica, and appointed one council-hall common to all the Athenians. Theſeus, however, did not truſt ſolely to the force of political regulations. He called to his aid all the power of religious prejudices; by eſtabliſhing common rites of religion to be performed in Athens, and by inviting thither ſtrangers from all quarters, by the proſpect of protection and privileges, he raiſed this city from an inconſiderable village to a powerful metropolis. The ſplendor of Athens and of Theſeus now totally eclipſed that of the other villages and their particular leaders. All the power of the ſtate was united in one city, and under one ſovereign. The petty chieftains, who had formerly occaſioned ſo much confuſion, by being diveſted of all influence and conſideration, became humble and ſubmiſſive; and Attica remained under the peaceable government of a monarch.

This is a rude ſketch of the origin of the firſt monarchy of which we have a diſtinct account, and may, without much variation, be applied to the other ſtates of Greece. This country, however, was not deſtined to continue long under the government of kings. A new influence aroſe, which in a ſhort time proved too powerful both for the king and the nobles. Theſeus had divided the Athenians into three diſtinct claſſes; the nobles, the artiſans, and the huſbandmen. In order to abridge the exorbitant power of the nobles, he had beſtowed many priveleges on the two other ranks of perſons. This plan of politics was followed by his ſucceſſors; and the lower ranks of the Athenians, partly from the countenance of their ſovereign, and partly from the progreſs of arts and manufactures, which gave them an opportunity of acquiring property, became conſiderable and independent. Theſe circumſtances were attended with a remarkable effect. Upon the death of Codrus, a prince of great merit, in the year B. C. 1070, the Athenians, become weary of the regal authority, under pretence of finding no one worthy of filling the throne of that monarch who had devoted himſelf to death for the ſafety of his people, aboliſhed the regal power, and proclaimed that none but Jupiter ſhould be king of Athens. This revolution in favour of liberty was ſo much the more remarkable, as it happened ſoon after that the Jews became unwilling to remain under the government of the true God, and deſired a mortal ſovereign, that they might be like unto other nations.

B. C. 1095.

The government of Thebes, another of the Grecian ſtates, much about the ſame time aſſumed the republican form. Near a century before the Trojan war Cadmus, with a colony from Phœnicia, had founded this city, which from that time had been

been governed by kings. But the laſt ſovereign being overcome in ſingle combat, by a neighbouring prince, the Thebans aboliſhed the regal power. Till the days, however, of Pelopidas and Epaminondas, a period of ſeven hundred years, the Thebans performed nothing worthy of the republican ſpirit. Other cities of Greece, after the example of Thebes and Athens, erected themſelves into republics. But the revolutions of Athens and Sparta, two rival ſtates, which, by means of the ſuperiority they acquired, gave the tone to the manners, genius, and politics of the Greeks, deſerve our principal attention. We have ſeen a tender ſhoot of liberty ſpring up in the city of Athens, upon the deceaſe of Codrus, its laſt ſovereign. This ſhoot gradually improved into a vigorous plant; and it cannot but be pleaſant to obſerve its progreſs. The Athenians, by aboliſhing the name of king, did not entirely ſubvert the regal authority: they eſtabliſhed a perpetual magiſtrate, who, under the name of Archon, was inveſted with almoſt the ſame rights which their king had enjoyed. The Athenians, in time, became ſenſible, that the archonic office was too lively an image of royalty for a free ſtate. After it had continued, therefore, three hundred and thirty-one years in the family of Codrus, they endeavoured to leſſen its dignity, not by abridging its power, but by ſhortening its duration. The firſt period aſſigned for the continuance of the archonſhip in the ſame hands, was three years. But the deſire of the Athenians for a more perfect ſyſtem of freedom than had hitherto been eſtabliſhed, increaſed in proportion to the liberty they enjoyed. They again demanded reduction of the power of their archons; and it was at length determined that nine annual magiſtrates ſhould be appointed for this office. Theſe magiſtrates were not only choſen by the people, but accountable to them for their conduct at the expiration of their office. Theſe alterations were too violent not to be attended with ſome dangerous conſequences. The Athenians, intoxicated with their freedom, broke out into the moſt unruly and licentious behaviour. No written laws had been as yet enacted in Athens; and it was hardly poſſible that the ancient cuſtoms of the realm, which were naturally ſuppoſed to be in part aboliſhed by the ſucceſſive changes in the government, ſhould ſufficiently reſtrain the tumultuary ſpirits of the Athenians, in the firſt flutter of their independence. This engaged the wiſer part of the ſtate, who began to prefer any ſyſtem of government to their preſent anarchy and confuſion, to caſt their eyes on Draco, a man of an auſtere but virtuous diſpoſition, as the fitteſt perſon for compoſing a ſyſtem of law, to bridle the furious and unruly manners of their countrymen. Draco undertook the office, about the year 628, but executed it with ſo much rigour, that, in the words of an ancient hiſtorian, "His laws were written with blood, and not with ink." Death was the indiſcriminate puniſhment of every offence, and the laws of Draco were found to be a remedy worſe than the diſeaſe. Affairs again returned into confuſion and diſorder, and remained ſo till the time of Solon, who died in the year 549. The gentle manners, diſintereſted virtue, and wiſdom, by which this ſage was diſtinguiſhed, pointed him out as the only character adapted to the moſt important of all offices, the giving laws to a free people. Solon, though this employment was aſſigned him by the unanimous voice of his country, long deliberated whether he ſhould undertake it. At length, the motives of public utility overcame all conſiderations of private eaſe, ſafety, and reputation, and determined him to enter an ocean pregnant with a thouſand dangers. The firſt ſtep of his legiſlation was to aboliſh all the laws of Draco, excepting thoſe relative to murder. The puniſhment of this crime could not be too great; but to conſider other offences as equally criminal, was to confound all notions of right and wrong, and to render the law ineffectual, by means of its ſeverity. Solon next proceeded to new-model the political law; and his eſtabliſhments on this head remained among the Athenians, while they preſerved their liberties. He ſeems to have ſet out with this principle, that a perfect republic, in

B. C. 1070.

B. C. 684.

which each citizen ſhould have an equal political importance, was a ſyſtem of government, beautiful indeed in theory, but not reducible to practice. He divided the citizens into four claſſes, according to the wealth which they poſſeſſed, and the pooreſt claſs he rendered incapable of any public office. They had a voice, however, in the general council of the nation, in which all matters of principal concern were determined in the laſt reſort. But leſt this aſſembly, which was compoſed of all the citizens, ſhould, in the words of Plutarch, like a ſhip with too many ſails, be expoſed to the guſt of folly, tumult, and diſorder, he provided for its ſafety by the two anchors of the Senate and Areopagus. The firſt of theſe courts conſiſted of four hundred perſons, a hundred out of each tribe of the Athenians, who prepared all important buſineſs that came before the aſſembly of the people; the ſecond, though but a court of juſtice, gained a prodigious aſcendancy in the republic, by the wiſdom and gravity of its members, who were not choſen, but after the ſtricteſt ſcrutiny, and the moſt ſerious deliberation.

Such was the ſyſtem of government eſtabliſhed by Solon, which, the nearer we examine it, will afford the more matter for our admiration. Upon the ſame plan moſt of the other ancient republics were eſtabliſhed. To inſiſt on all of them, therefore, would neither be entertaining nor inſtructive. But the government of Sparta, or Lacedæmon, had ſomething in it ſo peculiar, that the great lines of it at leaſt ought not to be omitted even in a delineation of this ſort. Sparta, like the other ſtates of Greece, was originally divided into a number of petty principalities, of which each was under the juriſdiction of its own immediate chieftain. Lelex is ſaid to be the firſt king, about the year B. C. 1516. At length, the two brothers

B. C. 1102. Euriſthenes and Procles, getting poſſeſſion of this country, became conjunct in the royalty; and, what is extremely ſingular, their poſterity, in the direct line, continued to rule conjunctly for nine hundred years, ending with Cleomenes, anno 220 before the Chriſtian æra. The Spartan government, how-

B. C. 884. ever, did not take that ſingular form which renders it ſo remarkable, until the time of Lycurgus, the celebrated legiſlator. The plan of policy deviſed by Lycurgus agreed with that already deſcribed, in comprehending a ſenate and aſſembly of the people, and in general in all thoſe eſtabliſhments which are deemed moſt requiſite for the ſecurity of political independence. It differed from that of Athens, and indeed from all other governments, in having two kings, whoſe office was hereditary, though their power was circumſcribed by proper checks and reſtraints. But the great characteriſtic of the Spartan conſtitution aroſe from this, that in all laws, Lycurgus had at leaſt as much reſpect to war as to political liberty. With this view, all ſorts of luxury, all arts of elegance or entertainment, every thing which had the ſmalleſt tendency to ſoften the minds of the Spartans, was abſolutely proſcribed. They were forbidden the uſe of money, they lived at public tables on the coarſeſt fare, the younger were taught to pay the utmoſt reverence to the more advanced in years, and all ranks, capable to bear arms, were daily accuſtomed to the moſt painful exerciſes. To the Spartans alone, war was a relaxation rather than a hardſhip, and they behaved in it with a ſpirit of which hardly any but a Spartan could even form a conception.

In order to ſee the effect of theſe principles, and to connect under one point of view the hiſtory of the different quarters of the globe, we muſt now caſt our eyes on Aſia, and obſerve the events which happened in thoſe great empires, of which

B. C. 781. we have ſo long loſt ſight. We have already mentioned in what obſcurity the hiſtory of Egypt is involved, until the reign of Bocchoris. From this period, to the diſſolution of their government by Cambyſes of Perſia, in the year B. C. 524, the Egyptians are more celebrated for the wiſdom of their laws and political inſtitutions than for the power of their arms. Several of theſe ſeem to have been dictated by the true ſpirit of civil wiſdom, and were admirably calculated for

preſerving

preſerving order and good government in an extenſive kingdom. The great empire of Aſſyria likewiſe, which had ſo long diſappeared, becomes again an object of attention, and affords the firſt inſtance we meet with in hiſtory, of a kingdom which fell aſunder by its own weight, and the effeminate weakneſs of its ſovereigns. Sardanapalus, the laſt emperor of Aſſyria, neglected the adminiſtration of affairs, and ſhutting himſelf up in his palace with his women and eunuchs, fell into contempt with his ſubjects. The governors of his provinces, to whom like a weak and indolent prince, he had entirely committed the command of his armies, did not fail to lay hold of this opportunity of raiſing their own fortune on the ruins of their maſter's power. Arbaces governor of Media, and Beleſis governor of Babylon, conſpire againſt their ſovereign, ſet fire to his capital, in which Sardanapalus periſhed, B. C. 820, and divide between them his extenſive dominions. Theſe two kingdoms, ſometimes united under one prince, and ſometimes governed each by a particular ſovereign, maintained the chief ſway of Aſia for many years. Phul revived the kingdom of Aſſyria anno B. C. 777, and Shalmaneſer, one of his ſucceſſors, put an end to the kingdom of Iſrael, and carried the ten tribes captive into Aſſyria and Media, B. C. 721. Nebuchadnezzar king of Babylon, alſo in the year B. C. 587, overturned the kingdom of Judah, which had continued in the family of David from the year 1055, and maſtered all the countries around him. But in the year 538, Cyrus the Great took Babylon, and reduced this quarter of the world under the Perſian yoke. The manners of this people as brave, hardy, and independent, as well as the government of Cyrus, in all its departments, are elegantly deſcribed by Xenophon, a Grecian philoſopher and hiſtorian. It is not neceſſary, that we ſhould enter on the ſame detail upon this ſubject, as with regard to the affairs of the Greeks. We have, in modern times, ſufficient example of monarchical governments; but how few are our republics? But the æra of Cyrus is in one reſpect extremely remarkable, beſide delivering the Jews from their captivity, becauſe, with it the hiſtory of the great nations of antiquity, which has hitherto engaged our attention, may be ſuppoſed to finiſh. Let us conſider then the genius of the Aſſyrians, Babylonians, and Egyptians, in arts and ſciences: and, if poſſible, diſcover what progreſs they had made in thoſe acquirements which are moſt ſubſervient to the intereſts of ſociety. B. C. 538.

The taſte for the great and magnificent, ſeems to have been the prevailing character of theſe nations; and they principally diſplayed it in their works of architecture. There are no veſtiges, however, now remaining, which confirm the teſtimony of ancient writers, with regard to the great works which adorned Babylon and Nineveh: neither is it clearly determined in what year they were begun or finiſhed. There are three pyramids, ſtupendous fabrics, ſtill remaining in Egypt at ſome leagues diſtance from Cairo, and about nine miles from the Nile, which are ſuppoſed to have been the burying places of the ancient Egyptian kings. The largeſt is five hundred feet in height, and two thouſand ſix hundred and forty broad each way at bottom. The apex is 13 feet ſquare. The ſecond ſtands on as much ground as the firſt, but is forty feet lower. It was a ſuperſtition among this people, derived from the earlieſt times, that even after death the ſoul continued in the body as long as it remained uncorrupted. Hence proceeded the cuſtom of embalming, or of throwing into the dead body ſuch vegetables as experience had diſcovered to be the greateſt preſervatives againſt putrefaction. The pyramids were erected with the ſame view. In them the bodies of the Egyptian kings were concealed. This expedient, together with embalming, as theſe ſuperſtitious monarchs conceived, would inevitably ſecure a ſafe and comfortable retreat for their ſouls after death. From what we read of the walls of Babylon, the temple of Belus, and other works of the Eaſt, and from what travellers have recorded of the pyramids, it appears that they were really ſuperb and magnificent ſtructures, but totally void

of

elegance. The orders of architecture were not yet known, nor even the conſtructing of vaults. The arts, in which theſe nations, next to architecture, principally excelled, were ſculpture and embroidery. As to the ſciences, they had all along continued to beſtow their principal attention on aſtronomy; but it does not appear that they made great progreſs in explaining the cauſes of the phenomena of the univerſe, or in any ſpecies of rational and ſound philoſophy. To demonſtrate this to an intelligent reader, it is ſufficient to obſerve, that, according to the teſtimony of ſacred and profane writers, the abſurd reveries of magic and aſtrology, which always decreaſe in proportion to the advancement of true ſcience, were in high eſteem among them, during the lateſt periods of their government. The countries which they occupied were extremely fruitful, and afforded without much labour all the neceſſaries and even luxuries of life. They had long been accuſtomed to a civilized and poliſhed life in great cities. Theſe circumſtances had tainted their manners with effeminacy and corruption, and rendered them an eaſy prey to the Perſians, a nation juſt emerging from barbariſm, and of conſequence brave and warlike. This was ſtill more eaſy in the infancy of the military art: when ſtrength and courage were the only circumſtances which gave the advantage to one nation over another; when, properly ſpeaking, there were no fortified places, which in modern times have been diſcovered to have been ſo uſeful in ſtopping the progreſs of a victorious enemy; and when the event of a battle commonly decided the fate of an empire. But we muſt now turn our attention to other objects.

The hiſtory of Perſia, after the reign of Cyrus, who died in the year B. C. 529, offers little, conſidered in itſelf, that merits our regard: but when combined with that of Greece, it becomes particularly intereſting. The monarchs who ſucceeded Cyrus gave an opportunity to the Greeks to exerciſe thoſe virtues which the freedom of their government had created and confirmed. Sparta remained under the influence of Lycurgus's inſtitutions: Athens had juſt recovered from the tyranny of the Piſiſtratidæ, a family who had trampled on the laws of Solon, and uſurped the ſupreme power. Such was their ſituation, when the luſt of univerſal empire, which ſeldom fails to torment the breaſt of tyrants, led Darius (at the inſtigation of Hippias who had been expelled from Athens, and on account of the Athenians burning the city of Sardis), to ſend forth his numerous armies into Greece. But the Perſians were no longer thoſe invincible ſoldiers who, under Cyrus, had conquered Aſia. Their minds were enervated by luxury and ſervitude. Athens, on the contrary, teemed with great men, whoſe minds were animated by the late recovery of their freedom. Miltiades, on the plains of Marathon, with ten thouſand Athenians, overcame the Perſian army of a hundred thouſand foot, and ten thouſand cavalry. His countrymen, Themiſtocles and Ariſtides, the firſt celebrated for his abilities, the ſecond for his virtue, gained the next honours to the general. It does not fall within our plan to mention the events of this war, which, as the nobleſt monuments of virtue over force, of courage over numbers, of liberty over ſervitude, deſerve to be read at length in ancient writers.

B. C. 504.

B. C. 490.

Xerxes, the ſon of Darius, came in perſon into Greece, with an army, which, according to Herodotus, amounted to two millions and one hundred thouſand men. This account has been juſtly conſidered, by ſome ingenious modern writers, as incredible. The truth cannot now be aſcertained: but that the army of Xerxes was extremely numerous, is the more probable from the great extent of his empire, and from the abſurd practice of the eaſtern nations, of encumbering their camp with a ſuperfluous multitude. Whatever the numbers of his army were, he was every where defeated, by ſea and land, and eſcaped to Aſia in a fiſhing-boat. Such was the ſpirit of the Greeks, and ſo well did they know that "wanting virtue, life is pain and woe; that wanting liberty even virtue mourns,

B. C. 480.

" and

" and looks around for happineſs in vain." But though the Perſian war concluded glorioufly for the Greeks, it is, in a great meaſure, to this war that the ſubſequent misfortunes of that nation are to be attributed. It was not the battles in which they ſuffered the loſs of ſo many brave men, but thoſe in which they acquired the ſpoils of Perſia; it was not their enduring ſo many hardſhips in the courſe of the war, but their connection with the Perſians after the concluſion of it, which ſubverted the Grecian eſtabliſhments, and ruined the moſt virtuous confederacy that ever exiſted upon earth. The Greeks became haughty after their victories: delivered from the common enemy, they began to quarrel with one another; their quarrels were fomented by Perſian gold, of which they had acquired enough to make them deſirous of more. Hence proceeded the famous Peloponneſian war, in which the Athenians and Lacedæmonians acted as principals, and drew after them the other ſtates of Greece. They continued to weaken themſelves by theſe inteſtine diviſions, till Philip king of Macedon (a country till this time little known, but which, by the active and crafty genius of this prince, became important and powerful) rendered himſelf the abſolute maſter of Greece, by the battle of Cheronæa. But this conqueſt is one of the firſt we meet with in hiſtory which did not depend on the event of a battle. Philip had laid his ſchemes ſo deeply, and by bribery, promiſes, and intrigues, gained ſuch a number of conſiderable perſons in the ſtates of Greece to his intereſt, that another day would have put in his poſſeſſion what Cheronæa had denied him. The Greeks had loſt that virtue which was the baſis of their confederacy. Their popular governments ſerved only to give a ſanction to their licentiouſneſs and corruption. The principal orators in moſt of their ſtates, were bribed into the ſervice of Philip; and all the eloquence of a Demoſthenes, aſſiſted by truth and virtue, was unequal to the mean, but more ſeductive arts of his opponents, who, by flattering the people, uſed the ſureſt method of gaining their affections.

B. C. 431.

B. C. 338.

Philip had propoſed to extend the boundaries of his empire beyond the narrow limits of Greece: but he did not long ſurvive the battle of Cheronæa. Upon his deceaſe, his ſon Alexander was choſen general againſt the Perſians, by all the Grecian ſtates, except the Athenians and Thebans. Theſe made a feeble effort for expiring liberty: but they were obliged to yield to ſuperior force. Secure on the ſide of Greece, Alexander ſet out on his Perſian expedition, at the head of thirty thouſand foot, and five thouſand horſe. The ſucceſs of this army, in conquering the whole force of Darius, in three pitched battles, in overrunning and ſubduing not only the countries then known to the Greeks, but many parts of India, the very names of which had never reached an European ear, has been deſcribed by many authors both ancient and modern, and conſtitutes a ſingular part of the hiſtory of the world. Soon after this rapid career of victory and ſucceſs, Alexander died at Babylon. His captains, after ſacrificing all his family to their ambition, divided his dominions among them. This gives riſe to a number of æras and events too complicated for our preſent purpoſe, and even too unintereſting. After conſidering, therefore, the ſtate of arts and ſciences in Greece, we ſhall paſs to the Roman affairs, where the hiſtorical deduction is more ſimple and more important.

B. C. 334.

B. C. 323.

The bare names of illuſtrious men, who flouriſhed in Greece from the time of Cyrus to that of Alexander, would fill a large volume. During this period, all the arts were carried to the higheſt pitch of perfection; and the improvements we have hitherto mentioned were but the dawnings of this glorious day. Though the eaſtern nations had raiſed magnificent and ſtupendous ſtructures, the Greeks were the firſt people in the world, who, in their works of architecture, added beauty to magnificence, and elegance to grandeur. The temples of Jupiter Olympus, and the Epheſian Diana, are the firſt monuments of good taſte. They were erected by the

Grecian colonies, who ſettled in Aſia Minor, before the reign of Cyrus. Phydias, the Athenian, who died in the year B. C. 432, is the firſt ſculptor whoſe works have been immortal. Zeuxis, Parrhaſius, and Timantheus, during the ſame age, firſt diſplayed the power of the pencil, and all the magic of painting. Compoſition, in all its various branches, reached a degree of perfection in the Greek language, of which a modern reader can hardly form an idea. After Heſiod and Homer, who flouriſhed 1000 years before the Chriſtian æra, the tragic poets Æſchylus, Sophocles, and Euripides, were the firſt great improvers of poetry. Herodotus gave ſimplicity and elegance to proſaic writing. Iſocrates gave it cadence and harmony; but it was left to Thucydides and Demoſthenes to diſcover the full force of the Greek tongue. It was not, however, in the finer arts alone that the Greeks excelled. Every ſpecies of philoſophy was cultivated among them with the utmoſt ſucceſs. Not to mention the divine Socrates, the virtue of whoſe life, and the excellence of whoſe philoſophy, juſtly entitled him to a very high degree of veneration; his three diſciples, Plato, Ariſtotle*, and Xenophon, may, for ſtrength of reaſoning, juſtneſs of ſentiment, and propriety of expreſſion, be put on a footing with the writers of any age or country. Experience, indeed, in a long courſe of years, has taught us many ſecrets in nature, with which theſe philoſophers were unacquainted, and which no ſtrength of genius could reach. But whatever ſome empyrics in learning may pretend, the moſt learned and ingenious men, both in France and England, have acknowledged the ſuperiority of the Greek philoſophers, and have reckoned themſelves happy in catching their turn of thinking, and manner of expreſſion.

The Greeks were not leſs diſtinguiſhed for their active than for their ſpeculative talents. It would be endleſs to recount the names of the famous ſtateſmen and warriors, and it is impoſſible to mention a few without doing injuſtice to a greater number. War was firſt reduced into a ſcience by the Greeks. Their ſoldiers fought from an affection to their country, and an ardor for glory, and not from a dread of their ſuperiors. We have ſeen the effect of this military virtue in their wars againſt the Perſians: the cauſe of it was the wiſe laws which Amphictyon, Solon, and Lycurgus had eſtabliſhed in Greece. But we muſt now leave this nation, whoſe hiſtory, both civil and philoſophical, is as important as their territory was inconſiderable, and turn our attention to the Roman affairs, which are more intereſting, both on their own account, and from the relation in which they ſtand to thoſe of modern Europe.

B. C. 753. The character of Romulus, the founder of the Roman ſtate, when we view him as the leader of a few lawleſs and wandering banditti, is an object of extreme inſignificance: but when we conſider him as the founder of an empire as extenſive as the world, and whoſe progreſs and decline have occaſioned the two greateſt revolutions that ever happened in Europe, we cannot help being intereſted in his conduct. His diſpoſition was extremely martial; and the political ſtate of Italy, divided into a number of ſmall but independent diſtricts, afforded a noble field for the diſplay of military talents. Romulus was continually embroiled with his neighbours; and war was the only employment by which he and his companions expected not only to aggrandize themſelves, but even to ſubſiſt. In the conduct of his wars with the neighbouring people, we may obſerve the ſame maxims by which the Romans afterwards became maſters of the world. Inſtead of deſtroying the nations he had ſubjected, he united them to the Roman ſtate, whereby Rome acquired a new acceſſion of ſtrength from every war ſhe undertook, and became powerful and populous from that circumſtance which ruins and depopulates other kingdoms. If the enemies, with which he contended, had, by means of the art or arms they employed, any advantage, Romulus immediately adopted that practice, or the uſe of that weapon, and improved the military ſyſtem of the Ro-

* Olympiodorus and Ammonius ſay that Ariſtotle was the diſciple of Socrates; but, from Euſebius, it appears that he began his ſtudies under Plato.

mans by the united experience of all their enemies. We have an example of both theſe maxims, by means of which the Roman ſtate arrived at ſuch a pitch of grandeur, in the war with the Sabines. Romulus having conquered that nation, not only united them to the Romans, but finding their buckler preferable to the Roman, inſtantly threw aſide the latter, and made uſe of the Sabine buckler in fighting againſt other ſtates. Romulus, though principally attached to war, did not neglect the civil policy of his infant kingdom. He inſtituted what was called the Senate, a court originally compoſed of a hundred perſons, diſtinguiſhed for their wiſdom and experience. He enacted laws for the adminiſtration of juſtice, and for reſtraining the fierce and unruly paſſions of his followers; and, after a long reign, ſpent in promoting the civil or military intereſts of his country, was, according to the moſt probable conjecture, privately aſſaſſinated by ſome of the members of that ſenate which he himſelf had inſtituted. B. C. 717.

The ſucceſſors of Romulus were all extraordinary perſonages. Numa, who came next to him, eſtabliſhed the religious ceremonies of the Romans, and inſpired them with that veneration for an oath, which was ever after the ſoul of their military diſcipline. Tullus Hoſtilius, Ancus Martius, Tarquinius Priſcus, and Servius Tullius, laboured each during his reign for the grandeur of Rome. But Tarquinius Superbus, the ſeventh and laſt king, having obtained the crown by the execrable murder of his father-in-law Servius, continued to ſupport it by the moſt cruel and infamous tyranny. This, together with the inſolence of his ſon Sextus Tarquinius who, by diſhonouring Lucretia, a Roman lady, affronted the whole nation, occaſioned the expulſion of the Tarquin family, and with it the diſſolution of the regal government. As the Romans were continually engaged in war, they found it neceſſary to have ſome officer inveſted with ſupreme authority, who might conduct them to the field, and regulate their military enterprizes. In the room of the kings, therefore, they appointed two annual magiſtrates called conſuls, who, without creating the ſame jealouſy, ſucceeded to all the power of their ſovereigns. This revolution was extremely favourable to the Roman grandeur. The conſuls, who enjoyed but a temporary power, were deſirous of ſignalizing their reign by ſome great action: each vied with thoſe who had gone before him, and the Romans were daily led out againſt ſome new enemy. When we add to this that the people, naturally warlike, were inſpired to deeds of valour by every conſideration which could excite them; that the citizens of Rome were all ſoldiers, and fought for their lands, their children, and their liberties, we need not be ſurpriſed that they ſhould, in the courſe of ſome centuries, extend their power all over Italy. B. C. 509.

The Romans, now ſecure at home, and finding no enemy to contend with, turn their eyes abroad, and meet with a powerful rival in the Carthaginians. This ſtate had been founded or enlarged on the coaſt of the Mediterranean, in Africa, ſome time before Rome, by a colony of Phœnicians, B. C. 869, and, according to the practice of their mother country, they had cultivated commerce and naval greatneſs.

Carthage, in this deſign, had proved wonderfully ſucceſsful. She now commanded both ſides of the Mediterranean. Beſides that of Africa, which ſhe almoſt entirely poſſeſſed, ſhe had extended herſelf on the Spaniſh ſide, through the Straits. Thus miſtreſs of the ſea, and of commerce, ſhe had ſeized on the iſlands of Corſica and Sardinia. Sicily had difficulty to defend itſelf; and the Romans were too nearly threatened not to take up arms. Hence a ſucceſſion of hoſtilities between theſe rival ſtates, known in hiſtory by the name of Punic wars, in which the Carthaginians were an unequal match for the Romans. Carthage was a powerful republic, when Rome was an inconſiderable ſtate; but ſhe was now become corrupt and effeminate, while Rome was in the vigour of her political conſtitution. Carthage employed mercenaries to carry on her wars; Rome, as we B. C. 264.

have already mentioned, was compoſed of ſoldiers. The firſt war with Carthage laſted twenty-three years, and taught the Romans the art of fighting on the ſea, with which they had been hitherto unacquainted. A Carthaginian veſſel was wrecked on their coaſt; they uſed it for a model, in three months fitted out a fleet, and the conſul Duilius, who fought their firſt naval battle, was victorious. It is not to our purpoſe to mention all the tranſactions of theſe wars. The behaviour of Regulus, the Roman general, may give us an idea of the ſpirit which then animated this people. Being taken priſoner in Africa, he is ſent back on his parole, to negociate a change of priſoners. He maintains in the ſenate, the propriety of that law, which cut off from thoſe who ſuffered themſelves to be taken, all hopes of being ſaved, and returns to a certain death.

B. C. 260.

B. C. 256.

Neither was Carthage, though corrupted, deficient in great men. Of all the enemies the Romans had to contend with, Hannibal was the moſt inflexible and dangerous. His father Hamilcar had imbibed an extreme hatred againſt the Romans, and having ſettled the inteſtine troubles of his country, he took an early opportunity to inſpire his ſon, though but nine years old, with his own ſentiments. For this purpoſe he ordered a ſolemn ſacrifice to be offered to Jupiter, and leading his ſon to the altar, aſked him whether he was willing to attend him in his expedition againſt the Romans; the courageous boy not only conſented to go, but conjured his father by the gods preſent, to form him to victory, and teach him the art of conquering. That I will joyfully do, replied Hamilcar, and with all the care of a father who loves you, if you will ſwear upon the altar to be an eternal enemy to the Romans. Hannibal readily complied; and the ſolemnity of the ceremony, and the ſacredneſs of the oath, made ſuch an impreſſion upon his mind, as nothing afterwards could efface. Being appointed general at twenty-five years of age, he croſſes the Ebro, the Pyrenees, and the Alps, and in a moment falls down upon Italy. The loſs of four battles threatens the fall of Rome. Sicily ſides with the conqueror. Hieronymus king of Syracuſe declares againſt the Romans, and almoſt all Italy abandons them. In this extremity Rome owed its preſervation to three great men. Fabius Maximus, deſpiſing popular clamour, and the military ardour of his countrymen, declines coming to an engagement. The ſtrength of Rome has time to recover. Marcellus raiſes the ſiege of Nola, takes Syracuſe, and revives the drooping ſpirits of his troops. The Romans admired the character of theſe great men, but ſaw ſomething more divine in the young Scipio. The ſucceſs of this young hero confirmed the popular opinion, that he was of divine extraction, and held converſe with the gods. At the age of four-and-twenty, he flies into Spain, where both his father and uncle had loſt their lives, attacks New Carthage, and carries it at the firſt aſſault. Upon his arrival in Africa, kings ſubmit to him, Carthage trembles in her turn, and ſees her armies defeated. Hannibal, ſixteen years victorious, is in vain called home to defend his country. Carthage is rendered tributary, gives hoſtages, and engages never to enter upon a war, but with the conſent of the Roman people.

B. C. 218.

B. C. 210.

B. C. 201.

After the conqueſt of Carthage, Rome had inconſiderable wars but great victories; before this time its wars were great, and its victories inconſiderable. At this time the world was divided, as it were, into two parts; in the one fought the Romans and Carthaginians; the other was agitated by thoſe quarrels which had laſted ſince the death of Alexander the Great. Their ſcene of action was Greece, Egypt, and the Eaſt. The ſtates of Greece had once more diſengaged themſelves from a foreign yoke. They were divided into three confederacies, the Etolians, Acheans, and Beotians; each of theſe was an aſſociation of free cities, which had aſſemblies and magiſtrates in common. The Etolians were the moſt powerful of them all.

The

The kings of Macedon maintained that ſuperiority, which, in ancient times, when the balance of power was little attended to, a great prince naturally poſſeſſed over his neighbours. Philip, the preſent monarch, had rendered himſelf odious to the Greeks, by ſome unpopular and tyrannical ſteps; the Etolians were moſt irritated; and hearing the fame of the Roman arms, called them into Greece, and overcame Philip by their aſſiſtance. The victory, however, chiefly redounded to the advantage of the Romans. The Macedonian garriſons were obliged to evacuate Greece; the cities were all declared free; but Philip became a tributary to the Romans, and the ſtates of Greece became their dependents. The Etolians, diſcovering their firſt error, endeavoured to remedy it by another ſtill more dangerous to themſelves, and more advantageous to the Romans. As they had called the Romans into Greece to defend them againſt king Philip, they now called in Antiochus, king of Syria, to defend them againſt the Romans. The famous Hannibal too had recourſe to the ſame prince, who was at this time the moſt powerful monarch in the Eaſt, and the ſucceſſor to the dominions of Alexander in Aſia. But Antiochus did not follow his advice ſo much as that of the Etolians; for, inſtead of renewing the war in Italy, where Hannibal, from experience, judged the Romans to be moſt vulnerable, he landed in Greece with a ſmall body of troops, and being overcome without difficulty, fled over into Aſia. In this war the Romans made uſe of Philip for conquering Antiochus, as they had before done of the Etolians for conquering Philip. They now purſue Antiochus, the laſt object of their reſentment, into Aſia, and, having vanquiſhed him by ſea and land, compel him to ſubmit to an infamous treaty. B. C. 190.

In theſe conqueſts the Romans allowed the ancient inhabitants to poſſeſs their territory; they did not even change the form of government; the conquered nations became the allies of the Roman people, which denomination, under a ſpecious name, concealed a condition very ſervile, and inferred that they ſhould ſubmit to whatever was required of them. When we reflect on theſe eaſy conqueſts, we have reaſon to be aſtoniſhed at the reſiſtance which the Romans met with from Mithridates king of Pontus, for the ſpace of 26 years. But this monarch had great reſources. His kingdom, bordering on the inacceſſible mountains of Caucaſus, abounded in a race of men, whoſe minds were not enervated by pleaſure, and whoſe bodies were firm and vigorous.

The different ſtates of Greece and Aſia, who now began to feel the weight of their yoke, but had not a ſpirit to ſhake it off, were tranſported at finding a prince, who dared to ſhew himſelf an enemy to the Romans, and cheerfully ſubmitted to his protection. Mithridates, however, at laſt was compelled to yield to the ſuperior fortune of the Romans. Vanquiſhed ſucceſſively by Sylla and Lucullus, he was at length ſubdued by Pompey, and ſtripped of his dominions and of his life, in the year B. C. 63. In Africa, the Roman arms met with equal ſucceſs. Marius, in conquering Jugurtha, made all ſecure in that quarter. Even the barbarous nations beyond the Alps began to feel the weight of the Roman arms. Gallia Narbonenſis had been reduced into a province. The Cimbri, Teutones, and other northern nations of Europe, broke into this part of the empire. The ſame Marius, whoſe name was ſo terrible in Africa, then made the North of Europe to tremble. The Barbarians, leſs formidable than the Roman legions, retired to their wilds and deſarts. But while Rome conquered the world, there ſubſiſted an eternal war within her walls. This war had ſubſiſted from the firſt periods of the government. Rome, after the expulſion of her kings, enjoyed but a partial liberty. The deſcendants of the ſenators, who were diſtinguiſhed by the name of Patricians, were inveſted with ſo many odious privileges, that the people felt their dependence, and became determined to ſhake

B. C. 106.

B. C. 102.

it

it off. A thouſand diſputes on this ſubject aroſe betwixt them and the Patricians, which always terminated in favour of liberty.

Theſe diſputes, while the Romans preſerved their virtue, were not attended with any dangerous conſequences. The Patricians, who loved their country, cheerfully parted with ſome of their privileges to ſatisfy the people; and the people, on the other hand, though they obtained laws, by which they might be admitted to enjoy the firſt offices of the ſtate, and though they had the power of nomination, always named Patricians. But when the Romans, by the conqueſt of foreign nations, became acquainted with all their luxuries and refinements; when they became tainted with the effeminacy and corruption of the eaſtern courts, and ſported with every thing juſt and honourable, in order to obtain them, the ſtate, torn by the factions between its members, and without virtue on either ſide, became a prey to its own children. Hence the bloody ſeditions of the Gracchi, which paved the way for an inextinguiſhable hatred between the nobles and commons, and made it eaſy for any turbulent demagogue to put them in action againſt each other. The love of their country was now no more than a ſpecious name; the better ſort were too wealthy and effeminate to ſubmit to the rigours of military diſcipline, and the ſoldiers, compoſed of the dregs of the republic, were no longer citizens. They had little reſpect for any but their commander; under his banner they fought, conquered, and plundered. He might command them to embrue their hands in the blood of their country. They who knew no country but the camp, and no authority but that of their general, were ever ready to obey him. The multiplicity of the Roman conqueſts, however, which required their keeping on foot ſeveral armies at the ſame time, retarded the ſubverſion of the republic. Theſe armies were ſo many checks upon each other. Had it not been for the ſoldiers of Sylla, Rome would have ſurrendered its liberty to the army of Marius.

Julius Cæſar at length appears. By ſubduing the Gauls, he gained his country the moſt uſeful conqueſt it ever made. Pompey, his only rival, is overcome in the plains of Pharſalia. Cæſar appears victorious almoſt at the ſame time all over the world: in Egypt, in Aſia, in Mauritania, in Spain, in Gaul, and in Britain: conqueror on all ſides, he is acknowledged maſter at Rome, and in the whole empire. Brutus and Caſſius attempt to give Rome her liberty, by ſtabbing him in the ſenate-houſe. But, though they deliver the Romans from the tyranny of Julius, the republic does not obtain its freedom. It falls into the hands of Marc Anthony; Cæſar Octavianus, nephew to Julius Cæſar, wreſts it from him by the ſea-fight at Actium, and there is no Brutus nor Caſſius to put an end to his life. Thoſe friends of liberty had killed themſelves in deſpair; and Octavius, under the name of Auguſtus, and title of emperor, remained the undiſturbed maſter of the empire. During theſe civil commotions, the Romans ſtill preſerved the glory of their arms among diſtant nations; and, while it was unknown who ſhould be maſter at Rome, the Romans were, without diſpute, the maſters of the world. Their military diſcipline and valour aboliſhed all the remains of the Carthaginian, the Perſian, the Grecian, the Aſſyrian, and Macedonian glory; they were now only a name. No ſooner, therefore, was Octavius eſtabliſhed on the throne than ambaſſadors, from all quarters of the known world, croud to make their ſubmiſſions. Æthiopia ſues for peace; the Parthians, who had been a formidable enemy, court his friendſhip; India ſeeks his alliance; Pannonia acknowledges him; Germany dreads him; and the Weſer receives his laws. Victorious by ſea and land, he ſhuts the temple of Janus. The whole earth lives in peace under his power; and Jeſus Chriſt comes into the world, four years before the common æra.

B. C. 7.

Having thus traced the progreſs of the Roman government, while it remained a republic, our plan obliges us to ſay a few words with regard to the arts, ſciences, and

and manners of that people. In the infancy of the republic, and even long after the conſular government was eſtabliſhed, learning and the arts made very little progreſs at Rome. Agriculture, and the cultivation of arms principally engaged their attention. An adequate idea may be formed of the little value they placed upon works of art by the edict of Mummius, who, having deſtroyed the city of Corinth, ordered the pictures painted by the moſt eminent artiſts of Greece, to be carried to Rome, with this remarkable caution, that if any were loſt in the paſſage, they ſhould be obliged to make up the number. Nor were the ſciences in more requeſt at Rome. Some of the ableſt philoſophers of Greece coming to Rome in the time of Cato the Elder, he ordered them to depart the city, leſt the minds of the youth ſhould be corrupted by philoſophy, and rendered too ſoft for military atchievements. They had for a long ſeries of years no written laws at Rome: thoſe of Solon, brought from Greece, were the firſt that were known in that city. They were generally called the laws of the twelve tables, becauſe they were written in twelve departments. Theſe conſtituted the civil law of the Romans. They were afterwards corrected by various decrees of the ſenate, orders of the people, and edicts of the prætors.

After the deſtruction of Carthage, and the ſtates of Greece, when the Romans had no rival to fear, they applied themſelves to cultivate the arts of peace. The curious remains of the Grecian magnificence which were ſent to Rome inſpired them with a deſire of imitating the perfect models of the Greek artiſts. Whatever was elegant, whatever was curious, whatever was beautiful, might be conſulted without trouble or expence. But the Romans, though undoubtedly great artiſts, never equalled the finiſhed models of their maſters. Eloquence had been long ſtudied in Rome, but it did not reach its greateſt height till Cicero appeared. His orations are inferior only to thoſe of Demoſthenes. Cicero gave to eloquence all the graces of which it is ſuſceptible, without leſſening its ſolidity and gravity. He gave cadence, and harmony to the Roman language, and enriched it with beauties before unknown. He was to Rome what Demoſthenes had been to Greece, the glory of his country; they both carried eloquence to the higheſt perfection it ever attained.—— The poetry of Virgil is equal to any thing produced by the Greeks, except the Iliad of Homer. Like the proſe of Demoſthenes, the verſes of Homer are inimitable: and the Grecian bard ſtill remained without an equal. But if Virgil fell ſhort of the majeſty of Homer, Horace excelled all that ever went before him in his ſatires and epiſtles; indeed he had no model that we know of, in that ſpecies of writing, and to this day continues without a rival. His odes have not indeed the majeſty and ſublimity of Pindar; but they abound in beauties of another kind; a delicacy of ſentiment, a ſmooth harmonious flow of verſe, and the moſt lively images conveyed in the correcteſt language.——In hiſtorians Rome alſo abounded; and Salluſt has, not without reaſon, been placed at their head. He is generally ranked with Thucydides; and ſome have not ſcrupled to conſider him as the moſt excellent hiſtorian of antiquity. The brevity of his ſtyle is remarkable; it proceeded from the lively vigor of his imagination. His deſcriptions, his characters, his harangues, are equally beautiful; he ſucceeds alike in all: nothing can be added to their force, ſpirit, and eloquence. Livy is one of thoſe few writers who have rendered their names immortal. Throughout his whole hiſtory there reigns an eloquence perfect in every kind. His ſtyle, though varied to infinity, is every where equal: ſimple without meanneſs; elegant and florid without affectation; great and ſublime without being tumid; full of force and ſweetneſs; always clear, and always intelligible. Livy poſſeſſes all the eaſe of Herodotus, and is more deſcriptive, more eloquent, and more ſentimental. Tacitus did not flouriſh till after the reign of Auguſtus; nor has his ſtyle the purity of the writers in that age of literary competition. The part of his hiſtory which contains the reign of Tiberius, has always been

been conſidered as his maſter-piece. There was no neceſſity for the abilities of a great writer to paint the vices of Caligula, the ſtupidity of Claudius, or the cruelties of Nero; but to write the life of Tiberius required the genius of Tacitus, who could unravel all the intrigues of the cabinet, aſſign the real cauſes of events, and withdraw the veil of deception, which concealed from the eyes of the public the real motives and ſprings of action. The Romans never applied themſelves greatly to philoſophy. Lucretius, who delivered in ſpirited verſification the opinions of Epicurus, is the only philoſopher, except Cicero, whoſe writings have reached our times: a cloſe and aſſiduous ſearch into the operations of nature, was not perhaps agreeable to the genius of the Romans.——In tragedy, and comedy, the Romans never produced any thing that can bear the leaſt compariſon with the immortal writers of Greece, Æſchylus, Euripides, and Sophocles. The tragic poets hardly deſerve to be mentioned. At the head of the comic department, Plautus and Terence are juſtly placed; but neither were poſſeſſed of the *vis comica*, or lively vein of humour, which is eſſential to comedy, and which diſtinguiſhes the writings of the comic poets of Greece, and of our Shakſpeare.

We now return to our hiſtory, and are arrived at an æra, which preſents us with a ſet of monſters, under the name of emperors, whoſe hiſtories, a few excepted, diſgrace human nature. They did not indeed aboliſh the forms of the Roman republic, though they extinguiſhed its liberties; and while they were practiſing the moſt unwarrantable cruelties upon their ſubjects, they themſelves were the ſlaves of their ſoldiers. They made the world tremble, while they in their turn trembled at the army. Rome, from the time of Auguſtus, became the moſt deſpotic empire that ever ſubſiſted in Europe. To form an idea of their government, we need only recall to our minds the ſituation of Turkey at preſent. It is of no importance, therefore to conſider the character of the emperors, ſince they had no power but what aroſe from a mercenary ſtanding army, nor to enter into a detail with regard to the tranſactions of the court, which were directed with that caprice, cruelty, and corruption, which univerſally prevail under a deſpotic government. When it is ſaid that the Roman republic conquered the world, it is only meant of the civilized part of it, chiefly in Greece, Carthage, and Aſia. A more difficult taſk ſtill remained for the emperors, to ſubdue the barbarous nations of Europe; the Germans, the Gauls, the Britons, and even the remote corner of Scotland; for though theſe countries had been diſcovered, they were not effectually ſubdued by the Roman generals. Theſe nations, though rude and ignorant, were brave and independent. It was rather from the ſuperiority of their diſcipline than of their courage, that the Romans gained any advantage over them. The Roman wars with the Germans are deſcribed by Tacitus, and from his accounts, though a Roman, it is eaſy to diſcover with what bravery they fought, and with what reluctance they ſubmitted to a foreign yoke. From the obſtinate reſiſtance of the Germans, we may judge of the difficulties the Romans met with in ſubduing the other nations of Europe. The conteſts were on both ſides bloody; the countries of Europe were ſucceſſively laid waſte, the inhabitants periſhed in the field, many were carried into ſlavery, and but a feeble remnant ſubmitted to the Roman power. This ſituation of affairs was extremely unfavourable to the happineſs of mankind. The barbarous nations, indeed from their intercouſe with the Romans, acquired ſome taſte for the arts, ſciences, language, and manners of their new maſters. Theſe, however, were but miſerable conſolations for the loſs of liberty, for being deprived of the uſe of their arms, for being overawed by mercenary ſoldiers kept in pay to reſtrain them, and for being delivered over to rapacious governors, who plundered them without mercy. The only circumſtance which could ſupport them under theſe complicated calamities, was the hope of ſeeing better days.

The Roman empire, now ſtretched out to ſuch an extent, had loſt its ſpring and

force. It contained within itſelf the ſeeds of diſſolution; and the violent irruption of the Goths, Vandals, Huns, and other barbarians, haſtened its deſtruction. Theſe fierce tribes, who came to take vengeance on the empire, either inhabited the parts of Germany which had never been ſubdued by the Romans, or were ſcattered over the vaſt countries of the north of Europe, and north-weſt of Aſia, which are now inhabited by the Danes, the Swedes, the Poles, the ſubjects of the Ruſſian empire, and the Tartars. They were drawn from their native country by that reſtleſſneſs which actuates the minds of Barbarians, and makes them rove from home in queſt of plunder, or new ſettlements. The firſt invaders met with a powerful reſiſtance from the ſuperior diſcipline of the Roman legions; but this, inſtead of daunting men of a ſtrong and impetuous temper, only rouſed them to vengeance. They return to their companions, acquaint them with the unknown conveniences and luxuries that abounded in countries better cultivated, or bleſſed with a milder climate than their own; they acquaint them with the battles they had fought, of the friends they had loſt, and warm them with reſentment againſt their opponents. Great bodies of armed men (ſays an elegant hiſtorian, in deſcribing this ſcene of deſolation) with their wives and children, and ſlaves and flocks, iſſued forth, like regular colonies, in queſt of new ſettlements. New adventurers followed them. The lands which they deſerted were occupied by more remote tribes of Barbarians. Theſe in their turn, puſhed forward into more fertile countries, and like a torrent continually increaſing, rolled on, and ſwept every thing before them. Wherever the Barbarians marched, their route was marked with blood. They ravaged or deſtroyed all around them. They made no diſtinction between what was ſacred, and what was profane. They reſpected no age, or ſex, or rank. If a man was called to fix upon the period in the hiſtory of the world, during which the condition of the human race was moſt calamitous and afflicted, he would, without heſitation, name that which elapſed from the death of Theodoſius the Great, A. D. 395, to the eſtabliſhment of the Lombards in Italy, A. D. 571. The cotemporary authors, who beheld that ſcene of deſolation, labour, and are at a loſs for expreſſions to deſcribe the horror of it. *The ſcourge of God, the deſtroyer of Nations,* are the dreadful epithets by which they diſtinguiſh the moſt noted of the barbarous leaders.

Conſtantine, who was emperor in the beginning of the fourth century, and who had embraced Chriſtianity, changed the ſeat of empire from Rome to Conſtantinople. This occaſioned a prodigious alteration. The weſtern and eaſtern provinces were ſeparated from each other, and governed by different ſovereigns. The withdrawing the Roman legions from the Rhine and the Danube to the Eaſt, threw down the weſtern barriers of the empire, and laid it open to the invaders. A. D. 328.

Rome (now known by the name of the *Weſtern Empire*, in contradiſtinction to Conſtantinople, which, from its ſituation, was called the *Eaſtern Empire*), weakened by this diviſion, becomes a prey to the barbarous nations. Its ancient glory, vainly deemed immortal, is effaced, and Odoacer, a Barbarian chieftain, is ſeated on the throne of the Cæſars. Theſe irruptions into the empire were gradual and ſucceſſive. The immenſe fabric of the Roman empire was the work of many ages, and ſeveral centuries were employed in demoliſhing it. The ancient diſcipline of the Romans, in military affairs, was ſo efficacious, that the remains of it deſcended to their ſucceſſors, and muſt have proved an overmatch for all their enemies, had it not been for the vices of their emperors, and the univerſal corruption of manners among the people. Satiated with the luxuries of the known world, the emperors were at a loſs to find new provocatives. The moſt diſtant regions were explored, the ingenuity of mankind was exerciſed, and the tribute of provinces expended upon one favourite diſh. The tyranny, and the univerſal depravation of manners that prevailed under the emperors, or, as they A. D. 476.

are called Cæſars, could only be equalled by the barbarity of thoſe nations who overcame them.

Towards the cloſe of the ſixth century, the Saxons, a German nation, were maſters of the ſouthern, and more fertile provinces of Britain; the Franks another tribe of Germans, of Gaul; the Goths, of Spain: the Goths and Lombards, of Italy, and the adjacent provinces. Scarcely any veſtige of the Roman policy, juriſprudence, arts, or literature remained. New forms of government, new laws, new manners, new dreſſes, new languages, and new names of men and countries, were every where introduced.

From this period, till the 16th century, Europe exhibited a picture of moſt melancholy Gothic barbarity. Literature, ſcience, taſte, were words ſcarcely in uſe during theſe ages. Perſons of the higheſt rank, and in the moſt eminent ſtations, could not read or write. Many of the clergy did not underſtand the breviary which they were obliged daily to recite: ſome of them could ſcarcely read it. The human mind neglected, uncultivated, and depreſſed, ſunk into the moſt profound ignorance. The ſuperior genius of Charlemagne, who, in the beginning of the 9th century, governed France and Germany with part of Italy; and Alfred the Great in England, during the latter part of the ſame century, endeavoured to diſpel this darkneſs, and gave their ſubjects a ſhort glimpſe of light. But the ignorance of the age was too powerful for their efforts and inſtitutions. The darkneſs returned, and even increaſed; ſo that a ſtill greater degree of ignorance and barbariſm prevailed throughout Europe.

A new diviſion of property gradually introduced a new ſpecies of government formerly unknown; which ſingular inſtitution is now diſtinguiſhed by the name of the *Feudal Syſtem*. The king, or general, who led the Barbarians to conqueſt, parcelled out the lands of the vanquiſhed among his chief officers, binding thoſe on whom they were beſtowed to follow his ſtandard with a number of men, and to bear arms in his defence. The chief officers imitated the example of the ſovereign, and in diſtributing portions of their lands among their dependents, annexed the ſame condition to the grant. But though this ſyſtem ſeemed to be admirably calculated for defence againſt a foreign enemy, it degenerated into a ſyſtem of oppreſſion.

The uſurpation of the nobles became unbounded and intolerable. They reduced the great body of the people into a ſtate of actual ſervitude. They were deprived of the natural and moſt unalienable rights of humanity. They were ſlaves fixed to the ſoil which they cultivated, and together with it were transferred from one proprietor to another, by ſale or by conveyance. Every offended baron, or chieftain, buckled on his armour, and ſought redreſs at the head of his vaſſals. His adverſaries met him in like hoſtile array. The kindred and dependents of the aggreſſor, as well as of the defender, were involved in the quarrel. They had not even the liberty of remaining neuter *.

The monarchs of Europe perceived the encroachments of their nobles with impatience. In order to create ſome power that might counterbalance thoſe potent vaſſals, who, while they enſlaved the people, controlled or gave law to the crown, a plan was adopted of conferring new priveilges on towns. Theſe privileges aboliſhed all marks of ſervitude; and the inhabitants of towns were formed into corporations, or bodies politic, to be governed by a council and magiſtrates of their own nomination.

The acquiſition of liberty made ſuch a happy change in the condition of man-

* This Gothic ſyſtem ſtill prevails in Poland: a remnant of it continued in the Highlands of Scotland ſo late as the year 1748. And even in England, a country renowned for civil and religious liberty, ſome relics of theſe Gothic inſtitutions are perceivable at this day.

kind,

kind, as rouſed them from that ſtupidity and inaction into which they had been ſunk by the wretchedneſs of their former ſtate. A ſpirit of induſtry revived; commerce became an object of attention, and began to flouriſh.

Various cauſes contributed to revive this ſpirit of commerce, and to renew the intercourſe between different nations. Conſtantinople, the capital of the eaſtern or Greek empire, had eſcaped the ravages of the Goths and Vandals, who overthrew that of the Weſt. In this city, ſome remains of literature and ſcience were preſerved: this too, for many ages, was the great emporium of trade, and where ſome reliſh for the precious commodities and curious manufactures of India was retained. They communicated ſome knowledge of theſe to their neighbours in Italy; and the cruſades, which were begun by the Chriſtian powers of Europe with a view to drive the Saracens from Jeruſalem, opened a communication between Europe and the Eaſt. Conſtantinople was the general place of rendezvous for the Chriſtian armies, in their way to Paleſtine, or on their return from thence. Though the object of theſe expeditions was conqueſt, and not commerce, and though the iſſue of them proved unfortunate, their commercial effects were both beneficial and permanent. A. D. 1096.

Soon after the cloſe of the holy war, the mariners compaſs was invented, which facilitated the communication between remote nations, and brought them nearer to each other. The Italian ſtates, particularly thoſe of Venice and Genoa, began to eſtabliſh a regular commerce with the Eaſt, and the ports of Egypt, and drew from thence all the rich productions of India. Theſe commodities they diſpoſed of to great advantage among the other nations of Europe, who began to acquire ſome taſte of elegance, unknown to their predeceſſors, or deſpiſed by them. During the 12th and 13th centuries, the commerce of Europe was almoſt entirely in the hands of the Italians. more commonly known in thoſe ages by the name of Lombards. Companies, or ſocieties of Lombard merchants, ſettled in every different kingdom; they became the carriers, the manufacturers, and the bankers of Europe. One of theſe companies ſettled in London; and from hence the name of Lombard-ſtreet was derived. A. D. 1302.

While the Italians in the ſouth of Europe cultivated trade with ſuch induſtry and ſucceſs, the commercial ſpirit awaked in the North towards the middle of the thirteenth century. As the Danes, Swedes, and other nations around the Baltic, were at that time extremely barbarous, and infeſted that ſea with their piracies, this obliged the cities of Lubec and Hamburgh, ſoon after they had begun to open ſome trade with the Italians, to enter into a league of mutual defence. They derived ſuch advantages from this union, that other towns acceded to their confederacy; and, in a ſhort time, eighty of the moſt conſiderable cities, ſcattered through thoſe large countries of Germany and Flanders, which ſtretch from the bottom of the Baltic to Cologne on the Rhine, joined in an alliance, called the *Hanſeatic League*; which became ſo formidable, that its alliance was courted, and its enmity was dreaded by the greateſt monarchs. The members of this powerful aſſociation formed the firſt ſyſtematic plan of commerce known in the middle ages, and conducted it by common laws enacted in their general aſſemblies. They ſupplied the reſt of Europe with naval ſtores; and pitched on different towns, the moſt eminent of which was Bruges, in Flanders, where they eſtabliſhed ſtaples, in which their commerce was regularly carried on. Thither the Lombards brought the productions of India, together with the manufactures of Italy, and exchanged them for the more bulky, but not leſs uſeful commodities of the North.

As Bruges became the centre of communication between the Lombards and Hanſeatic merchants, the Flemings traded with both in that city to ſuch extent as well as advantage, as diffuſed among them a general habit of induſtry, which long

rendered Flanders and the adjacent provinces the moſt opulent, the moſt populous, and beſt cultivated countries in Europe.

Struck with the flouriſhing ſtate of theſe provinces, of which he diſcovered the true cauſe, Edward III. of England endeavoured to excite a ſpirit of in-
A. D. 1330. duſtry among his own ſubjects, who, blind to the advantages of their ſituation, and ignorant of the ſource from which opulence was deſtined to flow into their country, totally neglected commerce, and did not even attempt thoſe manufactures, the materials of which they furniſhed to foreigners. By alluring Flemiſh artiſans to ſettle in his dominions, as well as by many wiſe laws for the encouragement and regulation of trade, he gave a beginning to the woollen manufactures of England; and firſt turned the active and enterpriſing genius of his people towards thoſe arts which have raiſed the Engliſh to the firſt rank among commercial nations.

The Chriſtian princes, after their great loſſes in the cruſades, endeavoured to cultivate the friendſhip of the great khans of Tartary, whoſe fame in arms had reached the moſt remote corners of Europe and Aſia, that they might be ſome check upon the Turks, who had been ſuch enemies to the Chriſtian name; and who, from a contemptible handful of wanderers, ſerving occaſionally in the armies of contending princes, had begun to extend their ravages over the fineſt countries of Aſia.

The Chriſtian embaſſies were managed chiefly by monks, a wandering profeſſion of men, who, impelled by zeal, and undaunted by difficulties and danger, found their way to the remote courts of theſe infidels. The Engliſh philoſopher Roger Bacon, was ſo induſtrious as to collect from their relations, or traditions, many particulars of the Tartars, which are to be found in Purchas's Pilgrim, and other books of travels. The firſt regular traveller of the monkiſh kind, who committed his diſcoveries to writing, was John du Plant Carpin, who, with ſome of his brethren, about the year 1246, carried a letter from pope Innocent to the great khan of Tartary, in favour of the Chriſtian ſubjects in that prince's extenſive dominions. Soon after this, a ſpirit of travelling into Tartary and India became general; and it would be no difficult matter to prove that many Europeans, about the end of the fourteenth century, ſerved in the armies of Tamerlane, one of the greateſt princes of Tartary, whoſe conqueſts reached to the moſt remote corners of India; and that they introduced into Europe the uſe of gunpowder and artillery; the diſcovery made by a German chemiſt being only partial and accidental.

After the death of Tamerlane, who, jealous of the riſing power of the Turks, had checked their progreſs, the Chriſtian adventurers, upon their return magni-
A. D. 1405. fying the vaſt riches of the Eaſt Indies, inſpired their countrymen with a ſpirit of adventure and diſcovery, and were the firſt that rendered a paſſage thither by ſea probable and practicable. The Portugueſe had been always famous for their application to maritime affairs; and to their diſcovery of the Cape of Good Hope, Great Britain is at this day indebted for her Indian commerce.

At firſt they contented themſelves with ſhort voyages, creeping along the coaſt of Africa, diſcovering cape after cape; but by making a gradual progreſs ſouthward, they, in the year 1497, were ſo fortunate as to ſail beyond the cape, which opened a paſſage by ſea to the eaſtern ocean, and all thoſe countries known by the names of India, China, and Japan.

While the Portugueſe were intent upon a paſſage to India by the eaſt, Columbus, a native of Genoa, conceived a project of ſailing thither by the weſt. His propoſal being condemned by his countrymen as chimerical and abſurd, he laid his ſchemes ſucceſſively before the courts of France, England, and Portugal, where he had no better ſucceſs. Such repeated diſappointments would have broken the ſpirit of any

any man but Columbus. The expedition required expence, and he had nothing to defray it. Spain was now his only reſource, and there, after eight years attendance, he at length ſucceeded through the intereſt of queen Iſabella. This princeſs was prevailed upon to patroniſe him, by the repreſentations of Juan Perez, guardian of the monaſtery of Rabida. He was a man of conſiderable learning, and of ſome credit with queen Iſabella; and being warmly attached to Columbus, from his perſonal acquaintance with him, and knowledge of his merit, he had entered into an accurate examination of that great man's project, in conjunction with a phyſician ſettled in his neigbourhood, who was eminent for his ſkill in mathematical knowledge. This inveſtigation completely ſatisfied them of the ſolidity of the principles on which Columbus founded his opinion, and of the probability of ſucceſs in executing the plan which he propoſed. Perez, therefore, ſo ſtrongly recommended it to queen Iſabella, that ſhe entered into the ſcheme, and even generouſly offered, to the honour of her ſex, to pledge her own jewels, in order to raiſe as much money as might be required in making preparations for the voyage. But Santangel, another friend and patron of Columbus, immediately engaged to advance the requiſite ſum, that the queen might not be reduced to the neceſſity of having recourſe to that expedient.

Columbus now ſet ſail, anno 1492, with three ſhips, upon one of the moſt adventurous attempts ever undertaken by man, and in the fate of which the inhabitants of two worlds were intereſted. In this voyage he had many difficulties to contend with; and his ſailors, who were often diſcontented, at length began to inſiſt upon his return, threatening, in caſe of refuſal, to throw him overboard: but the firmneſs of the commander, and the diſcovery of land, after a paſſage of 33 days, put an end to the commotion. From the appearance of the natives, he found, to his ſurpriſe, that this could not be the Indies he was in queſt of, and which he ſoon diſcovered to be a new world: of this the reader will find a more circumſtantial account in that part of the following work which treats of America.

Europe now began to emerge out of that darkneſs into which ſhe had been ſunk ſince the ſubverſion of the Roman empire. Theſe diſcoveries, from which ſuch wealth was deſtined to flow to the commercial nations of Europe, were ſucceeded by others of unſpeakable benefit to mankind. Learning now awoke from her ſlumber of near twelve centuries, and the inhabitants of Europe became another people. The art of printing which ſpreads with ſuch rapidity from country to country the wiſdom, and follies of mankind, was invented: artillery and engineering were brought to perfection, and totally changed the operations of war. Every maritime nation fitted out fleets for making diſcoveries, and the whole world became connected by commerce. The reformation in religion reſtored liberty to genius; the human mind was releaſed from the ſhackles of ſuperſtition, which had long ſilenced reaſon, and prevented the thinking faculty from exerting its powers. The arts and ſciences began to be cultivated, literature was eſteemed; commerce was every day improved, and riches flowed into Europe from every quarter. New principles of action, and new ſyſtems of conduct, were introduced at this æra of mental improvement; but the powers of the human mind are unfolded only by ſlow degrees. Many prejudices were to be removed, many abuſes corrected, and many difficulties ſurmounted, before the ſciences could appear in their genuine luſtre; for the principles of the arts and ſciences were forgotten. Truth and beauty ſeem indeed to ſurround mankind; but they are diſregarded till properly pointed out. The veil muſt be withdrawn from the face of nature, before her genuine graces can be diſcovered. A ſucceſſion of great geniuſes is neceſſary to explore the hidden paths of true philoſophy.

A. D. 1440.

The

The firſt ſtudies that engaged mankind at the revival of learning, were languages and hiſtory. The human mind, releaſed from barbariſm, grew eager to collect ideas; but was then incapable of acquiring them in a regular order. Memory, therefore, was the firſt faculty cultivated; becauſe the moſt eaſily ſatisfied, and the knowledge it procures the moſt eaſily attained. Hence proceeded that ſwarm of ſcholars, ſo deeply ſkilled in the learned languages, as to neglect their own; who knew every thing of the ancients but their graces, and who prided themſelves with the pomp of learning. An inventive genius is always diſſatisfied with its own province; becauſe it ſees much farther than it reaches; and the moſt penetrating minds often find in themſelves a ſecret rigorous judge; which the approbation of others may ſilence for a while, but can never corrupt. We need not therefore be ſurpriſed that theſe ſcholars ſhould boaſt ſo highly of their pompous province; though it often appears ridiculous, and ſometimes barbarous. Erudition was then abſolutely neceſſary; it paved the way to polite learning.

But this fondneſs for the ancient, and neglect of the modern languages did not long continue. The learned were ſoon convinced that beautiful thoughts loſt nothing by being clothed in a living language; and hence they endeavoured to expreſs in their own tongues, what the ancients had delivered in theirs. Thus the imagination of the moderns was gradually kindled up by that of the ancients; and produced all the noble performances in the laſt and preſent centuries in eloquence, hiſtory, and poetry.

The arts of elegance are ſo cloſely connected with polite learning, that a genius for cultivating the one, leads to the improvement of the other. The various works of the ancients were no ſooner carefully examined, than judicious artiſts were ſtruck with thoſe obvious maſter-pieces of antiquity, which had eſcaped the fury of Gothic barbarity. But the works of Praxiteles and Phidias could only be imitated but by exact copies. Hence Raphael, and Michael Angelo, brought their art to a degree of perfection, which has not ſince been exceeded.

The progreſs of philoſophy was much ſlower than that of the polite arts. Moſt of the works of the ancients were loſt; and the few that remained, being imperfect or ſpoiled by time, could give but very uncertain and confuſed glimmerings of ſo diffuſive a ſubject. The face of nature is the primary book of philoſophers, and the moderns were obliged to ſtudy it: the ancients could not ſave them the labour. But philoſophy had other difficulties that retarded its progreſs; ignorance, a blind admiration for antiquity, and ſuperſtitious bigotry, joined in obſcuring the light of reaſon, and had almoſt ſtifled the genuine rays of ſcience in their dawn.

Whilſt ignorant or malevolent enemies therefore declared open war with ſcience, philoſophy retreated under the covert of ſome extraordinary men; who, without entertaining the dangerous ambition of unveiling the eyes of their cotemporaries, prepared in ſhade and ſilence, that light which afterwards, by inſenſible degrees, enlightened the world.

By this prudent method the labours of the learned were at laſt crowned with ſucceſs; the rays of ſcience diſpelled the night of ignorance, and philoſophy triumphed over the chicanery of the ſchools. In this noble conteſt the Engliſh had the greateſt ſhare: they were at once the champions of liberty and learning; and to their diſcoveries and penetrating ſagacity, the world is principally indebted for the preſent perfection of literature. In the profound parts of ſcience they were never ſurpaſſed, perhaps never equalled: they demoliſhed the ſyſtems which imagination had built on the foundations of ſophiſtry, followed nature through her intricate mazes, and eſtabliſhed philoſophy on the ſolid baſis of truth.

The 15th and 16th centuries were thus diſtinguiſhed for ſo many important diſcoveries. "It was in theſe ages that the powers of Europe were formed into one

great political ſyſtem, in which each took a ſtation, wherein it has ſince remained, with leſs variation than could have been expected, after the ſhocks occaſioned by ſo many internal revolutions, and ſo many foreign wars, of which we have given ſome account in the hiſtory of each particular ſtate in the following work. The great events which happened then have not hitherto ſpent their force. The political principles and maxims then eſtabliſhed, ſtill continue to operate; and the ideas concerning the balance of power then introduced, or rendered general, ſtill influence, in ſome degree, the councils of European nations."

From all which it ſeems extremely certain, that the concurrence of ſo many rival princes will always prevent any one of them from gaining the empire over Europe. But it is no leſs certain, that, in contending for it, they muſt weaken their own force, and may at length render themſelves incapable of defending even their juſt poſſeſſions. The partial conqueſts they may make are extremely illuſive; inſtead of promoting, they rather oppoſe their deſigns; the more any kingdom is extended, it becomes the weaker; and great projects have not been ſo often executed by ſlow reiterated efforts, as in the courſe of a few years, and ſometimes by a ſingle expedition. A prince may form a deliberate plan of deſtroying the rights of his ſubjects; he may proceed by ſlow degrees in the execution of it; and if he die before it is completed, his ſucceſſor may purſue the ſame ſteps, and avail himſelf of what was done before him. But external conqueſts cannot be concealed; they generally occaſion more fear than hurt, and are almoſt always leſs ſolid than brilliant. Hence the alarms they excite, the confederacies they give occaſion to, by which the prince who, by misfortune has been a conqueror, is commonly reduced to the laſt extremities. This doctrine, however contrary to the prejudices of a powerful and victorious nation, is one of the beſt eſtabliſhed in the ſcience of politics. It is confirmed by examples both ancient and modern. The ſtates of Greece, in particular, delivered from the terror of the Perſian invaſions, exhibit the ſame truth in a great variety of lights. There was not one of the moſt inconſiderable of theſe little ſocieties, but in its turn imbibed the frenzy of conqueſt, and in its turn too was reduced by this frenzy to the utmoſt miſery and diſtreſs *. The modern examples are ſo well known, that it is almoſt unneceſſary to mention them. Who does not know that the houſe of Auſtria † excited the terror of all Europe, before it excited the pity of Great Britain! Had that family never been the object of fear, the empreſs-queen would never have become the object of compaſſion. France affords an example not leſs ſtriking. The nerves of that kingdom were ſtrained ſo far beyond their ſtrength, by an ambitious monarch, that it ſeemed hardly poſſible they ſhould acquire their natural tone in the courſe of this century. The debility of their efforts in the war of 1756 proved the greatneſs of the evil, and the inefficacy of any remedy which is not ſlow and gradual.

Of all the kingdoms of Europe, Great Britain for a long time enjoyed the greateſt degree of proſperity and glory. She ought, therefore, to have been the more attentive to preſerve ſo brilliant an exiſtence. A great empire cannot be continued

* The reader who would ſee this ſubject fully illuſtrated, may look at Iſocrates' Oration on the Peace; one of the moſt finiſhed models of ancient eloquence; and which contains a rich fund of political knowledge.

† Germany, Holland, and all the Low Countries, ſeveral ſtates in Italy, the kingdom of Spain, with the vaſt empires of Mexico and Peru in South America, were, at the time of the Reformation, governed by Charles V. of the houſe of Auſtria: territories which, though exceeding in riches and extent the moſt powerful empires of antiquity, did not gratify the ambition of that monarch; and his whole reign was a ſcene of hoſtility againſt his neighbours. One of his ſucceſſors, the late empreſs-queen, and the repreſentative of that family, was, however, upon the death of her father, not only ſtripped of her dominions, but reduced ſo low as to be in want of neceſſaries; and contributions were actually raiſed for her in Great Britain, whoſe king, George II. engaged in her cauſe, and at the expence of this nation reinſtated her upon the imperial throne.

in

in a happy ſituation, but by wiſdom and moderation. Every attempt to extend her dominions muſt be attended with two infallible conſequences; the firſt, to alarm her neighbours; the ſecond, to augment her armies. The augmentation of armies may, in time, endanger our conſtitution; and the farther our conqueſts are removed from home, this danger becomes the greater, as thoſe armies will ſoon, by living in a diſtant climate, loſe all affection for their native country. Without entering into the labyrinth of political diſputes, it will be acknowledged, that the unhappy conteſt of Great Britain with the American colonies, has plunged her into difficulties; her national debt has been augmented to a prodigious height; and her taxes greatly increaſed. But there is reaſon to believe, that the preſent peace with America, and with the European powers with whom ſhe has been lately involved in war, will ſoon reſtore her proſperity and tranquillity.

PART III.

OF THE ORIGIN AND PROGRESS OF RELIGION.

DEITY is an awful object, and has ever rouſed the attention of mankind: but they being incapable of elevating their ideas to all the ſublimity of his perfections, have too often brought down his perfections to the level of their own ideas. This is more particularly true with regard to thoſe nations whoſe religion had no other foundation but the natural feelings, and more often the irregular paſſions, of the human heart, and who had received no light from heaven reſpecting this important object. In deducing the hiſtory of religion, therefore, we muſt make the ſame diſtinction which we have hitherto obſerved, in tracing the progreſs of arts, ſciences, and of civilization among mankind. We muſt ſeparate what is human from what is divine, what had its origin from particular revelations, from what is the effect of general laws, and of the unaſſiſted operations of the human mind.

Agreeably to this diſtinction, we find, that in the firſt ages of the world, the religion of the eaſtern nations was pure and luminous. It aroſe from a divine ſource, and was not then diſfigured by human fancies or caprice. In time, however, theſe began to have their influence; the ray of tradition was obſcured, and among thoſe tribes which ſeparated at the greateſt diſtance, and in the ſmalleſt numbers, from the more improved ſocieties of men, it was altogether obliterated.

In this ſituation a particular people were ſelected by God himſelf, to be the depoſitaries of his law and worſhip; but the reſt of mankind were left to form hypotheſes upon theſe ſubjects, which were more or leſs perfect according to an infinity of circumſtances, which cannot properly be reduced under any general heads.

The moſt common religion of antiquity, that which prevailed the longeſt, and extended the wideſt, was POLYTHEISM, or the doctrine of a plurality of Gods. The rage of ſyſtem, the ambition of reducing all the phenomena of the moral world to a few general principles, has occaſioned many imperfect accounts, both of the origin and nature of this ſpecies of worſhip. For, without entering into a minute detail, it is impoſſible to give an adequate idea of the ſubject; and what is ſaid upon it in general, muſt always be liable to many exceptions.

One thing, however, may be obſerved, that the polytheiſm of the ancients ſeems neither to have been the fruit of philoſophical ſpeculations, nor of diſfigured traditions, concerning the nature of the divinity. It ſeems to have ariſen during the

rudeſt ages of ſociety, while the rational powers were feeble, and while mankind were under the tyranny of imagination and paſſion. It was built ſolely upon ſentiment: as each tribe of men had their heroes, ſo likewiſe they had their gods. Thoſe heroes who led them forth to the combat, who preſided in their councils, whoſe image was engraved on their fancy, whoſe exploits were imprinted on their memory, even after death enjoyed an exiſtence in the imagination of their followers. The force of blood, of friendſhip, of affection, among rude nations, is what we cannot eaſily conceive; but the power of imagination over the ſenſes is what all men have in ſome degree experienced. Combine theſe two cauſes, and it will not appear ſtrange that the images of departed heroes ſhould have been ſeen by their companions, animating the battle, taking vengeance on their enemies, and performing, in a word, the ſame functions which they performed when alive. An appearance ſo unnatural would not excite terror among men unacquainted with evil ſpirits, and who had not learnt to fear any thing but their enemies. On the contrary, it confirmed their courage, flattered their vanity, and the teſtimony of thoſe who had ſeen it, ſupported by the extreme credulity and romantic caſt of thoſe who had not, gained an univerſal aſſent among all the members of their ſociety. A ſmall degree of reflection would be ſufficient to convince them, that, as their own heroes exiſted after death, it might likewiſe be the caſe of thoſe of their enemies. Two orders of gods, therefore, would be eſtabliſhed, the propitious and the hoſtile; the gods who were to be loved, and thoſe who were to be feared. But time which wears off the impreſſions of tradition, the frequent invaſions by which the nations of antiquity were ravaged, deſolated, or tranſplanted, made them loſe the names, and confound the characters of thoſe two orders of divinities, and form various ſyſtems of religion, which, though warped by a thouſand particular circumſtances, gave no ſmall indications of their firſt texture and original materials. In general the gods of the ancients gave abundant proof of human infirmity: they were ſubject to all the paſſions of men; they partook even of their partial affections, and in many inſtances diſcovered the preference of one race or nation to all others. They did not eat and drink the ſame ſubſtances with men; but they lived on nectar and ambroſia; they had a particular pleaſure in ſmelling the ſteam of the ſacrifices, and they made love with a ferocity unknown in northern climates. The rites by which they were worſhipped, naturally reſulted from their character. The moſt enlightened among the Greeks entertained nearly the ſame notion of gods and religion, with thoſe that are to be met with in the poems of Heſiod and Homer; and Anaxagoras, who flouriſhed B. C. 430 years, was the firſt, even in Greece, that publicly announced the exiſtence of one Creator and Governor of the univerſe.

It muſt be obſerved, however, that the religion of the ancients was not much connected, either with their private behaviour, or with their political arrangements. If we except a few fanatical ſocieties, whoſe principles do not fall within our plan, the greateſt part of mankind were extremely tolerant in their principles. They had their own gods who watched over them; their neighbours, they imagined, alſo had their's; and there was room enough in the univerſe for both to live together in friendſhip, without interfering with one another.

The introduction of Chriſtianity, by inculcating the unity of God, by announcing the purity of his character, and by explaining the ſervice he required of men, produced a total alteration in their religious ſentiment and belief. But this is not the place for handling this ſublime ſubject: it is ſufficient to obſerve here, that a religion which was founded on the unity of the Deity, which admitted of no aſſociation with falſe gods, muſt either be deſtroyed, or become the prevailing belief of mankind. The latter was the caſe. Chriſtianity made its way among the civilized part of mankind, by the ſublimity of its doctrines and precepts; it required not the aid of human power; it ſuſtained itſelf by the truth and wiſdom by which it was characteriſed. But in time it became corrupted by the introduction of worldly

maxims, of maxims very inconſiſtent with the precepts of its divine author, and by the ambition of the clergy.

The management of whatever related to the church being naturally conferred on thoſe who had eſtabliſhed it, firſt occaſioned the elevation and then the domination of the clergy, and the exorbitant claim of the biſhop of Rome, over all the members of the Chriſtian world. It is impoſſible to deſcribe, within our narrow limits, all the concomitant cauſes, ſome of which were extremely delicate, by which this ſpecies of univerſal monarchy was eſtabliſhed. The biſhops of Rome, by being removed from the controul of the Roman emperors, then reſiding in Conſtantinople; by borrowing, with little variation, the religious ceremonies and rites eſtabliſhed among the heathen world, and otherwiſe working on the credulous minds of Barbarians, by whom that empire began to be diſmembered; and by availing themſelves of every circumſtance which Fortune threw in their way, ſlowly erected the fabric of their antichriſtian power, at firſt an object of veneration, and afterwards a terror to all temporal princes. The cauſes of its happy diſſolution are more palpable and operated with greater activity. The moſt efficacious were the invention of printing, the rapid improvement of arts, government, and commerce, which after many ages of barbarity, made their way into Europe. The ſcandalous lives of thoſe who called themſelves the *miniſters of Jeſus Chriſt*, their ignorance and tyranny, the deſire natural to ſovereigns of delivering themſelves from a foreign yoke, the opportunity of applying to national objects, the incredible wealth which had been diverted to the ſervice of the church in every kingdom of Europe, conſpired with the ardour of the firſt reformers, and haſtened the progreſs of the reformation. The abſurdity of the claims of the church of Rome was demonſtrated; many of their doctrines were proved to be equally unſcriptural and irrational; and ſome of their abſurd mummeries and ſuperſtitions were expoſed both by argument and ridicule. The ſervices of the reformers in this reſpect give them a juſt claim to our veneration; but involved as they had themſelves been in the darkneſs of ſuperſtition, it was not to be expected that they ſhould be able wholly to free themſelves from errors; they ſtill retained an attachment to ſome abſurd doctrines, and preſerved too much of the intolerant ſpirit of the church from which they had ſeparated themſelves. With all their defects, they are entitled to our admiration and eſteem; and the Reformation begun by Luther in Germany in the year 1517, and which took place in England A. D. 1534, was an event highly favourable to the civil, as well as to the religious rights of mankind.

We ſhall now proceed to the main part of our work, beginning with EUROPE.

EUROPE.

EUROPE.

EUROPE, though the leaſt extenſive quarter of the globe, containing according to Zimmermann* only about 2,627,574 ſquare miles, whereas the habitable parts of the world in the other quarters, are eſtimated at 36,666,806 ſquare miles, is in many reſpects that which moſt deſerves our attention. There the human mind has made the greateſt progreſs towards improvement; and there the arts, whether of utility or ornament, the ſciences, both military and civil, have been carried to the greateſt perfection. If we except the earlieſt ages of the world, it is in Europe that we find the greateſt variety of character, government, and manners; and from whence we draw the greateſt number of facts and memorials, for our entertainment or inſtruction.

Geography diſcovers to us two circumſtances with regard to Europe, which perhaps have had a conſiderable tendency in giving it the ſuperiority over the reſt of the world. Firſt, the happy temperature of its climate, no part of it lying within the torrid zone; and ſecondly, the great variety of its ſurface. The effect of a moderate climate, both on plants and animals, is well known from experience. The great number of mountains, rivers, ſeas, &c. which divide the different countries of Europe from one another, is likewiſe extremely commodious for its inhabitants. Theſe natural boundaries check the progreſs of conqueſt or deſpotiſm, which has always been ſo rapid in the extenſive plains of Africa and the Eaſt: the ſeas and rivers facilitate the intercourſe and commerce between different nations; and even the barren rocks and mountains are more favourable for exciting human induſtry and invention, than the natural unſolicited luxuriancy of more fertile ſoils. There is no part of Europe ſo diverſified in its ſurface, ſo interrupted by natural boundaries or diviſions, as Greece: and we have ſeen that it was there the human mind began to avail itſelf of its ſtrength, and that many of the arts, ſubſervient to utility or pleaſure, were invented, or at leaſt much improved. What Greece therefore was, with regard to Europe, Europe is with regard to the reſt of the globe. The analogy may even be carried farther, and it is neceſſary to attend to it. As ancient Greece (for we do not ſpeak of Greece as it is at preſent, under the dominion of Barbarians) was diſtinguiſhed above all the reſt of Europe for the equity of its laws, and the freedom of its political conſtitution; ſo has Europe in general been remarkable for ſmaller deviations, at leaſt, from the laws of nature and equality, than have been admitted in other quarters of the world. Though moſt of the European governments are monarchical, we may diſcover, on due examination, that there are a thouſand little ſprings, which check the force, and ſoften the rigour of monarchy in Europe, that do not exiſt any where elſe. In proportion to the number and force of theſe checks, the monarchies of Europe, ſuch as Ruſſia, France, Spain, and Denmark, differ from one another. Beſides *monarchies*, in which one man bears the chief ſway, there are in Europe, *ariſtocracies* or governments of the nobles, and *democracies* or governments of the people. Venice is an example of the former; Holland, and ſome ſtates of Italy and Switzerland, afford examples of the latter.

* See Zimmermann's Political Survey of Europe, p. 5. where the reader will find an account of the geographical ſquare miles contained in Europe, as ſtated by ſix of the ableſt modern geographers, viz. Buſching, Kitchin, Templeman, Bergman, Crome, and Staliſt. Ueberſich; of their different accounts the average is exactly the number ſtated above.

There are, likewiſe, mixed governments, which cannot be aſſigned to any one claſs. Great Britain, which partakes of all the three, is the moſt ſingular inſtance of this kind we are acquainted with. The other mixed governments in Europe are compoſed of two of the ſimple forms, ſuch as Poland, ſeveral ſtates of Italy, &c. all which ſhall be explained in their proper places.

The Chriſtian religion is eſtabliſhed throughout every part of Europe, except Turkey; but, from the various capacities of the human mind, and the different lights in which ſpeculative opinions are apt to appear, when viewed by perſons of different educations and paſſions, that religion is divided into a number of different ſects, but which may be comprehended under three general denominations; 1ſt, The Greek church; 2d, Popery; and 3d, Proteſtantiſm: which laſt is again divided into Lutheraniſm and Calvaniſm, ſo called from Luther and Calvin, the two diſtinguiſhed reformers of the 16th century.

The languages of Europe are derived from the Greek, Latin, Teutonic or old German, the Celtic, Sclavonic, and Gothic.

"The greateſt part of Europe being ſituated above the 45th degree of northern latitude, and even its moſt ſouthern provinces being far diſtant from the torrid zone, the ſpecies of organized bodies are much leſs numerous in Europe than in the other parts of the globe. Thus for inſtance upon an equal number of ſquare miles, the number of ſpecies of quadrupeds in Europe is to the number of them in Aſia as 1 to $2\frac{1}{5}$, to that in America as 1 to $2\frac{1}{3}$, and to that in Africa as 1 to 10: and the number of the vegetable ſpecies in the other three diviſions of the globe, is greatly ſuperior to that in Europe. But Nature has enriched our continent with every ſpecies of minerals; diamonds, and platina perhaps excepted. Gold, the firſt of metals, is not found in Europe as plentifully as in the other continents. However as the European nations excel the reſt of mankind not only in the ſkill of making the beſt uſe of their natural productions, but alſo in the art of tranſplanting into their own ſoil as many of the foreign productions as their nature will permit; Europe upon the whole muſt be allowed to be one of the richeſt parts of the globe *."

It will doubtleſs be agreeable to the inquiſitive mind to have at one view a comparative eſtimate of the different ſtates of Europe, both as to the article of revenue, and that of their land and naval forces: we ſhall therefore add from the ſame reſpectable authority †.

Public Revenue *of the* Principal States *in* Europe.

	£. Sterl.	
1. Great Britain	14,500,000	
2. Auſtria —	12,400,000	(112 million florins)
3. France —	18,000,000	(Necker Compte Rendu)
4. Spain —	5,000,000	Of Old Spain alone
5. Ruſſia —	5,800,000	
6. Turkey —	5,000,000	
7. Pruſſia —	3,600,000	
8. Portugal —	1,800,000	
9. Sicily —	1,400,000	medium
10. Holland —	4,000,000	
11. Sweden —	1,300,000	
12. Venice —	1,000,000	
13. Denmark —	1,000,000	
14. Electorate of Saxony —	1,100,000	
15. Electorate of Hanover	900,000	
16. Joint Elect. of the Palat. and Bavaria	1,100,000	
17. Sardinia —	1,000,000	

"A more exact account will be found in the ſpecial tables, the preceding ſtatement in round numbers being intended merely to give the reader a general idea of the relative ſtate of European finances. It would, however, be very impro-

* Zimmermann, p. 8.

† Ibid, p. 11—15.

per

per to judge of the power of ſtates merely by their finances, becauſe, in ſome countries, the value of money is much higher than in others: thus, for inſtance, the whole Ruſſian army coſts the ſtate leſs than two millions of rubles. Ruſſia, Denmark, England, Sweden, and others have paper money."

LAND FORCES *of the* EUROPEAN STATES *in the Year* 1783.

France — —	300,000	
Auſtria — —	282,000	
Ruſſia (450,000 in all) in Europe — —	290,000	
Pruſſia — —	224,000	
Turkey (210,000 in all) in Europe only —	170,000	
Spain — —	60,000	including militia
Denmark — —	72,000	
Great Britain — —	58,000	including militia
Sweden — —	50,000	
Sardinia — —	40,000	
Holland — —	37,000	
Naples and Sicily —	30,000	
Electorate of Saxony —	26,000	
Portugal — —	20,000	
Electorate of Bavaria and the Palatinate —	24,000	
Heſſe Caſſel — —	15,000	
Hanover — —	20,000	
Poland — —	15,000	
Venice — —	8,000	
Wurtemburg — —	6,000	
The Eccleſiaſtical State —	5,000	
Tuſcany — —	3,000	

"As I have ſtated here the forces of the principal ſtates only, paſſing over a conſiderable part of Germany, Italy and Switzerland, we may calculate the armies of all the countries in Europe to amount to two millions of men; ſo that ſuppoſing 140 millions of inhabitants in Europe, no more than $\frac{1}{70}$ of the whole population are ſoldiers. The preſent military eſtabliſhment of every kingdom, in a time of general peace, differs ſomewhat from the above ſtatement. France, Auſtria, and Pruſſia have by far the moſt formidable armies: as to Ruſſia, the immenſe extent of its provinces can never allow an army of more than 120,000, or 130,000, men to act againſt an enemy; and as to the Turkiſh forces, they are a preſent much inferior to any other well-diſciplined army. The different proportions, in different countries, between the population, and the number of ſoldiers, is not unworthy of obſervation. There are in Germany, nearly 500,000 ſoldiers, conſequently $\frac{1}{52}$ of the whole population are engaged in the military profeſſion: in Italy, on the contrary, even ſuppoſing the ſtanding armies of that country to amount to 120,000 men, this number makes only $\frac{1}{133}$ of the whole population, which amounts to 16 millions."

NAVAL FORCES.

NUMBER of SHIPS of the LINE, FRIGATES, CUTTERS, SLOOPS, &c.

1. England —	465	
2. France —	266	
3. Spain —	130	
4. Holland —	95	
5. Sweden —	85	
6. Denmark —	60	
7. Turkey —	50	commonly reckoned 60
8. Ruſſia —	63	
9. Sardin —	32	
10. Venice —	30	
11. Sicily —	25	
12. Portugal —	24	
Total	1325	

"Several of theſe numbers, taken from the naval liſts of 1783, are at preſent reduced; the actual number will be mentioned in the ſpecial tables. This gives, however, ſome idea of the reſpective naval ſtrength of the different powers of Europe. Some of them, as for inſtance, Denmark, Sweden, Sicily, Portugal, having had no war for many years paſt, and having, for that reaſon, built but a ſmall

ſmall number of ſhips, are capable of maintaining a much larger navy than they now have; and they would, undoubtedly, increaſe their naval forces very conſiderably in caſe of a war.

" It may, perhaps, be an object of curioſity, to compare the proportions of ground now occupied, and formerly diſputed by the Roman Catholic and Proteſtant religions, with the numbers of their adherents. The proportion of the ſurface of the countries in which the Proteſtant religion is eſtabliſhed, to thoſe in which the Roman Catholic religion prevails, is nearly as 3 to 4: the number of Roman Catholics is, according to my calculations, drawn up with as much accuracy as ſuch an intricate matter will allow of, about 90,000,000; the number of Proteſtants only 24,000,000, which is a proportion of nearly 4 to 1. I ſhall obſerve, in addition to this account of the European religions, that an inconſiderable number of ignorant Laplanders may, with propriety, be called Pagans*.

" The greateſt part of Europe is under the influence of a climate, which, being tempered with a moderate degree of cold, forms a race of men, ſtrong, bold, active, and ingenious; forced by neceſſity to make the beſt uſe they can of the ſmaller ſhare of vegetable and animal treaſures, which their ſoil produces. In hotter and richer parts of the globe, the profuſion of ſpontaneous natural productions, and the heat of the atmoſphere, relax the bodily and mental powers of the inhabitants, check their ſpirit of enterprize, and confine the compaſs of their thought. The torrid zone has never been able, nor is it likely. to boaſt of a Newton, a Cæſar, or a Frederic.

" Great ridges of mountains, the chief of which are the Alps, the Appenines, the Pyrenean, the Carpathian, Sudetic, and Saxon mountains, effect not only a great variety in the climate, but pour out many large and navigable rivers, and contain every ſpecies of minerals. It is likewiſe no ſmall convenience and encouragement to commerce, that Europe is interſected by ſeveral ſeas, and that it is contiguous to the Atlantic Ocean.

" The ſeeming natural diſadvantages of Europe have, by dint of the ingenuity and perſeverance of the inhabitants, given riſe to numberleſs arts and ſciences, which have been carried to ſuch a degree of perfection, as inſures to Europe a decided ſuperiority over the reſt of the globe. Aſia, Africa, and America have immenſe deſerts, ſuch as are no where to be found in Europe; deſerts of many thouſand ſquare miles, and which are partly owing to natural, and inſuperable diſadvantages of ſituation, partly to want of induſtry, which is at once both cauſe, and effect of deſolation. It is almoſt needleſs to mention how far the ſciences of Europe excel thoſe of the other three continents, excepting thoſe parts into which European knowledge and civilization have been tranſplanted. Europe may alſo boaſt of the greateſt number of uſeful inventions and inſtitutions, to preſerve and to propagate acquired knowledge. It has at preſent about 130 univerſities, and an almoſt infinite number of literary ſocieties, or academies of ſciences, arts and languages. In conſequence of the great progreſs of knowledge, we enjoy all the conveniences of life in a much higher degree than the inhabitants of regions, on which nature has beſtowed greater riches. And ſuch is our ſuperiority of ſkill in aſtronomy and navigation, that, having conquered in a great meaſure, the dangers of the ocean, the commerce of the Europeans ſeems to be bounded only by the limits of the globe itſelf †.

" The ſtates of Europe, conſidered with reſpect to their intrinſic power and influence abroad, may be divided into three claſſes: France, Great-Britain, Auſtria, Pruſſia, and Ruſſia, belong to the firſt claſs. Secondary powers are thoſe

* Zimmermann, p. 16, 17.

† Zimmermann, p. 17—19.

of

of Turkey, Spain, Holland, Denmark, Sweden, and Sardinia: the third claſs comprehends Portugal, Naples, and Sicily, Poland, the Joint Electorate of the Palatinate and Bavaria, the Electorate of Saxony, Switzerland, and Venice. For the laſt three centuries paſt, the cabinets of Europe, and chiefly that of France, have endeavoured to keep up a conſtant equilibrium between the different ſtates. France and England endeavoured to preſerve the balance of power in the weſt; Pruſſia, Auſtria, and Ruſſia, that in the eaſt, of Europe: Ruſſia has, by its late extraordinary increaſe of power, gained a great aſcendency in the north, after a ſucceſsful ſtruggle with the rival power of Sweden*."

GRAND DIVISIONS of EUROPE.

THIS grand diviſion of the earth is ſituated between the 10th degree weſt, and the 65th degree eaſt longitude from London; and between the 36th and 72d degree of north latitude. It is bounded on the north, by the Frozen Ocean; on the eaſt by Aſia; on the ſouth by the Mediterranean Sea which divides it from Africa; and on the weſt by the Atlantic Ocean, which ſeparates it from America: being 3000 miles long from Cape St. Vincent in the weſt, to the mouth of the river Oby in the north-eaſt; and 2500 broad from north to ſouth, from the north Cape in Norway to Cape Caya or Metapar in the Morea, the moſt ſouthern promontory in Europe. It contains the following kingdoms and ſtates.

	Kingdoms.	Length.	Breadth.	Chief City.	Diſt. & Bearing from London.	Diff. of Time from London.	Religions.
					Miles.	H. M.	
British Empire	England	380	300	London	* * *	* * *	Calviniſts, Luth. &c.

* Zimmermann, p. 21, 22.

† This includes the Crim Tartary, now ceded to Ruſſia, for the particulars of which, ſee RUSSIA.

Exclusive of the British isles, before mentioned, Europe contains the following principal islands:

	Islands.	Chief Towns.	Subject to
In the Northern Ocean.	Iceland	Skalholt,	Denmark.
Baltic Sea.	Zealand, Funen, Alsen, Falster, Langland, Laland, Femeren, Mona, Bornholm,	— —	Denmark.
	Gothland, Aland, Rugen,	— —	Sweden,
	Osel, Dagho,	— —	Russia.
	Usedom, Wollin,	— —	Prussia.
Mediterranean Sea.	Ivica,	Ivica,	Spain.
	Majorca,	Majorca,	Ditto.
	Minorca,	Port Mahon	Ditto.
	Corsica,	Bastia,	France.
	Sardinia,	Cagliari,	King of Sardinia
	Sicily,	Palermo	King of Two Sicilies.
Adriatic, or Gulf of Venice.	Lusiena, Corfu, Cephalonia, Zant, Leucadia,	— —	Venice.
Archipelago and Levant Seas.	Candia, Rhodes, Negropont, Lemnos, Tenedos, Scyros, Mytelene, Scio, Samos, Patmos, Paros, Cerigo, Santorin, &c. being part of ancient and modern Greece.	— —	Turkey.

DENMARK.

I Shall, according to my plan, begin this account of his Danish Majesty's dominions with the most northerly situations, and divide them into four parts: 1st, East and West Greenland, Iceland, and the islands in the Atlantic Ocean; 2d, Norway; 3d, Denmark Proper; and 4th, his German territories.

The dimensions of these countries may be seen in the following table.

Denmark.		Square Miles.	Length.	Breadth.	Chief Cities.
Denmark Proper	North Jutland	9,600	155	98	Wyburg.
	South Jutland, or Sleswiek,	2,115	70	63	Sleswick.
Islands at the entrance of the Baltic Sea.	Zealand,	1,935	60	60	COPENHAGEN, N. Lat. 55--41, E. Long. 12--50
	Funen,	768	38	32	Odensee.
	Falster and Langland,	220	27	12	Nikoping. Naxkaw.
	Femeren,	50	13	8	Borge.
	Alsen,	54	15	6	Sonderborge.
	Mona,	39	14	5	Stege.
	Bornholm,	160	20	12	Rostcomby.
In the North Seas,	Iceland Island,	46,000	435	185	Skalholt.
	Norway,	71,400	750	170	Bergen.
	Danish Lapland,	28,400	285	172	Wardhuys.
Westphalia,	Oldenburg,	1260	62	32	Oldenburg.
Lower Saxony,	Stormar	1000	52	32	Gluckstadt
	Danish Holstein.				
	Total	163,041			

The

The reader may perceive, that in the preceding table no calculation is made of the dimenſions of Eaſt and Weſt Greenland; becauſe they are not yet known, or known very imperfectly: we ſhall proceed to give the lateſt accounts of them, and from the beſt authorities that have come to our hands.

EAST AND WEST GREENLAND, ICELAND, AND THE ISLANDS IN THE ATLANTIC OCEAN.

EAST GREENLAND.

THE moſt northerly part of his Daniſh majeſty's dominions; or, as others call it, New Greenland, and the country of Spitzbergen, lies between 10 and 11 deg. E. long. and 76 and 80 deg. N. lat. Though it is now claimed by Denmark, it certainly was diſcovered by ſir Hugh Willoughby in 1553; and is ſuppoſed to be a continuation of Old Greenland. It obtained the name of Spitzbergen from the height and raggedneſs of its rocks. Few animals or vegetables are to be found here, and the fiſh and fowl are ſaid to forſake the coaſt in winter. The Ruſſians of Archangel have formed, within the laſt 30 years, ſettlements for hunting in ſeveral places of the iſland of Spitzbergen. The Aurora Borealis or northern lights reflected from the ſnow, enable them to purſue the chace during the long winter's night that reigns in thoſe gloomy regions, and they take a great number of ſea-lions which ſerve them for food. There is a whale-fiſhery, chiefly proſecuted by the Dutch and Britiſh veſſels, on its coaſt. It likewiſe contains two harbours; one called South Haven, and the other Maurice Bay; but the inland parts are uninhabited.

WEST GREENLAND

LIES between the meridian of London, and 50 deg. W. long. and between 60 and 76 deg. N. lat.

INHABITANTS.] By the lateſt accounts from the miſſionaries employed for the converſion of the Greenlanders, their whole number does not amount to above 957 ſtated inhabitants: Mr. Crantz, however, thinks that the roving ſouthlanders of Greenland may amount to about 7000. There is a great reſemblance between the aſpect, manners, and dreſs of thoſe natives, and the Eſquimaux Americans, from whom they differ but little, after all the pains which the Daniſh and German miſſionaries have taken to convert and civilize them. They are low in ſtature, few exceeding five feet in height, and the generality are not ſo tall. The hair of their heads is long, ſtrait, and of a black colour; but they have ſeldom any beards, becauſe it is their conſtant practice to root them out. They have high breaſts and broad ſhoulders, eſpecially the women, who are obliged to carry great burdens from their younger years. They are very light and nimble of foot, and can uſe their hands with ſkill and dexterity. They are not very lively in their tempers, but are good humoured, friendly, and unconcerned about futurity. Their moſt agreeable food is the fleſh of rein-deer; but that is now ſcarce among them, and their beſt proviſions are fiſh, ſeals, and ſea-fowl. Their drink is clear water, which ſtands in the houſe in a great copper veſſel, or in a wooden tub, which is very neatly made by them, ornamented with fiſh bones and rings, and provided with a pewter ladle or dipping diſh. The men make their hunting and fiſhing implements, and prepare the wood-work of their boats; and the women cover them with ſkins. The men hunt and fiſh, but when they have towed their booty to land, they trouble themſelves no farther about it; nay, it would be accounted beneath their dignity only to draw the ſeal upon the ſhore. The women are the butchers and cooks, and alſo the curriers to dreſs the pelts, and make clothes, ſhoes, and boots, out of them;

ſo that they are likewiſe both ſhoemakers and taylors. The women alſo build and repair the houſes and tents, ſo far as relate to the maſonry, the men doing only the carpenters work. They live in huts during their winter, which is incredibly ſevere; but Mr. Crantz, who has given us the lateſt and beſt accounts of this country, ſays, that in their longeſt ſummer days it is ſo hot, from the long continuance of the ſun's rays, that the inhabitants are obliged to throw off their ſummer garments. They have no trade, though they have a moſt improveable fiſhery upon their coaſt; but they employ all the year either in fiſhing or hunting, in which they are very dexterous, particularly in catching and killing ſeals.

CURIOSITIES.] The taking of whales in the ſeas of Greenland, among the fields of ice that have been increaſing for ages, is one of the greateſt curioſities in nature. Theſe pieces of ice are frequently more than a mile in length, and upwards of 100 feet in thickneſs; and when they are put in motion by a ſtorm, nothing can be more terrible; the Dutch had 13 ſhips cruſhed to pieces by them in one ſeaſon.

There are ſeveral kinds of whales in Greenland; ſome white, and others black. The black ſort, the grand bay whale, is in moſt eſteem, on account of his bulk, and the great quantity of fat or blubber he affords. His tongue is about 18 feet long, incloſed in long pieces of what we call whalebone, which are covered with a kind of hair like horſe hair; and on each ſide of his tongue are 250 pieces of this whalebone. The bones of his body are as hard as an ox's bones, and of no uſe. There are no teeth in his mouth; and he is uſually between 60 and 80 feet long; very thick about the head, but grows leſs from thence to the tail.

When the ſeamen ſee a whale ſpout, the word is immediately given, *fall, fall*, when every one haſtens from the ſhip to his boat; ſix or eight men being appointed to a boat, and four or five boats uſually belong to one ſhip.

When they come near the whale, the harpooner ſtrikes him with his harpoon (a barbed dart), and the monſter, finding himſelf wounded, runs ſwiftly down into the deep, and would carry the boat along with him if they did not give him line faſt enough; and to prevent the wood of the boat taking fire by the violent rubbing of the rope on the ſide of it, one wets it conſtantly with a mop. After the whale has run ſome hundred fathoms deep, he is forced to come up for air, when he makes ſuch a noiſe with his ſpouting, that ſome have compared it to the firing of cannon. As ſoon as he appears on the ſurface of the water, ſome of the harpooners fix another harpoon in him, whereupon he plunges again into the deep; and when he comes up a ſecond time, they pierce him with ſpears in the vital parts till he ſpouts out ſtreams of blood inſtead of water, beating the waves with his tail and fins till the ſea is all in a foam, the boats continuing to follow him ſome leagues, till he has loſt his ſtrength; and when he is dying he turns himſelf upon his back, and is drawn on ſhore, or to the ſhip, if they be at a diſtance from the land. There they cut him in pieces, and by boiling the blubber extract the oil, if they have conveniencies on ſhore; otherwiſe they barrel up the pieces, and bring them home. Every fiſh is computed to yield between 60 and 100 barrels of oil, of the value of 3l. or 4l. a barrel. The Dutch and the Engliſh are very ſucceſsful in this fiſhery.

ICELAND.

THIS iſland, which receives its name from the great maſſes of ice that are ſeen near it, lies between 63 and 67 deg. N. lat. and between 11 and 27 deg. W. long. It extends four hundred miles in length, and an hundred and ſixty in breadth, containing about 46,000 ſquare miles. In April, 1783, the inhabitants of Iceland obſerved ſomething riſen and flaming in the ſea, to the ſouth of Grinbourg, at eight miles diſtant from the rocks des Oiſeaux, which afterwards was found to be a new iſland. The fact is authentic, but its dimenſions and ſituation

are not well aſcertained. The information brought by the laſt ſhip from thence, was, that the iſland was ſtill increaſing, and that great quantities of fire iſſued from two of its eminences.

POPULATION, INHABITANTS, MANNERS, AND CUSTOMS.] It appears that a Norwegian colony, among which there were many Swedes, ſettled in Iceland in the ninth century. They found there inhabitants who were Chriſtians, and whom they called *Papas*. It is ſaid, that the Norwegians alſo found among them Iriſh books, bells, and croſiers: and it is conjectured, that the people who were there, when the Norwegians arrived in the iſland, originally came from England and Ireland. The inhabitants long retained their freedom; but they were at laſt obliged to ſubmit to the kings of Norway, and afterwards became ſubject, together with Norway, to the kings of Denmark. They were at firſt governed by an admiral, who was ſent there every year to make the neceſſary regulations, but that mode has now been changed for many years, and a governor appointed, who is ſtyled *Stiftſamtmann*, and who conſtantly reſides in the country.

The number of the inhabitants of Iceland is computed at about 60,000, which is by no means adequate to the extent of the country. It has been much more populous in former times, but great numbers have been deſtroyed by contagious diſeaſes. The plague carried off many thouſands, from 1402 to 1404. Many parts of Iceland have alſo been depopulated by famine; for though the Icelanders cannot in general be ſaid to be in want of neceſſary food, yet the country has ſeveral times been viſited by great famines. Theſe have been chiefly occaſioned by the Greenland floating ice; which, when it comes in great quantities, prevents the graſs from growing, and puts an entire ſtop to their fiſhing. The ſmall-pox has likewiſe been very fatal here; for, in the years 1707 and 1708, that diſeaſe deſtroyed 16,000 perſons.

The Icelanders in general are middle-ſized, and well-made, though not very ſtrong. They are an honeſt, well-intentioned people, moderately induſtrious, and very faithful and obliging. Theft is ſeldom heard of among them. They are much inclined to hoſpitality, and exerciſe it as far as their poverty will permit. Their chief employment is attending to fiſhing, and the care of their cattle. On the coaſts the men employ their time in fiſhing both winter and ſummer; and the women prepare the fiſh, and ſew and ſpin. The men alſo prepare leather, work at ſeveral mechanic trades, and ſome few work in gold and ſilver. They likewiſe manufacture a coarſe kind of cloth, which they call Wadmal. They have an uncommonly ſtrong attachment to their native country, and think themſelves no where elſe ſo happy. An Icelander, therefore, ſeldom ſettles in Copenhagen, though the moſt advantageous conditions ſhould be offered him. Their diſpoſitions are ſerious, and they are much inclined to religion. They never paſs a river, or any other dangerous place, without previouſly taking off their hats, and imploring the divine protection: and they are always thankful for their preſervation, when they have paſſed the danger. When they meet together, their chief paſtime conſiſts in reading their hiſtory. The maſter of the houſe begins, and the reſt continue in their turns when he is tired. They are famous for playing at cheſs; and one of their paſtimes conſiſts in reciting verſes. Sometimes a man and woman take one another by the hand, and by turns ſing ſtanzas, which are a kind of dialogue, and in which the company occaſionally join in chorus. The dreſs of the Icelanders is not elegant or ornamental, but it is neat, cleanly, and ſuited to the climate. On their fingers the women wear ſeveral gold, ſilver, or braſs rings. The poorer women dreſs in the coarſe cloth called Wadmal, and always wear black: thoſe who are in better circumſtances wear broad cloth, with ſilver ornaments, gilt. The houſes of the Icelanders are generally bad: in ſome places they are built of drift wood, and in others they are raiſed of lava, with moſs ſtuffed between the

lava. Their roofs are covered with ſods laid over rafters, or ſometimes over ribs of whales, which are both more durable and more expenſive than wood. They have not even a chimney in their kitchens, but only lay their fuel on the earth, between three ſtones; and the ſmoke iſſues from a ſquare hole in the roof. Their food principally conſiſts of dried fiſh, ſour butter, which they conſider as a great dainty, milk mixed with water and whey, and a little meat. Bread is ſo ſcarce among them, that there is hardly any peaſant who eats it above three or four months in the year.

RELIGION.] The only religion tolerated in Iceland is the Lutheran. The churches on the eaſt, ſouth, and weſt quarters of the iſland, are under the juriſdiction of the biſhop of Skalholt (the capital of the iſland), and thoſe of the north quarter are ſubject to the biſhop of Hoolum. The iſland is divided into 189 pariſhes, of which 127 belong to the ſee of Skalholt, and 62 to that of Hoolum. All the miniſters are natives of Iceland, and receive a yearly ſalary of four or five hundred rix-dollars from the king, excluſive of what they have from their congregations.

LANGUAGE.] The language in Iceland is the ſame as that formerly ſpoken in Sweden, Denmark, and Norway, and has been preſerved ſo pure, that any Icelanders underſtand their moſt ancient traditional hiſtories.

LEARNING AND LEARNED MEN.] It is ſaid that poetry formerly flouriſhed very much in Iceland; and we are informed that Egil Skallagrimſon, Kormak Ogmundſon, Glum Geirſon, and Thorlief Jarlaa were celebrated as great poets. But the art of writing was not much in uſe till after the year 1000; though the Runic characters were known in that country before that period, and moſt probably brought thither from Norway. After the reception of the Chriſtian religion, the Latin characters were immediately adopted, as the Runic alphabet, which only conſiſts of ſixteen letters, was found inſufficient. The firſt Icelandic biſhop, Iſleif, founded a ſchool at Skalholt; and ſoon after they founded four other ſchools, in which the youth were inſtructed in the Latin tongue, divinity, and ſome parts of theoretic philoſophy. And from the introduction of the Chriſtian religion here till the year 1264, when Iceland became ſubect to Norway, it was one of the few countries in Europe, and the only one in the North, wherein the ſciences were cultivated and held in eſteem.

But this period of time ſeems to have produced more learned men in Iceland than any other period ſince. It appears from their ancient chronicles, that they had conſiderable knowledge in morality, philoſophy, natural hiſtory, and aſtronomy. Moſt of their works were written in the 11th, 12th, 13th, and 14th centuries; and ſome of them have been printed. Sir Joſeph Banks preſented one hundred and ſixty-two Icelandic manuſcripts to the Britiſh Muſeum. That gentleman viſited Iceland in 1772, accompanied by Dr. Solander, Dr. Van Troil, and Dr. Lind. Dr. Van Troil, who publiſhed an account of their voyage, obſerves, that he found more knowledge among the lower claſs in Iceland than is to be met with in moſt other places; that many of them could repeat the works of ſome of their poets by heart; and that a peaſant was ſeldom to be found, who, beſides being well inſtructed in the principles of religion, was not alſo acquainted with the hiſtory of his own country; which proceeds from the frequent reading of their traditional hiſtories, that being one of their principal amuſements.

John Areſon, biſhop of Hoolum, employed John Matthieſſon, a native of Sweden, in eſtabliſhing a printing-preſs in Iceland, about the year 1530; and the firſt book printed by him there was the Breviarium Nidaroſienſe. He alſo printed an eccleſiaſtical manual, Luther's catechiſm, and other books of that kind. The Icelandic code of laws appeared in 1578, and the Icelandic Bible in 1584. A new privileged

privileged printing-office has lately been eſtabliſhed at Hrappſey in this iſland, at which ſeveral valuable books have been printed.

MOUNTAINS, VOLCANOES, AND NATURAL CURIOSITIES.] Though this iſland is ſituated ſo far to the north, earthquakes and volcanoes are more known than in many countries in much warmer climates. The former have ſeveral times laid the country almoſt deſolate, particularly in the years 1734, 1752, and 1755, when fiery eruptions broke out of the earth, and produced very fatal conſequences. Many of the ſnowy mountains have alſo gradually become volcanoes. Of theſe burning mountains Heckla is the beſt known, eſpecially to foreigners. This mountain is ſituated in the ſouthern part of the iſland, about four miles from the ſea-coaſt, and is divided into three points at the top, the higheſt of which is that in the middle; and which is computed to be above 5000 feet higher than the ſea. It has frequently ſent forth flames and a torrent of burning matter. Its eruptions were particularly dreadful in 1693, when they occaſioned terrible devaſtations, the aſhes being thrown all round the iſland to the diſtance of 180 Engliſh miles. The laſt eruption of mount Heckla happened in 1766. It began on the 5th of April, and continued to the 7th of September following. Flames proceeded alſo from it in December 1771, and in September 1772; but no eruptions of lava.

Amongſt all the curioſities in Iceland, nothing is more worthy of attention than the hot ſpouting water-ſprings with which this iſland abounds. The hot ſprings at Aix-la-Chapelle, Carlſbad, Bath, and Switzerland, and ſeveral others found in Italy, are conſidered as very remarkable: but, excepting in the laſt mentioned country, the water no where becomes ſo hot as to boil; nor is it any where known to be thrown ſo high as the hot ſpouting water-ſprings in Iceland. All thoſe water-works that have been contrived with ſo much art, and at ſo enormous an expence, cannot by any means be compared with theſe. The water works at St. Cloud, which are thought the greateſt amongſt all the French water-works, caſt up a thin column eighty feet into the air: while ſome ſprings in Iceland ſpout columns of water, of ſeveral feet in thickneſs, to the height of many fathoms; and, as many affirm, of ſeveral hundred feet. Theſe ſprings are of unequal degrees of heat. From ſome, the water flows gently as from other ſprings, and it is then called a bath: from others, it ſpouts boiling water with a great noiſe, and it is then called a kettle. Though the degree of heat is unequal, yet Dr. Van Troil does not remember ever to have obſerved it under 188 of Fahrenheit's thermometer. At Geyſer, Rœynum, and Laugarvatn, he found it at 212; and in the laſt place, in the ground, at a little hot current of water, 213 degrees. It is common for ſome of the ſpouting-ſprings to ceaſe, and others to riſe up in their ſtead. Frequent earthquakes, and ſubterranean noiſes heard at the time, cauſe great terror to the people who live in the neighbourhood. In ſeveral of theſe hot ſprings, the inhabitants who live near them boil their victuals, only by hanging a pot into which the fleſh is put in cold water, in the water of the ſpring. They alſo bathe in the rivulets that run from them, which, by degrees, become luke-warm, or are cooled by their being mixed with rivulets of cold water. The cows that drink of theſe ſprings are ſaid to yield an extraordinary quantity of milk; and it is eſteemed very wholeſome when drank by the human ſpecies.

The largeſt of all the ſpouting-ſprings in Iceland is called Geyſer. It is about two days journey from Heckla, and not far from Skalholt. In approaching towards it, a noiſe is heard, like the ruſhing of a torrent, precipitating itſelf from ſtupendous rocks. The water here ſpouts ſeveral times a day, but always by ſtarts, and after certain intervals. Some travellers have affirmed, that it ſpouts to the height of ſixty fathoms. The water is thrown up much higher at ſome times than at others: when Dr. Van Troil was there, the utmoſt height to which it mounted was computed to be 92 feet.

Baſaltine

Baſaltine pillars are likewiſe very common in Iceland, which are ſuppoſed to have been produced by ſubterraneous fires. The lower ſort of people imagine theſe pillars to have been piled upon one another by giants, who made uſe of ſupernatural force to effect it. They have generally from three to ſeven ſides, and are from four to ſix feet in thickneſs, and from twelve to ſixteen yards in length, without any horizontal diviſions. In ſome places, they are only ſeen here and there among the lava in the mountains; but, in ſome other places, they extend two or three miles in length without interruption.

There are immenſe maſſes of ice, by which every year great damage is done to this country, and which affect the climate of it; they arrive commonly with a N. W. or N. N. W. wind from Greenland. The field ice is of two or three fathoms thickneſs, is ſeparated by the winds, and leſs dreaded than the rock or mountain ice, which is often ſeen fifty and more feet above water, and is at leaſt nine times the ſame depth below water. Theſe prodigious maſſes of ice are frequently left in ſhoal water, fixed, as it were, to the ground, and in that ſtate remain many years undiſſolved, chilling all the ambient part of the atmoſphere for many miles round. When many ſuch lofty and bulky maſſes of ice are floating together, the wood that is often drifted along between them is ſo much chafed, and preſſed with ſuch violence together, that it takes fire; which circumſtance has occaſioned fabulous accounts of the ice being in flames. The ice cauſed ſo violent a cold in 1753 and 1754, that horſes and ſheep dropped down dead on account of it, as well as for want of food: horſes were obſerved to feed upon dead cattle, and the ſheep to eat of each other's wool. A number of bears arrive yearly with the ice, which commit great ravages, particularly among the ſheep. The Icelanders attempt to deſtroy theſe intruders as ſoon as they get ſight of them; and ſometimes they aſſemble together, and drive them back to the ice, with which they often float off again. For want of fire arms, they are obliged to make uſe of ſpears on theſe occaſions. The government encourages the natives to deſtroy theſe animals, by paying a premium of ten dollars for every bear that is killed. Their ſkins are alſo purchaſed for the king, and are not allowed to be ſold to any other perſon.

It is extraordinary that no wood grows ſucceſsfully in Iceland; nay, there are very few trees to be found on the whole iſland, though there are certain proofs that wood formerly grew there in great abundance. Nor can corn be cultivated here to any advantage; though cabbages, parſley, turnips, and peas, may be met with in five or ſix gardens, which are ſaid to be all that are in the iſland.

Trade.] The commerce of this iſland is monopolized by a Daniſh company. The ſoil upon the ſea-coaſts is tolerably good for paſture; and though there is not any conſiderable town in the whole iſland, the Iceſlanders have ſeveral frequented ports. Their exports conſiſt of dried fiſh, ſalted mutton and lamb, beef, butter, tallow, train-oil, coarſe woollen-cloth, ſtockings, gloves, raw wool, ſheep-ſkins, lamb-ſkins, fox-furs of various colours, eider-down, and feathers. Their imports conſiſt of timber, fiſhing-lines and hooks, tobacco, bread, horſe-ſhoes, brandy, wine, ſalt, linen, and a little ſilk; excluſive of ſome neceſſaries and ſuperfluities for the more wealthy.

Strength and revenue.] As Iceland affords no bait for avarice or ambition, the inhabitants depend entirely upon his Daniſh majeſty's protection; and the revenue he draws from the country amounts to about 30,000 crowns a year.

THE FARO or FERRO ISLANDS.

So called from their lying in a cluſter, and the inhabitants ferrying from one iſland to another. They are about 24 in number, and lie between 61 and 63 deg. W. long. from London. The ſpace of this cluſter extends about 60 miles in length,

length, and 40 in breadth, 300 miles to the weſtward of Norway; having Shetland and the Orkneys on the ſouth-eaſt, and Greenland and Iceland upon the north and north-weſt. The trade and income of the inhabitants, who may be about 4000, add little to the revenues of Denmark.

NORWAY.

NAME, BOUNDARIES, AND EXTENT.] THE natural ſignification of Norway is, the *Northern-way*. It is bounded on the ſouth by the entrance into the Baltic, called the Scaggerac, or Categate; on the weſt and North, by the northern ocean; and on the eaſt it is divided from Sweden by a long ridge of mountains, called at different parts by different names; as Fillefield, Dofrefield, Rundfield, and Dourfield. The reader may conſult the table of dimenſions in Denmark for its extent; but it is a country ſo little known to the reſt of Europe, that it is difficult to fix its dimenſions with preciſion.

CLIMATE.] The climate of Norway varies according to its extent, and its poſition towards the ſea. At Bergen the winter is moderate, and the ſea is practicable. The eaſtern parts of Norway are commonly covered with ſnow; and the cold generally ſets in about the middle of October, with intenſe ſeverity, to the middle of April; the waters being all the time frozen to a conſiderable thickneſs. In 1719, 7000 Swedes, who were on their march to attack Drontheim, periſhed in the ſnow, on the mountains which ſeparate Sweden from Norway; and their bodies were found in different poſtures. But even froſt and ſnow have their conveniences, as they facilitate the conveyance of goods by land. As to the more northerly parts of this country called Finmark, the cold is ſo intenſe that they are but little known. At Bergen, the longeſt day conſiſts of abour 19 hours, and the ſhorteſt of about five. In ſummer, the inhabitants can read and write at midnight by the light of the ſky; and in the moſt northerly parts, about midſummer, the ſun is continually in view. In thoſe parts, however, in the middle of winter, there is only a faint glimmering of light at noon for about an hour and a half; owing to the reflection of the ſun's rays on the mountains. Nature, notwithſtanding, has been ſo kind to the Norwegians, that in the midſt of their darkneſs the ſky is ſo ſerene, and the moon and the aurora borealis ſo bright, that they can carry on their fiſhery, and work at their ſeveral trades in open air.

The air is ſo pure in ſome of the inland parts, that it has been ſaid the inhabitants lived ſo long as to be tired of life, and cauſe themſelves to be tranſported to a leſs ſalubrious air. Sudden thaws and ſnow-falls have, however, ſometimes dreadful effects, and deſtroy whole villages.

MOUNTAINS.] Norway contains a chain of unequal mountains running from ſouth to north: to paſs that of Hardanger, a man muſt travel about ſeventy Engliſh miles; and to paſs others, upwards of fifty. Dofrefield is counted the higheſt mountain in Europe. The rivers and cataracts which interſect thoſe dreadful precipices, and that are paſſable only by ſlight tottering wooden bridges, render travelling in this country very terrible and dangerous; though the government is at the expence of providing, at different ſtages, houſes accomodated with fire, light, and kitchen furniture. Detached from this vaſt chain, other immenſe mountains preſent themſelves all over Norway; ſome of them with reſervoirs of water on the top; and the whole forming a moſt ſurpriſing landſcape. The activity of the natives, in recovering their ſheep and goats, when penned up, through a falſe ſtep, in one of thoſe rocks, is wonderful. The owner directs himſelf to be lowered down from the top of the mountain, ſitting on a croſs ſtick, tied to the end of a long rope; and

when

when he arrives at the place where the creature ſtands, he faſtens it to the ſame cord, and it is drawn up with himſelf. The caverns that are to be met with in theſe mountains are more wonderful than thoſe, perhaps, in any other part of the world. One of them, called Dolſteen, was, in 1750, viſited by two clergymen, who reported, that they proceeded in it till they heard the ſea daſhing over their heads; that the paſſage was as wide and high as an ordinary church, the ſides perpendicular, and the roof vaulted: that they deſcended a flight of natural ſtairs; but when they arrived at another, they durſt not venture to proceed, but returned; and that they conſumed two candles going and returning.

FORESTS.] The chief wealth of Norway lies in its foreſts, which furniſh foreigners with maſts, beams, planks, and boards; and ſerve beſide for all domeſtic uſes; particularly the conſtruction of houſes, bridges, ſhips, and for charcoal to the founderies. The timber growing here are fir and pine, elm, aſh, yew, benreed (a very curious wood), birch, beech, oak, eel or alder, juniper, the aſpin-tree, the comol or ſloe-tree, haſel, elder, ebony (under the mountains of Kolen), lime or linden tree, and willows. The ſums which Norway receives for timber are very conſiderable; the induſtry of the inhabitants is greatly aſſiſted by the courſe of their rivers, and the ſituation of their lakes; which afford them not only the conveniency of floating down their timber, but of erecting ſaw-mills, for dividing their large beams into planks and deals. A tenth of all ſawed timber belongs to his Daniſh majeſty, and forms no inconſiderable part of his revenue.

STONES, METALS, AND MINERALS.] Norway contains quarries of excellent marble, as well as many other kinds of ſtones; and the magnet is found in the iron mines. The amianthus, or aſbeſtos, is likewiſe found here; as are cryſtals, granites, amethyſts, agate, thunder-ſtones, and eagle-ſtone. Gold found in Norway has been coined into ducats. His Daniſh majeſty is now working, to great advantage, a ſilver mine at Koningſberg; other ſilver mines have been found in different parts of the country; and one of the many ſilver maſſes that have been diſcovered weighing 560 pounds, is to be ſeen at the royal muſeum at Copenhagen. Lead, copper, and iron mines, are common in this country: one of the copper-mines at Roraas is thought to be the richeſt in Europe. Norway produces quickſilver, ſulphur, ſalt, coal, vitriol, alum, and various kinds of loam; the mannfactures of which bring in a large revenue to the crown.

RIVERS AND LAKES.] The rivers and lakes in this country are well ſtocked with fiſh, and navigable for veſſels of conſiderable burden. The moſt extraordinary circumſtance attending the lakes is, that ſome of them contain floating iſlands formed by the coheſion of roots of trees and ſhrubs; and, though torn from the main land, bear herbage and trees. In the year 1702, the noble family-ſeat of Borge, near Fredricſtadt, ſuddenly ſunk, with all its towers and battlements, into an abyſs a hundred fathom in depth; and its ſite was inſtantly filled with water, and formed a lake 300 ells in length, and about half as broad. This melancholy accident, by which 14 people and 200 head of cattle periſhed, was occaſioned by the foundation being undermined by the waters of a river.

UNCOMMON QUADRUPEDS, FOWLS, AND FISHES.] All the animals that are natives of Denmark are to be found in Norway, with an addition of many more. The wild beaſts peculiar to Norway, are the elk, the rein-deer, the hare, the rabbit, the bear, the wolf, the ſox, the lynx, the glutton, the leming, the ermin, the martin, and the beaver. The elk is a tall, aſh-coloured animal, its ſhape partaking at once of the horſe and the ſtag; it is harmleſs, and in winter, ſocial; and the fleſh of it taſtes like veniſon. The hares are ſmall; and are ſaid to live upon mice in the winter time, and to change their colour from brown to white. The Norwegian bears are ſtrong and ſagacious; they are remarkable for not hurting children; but their other qualities are in common with the reſt of their ſpecies in northern countries;

nor

nor can we much credit the extraordinary ſpecimens of their ſagacity, recorded by the natives. The Norwegian wolves, though fierce, are ſhy even of a cow or goat, unleſs impelled by hunger: the natives are dexterous in digging traps for them, in which they are taken or killed. The lynx, by ſome called the goupes, is ſmaller than a wolf, but as dangerous: they are of the cat kind, and have claws like tygers; they dig under ground, and often undermine ſheep-folds, where they make dreadful havock. The ſkin of the lynx is beautiful and valuable, as is that of the black fox. White and red foxes are likewiſe found in Norway, and partake of the nature of that wily animal in other countries; they have a particular way of drawing crabs aſhore, by dipping their tails in the water, which the crab lays hold of. The glutton, otherwiſe called the erven, or vielfras, reſembles a turn-ſpit dog; with a long body, thick legs, ſharp claws and teeth: his fur which is variegated, is ſo precious, that he is ſhot with blunt arrows, to preſerve the ſkin unhurt: he is bold, and ſo ravenous, that it is ſaid he will devour a carcaſe larger than himſelf, and unburthens his ſtomach by ſqueezing himſelf between two cloſe-ſtanding trees: when taken, he has been even known to eat ſtone and mortar. The ermine is a little creature, remarkable for its ſhyneſs and cleanlineſs; and their fur forms a principal part even of royal magnificence. There is little difference between the martin and a large brown foreſt cat, only its head and ſnout are ſharper; it is very fierce, and its bite dangerous. We ſhall mention the beavers in treating of North America.

No country produces a greater variety of birds than Norway. The alks build upon rocks; their numbers often darken the air, and the noiſe of their wings reſembles a ſtorm; their ſize is that of a large duck, and their fleſh is much eſteemed. Many kinds of thruſhes reſide in Norway; with various kinds of pigeons, and ſeveral ſorts of beautiful wild ducks. The Norwegian cock-of-the-wood is of a black or dark grey colour; his eye reſembles that of a pheaſant; and he is ſaid to be the largeſt of all eatable birds. Norway produces two kinds of eagles, the land and the ſea; the former is ſo ſtrong, that it has been known to carry off a child of two years old: the ſea, or fiſh-eagle, is larger than the other; he ſubſiſts on aquatic food; and ſometimes darts on large fiſhes with ſuch force, that, being unable to free his talons from their bodies, he is dragged into the water and drowned.

Nature ſeems to have adapted theſe aërial inhabitants for the coaſt of Norway; and induſtry has produced a ſpecies of mankind peculiarly fitted for making them ſerviceable to the human race: theſe are the birdmen, or climbers, who are amazingly dexterous in mounting the ſteepeſt rocks, and bringing away the birds and their eggs: the latter are nutritive food, and are ſometimes parboiled in vinegar; the fleſh is eaten by the peaſants, who generally reliſh it; while the feathers and down form a profitable commodity. Even the dogs of the farmers, in the northern diſtricts, are trained up to be aſſiſtants to theſe birdmen in ſeizing their prey.

The Scandinavian lakes and ſeas are aſtoniſhingly fruitful in all fiſh that are found on the ſea-coaſts of Europe. Stock-fiſh innumerable, which are dried upon the rocks without ſalting. Some fiſhes in thoſe ſeas have their peculiarities. The haacmoren is a ſpecies of ſhark, ten fathoms in length, and its liver yields three caſks of train oil. The tuella-flynder is an exceſſively large turbot, which has been known to cover a man who had fallen over-board, to keep him from riſing. The ſeaſon for herring-fiſhing is announced to fiſhermen by the ſpouting of water from the whales (of which ſeven different ſpecies are mentioned) in following the herring ſhoals. The large whale reſembles a cod, with ſmall eyes, a dark marbled ſkin, and white belly: they ſpout out the water, which they take in by inſpiration, through two holes or openings in the head. They copulate like land-animals, ſtanding upright in the ſea. A young whale, when firſt produced, is about nine or ten feet long; and the female ſometimes brings forth two at a birth. The whale devours ſuch an

incredible number of ſmall fiſh, that his belly is often ready to burſt; in which caſe he makes a moſt tremendous noiſe from pain. The ſmaller fiſh have their revenge; ſome of them faſten on his back, and inceſſantly beat him; others, wi h ſharp horns, or rather bones, on their beaks, ſwim under his belly, and ſometimes rip it up; ſome are provided with long ſharp teeth, and tear his fleſh. Even the aquatic birds of prey declare war againſt him when he comes near the ſurface of the water; and he has been known to be ſo tortured, that he has beat himſelf to death on the rocks. The coaſt of Norway may be ſaid to be the native country of herrings. Innumerable are the ſhoals that come from under the ice at the north pole, and about the latitude of Iceland divide themſelves into three bodies; one of theſe ſupply the Weſtern Iſles and coaſts of Scotland, another directs its courſe round the eaſtern part of Great Britain down the Channel, and the third enters the Baltic through the Sound. They form great part of the food of the common people; the cod, ling, kabeliau, and torſk-fiſhes follow them, and feed upon their ſpawn; and are taken in prodigious numbers in 50 or 60 fathoms water: theſe, eſpecially their roes, and the oil extracted from their livers, are exported and ſold to great advantage; and above 150,000 people are maintained by the herring and other fiſhing on the coaſt of Norway. The ſea-devil is about ſix feet in length, and is ſo called from its monſtrous appearance and voracity. The ſea-ſcorpion is likewiſe of a hideous form, its head being larger than its whole body, which is about four feet in length; and its bite is ſaid to be poiſonous.

The moſt ſeemingly fabulous accounts of the ancients, concerning ſea-monſters, are rendered credible by the productions of the Norwegian ſeas; and the ſea-ſnake, or ſerpent of the ocean, is no longer counted a chimera. In 1756, one of them was ſhot by a maſter of a ſhip; its head reſembled that of a horſe; the mouth was large and black, as were the eyes, a white mane hanging from its neck: it floated on the ſurface of the water, and held its head at leaſt two feet out of the ſea: between the head and neck were ſeven or eight folds, which were very thick; and the length of this ſnake was more than a hundred yards, ſome ſay fathoms. They have a remarkable averſion to the ſmell of caſtor; for which reaſon, ſhip, boat, and bark maſters provide themſelves with quantities of that drug, to prevent being overſet, the ſerpent's olfactory nerves being remarkably exquiſite. The peculiarities related of this animal would be incredible, were they not atteſted upon oath. Egede (a very reputable author) ſays, that on the 6th day of July, 1734, a large and frightful ſea-monſter raiſed itſelf ſo high out of the water, that its head reached above the main-top-maſt of the ſhip; that it had a long ſharp ſnout, broad paws, and ſpouted water like a whale; that the body ſeemed to be covered with ſcales; the ſkin was uneven and wrinkled, and the lower part was formed like a ſnake. The body of this monſter is ſaid to be as thick as a hogſhead; the ſkin is variegated like a tortoiſe-ſhell; and his excrement, which floats upon the ſurface of the water, is corroſive.

The exiſtence of the kraken, or korven, is ſtrongly aſſerted; and, as it is ſaid to exiſt in theſe ſeas, we think proper to mention it in this place, leaving it to the judgement of the reader to give what credit to it he pleaſes. Its bulk is ſaid to be a mile and a half in circumference; and when part of it appears above the water, reſembles a number of ſmall iſlands and ſand-banks, on which fiſhes ſport, and ſea-weeds grow: upon a farther emerging, a number of pellucid antennæ, each about the height, form, and ſize of a moderate maſt, appear; and by their action and reaction he gathers his food, conſiſting of ſmall fiſhes. When he ſinks, which he does gradually, a dangerous ſwell of the ſea ſucceeds, and a kind of whirlpool is formed in the water. In 1680, a young kraken periſhed among the rocks and cliffs of the pariſh of Alſtahong; and his death was attended by ſuch a ſtench, that the channel was impaſſable. Without entering into any romantic theories, we may ſafely ſay,

that

that the exiſtence of this fiſh accounts for many of the phænomena of floating iſlands and tranſitory appearances in the ſea, that have hitherto been held as fabulous by the learned, who could have no idea of ſuch an animal.

The mer-men and mer-women hold their reſidence in the Norwegian ſeas; but I cannot credit all that is related concerning them by the natives. The mer-man is about eight ſpans long, and, undoubtedly, has as much reſemblance as an ape has to the human ſpecies; a high forehead, little eyes, a flat noſe, and large mouth, without chin or ears, characterize its head; its arms are ſhort, but without joints or elbows, and they terminate in members reſembling a human hand, but of the paw kind, and the fingers connected by a membrane: the parts of generation indicate their ſexes: though their under parts, which remain in the water, terminate like thoſe of fiſhes. The females have breaſts, at which they ſuckle their young ones.

CURIOSITIES.] Thoſe of Norway are only natural. On the coaſt, latitude 67, is that dreadful vortex, or whirlpool, called by navigators the navel of the ſea, and by ſome Maleſtrom, or Moſkoeſtrom. The iſland Moſkoe, from whence this ſtream derives its name, lies between the mountain Heſleggen in Lofoden, and the iſland Ver, which are about one league diſtant; and between the iſland and coaſt on each ſide, the ſtream makes its way. Between Moſkoe and Lofoden it is near 400 fathoms deep; but between Moſkoe and Ver it is ſo ſhallow as not to afford paſſage for a ſmall ſhip. When it is flood, the ſtream runs up the country with a boiſterous rapidity; and when it is ebb, returns to the ſea with a violence and noiſe unequalled by the loudeſt cataracts. It is heard at the diſtance of many leagues, and forms a whirlpool of great depth and extent; ſo violent, that if a ſhip comes near, it is immediately drawn irreſiſtibly into the whirl, and there diſappears, being carried down to the bottom in a moment, where it is daſhed to pieces againſt the rocks; and juſt at the turn of ebb and flood, when the water becomes ſtill for about a quarter of an hour, it riſes again in ſcattered fragments, ſcarcely to be known for the parts of a ſhip. When it is agitated by a ſtorm, it has reached veſſels at the diſtance of more than a Norway mile, where the crews have thought themſelves in perfect ſecurity. Perhaps it is hardly in the power of fancy to conceive a ſituation of more horror than that of being thus driven forward by the ſudden violence of an impetuous torrent to the vortex of a whirlpool, of which the noiſe and turbulence ſtill increaſing as it is approached are an earneſt of quick and inevitable deſtruction; while the wretched victims, in an agony of deſpair and terror, cry out for that help which they know to be impoſſible; and ſee before them the dreadful abyſs in which they are about to be plunged, and daſhed among the rocks at the bottom. Even whales are frequently carried away; and the moment they feel the force of the water, they ſtruggle againſt it, howling and bellowing in a frightful manner. The like happens frequently to bears, who attempt to ſwim to the iſland to prey upon the ſheep.

It was the opinion of Kircher, that the Maleſtrom is a ſea-vortex, which attracts the flood under the ſhore of Norway, and diſcharges it again in the gulph of Bothnia: but this opinion is now known to be erroneous, by the return of the ſhattered fragments of whatever happens to be ſucked down by it. The large ſtems of firs and pines riſe again ſo ſhivered and ſplintered, that the pieces look as if covered with briſtles. The whole phænomena are the effects of the violence of the daily ebb and flow, occaſioned by the contraction of the ſtream in its courſe between the rocks.

PEOPLE, LANGUAGE, RELIGION, AND CUSTOMS OF NORWAY } The Norwegians are a middling kind of people, between the ſimplicity of the Greenlanders and Icelanders, and the more poliſhed manners of the Danes. Their religion is Lutheran; and they have biſhops, as thoſe of Denmark, without temporal

incredible number of ſmall fiſh, that his belly is often ready to burſt; in which caſe he makes a moſt tremendous noiſe from pain. The ſmaller fiſh have their revenge; ſome of them faſten on his back, and inceſſantly beat him; others, wi h ſharp horns, or rather bones, on their beaks, ſwim under his belly, and ſometimes rip it up; ſome are provided with long ſharp teeth, and tear his fleſh. Even the aquatic birds of prey declare war againſt him when he comes near the ſurface of the water; and he has been known to be ſo tortured, that he has beat himſelf to death on the rocks. The coaſt of Norway may be ſaid to be the native country of herrings. Innumerable are the ſhoals that come from under the ice at the north pole, and about the latitude of Iceland divide themſelves into three bodies; one of theſe ſupply the Weſtern Iſles and coaſts of Scotland, another directs its courſe round the eaſtern part of Great Britain down the Channel, and the third enters the Baltic through the Sound. They form great part of the food of the common people; the cod, ling, kabeliau, and torſk-fiſhes follow them, and feed upon their ſpawn; and are taken in prodigious numbers in 50 or 60 fathoms water: theſe, eſpecially their roes, and the oil extracted from their livers, are exported and ſold to great advantage; and above 150,000 people are maintained by the herring and other fiſhing on the coaſt of Norway. The ſea-devil is about ſix feet in length, and is ſo called from its monſtrous appearance and voracity. The ſea-ſcorpion is likewiſe of a hideous form, its head being larger than its whole body, which is about four feet in length; and its bite is ſaid to be poiſonous.

The moſt ſeemingly fabulous accounts of the ancients, concerning ſea-monſters, are rendered credible by the productions of the Norwegian ſeas; and the ſea-ſnake, or ſerpent of the ocean, is no longer counted a chimera. In 1756, one of them was ſhot by a maſter of a ſhip; its head reſembled that of a horſe; the mouth was large and black, as were the eyes, a white mane hanging from its neck: it floated on the ſurface of the water, and held its head at leaſt two feet out of the ſea: between the head and neck were ſeven or eight folds, which were very thick; and the length of this ſnake was more than a hundred yards, ſome ſay fathoms. They have a remarkable averſion to the ſmell of caſtor; for which reaſon, ſhip, boat, and bark maſters provide themſelves with quantities of that drug, to prevent being overſet, the ſerpent's olfactory nerves being remarkably exquiſite. The peculiarities related of this animal would be incredible, were they not atteſted upon oath. Egede (a very reputable author) ſays, that on the 6th day of July, 1734, a large and frightful ſea-monſter raiſed itſelf ſo high out of the water, that its head reached above the main-top-maſt of the ſhip; that it had a long ſharp ſnout, broad paws, and ſpouted water like a whale; that the body ſeemed to be covered with ſcales; the ſkin was uneven and wrinkled, and the lower part was formed like a ſnake. The body of this monſter is ſaid to be as thick as a hogſhead; the ſkin is variegated like a tortoiſe-ſhell; and his excrement, which floats upon the ſurface of the water, is corroſive.

The exiſtence of the kraken, or korven, is ſtrongly aſſerted; and, as it is ſaid to exiſt in theſe ſeas, we think proper to mention it in this place, leaving it to the judgement of the reader to give what credit to it he pleaſes. Its bulk is ſaid to be a mile and a half in circumference; and when part of it appears above the water, reſembles a number of ſmall iſlands and ſand-banks, on which fiſhes ſport, and ſea-weeds grow: upon a farther emerging, a number of pellucid antennæ, each about the height, form, and ſize of a moderate maſt, appear; and by their action and reaction he gathers his food, conſiſting of ſmall fiſhes. When he ſinks, which he does gradually, a dangerous ſwell of the ſea ſucceeds, and a kind of whirlpool is formed in the water. In 1680, a young kraken periſhed among the rocks and cliffs of the pariſh of Alſtahong; and his death was attended by ſuch a ſtench, that the channel was impaſſable. Without entering into any romantic theories, we may ſafely ſay,

that

that the exiſtence of this fiſh accounts for many of the phænomena of floating iſlands and tranſitory appearances in the ſea, that have hitherto been held as fabulous by the learned, who could have no idea of ſuch an animal.

The mer-men and mer-women hold their reſidence in the Norwegian ſeas; but I cannot credit all that is related concerning them by the natives. The mer-man is about eight ſpans long, and, undoubtedly, has as much reſemblance as an ape has to the human ſpecies; a high forehead, little eyes, a flat noſe, and large mouth, without chin or ears, characterize its head; its arms are ſhort, but without joints or elbows, and they terminate in members reſembling a human hand, but of the paw kind, and the fingers connected by a membrane: the parts of generation indicate their ſexes: though their under parts, which remain in the water, terminate like thoſe of fiſhes. The females have breaſts, at which they ſuckle their young ones.

CURIOSITIES.] Thoſe of Norway are only natural. On the coaſt, latitude 67, is that dreadful vortex, or whirlpool, called by navigators the navel of the ſea, and by ſome Maleſtrom, or Moſkoeſtrom. The iſland Moſkoe, from whence this ſtream derives its name, lies between the mountain Heſleggen in Lofoden, and the iſland Ver, which are about one league diſtant; and between the iſland and coaſt on each ſide, the ſtream makes its way. Between Moſkoe and Lofoden it is near 400 fathoms deep; but between Moſkoe and Ver it is ſo ſhallow as not to afford paſſage for a ſmall ſhip. When it is flood, the ſtream runs up the country with a boiſterous rapidity; and when it is ebb, returns to the ſea with a violence and noiſe unequalled by the loudeſt cataracts. It is heard at the diſtance of many leagues, and forms a whirlpool of great depth and extent; ſo violent, that if a ſhip comes near, it is immediately drawn irreſiſtibly into the whirl, and there diſappears, being carried down to the bottom in a moment, where it is daſhed to pieces againſt the rocks; and juſt at the turn of ebb and flood, when the water becomes ſtill for about a quarter of an hour, it riſes again in ſcattered fragments, ſcarcely to be known for the parts of a ſhip. When it is agitated by a ſtorm, it has reached veſſels at the diſtance of more than a Norway mile, where the crews have thought themſelves in perfect ſecurity. Perhaps it is hardly in the power of fancy to conceive a ſituation of more horror than that of being thus driven forward by the ſudden violence of an impetuous torrent to the vortex of a whirlpool, of which the noiſe and turbulence ſtill increaſing as it is approached are an earneſt of quick and inevitable deſtruction; while the wretched victims, in an agony of deſpair and terror, cry out for that help which they know to be impoſſible; and ſee before them the dreadful abyſs in which they are about to be plunged, and daſhed among the rocks at the bottom. Even whales are frequently carried away; and the moment they feel the force of the water, they ſtruggle againſt it, howling and bellowing in a frightful manner. The like happens frequently to bears, who attempt to ſwim to the iſland to prey upon the ſheep.

It was the opinion of Kircher, that the Maleſtrom is a ſea-vortex, which attracts the flood under the ſhore of Norway, and diſcharges it again in the gulph of Bothnia: but this opinion is now known to be erroneous, by the return of the ſhattered fragments of whatever happens to be ſucked down by it. The large ſtems of firs and pines riſe again ſo ſhivered and ſplintered, that the pieces look as if covered with briſtles. The whole phænomena are the effects of the violence of the daily ebb and flow, occaſioned by the contraction of the ſtream in its courſe between the rocks.

PEOPLE, LANGUAGE, RELIGION, AND CUSTOMS OF NORWAY } The Norwegians are a middling kind of people, between the ſimplicity of the Greenlanders and Icelanders, and the more poliſhed manners of the Danes. Their religion is Lutheran; and they have biſhops, as thoſe of Denmark, without temporal

juriſdiction. Their viceroy, like his maſter, is abſolute; but the farmers and common people in Norway are much leſs oppreſſed than thoſe in Denmark.

The Norwegians in general are ſtrong, robuſt, and brave; but quick in reſenting real or ſuppoſed injuries. The women are handſome and courteous; and the Norwegian forms, both of living and enjoying property, are mild, and greatly reſembling the Saxon anceſtors of the preſent Engliſh. Every inhabitant is an artiſan, and ſupplies his family in all its neceſſaries with his own manufactures; ſo that in Norway there are few by profeſſion, who are hatters, ſhoe-makers, taylors, tanners, weavers, carpenters, ſmiths, or joiners. The loweſt Norwegian peaſant is an artiſt and a gentleman, and even a poet. They often mix with oat-meal the bark of the fir, made into a kind of flour; and they are reduced to very extraordinary ſhifts for ſupplying the place of bread, or farinaceous food. The manners of the middling Norwegians form a proper ſubject of contemplation even to a philoſopher, as they lead that kind of life which we may ſay is furniſhed with plenty; but they are neither fond of luxury, nor do they dread penury: and this middle ſtate prolongs their ages ſurpriſingly. Though their dreſs is in many reſpects accommodated to their climate, yet, by cuſtom, inſtead of guarding againſt the inclemency of the weather, they outbrave it; for they expoſe themſelves to cold, without any cover upon their breaſts or necks. A Norwegian of a hundred years of age is not accounted paſt his labour: and in 1733, four couples were married, and danced before his Daniſh majeſty at Fredericſhall, whoſe ages, when joined, exceeded 800 years.

The funeral ceremonies of the Norwegians contain veſtiges of their former paganiſm: they play on the violin at the head of the coffin, and while the corpſe is carried to the church, which is often done in a boat. In ſome places the mourners aſk the dead perſon why he died; whether his wife and neighbours were kind to him, and other ſuch queſtions; frequently kneeling down and aſking forgiveneſs, if ever they had offended the deceaſed.

COMMERCE.] We have little to add to this head, different from what will be obſerved in our account of Denmark. The duties on their exports, moſt of which have been already recounted, amount to about 100,000 rixdollars a year.

STRENGTH AND REVENUE.] By the beſt calculations, Norway can furniſh out 14,000 excellent ſeamen, and above 30,000 brave ſoldiers, for the uſe of their king. The royal annual revenue from Norway amounts to near 200,000l. and till his preſent majeſty's acceſſion, the army, inſtead of being expenſive, added conſiderably to his income, by the ſubſidies it brought him in from foreign princes.

HISTORY.] We muſt refer to Denmark for this head. The ancient Norwegians certainly were a very brave and powerful people, and the hardieſt ſeamen in the world. If we are to believe their hiſtories, they were no ſtrangers to America long before it was diſcovered by Columbus. Many cuſtoms of their anceſtors are yet diſcernible in Ireland and the north of Scotland, where they made frequent deſcents, and ſome ſettlements, which are generally confounded with thoſe of the Danes. From their being the moſt turbulent, they are become now the moſt loyal ſubjects in Europe; which we can eaſily account for, from the barbarity and tyranny of their kings, when a ſeparate people. Since the union of Calmar, which united Norway to Denmark, their hiſtory, as well as intereſts, are the ſame with thoſe of Denmark.

DENMARK.

DENMARK * PROPER, or JUTLAND, exclusive of the ISLANDS in the BALTIC.

EXTENT AND SITUATION.

	Miles.		Degrees.
Length	240†	between	54 and 58 North latitude.
Breadth	114		8 and 11 East longitude.

BOUNDARIES AND DIVISIONS. IT is divided on the north from Norway by the Scaggerac ſea, and from Sweden on the eaſt by the ſound; on the ſouth by Germany and the Baltic; and the German ſea divides it from Great Britain on the weſt.

Denmark proper is divided into two parts: the peninſula of Jutland, anciently called *Cimbria Cherſoneſus*, and the Iſlands at the entrance of the Baltic, mentioned in the table. It is remarkable, that though all theſe together conſtitute the kingdom of Denmark, yet not any one of them is ſeparately called by that name. Copenhagen, the metropolis, is in the iſland of Zealand.

AIR, CLIMATE, SOIL, STATE OF AGRICULTURE, &c.] One of the largeſt and moſt fertile of all the provinces of this kingdom is Jutland, which produces abundance of all ſorts of grain and paſturage, and is a kind of magazine for Norway on all occaſions. A great number of ſmall cattle are bred in this province, and afterwards tranſported into Holſtein, to be fed for the uſe of Hamburgh, Lubec, and Amſterdam. Jutland is every where interſperſed with hills, and on the eaſt ſide has fine woods of oak, fir, beech, birch, and other trees; but the weſt ſide being leſs woody, the inhabitants are obliged to uſe turf and heath for fuel. Zealand is for the moſt part a ſandy ſoil, but rather fertile in grain and paſturage, and agreeably variegated with woods and lakes of water. The climate is more temperate here, on account of the vapours from the ſurrounding ſea, than it is in many more ſoutherly parts of Europe. Spring and autumn are ſeaſons ſcarcely known in Denmark, on account of the ſudden tranſitions from cold to heat, and from heat to cold, which diſtinguiſh the climate of this kingdom. In all the northern provinces of Denmark the winters are very ſevere, ſo that the inhabitants often paſs arms of the ſea in ſledges upon the ice; and during the winter all their harbours are frozen up.

The greateſt part of the lands in Denmark and Holſtein are fiefs, and the ancient nobility, by grants which they extorted at different times from the crown, gained ſuch a power over the farmers, and thoſe who reſided upon their eſtates, that at length they reduced them to a ſtate of extreme ſlavery; ſo that they were bought and ſold with the lands, and were eſteemed the property of their lords. Many of the noble landholders in Sleſwick and Holſtein have the power of life and death. The ſituation of the farmers has, indeed, been made ſomewhat more agreeable by ſome modern edicts; but they are ſtill, if ſuch an expreſſion may be allowed, chained to their farms, and are diſpoſed of at the will of their lords. When a farmer in Denmark, or in Holſtein, happens to be an induſtrious man, and is ſituated upon a poor farm, which by great diligence he has laboured to cultivate

* See Mallet's Denmark, page 1 to 18. vol. v.

† Meaning where longeſt and broadeſt, a method which is the practice of other writers on the ſubject. Great allowances muſt therefore be made in moſt countries, as the reader will perceive by looking on the maps. Jutland, for inſtance, is 114 miles where broadeſt, though in ſundry other parts it is not 50.

advan-

advantageouſly, as ſoon as he has performed the toilſome taſk, and expects to reap the profits of what he has ſown, his lord, under pretence of taking it into his own hand, removes him from that farm to another of his poor farms, and expects that he ſhould perform the ſame laborious taſk there, without any other emolument than what he ſhall think proper to give him. This has been ſo long the practice in this country, that it neceſſarily throws the greateſt damp upon the efforts of induſtry, and prevents thoſe improvements in agriculture which would otherwiſe be introduced: the conſequence of which is, that nine parts in ten of the inhabitants are in a ſtate of great poverty. But if the farmers had a ſecurity for their property, the lands of Denmark might have been cultivated to much greater advantage than they are at preſent, and a much greater number of people ſupported by the produce of agriculture.

ANIMALS.] Denmark produces an excellent breed of horſes, both for the ſaddle and carriage, about 5000 are ſold annually out of the country, and of their horned cattle 30,000. They have alſo ſheep, hogs, and game; and the ſea-coaſts are generally well ſupplied with fiſh.

POPULATION, MANNERS, AND CUSTOMS.] By a numeration made, in 1759, of his Daniſh majeſty's ſubjects in his dominions of Denmark, Norway, Holſtein, the iſlands in the Baltic, and the counties of Oldenburgh and Delmenhorſt, in Weſtphalia, they were ſaid to amount to 2,444,000 ſouls, excluſive of the Icelanders and Greenlanders. The moſt accurate account of the population, is that made under the direction of the famous Struenſee, by which

Jutland numbered	358,136	Iceland	46,201
Denmark Iceland	283,466	Duchy of Sleſwick	243,605
Funen	143,988	Duchy of Holſtein	134,665
Norway	723,141	Oldenburgh	62,854
Iſlands of Ferro	4,754	Delmenhorſt	16,217
		Sum Total,	2,017,027

However diſproportioned this number may ſeem to the extent of his Daniſh majeſty's dominions; yet, every thing conſidered, it is greater than could have been expected from the uncultivated ſtate of his poſſeſſions. But the trade of Denmark hath been ſo ſhackled, and her merchants ſo terrified by the deſpotiſm of her government, that this kingdom is at preſent one of the moſt indigent ſtates in Europe. Theſe circumſtances prevent Denmark from being ſo populous as it might be, if the adminiſtration of government were more mild and equitable, and if proper encouragement were given to foreigners, and to thoſe who engage in agriculture, and other arts. The empreſs of Ruſſia, in 1773, ceded to the king of Denmark that portion of Holſtein which deſcended to the line of Holſtein-Gottorp, in exchange for Oldenburgh and Delmenhorſt, which ſhe gave to the prince of Lubeck. This exchange is favourable to Denmark, both as to trade and population.

The ancient inhabitants of Denmark poſſeſſed a degree of courage which approached even to ferocity; but by a continued ſeries of tyranny and oppreſſion, their national character is much changed, and from a brave, enterpriſing, and warlike people, they are become indolent and timid. They value themſelves extremely upon thoſe titles and privileges which they derive from the crown, and are exceedingly fond of pomp and ſhew. They endeavour to imitate the French in their manners, dreſs, and even in their gallantry; though they are naturally the very contraſt of that nation. The Danes, like other northern nations are given to intemperance in drinking, and convivial entertainments; but their nobility, who now begin

begin to visit the other courts of Europe, are refining from their provincial habits and vices.

RELIGION.] The religion is Lutheran; and the kingdom is divided into six dioceses; one in Zealand, one in Funen, and four in Jutland; besides four in Norway, and two in Iceland. These dioceses are governed by bishops, whose profession is to superintend the other clergy; nor have they any other mark of pre-eminency than a distinction of their ecclesiastical dress, for they have neither cathedral nor ecclesiastical courts, nor the smallest concern with civil affairs. They are paid by the state, as all the other church-lands were appropriated to the goverument at the Reformation.

LANGUAGE AND LEARNING.] The language of Denmark is a dialect of the Teutonic; but High Dutch and French are spoken at court; and the nobility have lately made great advances in the English, which is now publicly taught at Copenhagen as a necessary part of education. A company of English comedians occasionally visit that capital, where they find tolerable encouragement. Denmark has two universities, that of Copenhagen, and that of Kiel; two academical colleges at Soroe and Odensee, and thirty-two other great schools in the principal towns. There is at Copenhagen a royal society of sciences, an historical society for the study of northern history, another of Icelandic history and literature, an academy for painting and architecture, a college of physicians and surgeons, and another society of sciences at Drontheim *.

The university of Copenhagen has funds for the gratuitous support of 328 students; these funds are said to amount to 300,000 rix-dollars: but the Danes in general make no great figure in literature; though astronomy and medicine are highly indebted to their Tycho Brahe, Borichius, and the Bartholines; the science of botany owes great obligations to the celebrated Christian Oeder, to whom, through the liberality of his monarch, we are indebted for the Flora Danica. In speaking of the publications on natural history, it would be unpardonable to omit mentioning the most splendid work of the kind ever produced in any nation; it is a collection of rare shells, in two volumes folio, engraved and coloured by Francis Michael Regenfus, at the royal expence. "The first volume, which is the only one I have seen, contains a short account of the collections of natural history, and particularly of shells in Denmark; a preliminary discourse on conchology, with a detail of the several authors who have written on the subject, and their different systems, and 78 complete and delicately-coloured figures, in 12 plates, accompanied with scientific descriptions in the Latin, French, and German languages†." The round tower and Christian's haven display the mechanical genius of a Longomontanus: the Danes begin to make some promising attempts in history, poetry, and the drama; and several of their learned men have lately employed their researches on the history and antiquities of the North.

CITIES AND CHIEF BUILDINGS.] Copenhagen, which is now situated on the fine island of Zealand, was originally a settlement of sailors, and first founded by some wandering fishermen in the twelfth century, but it is now the metropolis, and makes a magnificent appearance at a distance. It is very strong, and defended by four castles or forts. It contains ten parish churches, besides nine others, belonging to the Calvinists and other persuasions, and some hospitals. Copenhagen is adorned by some public and private palaces, as they are called. Its streets are 186 in number; and its inhabitants amount to 100,000. The houses in the principal streets are built of brick, and those in their lanes chiefly of timber. But the chief glory of Copenhagen is its harbour, formed by a large canal flowing through the city, which

* Zimmermann p. 79.

† Coxe's Travels into Poland, Russia, Sweden, and Denmark, 4to. vol. 2. p. 566, 568.

admits

admits of only one ſhip to enter at a time, but is capable of containing 500. Several of the ſtreets have canals, and quays for ſhips to lie cloſe to the houſes; and its naval arſenal is ſaid to exceed that of Venice. The road for the ſhipping begins about two miles from the town, and is defended by 90 pieces of cannon, as well as the difficulty of the navigation. The public places are filled with officers either in the land or ſea ſervice; and the number of forces is too large for the kingdom. The police of Copenhagen is extremely regular, and people may walk through the city at midnight with great ſafety. Indeed, it is uſually as quiet here at eleven o'clock at night as in a country village.

The apartments of the palace at Copenhagen are grand, and the tapeſtry in many of them beautiful, particularly the ſtory of Eſther, and an aſſortment of wild beaſts, after the manner of Quida. A colonnade at each extremity forms the ſtables, which for their extent and beauty are equal to any in Europe. The fineſt palace belonging to his Daniſh majeſty lies about 20 Engliſh miles from Copenhagen, and is called Fredericſburg. It is a very large building, moated round with a triple ditch, and calculated, like moſt of the ancient reſidences of princes, for defence againſt an enemy. It was built by Chriſtian the IVth. and, according to the architecture of the times, partakes of the Greek and Gothic ſtyles. In the front of the grand quadrangle appear Tuſcan and Doric pillars, and on the ſummit of the building are ſpires and turrets. Some of the rooms are very ſplendid, though furniſhed in the antique taſte. The Knights' hall is of great length. The tapeſtry repreſents the wars of Denmark, and the cieling is a moſt minute and laboured performance in ſculpture. The chimney-piece was once entirely covered with plates of ſilver, richly ornamented; but the Swedes, who have often landed here, and even beſieged the capital, tore them all away, and rifled the palace, notwithſtanding its triple moat and formidable appearance. The late unhappy queen Matilda ſpent much of her time at this palace, during the king's tour through Europe. About two miles from Elſineur is another ſmall royal palace, flat roofed, with 12 windows in front, ſaid to be built on the place formerly occupied by the palace of Hamlet's father. In an adjoining garden is ſhewn the very ſpot where, according to that tradition, that prince was poiſoned. Jagerſburg is a park which contains a royal country ſeat, called the Hermitage, remarkable for the diſpoſition of its apartments, and the quaintneſs of its furniture; particularly a machine which conveys the diſhes to and from the king's table in the ſecond ſtory. The chief eccleſiaſtical building in Denmark is the cathedral of Roſchild, where the kings and queens of Denmark were formerly buried, and their monuments ſtill remain. Joining to this cathedral, by a covered paſſage, is a royal palace, built in 1732.

Elſineur is well-built, contains 5000 inhabitants, and, with reſpect to commerce, is only exceeded by Copenhagen. It is ſtrongly fortified on the land-ſide; and towards the ſea is defended by a ſtrong fort, containing ſeveral batteries of long cannon. Here all veſſels pay a toll, and in paſſing lower their top-ſails.

Commerce.] Denmark is extremely well ſituated for commerce; her harbours are well calculated for the reception of ſhips of all burthens, and her mariners are very expert in the navigation of the different parts of the ocean. The dominions of his Daniſh majeſty alſo ſupply a great variety of timber, and other materials for ſhipbuilding; and ſome of his provinces afford many natural productions for exportation. Among theſe, beſides fir, and other timber, are black cattle, horſes, butter, ſtock-fiſh, tallow, hides, train-oil, tar, pitch, and iron, which being the natural product of the Daniſh dominions, are conſequently ranked under the head of exports. To theſe we may add furs; but the exportation of oats is forbidden. The imports are ſalt, wine, brandy, and ſilk, from France, Portugal, and Italy. Of late the Danes have had a great intercourſe with England, from whence they import broad-cloths,

clocks, cabinet, lock-work, and all other manufactures carried on in the great trading towns of England.

Nothing ſhews the commercial ſpirit of the Danes in a more favourable light than their eſtabliſhments in the Eaſt and Weſt Indies. In 1612 Chriſtian IV. of Denmark eſtabliſhed an Eaſt India Company at Copenhagen; and ſoon after four ſhips ſailed from thence to the Eaſt Indies. The hint of this trade was given to his Daniſh majeſty by James I. of England, who married a princeſs of Denmark; and in 1617 they built and fortified a caſtle and town at Tranquebar, on the coaſt of Coromandel. The ſecurity which many of the Indians found under the cannon of this fort invited numbers of them to ſettle here; ſo that the Daniſh Eaſt-India Company were ſoon rich enough to pay to their king a yearly tribute of 10,000 rix-dollars. The company, however, willing to become rich all of a ſudden, in 1620 endeavoured to poſſeſs themſelves of the ſpice trade at Ceylon; but were defeated by the Portugueſe. The truth is, they ſoon embroiled themſelves with the native Indians on all hands; and had it not been for the generous aſſiſtance given them by Mr. Pitt, an Engliſh Eaſt-India governor, the ſettlement at Tranquebar muſt have been taken by the Rajah of Tanjour. Upon the cloſe of the wars in Europe, after the death of Charles XII. of Sweden, the Daniſh Eaſt-India Company found themſelves ſo much in debt, that they publiſhed propoſals for a new ſubſcription for enlarging their ancient capital ſtock, and for fitting out ſhips to Tranquebar, Bengal, and China. Two years after, his Daniſh majeſty granted a new charter to his Eaſt-India Company, with vaſt privileges; and for ſome time its commerce was carried on with great vigour. I ſhall juſt mention, that the Danes likewiſe poſſeſs the iſlands of St. Thomas and St. Croix, and the ſmall iſland of St. John, in the Weſt Indies, which are free ports and celebrated for ſmuggling; alſo the fort of Chriſtianburg, on the coaſt of Guinea; and carry on a conſiderable commerce with the Mediterranean.

CURIOSITIES, NATURAL AND ARTIFICIAL.] Denmark Proper affords fewer of theſe than the other parts of his Daniſh majeſty's dominions, if we except the contents of the royal Muſeum at Copenhagen, which conſiſts of a numerous collection of both. It contains ſeveral good paintings and a fine collection of coins, particularly thoſe of the Conſuls in the time of the Roman Republic, and of the Emperors after the ſeat of empire was divided into the Eaſt and Weſt. Beſides artificial ſkeletons, ivory carvings, models, clock-work, and a beautiful cabinet of ivory and ebony, made by a Daniſh artiſt who was blind, here are to be ſeen two famous antique drinking veſſels; the one of gold, the other of ſilver, both in the form of a hunting horn: that of gold ſeems to be of Pagan manufacture; and from the raiſed hieroglyphical figures on its outſide, probably was made uſe of in religious ceremonies: it is about two feet nine inches long, weighs 102 ounces, contains two Engliſh pints and a half, and was found in the dioceſe of Ripen, in the year 1639. The other, of ſilver, weighs about four pounds, and is termed *Cornu Oldenburgicum*; which, they ſay, was preſented to Otho I. duke of Oldenburg, by a ghoſt. Some, however, are of opinion, that this veſſel was made by order of Chriſtian I. king of Denmark, the firſt of the Oldenburg race, who reigned in 1448. Several veſſels of different metals, and the ſame form, have been found in the North of England, and are probably of Daniſh original. This muſeum is likewiſe furniſhed with a prodigious number of aſtronomical, optical, and mathematical inſtruments; ſome Indian curioſities, and a ſet of medals, ancient and modern. Many curious aſtronomical inſtruments are likewiſe placed in the round tower at Copenhagen, which is ſo contrived that a coach may drive to its top. The village of Anglen, lying between Flenſburg and Sleſwick, is alſo eſteemed a curioſity, as giving its name to the Angles, or Anglo-Saxon inhabitants of Great-Britain, and the anceſtors of the bulk of the modern Engliſh.

The greateſt rarities in his Daniſh majeſty's dominions are omitted, however, by geographers; I mean thoſe ancient inſcriptions upon rocks, that are mentioned by antiquarians and hiſtorians; and are generally thought to be the old and original manner of writing, before the uſe of paper of any kind, and waxen tables, was known. Theſe characters are Runic, and ſo imperfectly underſtood by the learned themſelves, that their meaning is very uncertain; but they are imagined to be hiſtorical. Stephanus, in his notes upon Saxo-Grammaticus, has exhibited ſpecimens of ſeveral of thoſe inſcriptions.

CIVIL CONSTITUTION, GOVERNMENT, AND LAWS.] The ancient conſtitution of Denmark was originally upon the ſame plan with other Gothic governments. The king came to the throne by election; and, in conjunction with the ſenate where he preſided, was inveſted with the executive power. He likewiſe commanded the army, and decided all the diſputes which aroſe between his ſubjects. The legiſlative power, together with the right of election of the king, was veſted in the ſtates; who were compoſed, firſt, of the order of nobility, and ſecondly, the order of the citizens and farmers: and after the Chriſtian religion had gained ground in the North, the clergy were alſo admitted, not only to be an order of the ſtates, but to have ſeats likewiſe in the ſenate. Theſe orders had their reſpective rights and privileges, and were independent of each other; the crown had alſo its prerogatives, and a certain fixed revenue ariſing out of lands, which were appropriated to its ſupport. This conſtitution had many evident advantages: but, unfortunately, the balance of this government was never properly adjuſted; ſo that the nobles very ſoon aſſumed a dictatorial power, and greatly oppreſſed the people, as the national aſſemblies were not regularly held to redreſs their grievances. And when the Roman Catholic clergy came to have a ſhare in the civil government, they far ſurpaſſed the nobility in pride and ambition. The repreſentatives of the people had neither power, credit, nor talents, to counteract the efforts of the other two orders, who forced the crown to give up its prorogatives, and to tyrannize over the people. Chriſtian the Second, by endeavouring, in an imprudent manner, to ſtem the torrent of their oppreſſion, loſt his crown and his liberty; but Chriſtian the Third, uniting with the nobles and the ſenate, deſtroyed the power of the clergy, though the oppreſſion of the common people by the nobility ſtill remained. At length, in the reign of Frederick the Third, the people, inſtead of exerting themſelves to remedy the defects of the conſtitution, and to maintain their common liberties, were ſo infatuated as to make the king deſpotic, in hopes of rendering themſelves leſs ſubject to the tyranny of the nobility. A ſeries of unſucceſsful wars had brought the nation in general into ſo miſerable a condition, that the public had not money for paying off the army. The diſpute came to a ſhort queſtion, which was, that the nobles ſhould ſubmit to taxes, from which they pleaded an exemption. The inferior people, upon this, threw their eyes towards the king for relief and protection from the oppreſſions of the order of nobility: in this they were encouraged by the clergy. In a meeting of the ſtates, it was propoſed that the nobles ſhould bear their ſhare in the common burden. Upon this, Otta Craeg reminded the people that the commons were no more *ſlaves* to the lords. This was the watch-word, which had been concerted between the leaders of the commons, the clergy, and even the court itſelf. Nanſon, ſpeaker of the commons, exclaimed at the term *Slavery*; the aſſembly broke up in a ferment; and the commons, with the clergy, withdrew to a houſe of their own, where they reſolved to make the king a ſolemn tender of their liberties and ſervices, and formally to eſtabliſh in his family the hereditary ſucceſſion to their crown. This reſolution was executed the next day. The king accepted of their tender, promiſing them relief and protection. The gates of Copenhagen were ſhut; and the nobility, finding the nerves of their power thus cut, ſubmitted with the beſt grace they could to confirm what had been done.

On

On the 18th of October, 1660, the three orders of nobility, clergy, and people, ſigned each a ſeparate act; by which they conſented that the crown ſhould be hereditary in the royal family, as well in the female as in the male line, and by which they inveſted the king with abſolute power, and gave him the right to regulate the ſucceſſion and the regency, in caſe of a minority. This renunciation of their rights, ſubſcribed by the firſt nobility, is ſtill preſerved as a precious relic among the archives of the royal family; a relic which perpetuates the memory of the humbled inſolence of the nobles, and the hypocriſy of the prince, who, to gratify his revenge againſt them, perſuaded the people that his only wiſhes were to repair a decayed edifice, and then excited them to pull it to the ground, cruſhing themſelves under its ruins.

After this extraordinary revolution in the government, the king of Denmark diveſted the nobility of many of their privileges; but he took no method to relieve thoſe poor people who had been the inſtruments of inveſting him with the ſovereign power, but left them in the ſame ſtate of ſlavery in which they were before, and in which they have remained to the preſent age. When the revolution in the reign of Frederick the Third had been effected, the king re-united in his perſon all the rights of the ſovereign power; but as he could not exerciſe all by himſelf, he was obliged to entruſt ſome part of the executive power to his ſubjects. The ſupreme court of judicature for the kingdoms of Denmark and Norway is holden in the royal palace at Copenhagen, of which the king is the nominal preſident. What they call the German provinces have likewiſe their ſupreme tribunal; which, for the duchy of Holſtein, is holden at Gluckſtadt; and for the duchy of Sleſwick, in the town of that name.

As to matters of importance, the king for the moſt part decides in his council, the members of which are named and diſplaced at his will. It is in this council, that the laws are propoſed, diſcuſſed, and receive the royal authority; and that any great changes or eſtabliſhments are propoſed, and approved or rejected by the king. It is here likewiſe, or in the cabinet, that he grants privileges, and decides upon the moſt important affairs of his dominions.

In this kingdom, as in many others, the king is ſuppoſed to be preſent to adminiſter juſtice in the ſupreme court of his kingdom; and, therefore, the kings of Denmark not only preſide nominally in the ſovereign court of juſtice, but they have a throne erected in it, towards which the lawyers always addreſs their diſcourſes in pleading, and the judges the ſame in giving their opinion. Every year the king is preſent at the opening of this court, and often gives the judges ſuch inſtructions as he thinks proper. The deciſion of theſe judges is final in all civil actions; but no criminal ſentence of a capital nature can be carried into execution till it is ſigned by the king.

There are many excellent regulations for the adminiſtration of juſtice in Denmark; but it is ſo far from being diſtributed in an equal and impartial manner, that a poor man can ſcarcely ever have juſtice againſt the nobility, or one who is favoured by the court. If the laws are ſo clearly in favour of the former, that the judges are aſhamed to decide againſt them, the latter, through the favour of the miniſter, obtains an order from the king to ſtop all the law-proceedings, or a diſpenſation from obſerving particular laws; and there the matter ends. The code of laws at preſent eſtabliſhed in Denmark was publiſhed by Chriſtiian V. founded upon the code of Valdemar, and all the other codes ſince publiſhed, and is nearly the ſame with that publiſhed in Norway. Theſe laws are very juſt and clear; and, if they were impartially carried into execution, would be productive of many beneficial conſequences to the people. But as the king can alter the laws, and ſupport his miniſters and favourites in any acts of violence and injuſtice, the people undergo a great degree of oppreſſion, and have abundant reaſon to regret the tameneſs and

ſervility with which their liberties have been ſurrendered into the hands of their monarchs.

PUNISHMENTS.] The common method of execution in Denmark is beheading and hanging: in ſome caſes, as an aggravation of the puniſhment, the hand is chopped off before the other part of the ſentence is executed. For the moſt atrocious crimes, ſuch as the murder of a father or mother, huſband or wife, and robbery upon the highway, the malefactor is broken upon the wheel. But capital puniſhments are not common in Denmark: and the other principal modes of puniſhments are branding in the face, whipping, condemnation to the raſp-houſe, to houſes of correction, and to public labour and impriſonment; all which are varied in duration and rigour, according to the nature of the crime.

POLITICAL AND NATURAL INTERESTS OF DENMARK.] After the acceſſion of his preſent majeſty, his court ſeemed for ſome time to have altered its maxims. His father, it is true, obſerved a moſt reſpectable neutrality during the late war; but never could get free from French influence, notwithſtanding his connections with Great Britain. The ſubſidies he received maintained his army; but his family-diſputes with Ruſſia concerning Holſtein, and the aſcendency which the French had obtained over the Swedes, not to mention other circumſtances, did not ſuffer him to act that deciſive part in the affairs of Europe, to which he was invited by his ſituation; eſpecially about the time when the treaty of Cloſter-ſeven was concluded. His preſent Daniſh majeſty's plan ſeemed, ſoon after his acceſſion, to be that of forming his dominions into a ſtate of independency, by availing himſelf of their natural advantages. But ſundry events which have ſince happened, and the general feebleneſs of his adminiſtration, have prevented any further expectations being formed, that the real welfare of Denmark will be promoted, at leaſt in any great degree, during the preſent reign.

With regard to the external intereſts of Denmark, they are certainly beſt ſecured by cultivating a friendſhip with the maritime powers. The exports of Denmark enable her to carry on a very profitable trade with France, Spain, and the Mediterranean; and ſhe has been particularly courted by the Mahometan ſtates, on account of her naval ſtores.

Were the Swedes to regain their military character, and to be commanded by ſo enterpriſing a prince as Charles XII. they probably would endeavour to repoſſeſs themſelves, by arms, of the fine provinces torn from them by Denmark. But the greateſt danger that can ariſe to Denmark from a foreign power is, when the Baltic (as has happened more than once) is ſo frozen over as to bear not only men but heavy artillery; in which caſe the Swedes have been known to march over great armies, and to threaten the conqueſt of the kingdom.

REVENUES.] His Daniſh majeſty's revenues have three ſources: the impoſitions he lays upon his own ſubjects: the duties paid by foreigners; and his own demeſne lands, including confiſcations. Wine, ſalt, tobacco, and proviſions of all kinds, are taxed. Paper, corporations, land, houſes, and poll-money, alſo raiſe a conſiderable ſum. The expences of fortifications are defrayed by the people: and when the king's daughter is married, they pay about 100,000 rix-dollars towards her portion. The internal taxes of Denmark are uncertain, becauſe they may be abated or raiſed at the king's will. Cuſtoms, and tolls upon exports and imports, are more certain. The tolls paid by ſtrangers ariſe chiefly from foreign ſhips that paſs through the Sound into the Baltic, through the narrow ſtrait of three miles between Schonen and the iſland of Zealand. Theſe tolls are in proportion to the ſize of the ſhip and the value of the cargo, exhibited in bills of lading. This tax, which forms a capital part of his Daniſh majeſty's revenue, has more than once thrown the northern parts of Europe into a flame. It was often diſputed by the Engliſh and Dutch, being

being nothing more originally than a voluntary contribution of the merchants towards the expence of light-houſes on the coaſt; and the Swedes who command the oppoſite ſide of the paſs, for ſome time refuſed to pay it: but in the treaty of 1720, between Sweden and Denmark, under the guarantee of his Britannic majeſty George I. the Swedes agreed to pay the ſame rates as are paid by the ſubjects of Great Britain and the Netherlands. The firſt treaty relative to it was by the Emperor Charles V. on behalf of his ſubjects in the Low Countries. The toll is paid at Elſineur, a town ſituated on the Sound, at the entrance of the Baltic ſea, and about 20 miles diſtant from Copenhagen. The whole revenue of Denmark, including what is received at Elſineur, amounts at preſent to above 5,000,000 of rix-dollars, or 1,002,000 ſterling yearly.

The following is a liſt of the king's revenues, excluſive of his private eſtates.

	Rix-dollars at 4s. each.
Tribute of hard corn, or land-tax,	1,000,000
Small taxes, including poll-tax, pound rents, exciſe, &c.	950,000
Cuſtom-houſe duties,	154,000
Duties of the Sound	200,000
Duties of Jutland, from ſalt-pits,	27,000
Tythes and poll-tax of Norway,	770,000
Tolls of Bergen, Drontheim, Chriſtianſand, and Chriſtiana,	160,000
Other tolls,	552,000
Revenues from mines	300,000
Revenue from Sleſwick, Holſtein, &c.	690,000
Taxes on acorns, and maſts from beech,	20,000
Tolls on the Weſer,	7,5000
Poſt-office,	70,000
Farms of Iceland and Ferro	35,000
Farms of Bornholm	14,800
Oyſter Fiſhery,	22,000
Stamp Paper	40,000
Sum total	5,012,300
In Engliſh money,	1,002,460

By a liſt of the revenue taken in 1730, it then only amounted to £.454,700.

ARMY AND NAVY.] The three laſt kings of Denmark, notwithſtanding the degeneracy of their people in martial affairs, were very reſpectable princes, by the number and diſcipline of their troops, which they kept up with great care. The preſent military force of Denmark conſiſts of near 70,000 men, cavalry and infantry, the greateſt part of which conſiſts of a militia, who receive no pay, but are regiſtered on the army liſt, and every Sunday exerciſed. The regular troops are about 20,000, and moſtly foreigners, or officered by foreigners; for Frederic III. was too refined a politician to truſt his ſecurity in the hands of thoſe he had tricked out of their liberty. Though this army is extremely burdenſome to the nation, yet it coſts little to the crown: great part of the infantry lie in Norway, where they live upon the boors at free quarter; and in Denmark the peaſantry are obliged to maintain the cavalry in victuals and lodging, and even to furniſh them with money. The fleet of Denmark is compoſed of 36 ſhips of the line, and 18 frigates; but many of them being old, and wanting great repairs, they cannot fit out more than 25 ſhips upon the greateſt emergency. This fleet is generally ſtationed at Copenhagen, where are the dock-yards, ſtore-houſes, and all the materials neceſſary for the uſe of the marine. They have near 40,000 regiſtered ſeamen, who cannot quit the kingdom without

leave, nor ſerve on board a merchantman without permiſſion from the admiralty; 4000 of theſe are kept in conſtant pay and employed in the dock-yards; their pay however, ſcarcely amounts to nine ſhillings a month, but then they have a ſort of uniform, with ſome proviſions and lodgings allowed for themſelves and families.

ORDERS OF KNIGHTHOOD IN DENMARK.] Theſe are two; that of the *Elephant*, and of *Daneburg:* the former was inſtituted by Chriſtian I. and is deemed the moſt honourable; its badge is an elephant ſurmounted with a caſtle, ſet in diamonds, and ſuſpended to a ſky-coloured watered ribband; worn like the George in England: the number of its members, beſides the ſovereign, are thirty. The badges of the Daneburg order, which is ſaid to be of the higheſt antiquity, conſiſt of a white ribband with red edges, worn over the left ſhoulder; from which depends a ſmall croſs of diamonds, and an embroidered ſtar on the breaſt of the coat, ſurrounded with the motto, *pietate & juſtitia*.

HISTORY.] We owe the chief hiſtory of Denmark to a very extraordinary phænomenon, the revival of the purity of the Latin language in Scandinavia, in the perſon of Saxo-Grammaticus, at a time (the 12th century) when it was loſt in all other parts of the European continent. Saxo, like the other hiſtorians of his age, has adopted, and at the ſame time ennobled by his ſtyle, the abſurdities of remote antiquity. We can, however, collect enough from him to conclude, that the ancient Danes, like the Gauls, the Scots, the Iriſh, and other northern nations, had their bards, who recounted the military atchievements of their heroes; and that their firſt hiſtories were written in verſe. There can be no doubt that the Scandinavians or Cimbri, and the Teutones (the inhabitants of Denmark, Norway, and Sweden) were Scythians by their original; but how far the tracts of land, called either Scythia * or Gaul, formerly reached, is uncertain.

Even the name of the firſt chriſtian Daniſh king is uncertain; and thoſe of the people whom they commanded were ſo blended, that it is impoſſible for the reader to conceive a preciſe idea of the old Scandinavian hiſtory. This, undoubtedly, was owing to the remains of their Scythian cuſtoms, particularly that of removing from one country to another; and of ſeveral nations or ſepts joining together in expeditions by ſea or land; and the adventurers being denominated after their chief leaders.

Thus the terms Danes, Saxons, Jutes or Goths, Germans, and Normans, were promiſcuouſly uſed long after the time of Charlemagne. Even the ſhort revival of literature, under that prince, throws very little light upon the Daniſh hiſtory. All we know is, that the inhabitants of Scandinavia, in their maritime expeditions, went generally under the name of Saxons with foreigners; that they were bold adventurers, rude, fierce, and martial: that ſo far back as the year of Chriſt 500, they inſulted all the ſea-coaſts of Europe; that they ſettled in Ireland, where they built ſtone houſes; and that they became maſters of England, and ſome part of Scotland; both which kingdoms ſtill retain proofs of their barbarity. When we read the hiſtory of Denmark and that of England under the Daniſh princes who reigned over both countries, we meet with but a faint reſemblance of events; but the Danes, as conquerors, always give themſelves the ſuperiority over the Engliſh.

In the eleventh century, under Canute the Great, Denmark may be ſaid to have been in its zenith of glory, as far as extent of dominion can give ſanction to the

* By Scythia may be underſtood all thoſe northern countries of Europe and Aſia, now inhabited by the Danes, Norwegians, Swedes, Ruſſians, and Tartars, whoſe inhabitants overturned and peopled the Roman empire, and continued, ſo late as the 13th century, to iſſue forth in large bodies, and naval expeditions, ravaging the more ſouthern and fertile kingdoms of Europe; hence by ſir William Temple, and other hiſtorians, they are termed the *Northern Hive, the Mother of Nations, the Storehouſe of Europe*.

expreſ-

expreſſion. Few intereſting events preceded the year 1385, when Margaret mounted that throne; and partly by her addreſs, and partly by hereditary right, ſhe formed the union of Calmar, anno 1397, by which ſhe was acknowledged ſovereign of Sweden, Denmark, and Norway. She held her dignity with ſuch firmneſs and courage, that ſhe was ſtyled the Semiramis of the North. Her ſucceſſors being deſtitute of her great qualifications, the union of Calmar, by which the three kingdoms were in future to be under one ſovereign, was diſſolved; though Norway continued annexed to Denmark. In 1448, the crown of Denmark fell to Chriſtian, count of Oldenburg, from whom the preſent royal family of Denmark is deſcended.

In 1513, Chriſtian II. king of Denmark, one of the moſt complete tyrants that modern times have produced, mounted the throne of Denmark; and, having married the ſiſter of the emperor Charles V. gave a looſe to his innate cruelty. Being driven out of Sweden, for the bloody maſſacres he committed there, the Danes rebelled againſt him likewiſe; and he fled, with his wife and children, into the Netherlands. Frederick, duke of Holſtein, was unanimouſly called to the throne, on the depoſition of his cruel nephew, who openly embraced the opinions of Luther, and about the year 1536, the proteſtant religion was eſtabliſhed in Denmark by that wiſe and politic prince Chriſtian III.

Chriſtian IV. of Denmark, in 1629, was choſen for the head of the proteſtant league, formed againſt the houſe of Auſtria; but, though brave in his own perſon, was in danger of loſing his dominions; when he was ſucceeded in that command by Guſtavus Adolphus, king of Sweden. The Dutch having obliged Chriſtian, who died in 1648, to lower the duties of the Sound, his ſon Frederic III. conſented to accept of an annuity of 150,000 florins for the whole. The Dutch, after this, perſuaded him to declare war againſt Charles Guſtavus, king of Sweden, which had almoſt coſt him his crown in 1657. Charles ſtormed the fortreſs of Fredricſtadt; and in the ſucceeding winter he marched his army over the ice to the iſland of Funen, where he ſurpriſed the Daniſh troops, took Odenſee and Nyburg, and marched over the Great Belt to beſiege Copenhagen. Cromwell, who then governed England under the title of Protector, interpoſed; and Frederic defended his capital with great magnanimity till the peace of Roſchild; by which Frederic ceded the provinces of Halland, Bleking, and Sconia, the iſland of Bornholm, and Bahus and Drontheim in Norway, to the Swedes. Frederic ſought to elude thoſe ſevere terms; but Charles took Cronenburgh, and once more beſieged Copenhagen by ſea and land. The ſteady intrepid conduct of Frederic, under theſe misfortunes, endeared him to his ſubjects; and the citizens of Copenhagen made an admirable defence till a Dutch fleet arrived in the Baltic, and beat the Swedes. The fortune of war was now entirely changed in favour of Frederic, who ſhewed on every occaſion great abilities, both civil and military; and having forced Charles to raiſe the ſiege of Copenhagen, might have carried the war into Sweden, had not the Engliſh fleet under Montague appeared in the Baltic. This enabled Charles to beſiege Copenhagen a third time; but France and England offering their mediation, a peace was concluded, by which the iſland of Bornholm returned to the Danes; but the iſland of Rugen, Bleking, Halland, and Schonen, remained with the Swedes.

Though this peace did not reſtore to Denmark all ſhe had loſt, yet the magnanimous behaviour of Frederic, under the moſt imminent dangers, and his attention to the ſafety of his ſubjects, even preferably to his own, greatly endeared him in their eyes; and he at length became abſolute, in the manner already related. Frederic was ſucceeded in 1670, by his ſon Chriſtian V. who obliged the duke of Holſtein Gottorp to renounce all the advantages he had gained by the treaty of Roſchild. He then recovered a number of places in Sconen; but his army was defeated in the bloody battle of Lunden, by Charles XI. of Sweden. Chriſtian obſtinately continued the war, till he was defeated at the battle of Landſcroon: and

and having almoſt exhauſted his dominions in military operations, and being abandoned by all his allies, he was forced to ſign a treaty, on the terms preſcribed by France, in 1679. Chriſtian afterwards became the ally and ſubſidiary of Lewis XIV. who was then threatening Europe with chains; and, after a variety of treating and fighting with the Holſteiners, Hamburghers, and other northern powers, died in 1699. He was ſucceeded by Frederic IV. who, like his predeceſſors, maintained his pretenſions upon Holſtein; and probably muſt have become maſter of that Duchy, had not the Engliſh and Dutch fleets raiſed the ſiege of Tonningen, while the young king of Sweden, Charles XII. who was then no more than ſixteen years of age, landed within eight miles of Copenhagen, to aſſiſt his brother-in-law the duke of Holſtein. Charles probably would have made himſelf maſter of Copenhagen, had not his Daniſh majeſty agreed to the peace of Travendahl, which was entirely in the duke's favour. By another treaty concluded with the States General, Charles obliged himſelf to furniſh a body of troops, who were to be paid by the confederates; and afterwards did great ſervice againſt the French in the wars of Queen Anne.

Notwithſtanding this peace, Frederic was perpetually engaged in wars with the Swedes, and while Charles XII. was an exile at Bender, he made a deſcent upon the Swediſh Pomerania; and another, in the year 1712, upon Bremen, and took the city of Stade. His troops, however, were totally defeated by the Swedes at Gadeſbuch, who laid his favourite city of Altena in aſhes. Frederic revenged himſelf by ſeizing great part of the ducal Holſtein, and forcing the Swediſh general, count Steinbock, to ſurrender himſelf priſoner, with all his troops. In the year 1716, the ſucceſſes of Frederic were ſo great, by taking Tonningen and Stralſund, by driving the Swedes out of Norway, and reducing Wiſmar in Pomerania, that his allies began to ſuſpect he was aiming at the ſovereignty of all Scandinavia. Upon the return of Charles of Sweden from his exile, he renewed the war againſt Denmark with a moſt imbittered ſpirit; but on the death of that prince, who was killed at the ſiege of Fredericſhall, Frederic durſt not refuſe the offer of his Britannic majeſty's mediation between him and the crown of Sweden; in conſequence of which a peace was concluded at Stockholm, which left him in poſſeſſion of the duchy of Sleſwick. Frederic died in the year 1730, after having two years before ſeen his capital reduced to aſhes by an accidental fire. His ſon Chriſtian Frederic, or Chriſtian VI. made no other uſe of his power, and the advantages with which he mounted the throne, than to cultivate peace with all his neighbours, and to promote the happineſs of his ſubjects, whom he eaſed of many oppreſſive taxes.

In 1734, after guarantying the Pragmatic ſanction *, Chriſtian ſent 6000 men to the aſſiſtance of the emperor, during the diſpute of the ſucceſſion to the crown of Poland. Though he was pacific, yet he was jealous of his rights, eſpecially over Hamburgh. He obliged the Hamburghers to call in the mediation of Pruſſia, to aboliſh their bank, to admit the coin of Denmark as current, and to pay him a million of ſilver marks. He had, in 1738, a diſpute with his Britannic majeſty about the little lordſhip of Steinhorſt, which had been mortgaged to the latter by a duke of Holſtein Lawenburg, and which Chriſtian ſaid belonged to him. Some blood was ſpilt during the conteſt; in which Chriſtian, it is thought, never was in earneſt. It brought on, however, a treaty, in which he availed himſelf of his Britannic majeſty's predilection for his German dominions, who agreed to pay Chriſtian a ſubſidy of 70,000l. ſterling a year, on condition of keeping in readineſs 7000 troops for the protection of Hanover: this was a gainful bargain for Denmark. Two years after, he ſeized ſome Dutch ſhips, for trading without his

* An agreement by which the princes of Europe engaged to ſupport the Houſe of Auſtria in favour of the queen of Hungary, daughter of the emperor Charles VI. who had no male iſſue.

leave

leave to Iceland; but the difference was made up by the mediation of Sweden. Chriſtian had ſo great a party in that kingdom, that it was generally thought he would revive the union of Calmar, by procuring his ſon to be declared ſucceſſor to his then Swediſh majeſty. Some ſteps for that purpoſe were certainly taken: but whatever Chriſtian's views might have been, the deſign was fruſtrated by the jealouſy of other powers, who could not bear the thoughts of ſeeing all Scandinavia ſubject to one family. Chriſtian died in 1746, with the character of being the father of his people. His ſon, Frederic V. in 1743, married the princeſs Louiſa, daughter to his Britannic majeſty George II. He improved upon his father's plan, for the happineſs of his people; but took no concern, except that of a mediator, in the German war. It was by his intervention that the treaty of Cloſter-ſeven was concluded between the late duke of Cumberland and the French general Richlieu. Upon the death of his firſt queen, who was mother to his preſent Daniſh majeſty, he married a daughter of the duke of Brunſwic-Wolfenbuttle; and died in 1766.

His ſon, Chriſtian VII. was born the 29th of January 1749; and married his preſent Britannic majeſty's youngeſt ſiſter, the princeſs Carolina-Matilda. This alliance, though it wore at firſt a very promiſing appearance, had a very unfortunate termination. This is partly attributed to the intrigues of the queen-dowager, mother-in-law to the preſent king, who has a ſon named Frederic, and whom ſhe is repreſented as deſirous of raiſing to the throne. When the princeſs Carolina-Matilda came to Copenhagen, ſhe received her with all the appearance of friendſhip and affection, acquainting her with all the king's faults, and at the ſame time telling her, that ſhe would take every opportunity, as a mother, to aſſiſt her in reclaiming him. By this conduct, ſhe became the depoſitary of all the young queen's ſecrets, whilſt at the ſame time, it is ſaid, ſhe placed people about the king, to keep him conſtantly engaged in all kinds of riot or debauchery. When the king was upon his travels, the queen-dowager uſed frequently to viſit the young queen; and, under the maſk of friendſhip and affection, told her of the exceſſes which the king had fallen into in Holland, England, and France, and perſuaded her not to live with him. But as ſoon as the king returned, the queen gently reproaching him with his conduct, his mother-in-law endeavoured to perſuade the king to give no ear to her counſels, as it was preſumption in a queen of Denmark to direct the king. Matilda now began to diſcover the deſigns of the queen-dowager, and afterwards lived upon good terms with the king. The young queen alſo now aſſumed to herſelf the part which the queen-dowager had been complimented with in the management of public affairs. This ſtung the old queen; and her thoughts were now entirely occupied with ſchemes of revenge. But her views of this kind at firſt appeared the more difficult to carry into execution, becauſe the king had diſplaced ſeveral of her friends who were about the court, who had been increaſing the national debt in times of the moſt profound peace, and who were rioting on the ſpoils of the public. However, ſhe at length found means to gratify her revenge in a very ample manner. About the end of the year 1770, it was obſerved that Brandt and Struenſee were particularly regarded by the king; the former as a favourite, and the latter as a miniſter, and that they paid great court to queen Matilda, and were ſupported by her. This opened a new ſcene of intrigue at Copenhagen; all the diſcarded placemen paid their court to the queen-dowager, and ſhe became the head of the party. Struenſee and Brandt wanted to make a reform in the adminiſtration of the public affairs at once, which ſhould have been the work of time; and thereby made a great number of enemies among thoſe whoſe intereſt it was that things ſhould continue upon the ſame footing that they had been for ſome time before. After this, queen Matilda was delivered of a daughter; but as ſoon as the queen-dowager ſaw her, ſhe, with a malicious ſmile, declared that the

child had all the features of Struenſee: on which her friends publiſhed it among the people, that the queen muſt have had an intrigue with Struenſee, which was corroborated by the queen's often ſpeaking with this miniſter in public. A great variety of evil reports were now propagated; and it was aſſerted, that the governing party had formed a deſign to ſuperſede the king, as being incapable of governing; that the queen was to be declared regent during the minority of her ſon; and that Struenſee was to be her prime-miniſter. Whatever Struenſee did to reform the abuſes of the late miniſtry was repreſented to the people as ſo many attacks upon, and attempts to deſtroy, the government of the kingdom. By ſuch means the people began to be greatly incenſed againſt this miniſter: and as he alſo wanted to make a reform in the military, he gave great offence to the troops, at the head of which were ſome of the creatures of the queen-dowager, who took every opportunity to make their inferior officers believe that it was the deſign of Struenſee to change the whole ſyſtem of government. It muſt be admitted, that this miniſter ſeems in many reſpects to have acted very imprudently, and to have been too much under the guidance of his paſſions: his principles alſo appear to have been of the libertine kind.

Many councils were held between the queen-dowager and her friends upon the proper meaſures to be taken for effectuating their deſigns: and it was at length reſolved to ſurpriſe the king in the middle of the night, and force him immediately to ſign an order, which was to be prepared in readineſs, for committing the perſons before mentioned to ſeparate priſons, to accuſe them of high-treaſon in general, and in particular of a deſign to poiſon or dethrone the king; and if that could not be properly ſupported, by torture or otherwiſe, to procure witneſſes to confirm the report of a criminal commerce between the queen and Struenſee. This was an undertaking of ſo hazardous a nature, that the wary count Moltke and moſt of the queen-dowager's friends excuſed themſelves from taking any open and active part in this affair. However, the queen-dowager at laſt procured a ſufficient number of active inſtruments for the executions of her deſigns. On the 16th of January, 1772, a maſked ball was given at the court of Denmark. The king had danced at this ball, and afterwards played at quadrille with general Gahler, his lady, and counſellor Struenſee, brother to the count. The queen, after dancing as uſual one country dance with the king, gave her hand to count Struenſee during the remainder of the evening. She retired about two in the morning, and was followed by him and count Brandt. About four the ſame morning, prince Frederic, who had alſo been at the ball, went with the queen dowager to the king's bed-chamber, accompanied by general Eichſtedt and count Rantzau. They ordered his majeſty's valet-de-chambre to awake him, and in the midſt of the ſurpriſe that this intruſion excited, they informed him, that queen Matilda and the two Struenſees were at that inſtant buſy in drawing up an act of renunciation of the crown, which they would immediately compel him to ſign: and that the only means to prevent ſo imminent a danger, was to ſign the orders which they had brought with them for arreſting the queen and her accomplices. It is ſaid that the king was not eaſily prevailed upon to ſign theſe orders, but at length complied. Count Rantzau, and three officers, haſtened at that untimely hour to the queen's apartments, and immediately arreſted her. She was put into one of the king's coaches, conveyed to the caſtle of Cronenburgh, together with the infant princeſs, attended by lady Moſtyn, and eſcorted by a party of dragoons. In the mean time, Struenſee and Brandt were alſo ſeized in their beds, and impriſoned in the citadel. Struenſee's brother, and moſt of the members of the late adminiſtration, were ſeized the ſame night, to the number of about eighteen, and thrown into confinement. The government after this ſeemed to be entirely lodged in the hands of the queen-dowager and her ſon, aſſiſted by

by thoſe who had the principal ſhare in the revolution; while the king appeared to be little more than a pageant, whoſe perſon and name it was neceſſary occaſionally to make uſe of. All the officers concerned in the revolution were immediately promoted, and an almoſt total change took place in the departments of adminiſtration. A new council was appointed, in which prince Frederic preſided, and a commiſſion of eight menbers, to examine the papers of the priſoners, and to commence a proceſs againſt them. The ſon of queen Matilda, the prince royal, now entered into the fifth year of his age, was put into the care of a lady of quality, who was appointed governeſs, under the ſuperintendency of the queen-dowager. Struenſee and Brandt were put in irons, and very rigorouſly treated in priſon; they both underwent frequent examinations, and at length received ſentence of death. They were beheaded on the 28th of April, having their right hands previouſly cut off. Struenſee at firſt abſolutely denied having any criminal intercourſe with the queen; but this he afterwards confeſſed: and though he is ſaid to have been induced to do this only by the fear of torture, the proofs of his guilt were eſteemed notorious, and his confeſſions full and explicit. Beſide, no meaſures were adopted by the court of Great Britain to clear up the queen's character in this reſpect.

During the confinement of queen Matilda in the palace of Cronenburgh, ſhe inhabited the governor's apartment, and had permiſſion to walk upon the ſide-batteries, or upon the leads of the tower. She was uncertain of the fate that awaited her; and had great reaſon to apprehend, that the party which had occaſioned her arreſt meditated ſtill more violent meaſures. When the Engliſh miniſter at Copenhagen brought an order for her enlargement, which he had obtained by his ſpirited conduct, ſhe was ſo ſurprized with the unexpected intelligence, that ſhe inſtantly burſt into a flood of tears, embraced him in a tranſport of joy, and called him her deliverer. After a ſhort conference, the miniſter propoſed that her majeſty ſhould immediately embark on board of a ſhip that was waiting to carry her from a kingdom in which ſhe had experienced ſuch a train of misfortunes. But however anxious ſhe was to depart, one circumſtance checked the exceſs of her joy: a few months before her impriſonment, ſhe had been delivered of a princeſs, (as has already been related) whom ſhe ſuckled herſelf. The rearing of this child had been her only comfort; and ſhe had conceived a more than parental attachment to it, from its having been the conſtant companion of her miſery. The infant was at that period afflicted with the meaſles; and, having nurſed it with unceaſing ſolicitude, ſhe was deſirous of continuing her attention and care. All thoſe circumſtances had ſo endeared the child to her, rendered more ſuſceptible of tenderneſs in a priſon than in a court, that when an order for detaining the young princeſs was intimated to her, ſhe teſtified the ſtrongeſt emotions of grief, and could not, for ſome time, be prevailed upon to bid a final adieu. At length, after beſtowing repeated careſſes upon this darling object of her affection, ſhe retired to the veſſel in an agony of deſpair. She remained upon the deck, her eyes immoveably directed towards the palace of Cronenburgh, which contained her child, that had been ſo long her only comfort, until darkneſs intercepted the view. The veſſel having made but little way during night, at day break ſhe obſerved with fond ſatisfaction that the palace was ſtill viſible; and could not be perſuaded to enter the cabin as long as ſhe could diſcover the faineſt glimpſe of the battlements.

It is well known that her majeſty reſided in the city of Zell, in the electoral dominions of his Britannic majeſty, where ſhe was carried off by a malignant fever, on the 10th of May 1775, and in the ſixteenth day of her illneſs; aged 23 years, and 10 months.

Queen Matilda was naturally of a lively diſpoſition, until her misfortunes brought on a ſettled melancholy, which preyed upon her mind. In company ſhe endeavoured to diſſemble her ſorrows, and aſſume a chearfulneſs to which her heart was a

ſtranger. She became extremely fond of ſolitude; and, when alone, indulged her grief in the moſt bitter lamentations. She retained, to her laſt moments, the moſt unaffected attachment to her children in Denmark: with all the anxiety of a parent ſhe made repeated inquiries after them, and was delighted with receiving the minuteſt accounts of their health, amuſements, and education. Having obtained their portraits from Copenhagen, ſhe placed them in her moſt retired apartment, often apoſtrophized them as if they were preſent, and addreſſed them in the tendereſt manner *.

In 1780, his Daniſh majeſty acceded to the armed neutrality propoſed by the empreſs of Ruſſia. He appears to have ſuch a debility of underſtanding, as to diſqualify him for the proper management of public affairs. On the 16th of April, 1784, another court revolution took place. The queen-dowager's friends were removed, a new council formed under the auſpices of the prince royal, ſome of the former old members reſtored to the cabinet, and no regard is to be paid for the future to any inſtrument, unleſs ſigned by the king, and counterſigned by the prince royal †.

HIS DANISH MAJESTY's GERMAN DOMINIONS.

HOLSTEIN, a duchy of Lower Saxony, about 100 miles long and 50 broad, and a fruitful country, was formerly divided between the empreſs of Ruſſia, (termed Ducal Holſtein) the king of Denmark, and the imperial cities of Hamburg and Lubeck: but on the 16th of November 1773, the Ducal Holſtein, with all the rights, privileges, and territorial ſovereignty, was formally transferred to the king of Denmark, by virtue of a treaty between both courts. The duke of Holſtein Gottorp is joint ſovereign of great part of it now with the Daniſh monarch. Kiel is the capital of Ducal Holſtein, and is well built, has a harbour, and neat public edifices. The capital of the Daniſh Holſtein is Gluckſtadt, a well built town and fortreſs, but in a marſhy ſituation on the right of the Elbe, and has ſome foreign commerce.

Altena, a large, populous, and handſome town, of great traffic, is commodiouſly ſituated on the Elbe, in the neighbourhood of Hamburg. It was built in that ſituation, that it might ſhare in the commerce of the former. Being declared a free port, and the ſtaple of the Daniſh Eaſt India Company, the merchants alſo enjoying liberty of conſcience, great numbers flocked to Altena from all parts of the North, and even from Hamburg.

The famous city of Hamburg lies, in a geographical ſenſe, in Holſtein; but is an imperial, free, and Hanſeatic city, lying on the verge of that part of Holſtein called Stormar. It has the ſovereignty of a ſmall diſtrict round it, of about ten miles circuit: it is one of the moſt flouriſhing commercial towns in Europe; and though the kings of Denmark ſtill lay claim to certain privileges within its walls, it may be conſidered as a well regulated commonwealth. The number of inhabitants are ſaid to amount to 180,000; and it is furniſhed with a variety of noble edifices, both public and private: it has two ſpacious harbours, formed by the river Elbe, which runs through the town, and 84 bridges are thrown over its canals.

* Coxe's Travels into Poland, Ruſſia, Sweden, and Denmark, 4to. vol. ii. p. 516—518.

† Chriſtian VII. reigning king of Denmark and Norway, LL. D. and F. R. S. was born in 1749; in 1760 he was married to the princeſs Carolina Matilda of England; and has iſſue Frederic, prince royal of Denmark, born Jan. 28, 1768; Louiſa Auguſta, princeſs royal, born July 7th, 1771; and married to the prince of Sleſwick-Holſtein, May 27, 1786.

Ham-

Hamburg has the good fortune of having been peculiarly favoured in its commerce by Great Britain, with whom it ſtill carries on a great trade. The Hamburghers maintain twelve companies of foot, and one troop of dragoons, beſides an artillery company.

Lubec, an imperial city, with a good harbour, and once the capital of the Hans Towns, and ſtill a rich and populous place, is alſo in this duchy, and governed by its own magiſtrates. It has 20 pariſh churches beſides a large cathedral. Lutheraniſm is the eſtabliſhed religion of the whole duchy.

LAPLAND.

THE northern ſituation of Lapland, and the diviſion of its property, require that I ſhould treat of it under a diſtinct head, and in the ſame method obſerved in other countries.

SITUATION, EXTENT, DIVISION, AND NAME.] The whole country of Lapland extends, ſo far as it is known, from the North Cape in 71 30 N. lat. to the White Sea, under the arctic circle. Part of Lapland belongs to the Danes, and is included in the government of Wardhuys; part to the Swedes, which is the moſt valuable; and ſome parts in the eaſt, to the Muſcovites or Ruſſians. It is needleſs to point out the ſuppoſed dimenſions of each. That belonging to the Swedes may be ſeen in the table of dimenſions given in the account of Sweden: but other accounts ſay, that it is about 100 German miles in length, and 90 in breadth; it comprehends all the country from the Baltic, to the mountains that ſeparate Norway from Sweden. The Muſcovite part lies toward the eaſt, between the lake Enarak and the White Sea. Thoſe parts, notwithſtanding the rudeneſs of the country, are divided into ſmaller diſtricts; generally taking their names from rivers: but, unleſs in the Swediſh part, which is ſubject to a prefect, the Laplanders can be ſaid to be under no regular government. The Swediſh Lapland, therefore, is the object chiefly conſidered by authors in deſcribing this country. It has been generally thought, that the Laplanders are the deſcendants of Finlanders driven out of their own country, and that they take their name from *Lappes*, which ſignifies exiles. The reader, from what has been ſaid in the Introduction, may eaſily conceive that in Lapland, for ſome months in the ſummer, the ſun never ſets; and, during winter, it never riſes: but the inhabitants are ſo well aſſiſted by the twilight, and the aurora borealis, that they never diſcontinue their work through darkneſs.

CLIMATE.] In the winter it is no unuſual thing for their lips to be frozen to the cup in attempting to drink; and in ſome thermometers, ſpirits of wine are concreted into ice: the limbs of the inhabitants very often mortify with cold: drifts of ſnow threaten to bury the traveller, and cover the ground four or five feet deep. A thaw ſometimes takes place, and then the froſt that ſucceeds preſents the Laplander with a ſmooth level of ice, over which he travels with a rein deer in a ſledge with inconceiveable ſwiftneſs. The heats of ſummer are exceſſive for a ſhort time; and the cataracts, which daſh from the mountains, often preſent to the eye the moſt pictureſque appearances.

MOUNTAINS, RIVERS, LAKES, AND FORESTS.] The reader muſt form in idea a maſs of mountains irregularly crowded together, to give him an idea of Lapland: they are, however, in ſome interſtices, ſeparated by rivers and lakes, which contain an incredible number of iſlands, ſome of which form delightful habitations; and are believed by the natives to be the terreſtrial paradiſe: even roſes and other flowers

grow

grow wild on their borders in the ſummer; though this is but a ſhort gleam of temperature, for the climate in general is exceſſively ſevere. Duſky foreſts, and noiſome, unhealthy moraſſes, and barren plains, cover great part of the flat country, ſo that nothing can be more uncomfortable than the ſtate of the inhabitants.

METALS AND MINERALS.] Silver and gold mines, as well as thoſe of iron, copper, and lead, have been diſcovered and worked in Lapland to great advantage; beautiful cryſtals are found here, as are ſome amethyſts and topazes; alſo various ſorts of mineral ſtones, ſurpriſingly poliſhed by the hand of nature; valuable pearls have likewiſe been ſometimes found in the rivers, but never in the ſeas.

QUADRUPEDS, BIRDS, FISHES, AND INSECTS.] We muſt refer to our accounts of Denmark and Norway for great part of this article, as its contents are in common with all the three countries. The *zibelin*, a creature reſembling the martin, is a native of Lapland; and its ſkin, whether black or white, is ſo much eſteemed, that it is frequently given as preſents to royal and diſtinguiſhed perſonages. The Lapland hares grow white in the winter; and the country produces a large black cat, which attends the natives in hunting. The moſt remarkable of the Lapland animals is the *rein deer*, which nature ſeems to have provided to ſolace the Laplanders for the privation of the other comforts of life. This animal, the moſt uſeful perhaps of any in the creation, reſembles the ſtag, only it ſomewhat droops the head, and the horns project forward. All deſcribers of this animal have taken notice of the cracking noiſe that they make when they move their legs, which is attributed to their ſeparating and afterwards bringing together the diviſions of the hoof. The under part is entirely covered with hair in the ſame manner that the claw of the *Ptarmigan* is with feathery briſtles, which is almoſt the only bird that can endure the rigour of the ſame climate. The hoof, however, is not only thus protected; the ſame neceſſity which obliges the Laplanders to uſe ſnow ſhoes, makes the extraordinary width of the rein's hoof to be equally convenient in paſſing over ſnow, as it prevents their ſinking too deep, which they continually would, did the weight of their body reſt only on a ſmall point. This quadruped hath therefore an inſtinct to uſe a hoof of ſuch a form in a ſtill more advantageous manner, by ſeparating it when the foot is to touch the ground ſo as to cover a larger ſurface of ſnow. The inſtant, however, the leg of the animal is raiſed, the hoof is immediatly contracted, and the colliſion of the parts occaſions the ſnapping which is heard on every motion of the rein. And probably the cracking which they perpetually make, may ſerve to keep them together when the weather is remarkably dark. In ſummer, the rein-deer provide themſelves with leaves and graſs, and in the winter they live upon moſs: they have a wonderful ſagacity at finding it out, and when found, they ſcrape away the ſnow that covers it with their feet. The ſcantineſs of their fare is inconceivable, as is the length of the journies, which they can perform without any other ſupport. They fix the rein deer to a kind of ſledge, ſhaped like a ſmall boat, in which the traveller, well ſecured from cold, is laced down, with the reins (which are faſtened to the horns of the animal) in one hand, and a kind of bludgeon in the other, to keep the carriage clear of ice and ſnow. The deer, whoſe harneſſing is very ſimple, ſets out, and continues the journey with prodigious ſpeed; and is generally ſo ſafe and tractable, that the driver is at little trouble in directing him. At night they ſearch for their own provender; and their milk often helps to ſupport their maſter. Their inſtinct in chooſing their road, and directing their courſe, can only be accounted for by their being well acquainted with the country during the ſummer months, when they live in woods. Their fleſh is a well taſted food, whether freſh or dried: their ſkin forms excellent clothing both for the bed and the body: their milk and cheeſe are nutritive and pleaſant; and their inteſtines and tendons ſupply their maſters with thread and cordage. When they run about in the fields, they may be ſhot at as other game. But

it

it is ſaid, that if one is killed in a flock, the ſurvivors will gore and trample him to pieces; therefore ſingle ſtragglers are generally pitched upon. Their ſurpriſing ſpeed (for they are ſaid to run at the rate of 200 * miles a day) ſeems to be owing to their impatience to get rid of their incumbrance. None but a Laplander could bear the uneaſy poſture in which he is placed, when he is confined in one of thoſe carriages or pulkhas; or would believe, that, by whiſpering the rein-deer in the ear, they know the place of their deſtination. But after all theſe abatements, the natives would have difficulty to ſubſiſt without the rein-deer, which ſerve them for ſo many purpoſes.

About autumn, when the lakes of Lapland begin to freeze, the water-fowl, which are found there in great abundance, migrate towards the ſouth; and upon the firſt opening of the ſpring, they return in large flocks to their prior habitations, where they find a plentiful ſubſiſtence from the grubs of the gnats. Theſe grubs too ſerve for the food of the *tetraones* or partridge tribe, thouſands whereof, and even myriads, are daily taken, and ſent to Stockholm. Theſe birds are caught in ſuch large quantities by the Laplanders, as to ſupply them with their ordinary proviſion in autumn, as the eggs of the water-fowl are their ſupport in ſpring †.

"Thoſe who have not ſeen it, will ſcarcely believe what numbers of water-fowl are to be met with; and my watermen would every now and then put into ſhore, to look for the eggs of wild ducks and geeſe amongſt the reeds, which grow here and there upon the river ſide, or in the little iſlands which in ſeveral places are formed in the middle of the river, and that after the manner of the Laplanders, who get vaſt quantities of theſe eggs, and of the wild fowl too, when in ſeaſon; for inſtance, the old ones in winter, and the goſlings and young ducks in ſummer, which they have ſeveral ways of killing; and their prey is in ſuch plenty that ſhould one of them go out a ſhooting for two hours, and not bring home a load of game, he would certainly conclude that ſome enchanter, who bore him a grudge, had, out of mere ſpite, ſpoiled his ſport ‡.

PEOPLE, CUSTOMS, AND MANNERS.] The language of the Laplanders is of Finniſh origin, and comprehends ſo many dialects, that it is with difficulty they underſtand each other. The greater part have neither writing nor letters among them, but a number of hieroglyphics, which they make uſe of in their Rounes, a ſort of ſticks that they call Piſtave, and which ſerve them for an almanack. Theſe hieroglyphics are alſo the marks they uſe inſtead of ſignatures, even in matters of law. Miſſionaries, from the chriſtianized parts of Scandinavia, introduced among them the Chriſtian religion; but they can hardly be ſaid even yet to be Chriſtians, though they have among them ſome religious ſeminaries, inſtituted by the king of Denmark. The majority of the Laplanders practiſe as groſs ſuperſtitions and idolatries as are to be found among the moſt uninſtructed pagans; and ſo abſurd, that they ſcarcely deſerve to be mentioned, were it not that the number and oddities of their ſuperſtitions have induced the northern traders to believe that they are ſkilful in magic and divination. For this purpoſe their magicians make uſe of what they call a drum, made of the hollowed trunk of a fir, pine, or birch-tree, one end of which is covered with a ſkin; on this they draw, with a kind of red colour, the figures of their own gods, as well as of Jeſus Chriſt, the apoſtles, the ſun, moon, ſtars, birds, and rivers; on theſe they place one or two braſs rings, which, when the drum is beaten with a little hammer, dance over the figures; and, according to

* Holberg ſays, the rein-deer, "if he is preſſed, will travel at the rate of ten or twelve Swediſh miles a day (70 or 84 Engliſh miles), but by ſuch hard driving he is generally deſtroyed. It, however, frequently happens, that he will perſevere in his journey 50 miles, without intermiſſion, and without taking any refreſhment." Linnæi Amœnit. Academ. Vol. I. p. 169.

† Holberg.

‡ Mortray's Travels, vol. ii. p. 301.

their progreſs, the ſorcerer prognoſticates. Theſe frantic operations are generally performed for gain; and the northern ſhip-maſters are ſuch dupes to the arts of theſe impoſtors, that they often buy from them a magic cord, which contains a number of knots, by opening of which, according to the magician's directions, they gain what wind they want. This is alſo a very common traffic on the banks of the Red Sea, and is managed with great addreſs on the part of the ſorcerer, who keeps up the price of his knotted taliſman. The Laplanders ſtill retain the worſhip of many of the Teutonic gods; but have among them great remains of the Druidical inſtitutions. They believe the tranſmigration of the ſoul; and have feſtivals ſet apart for the worſhip of certain genii, called Juhles, who they think inhabit the air, and have great power over human actions; but, being without form or ſubſtance, they aſſign to them neither images nor ſtatues.

Agriculture is not much attended to among the Laplanders. They are chiefly divided into Lapland fiſhers, and Lapland mountaineers. The former always make their habitations on the brink, or in the neigbourhood of ſome lake, from whence they draw their ſubſiſtence. The others ſeek their ſupport upon the mountains, and their environs, poſſeſſing herds of rein-deer more or leſs numerous, which they uſe according to the ſeaſon, but go generally on foot. They are excellent and induſtrious herdſmen, and are rich in compariſon of the Lapland fiſhers. Some poſſeſs ſix hundred or a thouſand rein-deer, and have often money and plate beſides. They mark every rein-deer on the ears, and divide them into claſſes; ſo that they inſtantly perceive whether any one is ſtrayed, though they cannot count to ſo great a number as that to which their ſtock often amounts. Thoſe who poſſeſs but a ſmall ſtock, give to every individual a proper name. The Lapland-fiſhers, who are alſo called Laplanders of the woods, becauſe in ſummer they dwell upon the borders of the lakes, and in winter in the foreſts, live by fiſhing and hunting, and chooſe their ſituation by its convenience for either. The greateſt part of them, however, have ſome rein-deer. They are active and expert in the chace: and the introduction of fire-arms among them has almoſt entirely aboliſhed the uſe of the bow and arrow. Beſides looking after their rein-deer, the fiſhery, and the chace, the men employ themſelves in the conſtruction of their canoes, which are ſmall, light, and compact. They alſo make ſledges, to which they give the form of a canoe, harneſs for the rein-deer, cups, bowls, and various other utenſils, which are ſometimes neatly carved, and ſometimes ornamented with bones, braſs, or horn. The employment of the women conſiſts in making nets for the fiſhery, in drying fiſh and meat, in milking the rein-deer, in making cheeſe, and in tanning hides: but it is underſtood to be the buſineſs of the men to look after the kitchen; in which, it is ſaid, the women never interfere.

The Laplanders live in huts in the form of tents. A hut is about twenty-five to thirty feet in diameter, and not much above ſix feet in height. They cover them according to the ſeaſon, and the means of the poſſeſſor; ſome with briars, bark of birch, and linen; others with turf, coarſe cloth, or felt, or the old ſkins of rein-deer. The door is of felt, made like two curtains, which open aſunder. A little place ſurrounded with ſtones is made in the middle of the hut for the fire, over which a chain is ſuſpended to hang the kettle upon. They are ſcarcely able to ſtand upright in their huts, but conſtantly ſit upon their heels round the fire. At night, they lie down quite naked; and, to ſeparate the apartments, they place upright ſticks at ſmall diſtances. They cover themſelves with their clothes, or lie upon them. In winter, they put their naked feet into a fur bag. Their houſehold-furniture conſiſts of iron or copper kettles, wooden cups, bowls, ſpoons, and ſometimes tin, or even ſilver baſons: to theſe may be added the implements of fiſhing and hunting. That they may not be obliged to carry ſuch a number of

things with them in their excurſions, they build in the foreſts, at certain diſtances, little huts, made like pigeon-houſes, and placed upon a poſt, which is the trunk of a tree, cut off at about the height of a fathom or ſix foot from the root. In theſe elevated huts they keep their goods and proviſions; and though they are never ſhut, yet they are never plundered. The rein-deer ſupply the Laplanders with the greateſt part of their proviſions; the chace and the fiſhery ſupply the reſt. Their principal diſhes are the fleſh of the rein-deer, and puddings made of their blood, by putting it either alone, or mixed with wild berries, into the ſtomach of the animal from whence it was taken, in which they cook it for food. But the fleſh of the bear is conſidered by them as moſt delicate meat. They eat every kind of fiſh even the ſea-dog; as well as all ſorts of wild animals, not excepting birds of prey, and carnivorous animals. Their winter proviſions conſiſt chiefly of fleſh and fiſh dried in the open air, which they eat raw. Their common drink is water, ſometimes mixed with milk: they make alſo broths and fiſh ſoups. Brandy is ſcarce with them, but they are extremely fond of it. Whenever they are inclined to eat, the head of the family ſpreads a mat on the ground; and then men and women ſquat round this mat, which is covered with diſhes. Every Laplander carries about him a knife, a ſpoon, and a little cup for drinking. Each has his portion ſeparately given him, that no perſon may be injured; for they are great eaters. Before and after the meal they make a ſhort prayer: and, as ſoon as they have done eating, each gives the other his hand.

In the dreſs of the Laplanders they uſe no kind of linen. In the Flora Lapponica, Linnæus ſays, "Perhaps the curious reader will wonder how the people in Lapland, during the terrible cold that reigns there in winter, can preſerve their lives; ſince almoſt all birds, and even ſome wild beaſts, deſert it at that time. The Laplander, not only in the day, but through the whole winter nights, is obliged to wander about in the woods with his herds of rein-deer. For the rein-deer never come under cover, nor eat any kind of fodder, but a particular kind of *liverwort*. On this account the herdſmen are under a neceſſity of living continually in the woods, in order to take care of their cattle, leſt they ſhould be devoured by wild beaſts. No part of our body is more eaſily deſtroyed by cold than the extremities of the limbs, which are moſt remote from the ſun of this microcoſm, the heart. The kibes that happen to our hands and feet, ſo common in the northern parts of Sweden, prove this. In Lapland you will never ſee ſuch a thing; although, were we to judge by the ſituation of the country, we ſhould imagine juſt the contrary; eſpecially as the people wear no ſtockings, as we do, not only ſingle, but double and triple. The Laplander guards himſelf againſt the cold in the following manner. He wears breeches made of rein-deer ſkins with the hair on, reaching down to his heels, and ſhoes made of the ſame materials, the hairy part turned outwards. He puts into his ſhoes *ſlender-eared*, *broad-leaved*, *cyperus graſs*, *carex veſicaria*. *Spec. Pl.* (or the bladder carex) that is cut in ſummer and dried. This he firſt combs and rubs in his hands, and then places it in ſuch a manner, that it not only covers his feet quite round, but his legs alſo; and being thus guarded, he is quite ſecured againſt the intenſe cold. With this graſs they ſtuff their gloves likewiſe, in order to preſerve their hands. As this graſs keeps off the cold in winter, ſo in ſummer it hinders the feet from ſweating, and at the ſame time preſerves them from being annoyed by ſtriking againſt ſtones, &c. for their ſhoes are very thin, being made, not of tanned leather, but of the raw hide *."

Their doublet is made to fit their ſhape, and open at the breaſt. Over this they wear a cloſe coat with narrow ſleeves; the ſkirts reach to the knees, and is faſtened round them by a leathern girdle, ornamented with plates of tin or braſs. To this

* Stillingfleet's Tracts. p. 137, 138.

girdle they tie their knives, their inſtruments for getting fire, their pipes, and the reſt of their ſmoking apparatus. Their clothes are made of fur, or leather, or of cloth; the cloſe coat is of cloth or leather, always bordered with fur, or bindings of cloth of different colours. Their caps are edged with fur, pointed at top, and the four ſeams adorned with liſts of a different colour from that of the cap. The women wear breeches, ſhoes, doublets, and cloſe coats, in the ſame manner as the men; but their girdle, at which they carry likewiſe the implements for ſmoking tobacco, is commonly embroidered with braſs wire. Their cloſe coat hath a collar, which comes up higher than that of the men. Beſides theſe, they wear handkerchiefs, and little aprons, made of painted cloth, rings on their fingers, and ear-rings, to which they ſometimes hang chains of ſilver, which paſs two or three times round the neck. They are often dreſſed in caps folded after the manner of turbans. They wear alſo caps fitted to the ſhape of the head; and, as they are much addicted to finery, they are all ornamented with the embroidery of braſs wire, or at leaſt with liſt of different colours.

Lapland is but poorly peopled, owing to the general barrenneſs of its ſoil. The number of its inhabitants may amount to about 60,000. Both men and women are in general conſiderably ſhorter than more ſouthern Europeans. Maupertuis meaſured a woman, who was ſuckling her child, whoſe height did not exceed four feet two inches and about a half; they make, however, a much more agreeable appearance than the men, who are often ill-ſhaped and ugly, and their heads too large for their bodies. Their women are complaiſant, chaſte, well-made, and extremely nervous; which is alſo obſervable among the men, although more rarely. It frequently happens, that a Lapland woman will faint away, or even fall into a fit of frenzy, on a ſpark of fire flying towards her, an unexpected noiſe, or the ſudden ſight of an unexpected object, though it is in its own nature not in the leaſt alarming: in ſhort, at the moſt trifling things imaginable. During theſe paroxyſms of terror, they deal about blows with the firſt thing that preſents itſelf; and, on coming to themſelves, are utterly ignorant of all that has paſſed.

When a Laplander intends to marry a female, he, or his friends, court her father with brandy; when, with ſome difficulty, he gains admittance to his fair one, he offers her a beaver's tongue, or ſome other eatable; which ſhe rejects before company, but accepts of in private. Cohabitation often precedes marriage; but every admittance to the fair one is purchaſed by her lover with a bottle of brandy, and this prolongs the courtſhip ſometimes for three years. The prieſt of the pariſh at laſt celebrates the nuptials; but the bridegroom is obliged to ſerve his father-in-law for four years after. He then carries his wife and her fortune home.

COMMERCE.] Little can be ſaid of the commerce of the Laplanders. Their exports conſiſt of fiſh, rein-deer, furs, baſkets, and toys; with ſome dried pikes, and cheeſes, made of rein-deer milk. They receive for theſe, rix-dollars, woollen cloths, linen, copper, tin, flour, oil, hides, needles, knives, ſpirituous liquors, tobacco, and other neceſſaries. Their mines are generally worked by foreigners, and produce no inconſiderable profit. The Laplanders travel in a caravan, with their families, to the Finland and Norway fairs. The reader may make ſome eſtimate of the medium of commerce among them, when he is told, that fifty ſquirrel ſkins, or one fox ſkin, and a pair of Lapland ſhoes, produce one rix-dollar; but no computation can be made of the public revenue, the greateſt part of which is allotted for the maintenance of the clergy. With regard to the ſecurity of their property, few diſputes happen; and their judges have no military to enforce their decrees, the people having a remarkable averſion to war.

SWEDEN.

Extent and Situation.

	Miles.		Degrees.
Length	800	between	56 and 69 North latitude.
Breadth	500		10 and 30 East longitude.

Boundaries and divisions. THIS country is bounded by the Baltic Sea, the Sound, and the Categate, or Scaggerac, on the South; by the impaſſable mountains of Norway, on the Weſt; by Daniſh or Norwegian Lapland, on the North; and by Muſcovy, on the Eaſt. It is divided into ſeven provinces: 1. Sweden Proper. 2. Gothland. 3. Livonia. 4. Ingria. (Theſe two laſt provinces belong now to the Ruſſians, having been conquered by Peter the Great, and ceded by poſterior treaties.) 5. Finland. 6. Swediſh Lapland. And 7. The Swediſh iſlands. Great abatements muſt be made for the lakes and unimproved parts of Sweden, which are ſo extenſive that the habitable part is confined to narrow bounds. The following are the dimenſions given us of this kingdom.

Sweden.	Square Miles. 76,835	Sum total. 228,715	Length.	Breadth.	Capital Cities.
Sweden Proper — —	47,900		342	194	Stockholm, N. Lat. 59—30. E. Long. 19—15.
Gothland — — —	25,975		253	160	Calmar.
Schonen — — —	2,960		77	56	Lunden.
Lapland and W. Bothnia —	76,000	76,835	420	340	Torne. Uma.
Swediſh Finland, and Eaſt Bothnia —	73,000		395	225	Abo. Cajenburg.
Gothland I. — —	1,000		80	23	Wiſby.
Oeland I. — —	560		84	9	Barkholm.
Upper Pomerania, P.	960	150,560	47	24	Stralſund.
Saxony Rugen I.	360	1,320	24	11	Bergen.

Of Sweden Proper, the following are the ſubdiviſions:

Uplandia,	Helſingia,
Sudermania,	Dalecarlia,
Weſtmania,	Medelpedia,
Nericia,	Angermania,
Geſtricia,	Jemptia.

Of Gothland, the following are the ſubdiviſions:

Eaſt Gothland,	Dalia,
Weſt Gothland,	Schonen,
Smaland,	Bleking,
Wermeland,	Halland.

Of Swediſh Lapland, the following are the ſubdiviſions:

Thorne Lapmark,	Pithia Lapmark,
Kimi Lapmark,	Uma Lapmark.
Lula Lapmark,	

The principal places in Weſt Bothnia are Umea, Pitea, and Tornea.

Of Finland, the following are the ſubdiviſions:

Eaſt Bothnia,	Nyland,
Cajania,	Travaſtia,
Savoloxia,	Finland Proper.

The Swediſh iſles are Gothland, Oeland, Aland, and Rugen.

The face of Sweden is pretty ſimilar to thoſe of its neighbouring countries; only it has the advantage of navigable rivers.

CLIMATE AND SEASONS, SOIL AND PRODUCTIONS. The ſame may be ſaid with regard to this article. Summer burſts from winter; and vegetation is more ſpeedy than in ſouthern climates; for the ſun is here ſo hot, as ſometimes to ſet foreſts on fire. Stoves and warm furs mitigate the cold of winter, which is ſo intenſe, that the noſes and extremities of the inhabitants are ſometimes mortified; and in ſuch caſes, the beſt remedy that has been found out, is rubbing the affected part with ſnow. The Swedes, ſince the days of Chares XII. have been at incredible pains to correct the native barrenneſs of their country, by erecting Colleges of Agrieulture, and in ſome places with great ſucceſs. The ſoil is much the ſame with that of Denmark, and ſome parts of Norway, generally very bad, but in ſome vallies ſurpriſingly fertile. The Swedes, till of late years, had not induſtry ſufficient to remedy the one, nor improve the other. The peaſants now follow the agriculture of France and England; and ſome late accounts ſay, that they raiſe almoſt as much grain as maintains the natives. Gothland produces wheat, rye, barley, oats, peas, and beans; and in caſe of deficiency, the people are ſupplied from Livonia and the Baltic provinces. In ſummer, the fields are verdant, and covered with flowers, and produce ſtrawberries, raſberries, currants, and other ſmall fruits. The common people know little of the cultivation of apricots, peaches, nectarines, and the like high-flavoured fruits; but melons are brought to great perfection in dry ſeaſons.

MINERALS AND METALS.] Sweden produces cryſtals, amethyſts, topazes, porphyry, lapis-lazuli, agate, cornelian, marble, and other foſſils. The chief wealth of Sweden ariſes from her mines of ſilver, copper, lead, and iron. The laſt mentioned metal employs no fewer than 450 forges, hammering-mills, and ſmelting houſes. A kind of a gold mine has likewiſe been diſcovered in Sweden, but ſo inconſiderable, that from the year 1741 to 1747, it produced only 2,398 gold ducats, each valued at 9s. 4d. ſterling. The firſt gallery of one ſilver mine is 100 fathoms below the ſurface of the earth; the roof is ſupported by prodigious oaken beams; and from thence the miners deſcend about 40 fathoms to the loweſt vein. This mine is ſaid to produce 20,000 crowns a year. The product of the copper-mines is uncertain; but the whole is loaded with great taxes and reductions to the government, which has no other reſources for the exigencies of the ſtate. Theſe ſubterraneous manſions are aſtoniſhingly ſpacious, and at the ſame time commodious for their inhabitants, ſo that they ſeem to form a hidden world. The water-falls in Sweden afford excellent conveniency for turning mills for forges; and for ſome years the exports of Sweden for iron brought in 300,000l. ſterling. Dr. Buſching thinks that they conſtituted two-thirds of the national revenue. It muſt be obſerved, that the extortions of the Swediſh government, and the importation of American bar-iron into Europe, and ſome other cauſes, have greatly diminiſhed this manufacture in Sweden; ſo that the Swedes may be obliged to apply themſelves to other branches of trade and improvements, eſpecially in agriculture.

ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL. A few leagues from Gottenburg is a hideous precipice, down which a dreadful cataract of water ruſhes with ſuch impetuoſity, from the height into ſo deep a bed of water,

ter, that maſts, and other bodies of timber, precipitated down it, diſappear, ſome for half an hour, and others for an hour, before they are recovered: the bottom of this bed has never been found, though ſounded by lines of ſeveral hundred fathoms. A remarkable ſlimy lake, which ſinges things put into it, has been found in the ſouthern part of Gothland: and ſeveral parts of Sweden contain a ſtone, which being of a yellow colour, intermixed with ſeveral ſtreaks of white, as if compoſed of gold and ſilver, affords ſulphur, vitriol, alum, and minium. The Swedes have a manuſcript copy of a tranſlation of the Goſpels into Gothic, done by a biſhop 1300 years ago. In the arſenal at Stockholm is the ſkin of the horſe which Guſtaphus Adolphus rode at the battle of Lutzen, and the cloaths worn by Charles XII. when he was ſhot at Fredericſhall.

SEAS.] Their ſeas are the Baltic, and the gulfs of Bothnia and Finland, which are arms of the Baltic; and on the weſt of Sweden are the Categate ſea, and the Sound, a ſtrait about four miles over which divides Sweden from Denmark.

Theſe ſeas have no tides, and are frozen up uſually four months in the year; nor are they ſo ſalt as the ocean, never mixing with it, becauſe a current ſets always out of the Baltic ſea into the ocean.

QUADRUPEDS, BIRDS, AND FISHES.] Theſe differ little from thoſe already deſcribed in Norway and Denmark; only the Swediſh horſes are more ſerviceable in war than the German. The Swediſh hawks, when carried to France, have been known to reviſit their native country; as appears from one that was killed in Finland, with an inſcription on a ſmall gold plate, ſignifying that he belonged to the French king. The fiſhes found in the rivers and lakes of Sweden are the ſame with thoſe in other northern countries, and taken in ſuch quantities, that their pikes (particularly) are ſalted and pickled for exportation. The train-oil of the ſeals taken in the gulf of Finland, is a conſiderable article of exportation.

INHABITANTS, MANNERS, AND CUSTOMS.] There is a great diverſity of characters among the people of Sweden; and what is peculiarly remarkable, they are known to have had different characters in different ages. At preſent, their peaſants ſeem to be a heavy plodding race of men, ſtrong and hardy; but without any other ambition than that of ſubſiſting themſelves and their families: the mercantile claſſes are much of the ſame caſt; but great application and perſeverance is diſcovered among them all. One could form no idea that the modern Swedes are the deſcendants of thoſe, who, under Guſtavus Adolphus and Charles XII. carried terror in their names through diſtant countries, and ſhook the foundations of the greateſt empires. The intrigues of their ſenators dragged them to take part in the late war againſt Pruſſia; yet their behaviour was ſpiritleſs. The nobility and gentry of Sweden are naturally brave, polite and hoſpitable; they have high notions of honour, and are jealous of their national intereſts. The dreſs, exerciſes, and diverſions of the common people, are almoſt the ſame with thoſe of Denmark: the better ſort are infatuated with French modes and faſhions. They are not fond of marrying their daughters when young, as they have little to ſpare in their own lifetime. The women go to plough, threſh out the corn, row upon the water, ſerve the bricklayers, carry burdens, and do all the common drudgeries in huſbandry.

RELIGION.] Chriſtianity was introduced here in the 9th century. Their religion is Lutheran, which was propagated among them by Guſtavus Vaſa, about the year 1523. The Swedes are ſurpriſingly uniform and unremitting in religious matters; and have ſuch an averſion to popery, that caſtration is the fate of every Roman catholic prieſt diſcovered in their country. The archbiſhop of Upſal has a revenue of about 400l. a year; and has under him 13 ſuffragans, beſides ſuperintendants, with moderate ſtipends. No clergyman has the leaſt direction in affairs of ſtate; but their morals, and the ſanctity of their lives, endear them ſo much to the people, that the government would repent making them its enemies. Their

churches

churches are neat, and often ornamented. A body of eccleſiaſtical laws and canons direct their religious œconomy. A converſion to popery, or a long continuance under excommunication, which cannot paſs without the king's permiſſion, is puniſhed by impriſonment and exile.

LANGUAGE, LEARNING, AND LEARNED MEN.] The Swediſh language is a dialect of the Teutonic, and reſembles that of Denmark. The paſſion of the famous queen Chriſtina for literature is well known to the public, and ſhe may be accounted to have been a genius in many branches of knowledge. The Swediſh nobility and gentry are, in general, more converſant in polite literature than thoſe of many other more flouriſhing ſtates. They have lately exhibited ſome ſpecimens of their munificence for the improvement of literature; witneſs their ſending, at the expence of private perſons, that excellent and candid natural philoſopher Haſſelquiſt, into the eaſtern countries for diſcoveries, where he died. This noble ſpirit is eminently encouraged by the royal family; and her Swediſh majeſty purchaſed, at no inconſiderable expence for that country, all Haſſelquiſt's collection of curioſities. That able civilian, ſtateſman, and hiſtorian Puffendorff, was a native of Sweden; and ſo was the late celebrated Linnæus, whoſe memory will be ever dear to all the lovers of ſcience, but particularly the ſcience of botany.

The name of Linnæus may be claſſed amongſt thoſe of Newton, Boyle, Locke, Haller, Euler, and other great philoſophers, who were friends to religion: he always teſtified in his converſations, writings, and actions, the higheſt reverence for the Supreme Being; and was ſo ſtrongly impreſſed with the idea of omnipreſence, that he wrote over the door of his ſtudy: *Innocui vivite, numen adeſt.*

The great merits of Linnæus as a naturaliſt are to be eſtimated from the rude ſtate in which he found all the branches of natural hiſtory, and the perfection to which he carried them; in drawing order from confuſion, and perſpicuity from darkneſs: his underſtanding comprehenſive, yet accurate, was capable of combining and arranging an almoſt infinite variety of objects, which the magnitude of the greateſt could not fatigue, nor the inſignificance of the ſmalleſt elude. The mere catalogue of his works would make an ordinary pamphlet; and it would require no ſmall volume to trace even the outlines of his ſyſtem, now diſtinguiſhed by the appellation of Linnæan, which new methodized and reformed the whole compaſs of natural hiſtory. In theſe extenſive and various purſuits, we know not which to admire moſt, his intimate knowledge, his fertility of invention, his indefatigable induſtry, his ſcientific arrangement, or that wonderful exactneſs in diſcriminating, where the minuteſt ſhades of difference are ſcarcely perceptible *.

Even in the midſt of the late diſtractions of Sweden, the fine arts, particularly drawing, ſculpture, and architecture, were encouraged and protected. Agricultural learning, both in theory and practice, is now carried to a conſiderable height in that kingdom; and the character given by ſome writers, that the Swedes are fitted only for bodily labour, is in a great meaſure owing to their having no opportunity of exerting their talents.

UNIVERSITIES.] The principal is that of Upſal, inſtituted near 400 years ago, and patronized by ſeveral ſucceſſive monarchs, particularly by the great Guſtavus Adolphus, and his daughter queen Chriſtina. The ſtudents in this univerſity are numerous; but do not inhabit, as in our univerſities, any diſtinct college or col-

* The reader, who is deſirous of further intelligence concerning this great naturaliſt, will find his curioſity amply gratified from the peruſal of Dr. Pulteney's "General View of the Writings of Linnæus." In that excellent publication the ingenious author has detailed a liſt of his numerous works, methodically claſſed according to the æra of their appearance, to which is ſubjoined a critical account of their contents. He has alſo traced the progreſs, and laid open the leading principles of the Linnæan ſyſtem, with a maſterly preciſion and accuracy, which could only be derived from the moſt perfect knowledge of the ſubject. See alſo Coxe's Travels, 4to. vol. ii. p. 428—448.

leges,

leges, there being no buildings for their accommodation, but lodge in the town; and repair to the general or public lectures, given by the ſeveral profeſſors, either at their own houſes, or at the public halls appropriated to ſuch purpoſes. The poorer ſtudents are aſſiſted in their expences, by being appointed to ſcholarſhips, the higheſt of which amount to about 13l. per annum. The profeſſors in different branches of literature are about twenty-two; of whom the principal are thoſe of divinity, eloquence, botany, anatomy, chemiſtry, natural philoſophy, aſtronomy, and agriculture. Their ſalaries are from 70l. to 100l. per annum. This univerſity, juſtly called by Stillingfleet, "that great and hitherto unrivalled ſchool of natural hiſtory," is certainly the firſt ſeminary of the North for academical education; and has produced, from the time of its inſtitution, perſons eminent in every branch of ſcience. The learned publications, which have lately been given to the world by its members, ſufficiently prove the flouriſhing ſtate of literature in theſe parts; and the theſes, compoſed by the ſtudents upon their admiſſion to their degrees, would form a very intereſting collection. Many of theſe tracts upon various ſubjects of polite literature, antiquities, languages, &c. evidence the erudition and taſte of the reſpective authors: among the works of this ſort, which have widely diffuſed the fame of this learned ſociety throughout Europe, are the *Amœnitates Academicæ*, or a Collection of Theſes upon Natural Hiſtory, held under the celebrated Linnæus, and chiefly ſelected by that able maſter. There is another univerſity at Abo, in Finland, but not ſo well endowed, nor ſo flouriſhing, and a third at Lunden, in Schonen, which is fallen into decay. Every dioceſe is provided with a free-ſchool, in which boys are qualified for the univerſity †.

MANUFACTUES, TRADE, COMMERCE, AND CHIEF TOWNS. The Swediſh commonalty ſubſiſt by agriculture, mining, grazing, hunting, and fiſhing. Their materials for traffic are bulky and uſeful commodities of maſts, beams, deal-boards, and other ſorts of timber for ſhipping; tar, pitch, bark of trees, potaſh, wooden utenſils, hides, flax, hemp, peltry, furs, copper, lead, iron, cordage, and fiſh. Even the manufacturing of iron was introduced into Sweden ſo late as the 16th century; for till that time they ſold their crude ore to the Hanſe towns, and brought it back again manufactured into utenſils. About the middle of the 17th century, by the aſſiſtance of the Dutch and Flemings, they ſet up ſome manufactures of glaſs, ſtarch, tin, woollen, ſilk, ſoap, leather-dreſſing, and ſaw-mills. Bookſelling was at that time a trade unknown in Sweden. They have ſince had ſugar-baking, tobacco-plantations, and manufactures of ſail-cloth, cotton, fuſtian, and other ſtuffs; of linen, alum, and brimſtone; paper-mills, and gunpowder-mills; vaſt quantities of copper, braſs, ſteel, and iron, are now wrought in Sweden. They have alſo founderies for cannon, forges for fire-arms and anchors, armories, wire and flatting-mills; mills alſo for fulling, and for boring and ſtamping; and of late they have built many ſhips for ſale.

Certain towns in Sweden, 24 in number, are called Staple-towns, where the merchants are allowed to import and export commodities in their own ſhips. Thoſe towns which have no foreign commerce, though lying near the ſea, are called land-towns. A third kind are termed mine-towns, as belonging to the mine diſtricts. The Swedes, about the year 1752, had greatly increaſed their exports, and diminiſhed their imports, moſt part of which arrive, or are ſent off in Swediſh ſhips: the Swedes having a navigation-act, like that of the Engliſh. Theſe promiſing appearances were, however, blaſted by the jealouſies of the Swediſh government.

Stockholm is a ſtaple-town, and the capital of the kingdom; it ſtands about 760 miles north-eaſt from London, upon ſeven ſmall rocky iſlands, beſides two penin-

† An academy of arts and ſciences was ſome years ſince eſtabliſhed at Stockholm, and is now in a flouriſhing condition. They have publiſhed ſeveral volumes of memoirs, which have been well received by the public.

ſulas, and built upon piles. It ſtrikes a ſtranger with its ſingular and romantic ſcenery. A variety of contraſted and enchanting views are formed by numberleſs rocks of granite riſing boldly from the ſurface of the water, partly bare and craggy, partly dotted with houſes, or feathered with wood. The harbour, which is ſpacious and convenient, though difficult of acceſs, is an inlet of the Baltic: the water is clear as chryſtal, and of ſuch depth, that ſhips of the largeſt burthen can approach the quay, which is of conſiderable breadth, and lined with ſpacious buildings and warehouſes. At the extremity of the harbour, ſeveral ſtreets riſe one above another in the form of an amphitheatre; and the palace, a magnificent building, crowns the ſummit. Towards the ſea, about two or three miles from the town, the harbour is contracted into a narrow ſtrait, and, winding among high rocks, diſappears from the ſight; and the proſpect is terminated by diſtant hills, overſpread with foreſt. It is far beyond the power of words, or of the pencil, to delineate theſe ſingular views. The central iſland, from which the city derives its name, and the Ritterholm, are the handſomeſt parts of the town.

Excepting in the ſuburbs, where the houſes are of wood painted red, the generality of the buildings are of ſtone, or brick ſtuccoed white. The royal palace, which ſtands in the centre of Stockholm, and upon the higheſt ſpot of ground, was begun by Charles XI. it is a large quadrangular ſtone edifice, and the ſtyle of architecture is both elegant and magnificent ‡. The number of houſekeepers, who pay taxes, are 60,000. This city is furniſhed with all the exterior marks of magnificence, and erections for manufactures and commerce (particularly a national bank, the capital of which is 466,666l. 13s. 4d. ſterling), that are common to other great European cities.

GOVERNMENT.] The government of Sweden has undergone many changes. The Swedes, like the Danes, were originally free, and during the courſe of many centuries the crown was elective; but after various revolutions, Charles XII. who was killed in 1718, became deſpotic. He was ſucceeded by his ſiſter Ulrica; who conſented to the abolition of deſpotiſm, and reſtored the ſtates to their former liberties; and they, in return, aſſociated her huſband, the landgrave of Heſſe-Caſſel, with her in the government. A new model of the conſtitution was then drawn up, by which the royal power was brought, perhaps, too low; for the king of Sweden could ſcarcely be called by that name, being limited in every exerciſe of government, and even in the education of his children. The diet of the ſtates appointed the great officers of the kingdom; and all employments of any value, eccleſiaſtical, civil, or military, were conferred by the king only with the approbation of the ſenate. The eſtates were formed of deputies from the four orders, nobility, clergy, burghers, and peaſants. The repreſentatives of the nobility, which included the gentry, amounted to above 1000, thoſe of the clergy to 200, the burghers to about 200, and the peaſants to 200. Each order ſat in its own houſe, and had its own ſpeaker, and each choſe a ſecret committee, for the diſpatch of buſineſs. The ſtates were to be convoked once in three years, in the month of January; and their collective body had greater powers than the parliament of Great Britain, becauſe the king's prerogative was more bounded.

When the ſtates were not ſitting, the affairs of the public were managed by the king and the ſenate, which were no other than a committee of the ſtates, but choſen in a particular manner; the nobility, or upper houſe, appointed 24 deputies, the clergy 12, and the burghers 12; theſe choſe three perſons, who were to be preſented to the king, that he might nominate one out of the three for each vacancy. The peaſants had no vote in electing a ſenate. Almoſt all the executive power was lodged in the ſenate, which conſiſted of 14 members, beſides the chief go-

‡ Coxe, vol. ii. p. 327, 328.

vernors

vernors of the provinces, the preſident of the chancery, and the grand marſhal. Thoſe ſenators, during the receſs of the ſtates, formed the king's privy council; but he had no more than a caſting vote in their deliberations. Appeals lay to them from different courts of judicature; but each ſenator was accountable for his conduct to the ſtates. Thus, upon the whole, the government of Sweden might be called republican, for the king's power was not ſo great as that of a Dutch ſtadtholder. The ſenate had even a power of impoſing upon the king a ſub-committee of their number, who were to attend upon his perſon, and to be a check upon all his proceedings, down to the very management of his family. It would be endleſs to recount the numerous ſubordinate courts, boards, commiſſions, and tribunals, which the jealouſy of the Swedes had introduced into the adminiſtration of civil, military, commercial, and other departments. Their officers and miniſters, under the notion of making them checks upon one another, were multiplied to an inconvenient degree; and the operations of government were greatly retarded, if not rendered ineffectual, by the tedious forms through which they muſt paſs.

But in Auguſt, 1772, the whole ſyſtem of the Swediſh government was totally changed by the preſent king, in the moſt unexpected manner. Some of the circumſtances which attended this revolution, will be found at the cloſe of our review of the hiſtory of Sweden. By that event, the Swedes, inſtead of having the defects of their conſtitution rectified, found their king inveſted with a degree of authority little inferior to that of the moſt deſpotic princes of Europe. By the new form of government, the king is to aſſemble and ſeparate the ſtates whenever he pleaſes; he is to have the ſole diſpoſal of the army, the navy, finances, and all employments civil and military; and though the king does not openly claim a power of impoſing taxes on all occaſions, yet ſuch as already ſubſiſt are to be perpetual; and in caſe of invaſion, or preſſing neceſſity, the king may impoſe ſome taxes till the ſtates can be aſſembled. But of this neceſſity he is to be the judge, and the meeting of the ſtates depends upon his pleaſure: and when they are aſſembled, they are to deliberate upon nothing but what the king thinks proper to lay before them. It is eaſy to diſcern, that a government thus conſtituted, can be little removed from one of the moſt deſpotic kind. However, the Swediſh nation is ſtill amuſed with ſome ſlight appearances of a legal and limited government; for in the new ſyſtem, which conſiſts of fifty-ſeven articles, a ſenate is appointed, conſiſting of ſeventeen members, comprehending the great officers of the crown, and the governor of Pomerania; and they are required to give their advice in all the affairs of the ſtate, whenever the king ſhall demand it. In that caſe, if the queſtions agitated are of great importance, and the unanimous advice of the ſenators ſhould be contrary to the opinion of the king, the king, it is ſaid, ſhall follow their advice. But this, it may be obſerved, is a circumſtance that can hardly ever happen, that all the members of a ſenate, conſiſting chiefly of officers of the crown, ſhould give their opinions againſt the king; and in every other caſe the king is to hear their opinions, and then to act as he thinks proper. There are ſome other apparent reſtraints of the regal power in the new ſyſtem of government, but they are in reality very inconſiderable. It is ſaid that the king cannot eſtabliſh any new law, nor aboliſh any old one, without the knowledge and conſent of the ſtates: but the king of Sweden, according to the preſent conſtitution, is inveſted with ſo much authority, power, and influence, that it is hardly to be expected that any perſon will venture to make an oppoſition to whatever he ſhall propoſe.

Punishments.] The common method of execution in Sweden is beheading and hanging; for murder, the hand of the criminal is firſt chopped off, and he is then beheaded and quartered: women, after beheading, inſtead of being quartered, are burned. No capital puniſhment is inflicted without the ſentence being

confirmed by the king. Every priſoner is at liberty to petition the king, within a month after the trial. The petition either complains of unjuſt condemnation, and in ſuch a caſe demands a reviſal of the ſentence; or elſe prays for pardon, or a mitigation of puniſhment. Malefactors are never put to death, except for very atrocious crimes, ſuch as murder, houſebreaking, robbery upon the highway, or repeated thefts. Other crimes, many of which in ſome countries are conſidered as capital, are chiefly puniſhed by whipping, condemnation to live upon bread and water, impriſonment and hard labour, either for life, or for a ſtated time, according to the nature of the crime. Criminals were tortured to extort confeſſion till the reign of the preſent king; but, in 1773, his Swediſh majeſty aboliſhed this cruel and abſurd practice.

POTITICAL INTERESTS OF SWEDEN.] In the reign of Guſtavus Vaſa, a treaty of alliance took place between Sweden and France; and Sweden entered into a ſubſidiary treaty with that crown, in the reign of Guſtavus Adolphus. In conſequence of theſe treaties, France by degrees acquired an aſcendancy in Sweden, which was very pernicious to the intereſts of the kingdom. During the reign of Charles the XIth and Charles the XIIth, Sweden was ſacrificed to the intereſt of France; and during the laſt war with the king of Pruſſia, for the ſake of a ſmall ſubſidy from France, the crown of Sweden was forced to contract a debt of 3,500,000l. which has ſince been conſiderably augmented: ſo that this debt now amounts to near five millions. Some of their wiſeſt men perceived the miſchievous tendency of their connection with France, and endeavoured to put an end to it. But the influence of the French court in Sweden, in conſequence of their ſubſidies and intrigues, has occaſioned conſiderable factions in that kingdom. In 1738, a moſt powerful party appeared in the diet in favour of French meaſures. The perſons who compoſed it went under the denomination of *Hats*. The object they held out to the nation was, the recovery of ſome of the dominions yielded to Ruſſia; and conſequently the ſyſtem they were to proceed upon, was to break with that power, and connect themſelves with France. The party directly oppoſed to them was headed by count Horn, and thoſe who had contributed to eſtabliſh the new form of government, which was ſettled after the death of Charles XII. Their object was peace, and the promotion of the domeſtic welfare of the nation. The ſyſtem, therefore, which they adopted, was to maintain a cloſe correſpondence with Ruſſia, and to avoid all farther connection with France. Theſe were ſtyled the *Caps*. There was beſides a third party, called the *Hunting Caps*, compoſed of perſons who were as yet undetermined to which of the other two they would join themſelves. Theſe parties long continued, but the French party generally prevailed. Some efforts were employed by the Engliſh court to leſſen or deſtroy the French influence in Sweden, and for ſome time they were ſucceſsful: but the Hat party again acquired the aſcendancy. Theſe parties are now aboliſhed, in conſequence of the preſent king of Sweden having made ſuch a total change in the conſtitution of government. And as, whatever reaſon his ſubjects may have to complain on account of the power he has aſſumed, he is certainly a prince of penetration and abilities, it is probable, that when his own intereſts and thoſe of his ſubjects do not interfere, he will attend to the advantage of the nation. His ſagacity, there is reaſon to conclude, will lead him to promote the external political intereſts of Sweden; and he may, perhaps, be contented, to obſerve a ſtrict neutrality with regard both to Denmark and Ruſſia.

REVENUE AND COIN.] The revenue of Sweden, ſince the unfortunate wars of Charles XII. and with the Ruſſians ſince, has been greatly reduced. Livonia, Bremen, Verden, and other places that kingdom was ſtripped off, contained about 78,000 ſquare miles. Her gold and ſilver ſpecie, in the late reign, aroſe chiefly from the king's German dominions. Formerly the crown-lands, poll-money,

tithes, mines, and other articles, are ſaid to have produced a million ſterling. The payments, that are made in copper, which was till lately the chief medium of commerce, is extremely inconvenient, ſome of thoſe pieces being as large as tiles; and a cart or wheelbarrow is often required to carry home home a moderate ſum. The Swedes, however, have gold ducats, and eight-mark pieces of ſilver, valued each at 5s. 2d. but theſe are ſcarce, and the inhabitants of Sweden have little ſpecie in circulation; large pieces of copper ſtamped, and ſmall bank notes being almoſt their only circulating money.

STRENGTH AND FORCES.] No country in the world has produced greater heroes, or braver troops, than the Swedes; and yet they cannot be ſaid to maintain a ſtanding army, as their forces conſiſt of a regulated militia. The cavalry is cloathed, armed, and maintained, by a rate raiſed upon the nobility and gentry, according to their eſtates; and the infantry by the peaſants. Each province is obliged to find its proportion of ſoldiers, according to the number of farms it contains; every farm of 60 or 70l. per annum is charged with a foot-ſoldier, furniſhing him with diet, lodging, and ordinary clothes, and about 20s. a year in money; or elſe a little wooden houſe is built for him by the farmer, who allows him hay and paſturage for a cow, and ploughs and ſows land enough to ſupply him with bread. When embodied, they are ſubject to military law, but otherwiſe to the civil law of the country. It may therefore literally be ſaid, that every Swediſh ſoldier has a property in the country he defends. This national army is thought to amount to above 40,000 men, and Sweden formerly could have fitted out 40 ſhips of the line; but of late years their ſhips, together with their docks, have been ſuffered greatly to run to decay.

ROYAL STYLE.] The king's ſtyle is king of the Goths and Vandals, great prince of Finland, duke of Schonen, Pomerania, &c.

ORDERS OF KNIGHTHOOD.] Theſe are, the order of the *North Star*, conſiſting of 24 members; the order of *Vaſa*; and the order of the *Sword*; the laſt created in 1772.

HISTORY OF SWEDEN.] The Goths, the ancient inhabitants of this country, joined by the Normans, Danes, Saxons, Vandals, &c. have had the reputation of ſubduing the Roman empire, and all the ſouthern nations of Europe. I ſhall not here follow the romances of Swediſh hiſtorians through the early ages, from Magog, the great grand-ſon of Noah. It is ſufficient to ſay, that Sweden has as good a claim to be an ancient monarchy as any we know of. The hiſtory of Sweden, and indeed of all the northern nations, even during the firſt ages of Chriſtianity, is confuſed, unintereſting, and often doubtful; but replete with murders, maſſacres, and ravages. That of Sweden is void of conſiſtency, till about the middle of the fourteenth century, when it aſſumes an appearance more regular. At this time the government of the Swedes was far from being clearly aſcertained, or uniformly adminiſtered. The crown was elective, though in this election the rights of blood were not altogether diſregarded. The great lords poſſeſſed the moſt conſiderable part of the wealth of the kingdom, which conſiſted chiefly in land; commerce being unknown or neglected, and even agriculture in a very rude and imperfect ſtate. The clergy, particularly thoſe of a dignified rank, from the great reſpect paid to their characters among the inhabitants of the North, had acquired an influence in all public affairs, and obtained poſſeſſions of what lands had been left unoccupied by the nobility. Theſe two ranks of men, enjoying all the property of the ſtate, formed a council called the Senate, which was maſter of all public deliberations. This ſyſtem of government was extremely unfavourable to the national proſperity. The Swedes periſhed in the diſſentions between their prelates and lay-barons, or between thoſe and their ſovereign; they were drained of the little riches they poſſeſſed, to ſupport the indolent pomp of a few biſhops; and, what was more fatal, the unlucky ſituation of their internal affairs expoſed them to the inroads and oppreſſion of a

foreign enemy. The Danes, by their neighbourhood and power, were able to avail themſelves of the diſſenſions in Sweden, and to ſubject, under a foreign yoke, a country weakened and exhauſted by its domeſtic broils. In this deplorable ſituation Sweden remained for more than two centuries; ſometimes under the nominal ſubjection of its own princes, ſometimes united to the kingdom of Denmark, and in either caſe equally oppreſſed and inſulted.

Magnus Ladeſlaus, crowned in 1276, was the firſt king of Sweden who purſued a regular ſyſtem to increaſe his authority; and to ſucceed in this, he made the augmentation of the revenues of the crown his principal object. He was one of the ableſt princes who ever ſat on the Swediſh throne; by his addreſs he prevailed upon the convention of eſtates to make very extraordinary grants to him for the ſupport of his royal dignity. The augmentation of the revenues of the crown was followed by a proportional increaſe of the regal power; and, by the ſteady and vigorous exertion of this power, Magnus humbled the haughty ſpirit of his nobles, and created in the reſt of the nation a reſpect for the royal dignity, with which they appear before to have been but little acquainted; he, at the ſame time, by employing his authority in many reſpects for the public good, reconciled his ſubjects to acts of power, which in former monarchs they would have oppoſed with the utmoſt violence. The ſucceſſors of Magnus did not maintain their authority with equal ability; and ſeveral revolutions followed, which threw the nation into great diſorder and confuſion, and the government was for a long time in an unſettled ſtate.

In the year 1387, Margaret, daughter of Valdemar, king of Denmark, and widow of Huguin, king of Norway, reigned in both theſe kingdoms. That princeſs, to the ordinary ambition of her ſex, added a penetration and enlargement of mind, which rendered her capable of conducting the greateſt and moſt complicated deſigns. She found means to reduce by arms, or by intrigue, an immenſe extent of territory; and became queen of Denmark, Norway, and Sweden, being elected to this laſt in 1394. She projected the union of Calmar, ſo famous in the North, by which theſe kingdoms were for the future to remain under one ſovereign, elected by each kingdom in its turn, and who ſhould divide his reſidence between them all. Several revolutions enſued after the death of Margaret; and at length Chriſtian II. the laſt king of Denmark, who, by virtue of the treaty of Calmar, was alſo king of Sweden, engaged in a ſcheme to render himſelf entirely abſolute. The policy by which he attempted to effect this deſign, proved the deſtruction of himſelf, and afforded an opportunity for changing the face of affairs in Sweden. To eſtabliſh his authority in that kingdom, he laid a plot for maſſacreing the principal nobility. This horrid deſign was actually carried into execution, November 8, 1520. Of all thoſe who could oppoſe the deſpotic purpoſes of Chriſtian, no one remained in Sweden but Guſtavus Vaſa, a young prince, deſcended of the ancient kings of that country, and who had ſignalized his arms againſt the king of Denmark. A price was laid on his head. The Daniſh ſoldiers were ſent in purſuit of him; but by his dexterity he eluded all their attempts, and eſcaped, under the diſguiſe of a peaſant, to the mountains of Dalecarlia. This is not the place to relate his dangers and fatigues, how to prevent his diſcovery he wrought in the braſs-mines, how he was betrayed by thoſe in whom he repoſed his confidence, and in fine, ſurmounting a thouſand obſtacles, engaged the ſavage but warlike inhabitants of Dalecarlia to undertake his cauſe, to oppoſe, and to conquer his tyrannical oppreſſor. Sweden, by his means, again acquired independence. Guſtavus was at the head of a victorious army, who admired his valour, and was attached to his perſon. He was created therefore firſt adminiſtrator, and afterwards king of Sweden, by the univerſal conſent of the whole nation. His circumſtances were much more favourable than thoſe of any former prince who had poſſeſſed this dignity.

The maſſacre of the nobles had rid him of thoſe proud and haughty enemies, who had long been the bane of all regular government in Sweden. The clergy, were no leſs powerful and dangerous; but the opinions of Luther, which began at this time to prevail in the North, and the credit which they had acquired among the Swedes, gave him an opportunity of changing the religious ſyſtem of that country; and the exerciſe of the Roman catholic religion was prohibited in the year 1544, under the ſevereſt penalties, which have never yet been relaxed. Inſtead of a Gothic ariſtocracy, the moſt turbulent of all governments, and, when empoiſoned by religious tyranny, of all governments the moſt wretched, Sweden, in this manner, became a regular monarchy. Some favourable effects of this change were ſoon viſible: arts and manufactures were eſtabliſhed and improved; navigation and commerce began to flouriſh; letters and civility were introduced; and a kingdom, known only by name to the reſt of Europe, began to be known by its arms, and to have weight in all public treaties or deliberations. Guſtavus died in 1559.

Under Eric, who ſucceeded his father Guſtavus Vaſa, the titles of count and baron were introduced into Sweden, and made hereditary. Eric's cauſeleſs jealouſy of his brothers forced them to take up arms; and the ſenate ſiding with them, he was depoſed in 1566. His brother John ſucceeded him, and entered into a ruinous war with Ruſſia. John attempted, by the advice of his queen, to re-eſtabliſh the catholic religion in Sweden; but, though he made ſtrong efforts for that purpoſe, and even reconciled himſelf to the pope, he was oppoſed by his brother Charles, and the ſcheme proved ineffectual. John's ſon, Sigiſmund, was choſen king of Poland in 1587, upon which he endeavoured again to reſtore the Roman catholic religion in his dominions; but he died in 1592.

Charles, brother to king John, was choſen adminiſtrator of Sweden; and being a ſtrenuous proteſtant, his nephew Sigiſmund endeavoured to drive him from the adminiſtratorſhip, but without effect; till at laſt he and his family were excluded from the ſucceſſion to the crown, which was conferred upon Charles in 1599. The reign of Charles, through the practices of Sigiſmund, who was a powerful prince, and at the head of a great party both in Sweden and Ruſſia, was turbulent; which gave the Danes encouragement to invade Sweden. Their conduct was checked by the great Guſtavus Adolphus, then a minor, and heir apparent to Sweden. Upon the death of his father, in 1611, he was declared of age by the ſtates, though then only in his eighteenth year. Guſtavus, ſoon after his acceſſion, found himſelf, through the intrigues of the Poles, Ruſſians, and Danes, engaged in a war with all his neighbours, under infinite diſadvantages; all which he ſurmounted. He narrowly miſſed being maſter of Ruſſia; but the Ruſſians were ſo tenacious of their independency, that his ſcheme was baffled. In 1617 he made a peace, under the mediation of James I. of England, by which he recovered Livonia, and four towns in the prefecture of Novogorod, with a ſum of money beſides.

The ideas of Guſtavus began now to extend. He had ſeen much military ſervice, and was aſſiſted by the counſels of La Gardie, one of the beſt generals and wiſeſt ſtateſmen of his age. His troops had become the beſt diſciplined and moſt warlike in Europe: and he carried his ambition farther than hiſtorians are willing to acknowledge. The princes of the houſe of Auſtria were early jealous of his enterprizing ſpirit, and ſupported his ancient implacable enemy Sigiſmund, whom Guſtavus defeated. In 1627, he formed the ſiege of Dantzick, in which he was unſucceſsful; but the attempt which was defeated only by the ſudden riſe of the Viſtula, added ſo much to his military character, that he was placed at the head of the confederacy for reducing the houſe of Auſtria. His life, from that time, was a continued chain of the moſt rapid and wonderful ſucceſſes: after taking Riga, and over-running Livonia, he entered Poland, where he was victorious; and

and from thence, in 1630, he landed in Pomerania, drove the Germans out of Mecklenburgh, defeated the famous count Tilly, who was till then thought invincible, and over-ran Franconia. Upon the defeat and death of Tilly, Walenſtein, another Auſtrian general, of equal reputation, was appointed to command againſt Guſtavus. The king was killed upon the plain of Lutzen, 1632, after gaining a battle; which had he ſurvived, would probably have put a period to the Auſtrian greatneſs.

The amazing abilities of Guſtavus Adolphus, both in the cabinet and the field, never appeared ſo fully as after his death. He left behind him a ſet of generals, trained by himſelf, who maintained the glory of the Swediſh army with moſt aſtoniſhing valour and ſucceſs. The names of duke Bernard, Bannier, Torſtenſon, Wrangel, and others, with their prodigious actions in war, never can be forgotten in the annals of Europe. It is uncertain what courſe Guſtavus would have purſued, had his life been prolonged, and his ſucceſſes continued; but there is the ſtrongeſt reaſon to believe, that he had in his eye ſomewhat more than the relief of the proteſtants, and the reſtoration of the Palatine family. His chancellor Oxenſteirn was as conſummate a politician as he was a warrior; and during the minority of his daughter Chriſtina, he managed the affairs of Sweden with ſuch ſucceſs, that ſhe in a manner dictated the peace of Weſtphalia, 1648, which brought the affairs of Europe into a new ſyſtem.

Chriſtina was but ſix years of age when her father was killed. She received a good education; but her fine genius took an uncommon, and indeed romantic turn. She invited to her court Deſcartes, Salmaſius, and other learned men; to whom ſhe was not, however, extremely liberal. She expreſſed a value for Grotius; and ſhe was an excellent judge of the polite arts: but illiberal and indelicate in the choice of her private favourites. She diſcharged all the duties of her high ſtation; and though her generals were baſely betrayed by France, ſhe continued to ſupport the honour of her crown. Being reſolved not to marry, ſhe reſigned her crown to her couſin Charles Guſtavus, ſon to the duke of Deux-Ponts, in 1654.

Charles had great ſucceſs againſt the Poles: he drove their king, John Caſimir, into Sileſia; and received from them an oath of allegiance, which, with their uſual inconſtancy, they broke. He died of a fever in 1660. His ſon Charles XI. was not five years of age at his father's death; and this rendered it neceſſary for his guardians to conclude a peace with their neighbours, by which the Swedes gave up the iſland of Bornholm, and Drontheim, in Norway. All differences were accommodated at the ſame time with Ruſſia and Holland; and Sweden continued to make a very reſpectable figure in the affairs of Europe. When Charles came to be of age, he received a ſubſidy from the French king, Lewis XIV. but perceiving the liberties of Europe to be in danger from that monarch's ambition, he entered into the alliance with England and Holland againſt him. He afterwards joined with France againſt the houſe of Auſtria; but being defeated in Germany at Felem-Bellin, a powerful confederacy was formed againſt him. The elector of Brandenburg made himſelf maſter of the Swediſh Pomerania: the biſhop of Munſter over-ran Bremen and Verden, and the Danes took Wiſmar, and ſeveral places in Schonen. They were afterwards beaten; and Charles by the treaty of St. Germains, which followed that of Nimeguen in 1678, recovered all he had loſt, except ſome places in Germany. He then married Ulrica Leonora, the king of Denmark's ſiſter: but made a very bad uſe of the tranquility he had regained; for he enſlaved his people, that he might render himſelf deſpotic, and his army formidable. The ſtates loſt all their power, and Sweden was now reduced to the condition of Denmark. He ordered the brave Patkul, who was at the head of the Livonian deputies, to loſe his head and his right hand, for the boldneſs of his remonſtrance in favour of his countrymen, but

he

he ſaved himſelf by flight; and Charles became ſo powerful, that the conferences for a general peace at Ryſwick, 1697, were opened under his mediation.

Charles XI. died in 1697, and was ſucceeded by his minor ſon, the famous Charles XII. The hiſtory of no prince is better known than that of this hero. His father's will had fixed the age of his majority to eighteen, but it was ſet aſide for an earlier date by the management of count Piper, who became his firſt miniſter. Soon after his acceſſion, the kings of Denmark and Poland, and the czar of Muſcovy, formed a powerful confederacy againſt him, encouraged by the mean opinion they had of his youth and abilities. He oppoſed them all; and beſieging Copenhagen, he dictated the peace of Travendahl to his Daniſh majeſty, by which the duke of Holſtein was re-eſtabliſhed in his dominions. The czar Peter was at this time ravaging Ingria, at the head of 80,000 men, and had beſieged Narva. The army of Charles did not exceed 20,000 men; but ſuch was his impatience, that he advanced at the head of 8000, entirely routed the main body of the Ruſſians, and raiſed the ſiege. Such were his ſucceſſes, and ſo numerous his priſoners, that the Ruſſians attributed his actions to necromancy. Charles from thence marched into Saxony, where his warlike atchievements equalled thoſe of Guſtavus Adolphus. He dethroned Auguſtus, king of Poland; but ſtained all his laurels, by putting the brave count Patkul to a death equally painful and ignominious. He raiſed Staniſlaus to the crown of Poland in 1705, and he was courted by all the powers of Europe; and, among others, by the duke of Marlborough, in the name of queen Anne, amidſt the full career of her ſucceſſes againſt France. His implacable diſpoſition, however, was ſuch, that he cannot be conſidered in a better light than that of an illuſtrious madman; for he loſt in the battle of Pultowa, 1709, which he fought in his march to dethrone the czar, more than all he had gained by his victories. His brave army was ruined, and he was forced to take refuge among the Turks at Bender. His actions there, in attempting to defend himſelf with 300 Swedes againſt 30,000 Turks, prove him to have been worſe than frantic. The Turks afterwards found it convenient for their affairs to ſet him at liberty. After his return to his dominions, he proſecuted his revenge againſt Denmark, till he was killed by a cannon ſhot, at the ſiege of Fredericſhall, in Norway, in 1718, when he was no more than thirty-ſix years of age. It has been ſuppoſed, that Charles was not in reality killed by a ſhot from the walls of Fredericſhall, but that a piſtol *, from one of thoſe about him, gave the deciſive blow, which put an end to the life of this celebrated monarch. This opinion is very prevalent in Sweden. And it appears, that the Swedes were tired of a prince, under whom they had loſt their richeſt provinces, their braveſt troops, and their national riches; and who yet, untamed by adverſity, purſued an unſucceſsful war, nor would ever have liſtened to the voice of peace, or conſulted the internal tranquillity of his country.

Charles XII. was ſucceeded by his ſiſter, the princeſs Ulrica Eleonora, wife to the hereditary prince of Heſſe. We have ſeen in what manner the Swedes recovered their liberties, and given ſome account of the capitulation ſigned by the queen and her huſband, when they entered upon the exerciſe of government. Their firſt care was to make a peace with Great Britain. The Swedes, to prevent farther loſſes by the progreſs of the Ruſſian, the Daniſh, the Saxon, and other arms, made many ſacrifices to obtain peace from thoſe powers. The French, however, about the year 1738, formed that dangerous party in the kingdom, under the name of the *Hats*, which not only broke the internal quiet of the kingdom, but led it into a ruinous war with Ruſſia. Their Swediſh majeſties having no children, it was ne-

* The reader, who is deſirous of ſeeing the arguments on both ſides of this queſtion, which could not with propriety be given in detail in this conciſe narrative, will be highly gratified by conſulting Coxe's Travels into Poland, Ruſſia, Sweden, and Denmark, 4to. vol. ii. p. 351—363.

ceſſary

ceſſary to ſettle the ſucceſſion; eſpecially as the duke of Holſtein was deſcended from the queen's eldeſt ſiſter, and was, at the ſame time, the preſumptive heir to the empire of Ruſſia. Four competitors appeared; the duke of Holſtein Gottorp, prince Frederic of Heſſe-Caſſel, nephew to the king, the prince of Denmark, and the duke of Deux-Ponts. The duke of Holſtein would have carried the election, had he not embraced the Greek religion, that he might mount the throne of Ruſſia. The czarina interpoſed, and offered to reſtore all the conqueſts ſhe had made from Sweden, excepting a ſmall diſtrict in Finland, if the Swedes would receive the duke of Holſtein's uncle, the biſhop of Lubec, as their hereditary prince, and ſucceſſor to their crown. This was agreed to; and a peace was concluded at Abo, under the mediation of his Britannic majeſty. This peace was ſo firmly adhered to by the czarina, that his Daniſh majeſty thought proper to drop all the effects of his reſentment, and to forget the indignity done to his ſon. The prince's ſucceſſor, Adolphus Frederic, married the princeſs Ulrica, ſiſter to the king of Pruſſia; and entered into the poſſeſſion of his new dignity in 1751. He was a prince of a mild and gentle temper, much haraſſed by the contending Swediſh factions, and found his ſituation extremely troubleſome, in conſequence of the reſtraints and oppoſition which he met with from the ſenate. He paſſed the greateſt part of his reign very diſagreeably, and was at length, through the intrigues of the queen, brought over to the French party. He died in February 1771, and was ſucceeded by his ſon, Guſtavus the Third, the preſent reigning prince, who poſſeſſes abilities greatly ſuperior to thoſe of his father.

He was about five and twenty years of age when he was proclaimed king of Sweden; his underſtanding had been much cultivated, he hath an inſinuating addreſs, and a graceful and commanding elocution. He was at Paris at the time of his father's death, from whence he wrote in the moſt gracious terms to the ſenate, repeatedly aſſuring them that he deſigned to govern according to the laws. In conſequence of the death of the late king, an extraordinary diet was called to regulate the affairs of the government, and to ſettle the form of the coronation-oath for the preſent king. Some time after his arrival in Sweden, on the 28th of March, 1773, his majeſty ſolemnly ſigned and ſwore to obſerve twenty-four articles, relative to his future adminiſtration of government. This was termed a capitulation; and among the articles were the following: "The king promiſes before God to ſupport the government of the kingdom as then eſtabliſhed; to maintain the rights and liberties of the ſtates, the liberties and ſecurity of all his ſubjects, and to reign with gentleneſs and equity according to the laws of the kingdom, the form of the regency as it was eſtabliſhed in the year 1720, and conformable to the preſent act of capitulation. In conſequence of the declaration of the ſtates, the king ſhall regard any perſon, who ſhall openly or clandeſtinely endeavour to introduce abſolute ſovereignty, as an enemy of the kingdom, and as a traitor to his country, and every perſon muſt take an oath reſpecting this matter before he can take poſſeſſion of any employment. With regard to the affairs of the cabinet and the ſenate, the king promiſes to follow the regulations of the year 1720 upon that head, which were to be directed always by a majority of votes, and never to do any thing therein without, and much leſs againſt, their advice. To the end that the council of ſtate may be ſo much the more convinced of the inviolable deſigns of his majeſty, and of his ſincere love for the good of his people, he declares them to be entirely diſengaged from their oath of fidelity, in caſe that he wilfully acts contrary to his coronation-oath, and to this capitulation. And laſtly, the king threatens any perſon with his higheſt diſpleaſure, who ſhall be ſo inconſiderate as to propoſe to him a greater degree of power and ſplendor than is marked out in this act of capitulation, as his majeſty deſires only to gain the affection of his faithful ſubjects, and to be their powerful defender againſt any attempts which may be made upon their lawful liberties."

But

But ſcarcely had the king taken theſe ſolemn oaths to rule according to the eſtabliſhed form of government, and accepted the crown upon theſe conditions, before he formed the plan to govern as he thought proper, regarding theſe only as matters of ceremony. On his firſt arrival at Stockholm, he adopted every method which the moſt profound diſſimulation and the utmoſt dexterity could ſuggeſt, to increaſe his popularity. Three times a week he regularly gave audience to all who preſented themſelves. Neither rank, fortune, nor intereſt, were neceſſary to obtain acceſs to him: it was ſufficient to have been injured, and to have a legal cauſe of complaint to lay before him. He liſtened to the meaneſt of his ſubjects with affability, and entered into the minuteſt details that concerned them; he informed himſelf of their private affairs, and ſeemed to intereſt himſelf in their happineſs. This conduct made him conſidered as truly the father of his people, and the Swedes began to idolize him. In the warmth of their gratitude they forgot that motives of ambition might have ſome ſhare in forming a conduct which to them appeared to proceed from principles of the pureſt benevolence. At the ſame time that he laboured to render himſelf generally popular, he alſo endeavoured to perſuade the leading men of the kingdom, that he was ſincerely and inviolably attached to the conſtitution of his country, that he was perfectly ſatisfied with the ſhare of power the conſtitution had allotted to him, and he took every opportunity to declare, that he conſidered it as his greateſt glory to be the firſt citizen of a free people. He ſeemed intent on baniſhing corruption, and promoting union; he declared he would be of no party but that of the nation, and that he would ever pay the moſt implicit obedience to whatever the diet ſhould enact. Theſe profeſſions lulled the many into a fatal ſecurity, though they created ſuſpicions among a few of greater penetration, who thought his majeſty promiſed too much to be in earneſt. In the mean time there happened ſome contentions between the different orders of the Swediſh ſtates, and no methods were left untried to foment theſe jealouſies. Emiſſaries were likewiſe planted in every part of the kingdom, for the purpoſe of ſowing diſcontent among the inhabitants, of rendering them diſaffected to the eſtabliſhed government, and of exciting them to an inſurrection. At length, when the king found his ſcheme ripe for execution, having taken the proper meaſures for bringing a conſiderable number of the officers and ſoldiers * into his intereſt, on the 19th of Auguſt, 1772, he totally overturned the Swediſh conſtitution of government. In leſs than an hour he made himſelf maſter of all the military force of Stockholm. He planted grenadiers, with their bayonets fixed, at the door of the council-chamber, in which the ſenate were aſſembled, and made all the members of it priſoners. And that no news might be carried to any other part of Sweden, of the tranſaction in which the king was engaged, till the ſcheme was completed, cannon were drawn from the arſenal, and planted at the palace, the bridges, and other parts of the town, and particularly at all the avenues leading to it. Soldiers ſtood over theſe with matches ready lighted; all communication with the country was cut off, no one without a paſſport from the king being allowed to leave the city. The ſenators were then confined in ſeparate apartments in the palace, and many others, who were ſuppoſed to be zealouſly attached to the liberties of Sweden, were put under arreſt. The remainder of the day the king employed in viſiting different quarters of the town, in order to receive oaths of fidelity to him from the magiſtrates, the colleges, and city militia. Oaths were alſo tendered

* The fidelity which was manifeſted by a private ſoldier, on this occaſion, deſerves to be recorded. The night preceding the revolution, the king being deſirous of viſiting the arſenal, went thither, and ordered the centinel to admit him. The latter refuſed. "Do you know who you are ſpeaking to?" ſaid the king, "Yes:" replied the ſoldier, "but I likewiſe know my duty."—*Vid.* a very judicious and well-written account of this extraordinary revolution in Sweden, publiſhed by Charles Francis Sheridan, eſq. who was ſecretary to the Britiſh envoy in Sweden at the time of the revolution.

the next day to the people in general, to whom he addreſſed a ſpeech, which he concluded by declaring, that his only intention was to reſtore tranquillity to his native country, by ſuppreſſing licentiouſneſs, overturning the ariſtocratic form of government, reviving the old Swediſh liberty, and reſtoring the ancient laws of Sweden, ſuch as they were before 1680. "I renounce now," ſaid he, "as I have already done, all idea of the abhorred abſolute power, or what is called *ſovereignty*, eſteeming it now, as before, my greateſt glory to be the firſt citizen among a truly free people." Heralds then went through the different quarters of the town, to proclaim an aſſembly of the ſtates for the following day. This proclamation contained a threat, that if any member of the diet ſhould abſent himſelf, he ſhould be conſidered and treated as a traitor to his country.

On the morning of the 21ſt of Auguſt, a large detachment of guards was ordered to take poſſeſſion of the ſquare, where the houſe of nobles ſtands. The palace was inveſted on all ſides with troops, and cannon were planted in the court, facing the hall where the ſtates were to be aſſembled. Theſe were not only charged, but ſoldiers ſtood over them with matches ready lighted in their hands. The ſeveral orders of the ſtates were here compelled to aſſemble by the king's order, and theſe military preparations were made in order to aſſiſt their deliberations. The king being ſeated on his throne, ſurrounded by his guards, and a numerous band of officers, after having addreſſed a ſpeech to the ſtates, he ordered a ſecretary to read a new form of government, which he offered to the ſtates for their acceptance. As they were ſurrounded by an armed force, they thought proper to comply with what was required of them. The marſhal of the diet, and the ſpeakers of the other orders, ſigned the form of government; and the ſtates took the oath to the king, which he dictated to them himſelf. This extraordinary tranſaction was concluded in a manner equally extraordinary. The king drew a book of Pſalms from his pocket, and taking off his crown, began to ſing *Te Deum*, in which he was joined by the aſſembly. He afterwards gave them to underſtand, that he intended in ſix years time again to convene an aſſembly of the ſtates. Thus was this great revolution completed without any bloodſhed, in which the Swedes ſurrendered that conſtitution, which their forefathers had bequeathed to them, after the death of Charles the Twelfth, as a bulwark againſt any deſpotic attempts of their future monarchs.

The Swedes, at ſome periods, have diſcovered an ardent love of liberty: at others, they have ſeemed fitted only for ſlavery; and when they were labouring to render themſelves free, they have wanted that ſound political knowledge, which would have pointed out to them the proper methods for ſecuring their future freedom. The moſt capital defect of the Swediſh conſtitution was the total want of all balance of its parts: and the diviſion of the Swediſh nation into three diſtinct claſſes of nobles, burghers, and peaſants, whoſe intereſts were perpetually claſhing, has been a circumſtance very unfavourable to the liberty of the Swedes. The power of their kings was much reſtrained; but no ſufficient regulations were adopted for ſecuring the perſonal freedom of the ſubject. Theſe defects in the Swediſh conſtitution paved the way for the late revolution: but it is notwithſtanding a juſt ſubject of ſurpriſe, that a bold and hardy people, who had ſo cautiouſly limited the power of their prince, ſhould at once, without a ſtruggle, ſuffer him to proceed to ſo great an extenſion of his authority. It appears, however, that the exorbitant power which Guſtavus the Third hath thus aſſumed, he has, ſince the revolution, exerciſed with moderation; and, at an aſſembly of the ſtates, in 1786, after many points were referred to them by the king, and debated with great freedom, he diſmiſſed them, with condeſcenſion and gentleneſs, at the ſame time remitting the tenth part of the ſubſidy which they had granted him.

On

On the 12th of July, 1788, hoſtilities commenced on the frontiers of Finland, between a body of Ruſſian light troops and a detachment of the Swedes poſted on the bridge of Pomalaſund. After various engagements both by land and ſea, in which Guſtavus III. gave a diſplay of the moſt extraordinary abilities, an agreement for eſtabliſhing an everlaſting peace, and fixing the frontiers of Ruſſia, as they were before the war broke out, was ſigned at Werela on the river Kymene, between the plenipotentiaries of the empreſs of Ruſſia and the king of Sweden.

Guſtavus, of Holſtein-Gottorp, king of Sweden, was born in 1746, and ſucceeded his father in 1771. He was married, in 1766, to Sophia Magdalena, the princeſs royal of Denmark, by whom he has iſſue a prince, Guſtavus Adolphus, born Nov. 1. 1778. His brothers and ſiſter are, 1. Charles, born in 1748; 2. Frederic Adolphus, born in 1750; 3. Sophia Albertina, born in 1753.

MUSCOVY, OR THE RUSSIAN EMPIRE IN EUROPE AND ASIA.

SITUATION AND EXTENT OF THE RUSSIAN EMPIRE IN EUROPE.

	Miles.		Degrees.
Length	1500	between	23 and 65 East longitude.
Breadth	1100		47 and 72 North latitude.

DIVISIONS AND NAME. ACCORDING to the moſt authentic accounts of this mighty empire, it conſiſts of 42 provinces, or governments, which are comprehended again under 19 general governments*. Carelia, Eſthonia, Ingria, Livonia, and part of Finland, were conquered from Sweden; the Crimea, or Crim Tartary, anciently the Taurica Cherſoneſus, a peninſula in the Euxine ſea, was ſubject to the Turks formerly, but added, in the year 1783, to the Ruſſian empire, with the iſle of Taman, and part of Cuban; alſo the duchy of Courland, and a great part of Lithuania, in Poland.

The following table will give ſome idea of the Ruſſian empire, properly ſo called, or Ruſſia in Europe, with its acquiſitions from Sweden in the preſent century; and alſo of the Ruſſian empire in its moſt extenſive ſenſe, for we muſt alſo include all the acquiſitions in Tartary now known by the name of Siberia: the whole comprehending the northern parts of Europe and Aſia, ſtretching from the Baltic and Sweden on the Weſt, to Kamtſchatka and the Eaſtern Ocean; and on the North, from the Frozen Ocean to the forty-ſeventh degree of latitude, where it is bounded by Poland, Little Tartary, Turkey, Georgia, the Euxine and Caſpian Seas, Great Tartary, Chineſe Tartary, and ſome unknown regions in Aſia.

The country now comprized under the name of Ruſſia, or the Ruſſias, is of an extent nearly equal to all the reſt of Europe, and greater than the Roman empire in the zenith of its power, or the empire of Darius ſubdued by Alexander, or both put together, as may be ſeen by turning to the table, * page 26, to which we may add the authority of Voltaire.

	Total -	4,151,495			

Ruſſia has alſo been ſubdivided into thirty-one provinces, viz.

Northern Provinces.
1. Lapland,
2. Samoida,
3. Bellamorenſkey,
4. Meſeen,
5. Dwina,
6. Syrianes,
7. Permia,
8. Rubeninſky,
9. Blaeſeda.

Middle Provinces.
10. Rezan, or Pereſlaf,
11. Belozero,
12. Wologda,
13. Jeraſlaf,
14. Tweer,
15. Moſcow,
16. Belgorod.

Eaſtern Provinces.
17. Bulgar,
18. Kaſan,
19. Tſcheremiſſi,
20. Little Novogrod,
21. Don Coſſacs.

Weſtern Provinces.
22. Great Novogrod,
23. Ruſſian Finland,
24. Kexholm,
25. Kaleria,
26. Ingria.

Southern Provinces.
27. Livonia,
28. Smolenſko,
29. Zernigof,
30. Seefſk,
31. Ukraine, or country of the Old Coſſacs.

Mr. Tooke, chaplain to the Britiſh factory at Peterſburgh, has enumerated the following nations as comprehended in this great empire:

The Mongouls,
The Kalmucs,
The Tartars,
The Samoides,
The Oſtiachs,
The Burattians,
The Jakuttians,
The Tunguſians,
The Voguls,
The Laplanders,
The Finns,
The Lettonians,
The Eſtonians,
The Lieffs,
The Ingrians,
The Tſcheremiſſes,
The Tſchouwaſches,
The Mordvines,

The

The Votiaks,
The Terptyaireis,
The Tartars of Kaſan and Orenburgh,
The Tartars of Tobolſk,
The Tartars of Tomſk.
The Nogayan Tartars,
The Tartars of the Ob,
The Tſchoulym Tartars,
The Katſchintz Tartars,
The Teleutes,
The Abinzes,
The Biryouſſes,
The Coſſacs,
The Kurilians,
The Kiſtim and Toulibert Tartars,
The Vergho Tomſkoi Tartars,
The Sayan Tartars,
The Touralinzes,
The Bougharians,
The Baſchkirians,
The Meſtſcheraiks,
The Barabinzes,
The Kirkguiſians,
The Beltirians,
The Yakoutes,
The Kamtſchadales,

and various others; but ſome of which muſt be conſidered rather as diſtinct tribes than as diſtinct nations.

As to the names of Ruſſia and Muſcovy, by which this empire is arbitrarily called, they probably are owing to the ancient inhabitants, the Ruſſi, or Boruſſi, and the river Moſca, upon which the ancient capital Moſcow was built.

CLIMATE, SOIL, PRODUCTIONS, VEGETABLES, MINES, AND MINERALS. In the ſouthern parts of Ruſſia, or Muſcovy, the longeſt day does not exceed fifteen hours and a half; whereas in the moſt northern the ſun is ſeen in ſummer two months above the horizon. The reader from this will naturally conclude, that there is in Muſcovy a great diverſity of ſoil as well as climate, and that the extremes of both are to be ſeen and felt in this vaſt empire.

The ſeverity of the climate in Ruſſia, properly ſo called, is very great. Dr. John Glen King, who reſided eleven years in Ruſſia, obſerves that the cold in St. Peterſburgh, by Fahrenheit's ſcale, is, during the months of December, January, and February, uſually from 8 to 15 or 20 degrees below 0; that is, from 40 to 52 degrees below the freezing point: though commonly, in the courſe of the winter, it is for a week or ten days ſome degrees lower. "It is difficult," ſays Dr. King, "for an inhabitant of our temperate climate to have any idea of a cold ſo intenſe: when a perſon walks out in that ſevere weather, the cold makes the eyes water, and that water freezing hangs in little icicles on the eye-laſhes. As the peaſants uſually wear their beards, you may ſee them hanging at the chin like a ſolid lump of ice; but, even in that ſtate, the beard is found very uſeful in protecting the glands of the throat: and the ſoldiers, who do not wear their beards, are obliged to tie a handkerchief under the chin to ſupply their place. All the parts of the face which are expoſed are liable to be frozen: though it has often been obſerved, that the perſon himſelf does not know when the freezing begins; but is commonly told of it by thoſe who meet him, and who call out to him to rub his face with ſnow, the uſual way to thaw it. It is alſo remarked, that the part, which has once been frozen, is ever after moſt liable to be frozen again. In ſome very ſevere winters, ſparrows, though a hardy ſpecies of birds, have been ſeen quite numbed by the intenſe cold, and unable to fly: and drivers, when ſitting on their loaded carriages, have ſometimes been found frozen to death in that poſture. When the thermometer has ſtood at 25 degrees below 0, boiling water, thrown up into the air by an engine, ſo as to ſpread, has fallen down perfectly dry, formed into ice. A pint bottle of common water was found frozen into a ſolid piece of ice in an hour and a quarter. A bottle of ſtrong ale has alſo been found frozen in an hour and an half: but in this ſubſtance there was about a tea-cup full in the middle unfrozen, which was as ſtrong and inflammable as brandy or ſpirits of wine. But notwithſtanding the ſeverity of the cold in Ruſſia, the inhabitants have ſuch various means to guard againſt it, that they ſuffer much leſs than might be expected. The houſes of perſons in tolerable circumſtances are ſo well protected, both without doors and within, that they are ſeldom heard to complain of cold. The method of warming the houſes in Ruſſia is by an oven conſtructed with ſeveral flues, and the country abounds with wood, which is the common fuel. Theſe ovens conſume a much ſmaller quantity of wood than might

be imagined, and yet they ſerve at the ſame time for the ordinary people to dreſs their food. They put a very moderate faggot into them, and ſuffer it to burn only till the thickeſt black ſmoke is evaporated; they then ſhut down the chimney to retain all the reſt of the heat in the chamber; by this method the chamber keeps its heat 24 hours, and is commonly ſo warm that they ſit with very little covering, eſpecially children, who are uſually in their ſhirts. The windows in the huts of the poor are very ſmall, that as little cold may be admitted as poſſible: in the houſes of perſons of condition, the windows are caulked up againſt winter, and commonly have double glaſs frames. They can regulate the warmth in their apartments by a thermometer with great exactneſs, opening or ſhutting the flues to increaſe or diminiſh the heat. When the Ruſſians go out, they are clothed ſo warmly, that they almoſt bid deſiance to froſt and ſnow; and it is obſervable, that the wind is ſeldom violent in the winter; but when there is much wind, the cold is exceedingly piercing."

One advantage, which the Ruſſians derive from the ſeverity of their climate, is, the preſerving proviſions by the froſt. Good houſewives, as ſoon as the froſt ſets in for the winter, about the end of October, kill their poultry, and keep them in tubs packed up with a layer of ſnow between them, and then take them out for uſe as occaſion requires: by this means they ſave the nouriſhment of the animal for ſeveral months. Veal frozen at Archangel, and brought to Peterſburgh, 830 miles, is eſteemed the fineſt they have; nor can it be diſtinguiſhed at the table from what is freſh killed, being equally juicy. The markets in Peterſburgh are thus ſupplied in winter with all manner of proviſions, at a cheaper rate than would otherwiſe be poſſible; and it is curious to ſee the vaſt ſtacks of whole hogs, ſheep, fiſh, and other animals, which are piled up in the markets for ſale. The method of thawing frozen proviſions in Ruſſia is by immerging them in cold water: for when the operation of thawing them is effected by heat, it ſeems to occaſion a violent fermentation, and almoſt a ſudden putrefaction; but when produced by cold water, the ice ſeems to be attracted out of the body, and forms a tranſparent incruſtation round it. If a cabbage, which is thoroughly frozen, be thawed by cold water, it is as freſh as if juſt gathered out of the garden; but if it be thawed by fire or hot water, it becomes ſo rancid and ſtrong that it cannot be eaten.

The quickneſs of vegetation in Ruſſia is pretty much the ſame as in Scandinavia, or Sweden and Denmark. The ſnow is the natural manure of Ruſſia, where grain grows in plenty, near Poland, and in the warmer provinces. The bulk of the people, however, are miſerably fed; the ſoil produces incredible numbers of muſhrooms for their ſubſiſtence; and in ſome places, beſides oaks and firs, Ruſſia yields rhubarb, flax, hemp, paſture for cattle, wax, honey, rice, and melons. The boors are particularly careful in the cultivation of honey, which yields them plenty of metheglin, their ordinary drink; they likewiſe extract a ſpirit from rye, which they prefer to brandy.

That a great part of Ruſſia was populous in former days, is not to be diſputed; though it is equally certain, that the inhabitants, till lately, were little acquainted with agriculture: and ſupplied the place of bread, as ſome inhabitants of Scandinavia do now, with a kind of ſaw-duſt and a preparation of fiſh-bones. Peter the Great, and his ſucceſſors, down to the preſent empreſs, have been at incredible pains to introduce agriculture into their dominions; and though the ſoil is not every where proper for corn, yet its fertility in ſome provinces bids fair to make grain as common in Ruſſia as it is in the ſouthern countries of Europe. The eaſy communication, by means of rivers, which the inland parts of that empire have with each other, ſerve to ſupply one province with thoſe products in which another may be deficient. As to mines and minerals, they are as plentiful in Ruſſia as in Scandinavia, and the people are daily improving in working them. Mountains of rich iron ore

are

are found in ſome places, moſt of which produce the load-ſtone, and yield from 50 to 70 per cent. Rich ſilver and copper mines are found on the confines of Siberia.

MOUNTAINS, RIVERS, FORESTS, AND FACE OF THE COUNTRY. Ruſſia is in general a flat, level country, except toward the north, where lie the Zimnopoias mountains, thought to be the famous Montes Riphæi of the ancients, now called the Girdle of the Earth. On the weſtern ſide of the Dnieper comes in part of the Carpathian mountains, and between the Black Sea and the Caſpian, Mount Caucaſus borders a range of vaſt plains extending to the Sea of Oral. And here we may obſerve, that from Peterſburgh to Pekin, one ſhall hardly meet with a mountain on the road through Independent Tartary; and from Peterſburgh to the north part of France, by the road of Dantzick, Hamburg, and Amſterdam, we ſcarcely can perceive the ſmalleſt hill.

The moſt conſiderable rivers are the Wolga, or Volga, running eaſt and ſouth, which, after traverſing the greateſt part of Muſcovy, and winding a courſe of 3000 Engliſh miles, diſcharges itſelf into the Caſpian ſea: it is reckoned the largeſt, and one of the moſt fertile rivers of Europe, produces many kinds of fiſh, and fertilizes the lands on each ſide with trees, fruits, and vegetables. In this long courſe there is not one cataract to interrupt the navigation, but the nearer it approaches to the mouth, the river multiplies its number of iſles, and divides itſelf into a greater number of arms than any known river in the world: all theſe arms divide themſelves into others ſtill leſs, which join and meet again; ſo that the Wolga diſcharges itſelf into the Caſpian ſea by more than 70 mouths. By means of this noble river, the city of Moſcow preſerves a communication, not only with all the ſouthern parts of Ruſſia, but even with Perſia, Georgia, Tartary, and other countries bordering on the Caſpian ſea. The Don, or Tanais, which divides the eaſtern part of Ruſſia from Aſia, in its courſe towards the eaſt, comes ſo near the Wolga, that the late czar intended to have cut a communication between them by means of a canal: all this grand project was defeated by the irruptions of the Tartars. This river, excluſive of its windings, diſcharges itſelf into the Palus Mæotis, or Sea of Aſoph, about four hundred miles from its riſe. The Boriſthenes, or Dnieper, which is likewiſe one of the largeſt rivers in Europe, runs through Lithuania, the country of the Zaporog Coſſacs, and that of the Nagaiſch Tartars, and falls into the Euxine, or Black Sea, at Kinbourn, near Oczakow; it has thirteen cataracts within a ſmall diſtance. To theſe may be added the two Dwinas, one of which empties itſelf at Riga into the Baltic; the other has its ſource near Uſtiaga, and dividing itſelf into two branches near Archangel, there falls into the White Sea.

Foreſts abound in this extenſive country; and the northern and north-eaſtern provinces are in a manner deſert; nor can the few inhabitants they contain be called Chriſtians rather than Pagans.

QUADRUPEDS, BIRDS, FISHES, AND INSECTS. Theſe do not differ greatly from thoſe deſcribed in the Scandinavian provinces. The lynx, famous for its piercing eye, is a native of this empire; it is ſaid to be produced chiefly in the fir tree foreſts. The hyænas, bears, wolves, foxes, and other creatures already deſcribed, afford their furs for clothing the inhabitants; but the furs of the black foxes and ermine are more valuable in Ruſſia than elſewhere. The dromedary and camel were formerly almoſt the only beaſts of burden known in many parts of Ruſſia. The czar Peter encouraged a breed of large horſes for war and carriages; but thoſe employed in the ordinary purpoſes of life are ſmall, as are their cows and ſheep.

We know of few birds in Ruſſia, that have not been already deſcribed. The ſame may be ſaid of fiſhes, only the Ruſſians are better provided than their neighbours with ſturgeon, cod, ſalmon, and beluga: the latter reſembles a ſturgeon, and

is often called the large ſturgeon; it is from twelve to fifteen feet in length, and weighs from 9 to 16 and 18 hundred weight; its fleſh is white and delicious. Of the roe of the ſturgeon and the beluga the Ruſſians make the famous cavear, ſo much eſteemed for richneſs and flavour, that it is often ſent in preſents to crowned heads. In cutting up the belugas, they often find what is called the beluga-ſtone, concealed in that maſs of glandular fleſh which covers the poſterior part of the dorſal ſpine, ſupplying the place of a kidney in fiſh. When it is taken from the fiſh, it it is ſoft and moiſt, but quickly hardens in the air. Its ſize is that of a hen's egg, ſhape ſometimes oval and ſometimes flatted, and commonly ſells for a ruble. This ſtone is ſuppoſed by profeſſor Pallas to belong to the genitals of the fiſh: it holds a conſiderable rank, though with little merit, among the domeſtic remedies of the Ruſſians, who ſcrape it, and mixed with water, give it in difficult labours, in the diſeaſes of children, and other diſorders.

POPULATION, MANNERS, AND CUSTOMS.] Nothing can be more remote from truth than the accounts we have from authors of the population of this vaſt empire, the whole of which, they think, does not exceed, at moſt, ſeven millions. It is ſurpriſing that ſuch a miſtake ſhould have continued ſo long, when we conſider the armies brought into the field by the ſovereigns of Ruſſia, and the bloody wars they maintained in Aſia and Europe. Mr. Voltaire produced a liſt, taken in 1747, of all the males who paid the capitation, or poll-tax, and which amount to ſix millions ſix hundred and forty-ſix thouſand three hundred and ninety. In this number are included boys and old men; but girls and women are not reckoned, or boys born between the making of one regiſter of the lands and another. Now, if we only reckon triple the number of heads ſubject to be taxed, including women and girls, we ſhall find near twenty millions of ſouls. The new regiſter in 1764 contains 8,500,000 ſubject to the poll-tax; and a late ingenious writer reſident ſome time in Ruſſia gives the following eſtimate:

Lower claſs of people paying capitation tax, -	18,000,000
Conquered provinces, - - -	1,200,000
Noble families, - - - -	60,000
Clergy, - - - -	100,000
Military, - - -	360,000
Civil, - - - -	30,000
Ukraine, Siberia, Coſſacks, &c. - -	350,000
	20,100,000

To theſe muſt now be added near a million more by the acquiſitions of the Crimea, and part of Cuban Tartary; and at leaſt 1,500,000 in the provinces diſmembered from Poland.

As her imperial majeſty of all the Ruſſias poſſeſſes many of the countries from whence the ſwarms of barbarians who overthrew the Roman empire iſſued, there is reaſon to believe that her dominions muſt have been better peopled formerly than they are at preſent. Perhaps the introduction of the ſmall-pox and the venereal diſeaſe may have aſſiſted in the depopulation; and it is likely that the prodigious quantity of ſtrong and ſpirituous liquors, conſumed by the inhabitants of the North, is unfriendly to generation.

The Ruſſians, properly ſo called, are a perſonable people, hardy, vigorous, and patient of labour, eſpecially in the field, to an incredible degree. Their complexions differ little from thoſe of the Engliſh; but the women think that an addition of red heightens their beauty. Their eye-ſight ſeems to be defective, occaſioned probably by the ſnow, which for a long time of the year is continually preſent to their eyes. Their officers and ſoldiers always poſſeſſed a large ſhare of paſſive

paſſive valour; but in the war with the king of Pruſſia, they proved as active as any troops in Europe; and in the late war with the Turks they greatly diſtinguiſhed themſelves. They are implicitly ſubmiſſive to diſcipline, let it be ever ſo ſevere; they endure hardſhips with great patience, and can content themſelves with very hard fare.

Before the days of Peter the Great, the Ruſſians were barbarous, ignorant, mean, and much addicted to drunkenneſs: no leſs than 4000 brandy ſhops have been reckoned in Moſcow. Not only the common people, but many of the boyars, or nobles, lived in a continual ſtate of idleneſs and intoxication; and the moſt complete objects of miſery and barbarity appeared in the ſtreets, while the court of Moſcow was the moſt ſplendid of any upon the globe. The czar and the grandees dreſſed after the ſuperb Aſiatic manner; and their magnificence exceeded every idea that can be conceived from modern examples. The earl of Carliſle, in the account of his embaſſy, ſays, that he could ſee nothing but gold and precious ſtones in the robes of the czar and his courtiers; and his account is corroborated by travellers who have lately viſited Ruſſia. The manufactures, however, of thoſe, and all other luxuries, were carried on by Italians, Germans, and other foreigners. Peter ſaw the bulk of his ſubjects, at his acceſſion to the throne, treated little better than beaſts of burden, to ſupport the pomp of the court. He forced his great men to lay aſide their long robes, and dreſs in the European manner; and he even obliged the laity to cut off their beards. The Ruſſians, before his time, had few ſhips upon their coaſts. They had no conveniencies for travelling, no pavements in their ſtreets, no places of public diverſion; and they entertained a contempt for all improvements of the mind. At preſent, a French or Engliſh gentleman may live as comfortably and ſociably in Ruſſia, as in moſt other parts of Europe. Their polite aſſemblies, ſince the acceſſion of the preſent empreſs, have been put under proper regulations; and few of the ancient uſages remain. However, drunkenneſs ſtill continues among ſome ranks; and the bulk of the people are uncivilized.

The Ruſſians were noted for ſo ſtrong an attachment to their native ſoil, that they ſeldom viſited foreign parts. This was the conſequence of their pride and ignorance; for Ruſſian nobility, beſides thoſe who are in a public character, are now found at every court in Europe. Her imperial majeſty even intereſts herſelf in the education of young men of quality in the knowledge of the world, and foreign ſervices, particularly that of the Britiſh fleet.

It is ſaid that the Ruſſian ladies were formerly as ſubmiſſive to their huſbands in their families, as the latter are to their ſuperiors in the field; and that they thought themſelves ill treated if they were not often reminded of their duty by the diſcipline of a whip, manufactured by themſelves, which they preſented to their huſbands on the day of their marriage. Their nuptial ceremonies are peculiar to themſelves; and formerly conſiſted of ſome very whimſical rites, many of which are now diſuſed. When the parents are agreed upon a match, though the parties perhaps have never ſeen each other, the bride is critically examined by a number of females, who are to correct, if poſſible, any defects they find in her perſon. On her wedding-day ſhe is crowned with a garland of wormwood; and after the prieſt has tied the nuptial knot, his clerk or ſexton throws a handful of hops upon the head of the bride, wiſhing that ſhe may prove as fruitful as that plant. She is then led home, with abundance of coarſe, and indeed indecent ceremonies, which are now wearing off even among the loweſt ranks; and the barbarous treatment of wives by their huſbands, which extended even to ſcourging or broiling them to death, is either guarded againſt by the laws of the country, or by particular ſtipulations in the marriage-contract.

FUNERALS.] The Ruſſians entertain many fantaſtic notions with regard to the ſtate of departed ſouls. After the dead body is dreſſed, a prieſt is hired to pray for

his ſoul, to purify it with incenſe, and to ſprinkle it with holy water while it remains above ground, which, among the better ſort, it generally does for eight or ten days. When the body is carried to the grave, which is done with many geſticulations of ſorrow, the prieſt produces a ticket, ſigned by the biſhop and another clergyman, as the deceaſed's paſſport to heaven. When this is put into the coffin between the fingers of the corpſe, the company returns to the deceaſed's houſe, where they drown their ſorrow in intoxication; which laſts, among the better ſort, with a few intervals, for forty days. During that time, a prieſt every day ſays prayers over the grave of the deceaſed; for though the Ruſſians do not believe in purgatory, yet they imagine that their departed friend may be aſſiſted by prayer in his long journey to the place of his deſtination after this life.

PUNISHMENTS.] The Ruſſians were remarkable for the ſeverity and variety of their puniſhments, which were both inflicted and endured with a wonderful inſenſibility. Peter the Great uſed to ſuſpend the robbers upon the Wolga, and other parts of his dominions, by iron hooks fixed to their ribs, on gibbets, where they writhed themſelves to death. The ſingle and double knout have been inflicted upon ladies *, as well as men of quality. Both of them are excruciating; but in the double knout, the hands are bound behind the priſoner's back, and the cord being fixed to a pulley, lifts him from the ground, with the diſlocation of both his ſhoulders, and then his back is in a manner ſcarified by the executioner, with a hard thong, cut from a wild aſs's ſkin. This puniſhment has been ſo often fatal, that a ſurgeon generally attends the patient, to pronounce the moment that it ſhould ceaſe. It is not always the number of the ſtrokes, but the method of applying them, which occaſions the death of the criminal; for the executioner can kill him in three or four blows, by ſtriking upon the ribs; though perſons are ſometimes recovered, in a few weeks, who have received three hundred ſtrokes, moderately inflicted. The boring and cutting out the tongue, are likewiſe practiſed in Ruſſia;

* A particular account of the manner in which this puniſhment was inflicted upon a Ruſſian lady, is given in Monſ. l'Abbé Chappe D'Auteroche's journey into Siberia. "Mad. Lapouchin was one of the fineſt women belonging to the court of the empreſs Elizabeth, and was intimately connected with a foreign ambaſſador, then engaged in a conſpiracy. This lady, therefore, being ſuſpected to be concerned in the conſpiracy, was condemned, by the empreſs Elizabeth, to undergo the puniſhment of the knout. She appeared at the place of execution in a genteel undreſs, which contributed ſtill to heighten her beauty. The ſweetneſs of her countenance, and her vivacity, were ſuch as might indicate indiſcretion, but not even the ſhadow of guilt; although I have been aſſured by every perſon of whom I have made enquiry, that ſhe was really guilty. Young, lovely, admired, and ſought for at the court, of which ſhe was the life and ſpirit; inſtead of the number of admirers her beauty uſually drew after her, ſhe then ſaw herſelf ſurrounded only by executioners. She looked on them with aſtoniſhment, ſeeming to doubt whether ſuch preparations were intended for her. One of the executioners then pulled off a kind of cloak which covered her boſom; her modeſty taking the alarm, made her ſtart back a few ſteps; ſhe alſo turned pale, and burſt into tears. Her cloaths were ſoon after ſtripped off, and in a few moments ſhe was quite naked to the waiſt, expoſed to the eager looks of a vaſt concourſe of people profoundly ſilent. One of the executioners then ſeized her by both hands, and turning half round, threw her on his back, bending forwards, ſo as to raiſe her a few inches from the ground: the other executioner then laid hold of her delicate limbs with his rough hands hardened at the plough, and, without any remorſe, adjuſted her on the back of his companion, in the propereſt poſture for receiving the puniſhment. Sometimes he laid his large hand brutally upon her head, in order to make her keep it down; ſometimes, like a butcher going to ſlay a lamb, he ſeemed to ſoothe her, as ſoon as he had fixed her in the moſt favourable attitude. This executioner then took a kind of whip called knout, made of a long ſtrap of leather prepared for this purpoſe; he then retreated a few ſteps, meaſuring the requiſite diſtance with a ſteady eye; and leaping backwards, gave a ſtroke with the end of the whip, ſo as to carry away a ſlip of ſkin from the neck to the bottom of the back; then ſtriking his feet againſt the ground, he took his aim for applying a ſecond blow parallel to the former; ſo that in a few moments all the ſkin of her back was cut away in ſmall ſlips, moſt of which remained hanging to the ſhift. Her tongue was cut out immediately after, and ſhe was directly baniſhed into Siberia. In 1762, ſhe was recalled from baniſhment by Peter III."

and

and even the late empreſs Elizabeth, though ſhe prohibited capital puniſhments, was forced to give way to the ſuppoſed neceſſity of thoſe tortures.

According to the ſtrict letter of the law, there are no capital puniſhments in Ruſſia, except in the caſe of high treaſon: but there is much leſs humanity in it than has been ſuppoſed; for there are many felons who die under the knout, and others die of fatigue in their journies to Siberia, and from the hardſhips they ſuffer in the mines: ſo that there is reaſon to believe, that not fewer criminals ſuffer death in Ruſſia than in thoſe countries wherein capital puniſhments are authoriſed by the laws. The prohibition of torture does honour to the humanity of the preſent empreſs.

Felons, after receiving the knout, and having their cheeks and foreheads marked, are ſometimes ſentenced for life to the public works at Cronſtadt, Viſhnei Voloſhok, and other places; but the common practice is to ſend them into Siberia, where they are condemned for life to the mines at Nerſhink. There are upon an average from 1600 to 2000 convicts at theſe mines. The greateſt part are confined in barracks, excepting thoſe who are married: the latter are permitted to build huts, near the mines, for themſelves and families.

TRAVELLING.] Among the many conveniences introduced of late into Ruſſia, that of travelling is extremely remarkable, and the expence very trifling. Nothing ſtrikes, either a reader or a ſtranger, more than the facility with which the Ruſſians perform the longeſt and moſt uncomfortable journies. Like their Scandinavian neighbours, they travel in ſledges made of the bark of the linden-tree, lined with thick felt, drawn by rein-deer, when the ſnow is frozen hard enough to bear them. In the internal parts of Ruſſia, horſes draw their ſledges; and the ſledge-way, in February, becomes ſo well beaten, that they erect a kind of coach upon the ſledges, in which they may lie at full length, and ſo ſleep and travel night and day, wrapped up in good furs; thus they often perform a journey of about 400 miles, ſuch as that between Peterſburg and Moſcow, in three days and three nights. Her imperial majeſty, in her journies, is drawn in a houſe which contains a bed, a table, chairs, and other conveniencies for four people, by 24 poſt-horſes; and the houſe itſelf is fixed on a ſledge.

DIFFERENT NATIONS SUBJECT TO RUSSIA. } As the preſent ſubjects of the Ruſſian empire, in its moſt extenſive ſenſe, are the deſcendants of many different people, and inhabit prodigious tracts of country, ſo we find among them a vaſt variety of character and manners; and the great reformation introduced of late years, as well as the diſcoveries made, render former accounts to be but little depended upon. Many of the Tartars, who inhabit large portions of the Ruſſian dominions, now live in fixed houſes and villages, cultivate the land, and pay tribute like other ſubjects. Till lately, they were not admitted into the Ruſſian armies; but they now make excellent ſoldiers. Other Ruſſian Tartars retain their old wandering lives. Both ſides of the Wolga are inhabited by the Tſcheremiſſes and Morduars, a peaceable induſtrious people. The Baſkirs are likewiſe fixed inhabitants of the tract that reaches from Kaſan to the frontiers of Siberia; and have certain privileges, of which they are tenacious. The wandering Kalmucs occupy the reſt of the tract to Aſtracan and the frontiers of the Uſbecs; and, in conſideration of certain preſents they receive from her imperial majeſty, they ſerve in her armies without pay, but are apt to plunder equally friends and foes.

The *Coſſacs*, who lately made a figure in the military hiſtory of Europe, were originally Poliſh peaſants, and ſerved in the Ukraine as a militia againſt the Tartars. Being oppreſſed by their unfeeling lords, a part of them removed to the uncultivated banks of the Don, or Tanais, and there eſtabliſhed a colony. They were ſoon after joined, in 1637, by two other detachments of their countrymen; and they reduced Aſoph, which they were obliged to abandon to the Turks, after

laying it in aſhes. They next put themſelves under the protection of the Ruſſians, built Circaſka, on an iſland in the Don; and their poſſeſſions, which conſiſted of thirty-nine towns on both ſides that river, reached from Ribna to Aſoph. They there lived in a fruitful country, which they took care to cultivate; and they were ſo wedded to their original cuſtoms, that they were little better than nominal ſubjects of the czars till the time of Peter the Great. They profeſſed the Greek religion; their inclinations were warlike, and they occaſionally ſerved againſt the Tartars and Turks on the Palus Mæotis.

The internal government of the Coſſacs approaches very near to the idea we form of that of the ancient Germans, as deſcribed by Tacitus. The captains and officers of the nations chooſe a chief, whom they call hauptman, and he reſides at Circaſka; but this choice is confirmed by the czar; and the hauptman holds his authority during life. He acts as a ſuperior over the other towns of the nation, each of which is formed into a ſeparate commonwealth, governed by its own hetman, who is choſen annually. They ſerve in war, in conſideration of their enjoying their laws and liberties. They indeed have ſeveral times rebelled, for which they ſuffered ſeverely under Peter the Great. But the Ruſſian yoke was ſo much eaſier than that of the Poles, that, in 1654, the Coſſacs of the Ukraine put themſelves likewiſe under the protection of Ruſſia. They complained, however, that their liberties had been invaded; and in the war between Charles XII. and Peter, their hetman, Mazeppa, joined the former; but he found himſelf unable to fulfil the magnificent promiſes he had made to Charles. He brought over ſome of the Zaparovian Coſſacs, who were ſettled about the falls of the river Nieper, but moſt of them were cut in pieces.

The mien and character of the Tartars of Kaſan, and of their deſcendants, are very uniform, and may ſerve for the characteriſtic marks of all the Mahometan Tartars in their neighbourhood. Very few of them are tall; but they are generally ſtraight and well-made, have ſmall faces, with freſh complexions, and a ſprightly and agreeable air. They are haughty and jealous of their honour, and of a very moderate capacity. They are ſober and frugal, dexterous at mechanical trades, and fond of neatneſs. The Tartarian women are of a wholeſome complexion rather than handſome, and of a good conſtitution: from their earlieſt infancy they are accuſtomed to labour, retirement, modeſty, and ſubmiſſion. The Tartars of Kaſan take great care of the education of their children. They habituate their youth to labour, to ſobriety, and to a ſtrict obſervance of the manners of their anceſtors. They are taught to read and write, and are inſtructed in the Arabic tongue, and the principles of their religion. Even the ſmalleſt village has its chapel, ſchool, prieſt, and ſchool-maſter; though ſome of theſe prieſts and ſchool-maſters are not much ſkilled in the Arabic language. The beſt Tartarian academies in the Ruſſian empire are thoſe of Kaſan, Tobolſk, and Aſtracan, which are under the direction of the Gagouns, or high-prieſts. It is not uncommon to find ſmall collections of hiſtorical anecdotes in manuſcript, in the huts of the boors; and their merchants, beſides what theſe little libraries contain, are pretty extenſively acquainted with the hiſtory of their own people, and that of the circumjacent ſtates with the antiquities of each. Such as chooſe to make a progreſs in theology, enter themſelves into the ſchools of Boughăria, which are more complete than the others.

The Tartar citizens of Kaſan, Orenberg, and other governments, carry on commerce, exerciſe ſeveral trades, and have ſome manufactures. Their manner of dealing is chiefly by way of barter: coin is very rarely ſeen among them, and bills of exchange never. Many of them carry on a great deal of buſineſs. At Kaſan they prepare what is called in England, Morocco leather. The villages of theſe people comprehend from ten to one hundred farms. Theſe villages were at firſt compoſed

of

of troops of wandering ſhepherds; but being drawn gradually cloſer together by ſucceſſive population, they found themſelves under the neceſſity of cultivating the earth, and erecting fixed habitations. They never leave their fields fallow, for which reaſon they uſe more manure than the Ruſſians. They are much attached to the cultivation of bees; many of them are perfect maſters of this part of rural œconomy, and reap great profit from it. Moſt of the villages alſo contain tanners, ſhoe-makes, taylors, dyers, ſmiths, and carpenters. The laborious females ſpin, and make cloth from the fleece of their flocks, and thread from hemp of their own cultivation.

The moveables of theſe Tartars are, for the moſt part, only ſuch as are neceſſary to the real wants of life. Their catalogue of kitchen and table furniture is very ſhort; and they have but few utenſils of agriculture and mechanics. A cheſt or two, ſome carpets and pieces of felt, mats made of the bark of trees, with which they cover broad benches, that they uſe inſtead of beds, with a few chairs and tables, are commonly all the furniture to be ſeen in their houſes; though ſome of the principal people have ſtuffed cuſhions and pillows on their ſleeping benches. But chairs and tables are only ſeen in towns; and even there, never but in the houſes of ſuch as have buſineſs with foreigners. They commonly make four meals a day, at which their bench ſerves them for table and chairs; for on this they place themſelves round the diſhes, each perſon ſitting on his heels, after the oriental manner. They make ablutions, and ſay prayers, at the beginning and end of all their meals. The Tartars of Kaſan, as well as moſt of the Mahometan Tartars, are very polite, both among one another, and towards ſtrangers. Old men, who have maintained good characters, are held in great veneration among them; and a great beard is conſidered as naturally entitling a man to reſpect. They are fond of aſking advice of their old men, who have always preference and precedence, and are the arbitrators in all diſputes.

The habitations and manner of living of the Tartar citizens and villages of Aſtracan are perfectly ſimilar with thoſe of the Tartars of Kaſan. In the city of Aſtracan they have a large magazine for goods, built of bricks, and ſeveral ſhops upon arches. They carry on an important commerce with the Armenians, Perſians, Indians, and Bougharians: and their manufactories of Morocco leather, cottons, camelots, and ſilks, are in a very thriving ſtate.

The *Finns* have a cloſe reſemblance to the Laplanders, only they are more civilized, and better informed. They live in towns and villages, have ſchools and academies, and make ſome progreſs in the arts and ſciences. They profeſs the Lutheran faith, and uſe the Chriſtian æra in their chronology. They carry on commerce, and exerciſe moſt of the common trades. The boors are chiefly employed in agriculture, hunting, and fiſhing. They are great eaters, making five meals a day, and are immoderately fond of brandy. They enjoy a conſiderable degree of freedom, as the Ruſſian government has continued to them the enjoyment of the privileges which they formerly had under the crown of Sweden.

The *Votiaks* a Finniſh race, chiefly inhabit the province of Viaitk, in the government of Kaſan. This nation was one of thoſe who were formerly under the protection of the Tartars; but ſince it has been ſubjected to Ruſſia, it has preferred the quiet and ſecurity, which agriculture affords, to the ambulatory life of herdſmen and ſhepherds, and fixed habitations to their ancient tents. The Votiaks are of a middle ſtature, and generally red-haired; they are honeſt, peaceable, and hoſpitable: but ſuperſtitious and very credulous. They are aſſiduous in rural œconomy, neglecting neither the culture of bees, nor the chace; in the latter they uſe indifferently the bow or fire-arms. In their leiſure hours many of them employ themſelves in making all ſorts of turnery, ſuch as cups, ſpoons, and ſhuttles; and others varniſh all kinds of cups and bowls. The women are employed in ſewing,

in

in making linen, coarſe cloths, and ornaments of embroidery. Some of the Votiaks are Chriſtians, but a great part of them are heathens and idolaters; though even theſe believe the doctrine of a future ſtate of rewards and puniſhments.

The *Oſtiaks*, likewiſe a Finniſh race, are one of the moſt numerous nations of Siberia. Before they were in ſubjection to Ruſſia, they were governed by princes of their own nation, and their deſcendants are ſtill reputed noble. As theſe people divide themſelves into different flocks or tribes, they chooſe their chiefs from among the progeny of their ancient rulers. Theſe maintain peace and good order, and ſuperintend the payment of the taxes. They are entirely unacquainted with the uſe of letters, and are extremely ignorant; they can reckon as far as ten, but no farther, as is the caſe with other Finniſh nations. Theſe people have a ſingular cuſtom, that the daughter-in-law never uncovers her face in the preſence of her father-in-law; nor is the ſon-in-law allowed to appear before the mother-in-law till his wife has had a child. They are idolaters; and one of their opinions is, that bears enjoy after death a happineſs at leaſt equal to that which they expect for themſelves. Whenever they kill one of theſe animals, they ſing ſongs over him, in which they aſk his pardon for the injury they have done him. They alſo hang up his ſkin, to which they ſhew many civilities, and pay many compliments, to induce him not to take vengeance on them in the world of ſpirits. Indeed, it appears that bears are in great eſtimation among all the Pagan nations of the north, and north-eaſt.

The *Vogouls* are rather below the middle ſtature, have generally black hair, and a ſcanty beard. They are of a gay diſpoſition, honeſt, laborious, and acute; but ſlovenly and fickle, and inclined to be extremely paſſionate. Their women are well made, robuſt, civil, and laborious. They are unacquainted with the uſe of letters, as well as ſome of their kindred nations: they do not reckon their time by years, though they mark the months, and name them after the various revolutions of nature which they obſerve in their foreſts. They diſtinguiſh themſelves into tribes or races; and a Vogoul village is commonly compoſed only of one family, whoſe chief or elder performs the functions of ſtaroſte, or magiſtrate of the village: their principal occupation is the chace, in which they diſcover much eagerneſs and addreſs; uſing indiſcriminately fire-arms, the bow, and the ſpear. They are alſo ſkilful in contriving traps, ſnares, gins, and all the lures of game.

The *Tſchouwaſches* dwell along the two ſides of the Wolga, in the governments of Niſchnei-Novogorod, Kaſan, and Orenberg. They never live in towns, but aſſemble in ſmall villages, and chooſe the foreſts for their habitations. They are very fond of hunting, and procure for that purpoſe ſcrew-barrel muſkets, which they prefer to the bow. One of their marriage ceremonies is, that on the wedding-night the bride is obliged to pull off her huſband's boots. A late writer ſays, "Among the Tſchouwaſches the huſband is maſter of the houſe; he orders every "thing himſelf; and it is the duty of the wife to obey without reply: a cuſtom "calculated to prevent domeſtic broils. Accordingly quarrels are very uncommon "in the families of the Tſchouwaſches."

The *Kirguiſians* have a frank and prepoſſeſſing air, ſimilar to that which characterizes the Tartars of Kaſan. They have a ſharp, but not a fierce look, and ſmaller eyes than thoſe Tartars. They have good natural ſenſe, are affable, and high-ſpirited; but fond of their eaſe, and voluptuous. They dwell in portable huts, wandering about their deſerts in ſearch of paſturage for their flocks and herds, which conſtitute their principal occupation. As their courſes are regulated by neceſſity, in ſummer they traverſe the northern deſerts, and in winter the ſouthern parts. It is when they have nothing elſe to do that they follow hunting and fiſhing, and agriculture is abſolutely unknown to them. Their troops of cattle conſiſt of horſes, camels, cows, goats, and ſheep, which ſupply them with food and raiment. Camels are of great ſervice to them throughout their whole œconomy, car-

rying their huts and furniture at every change of ſtation, which they do to the weight of nine hundred pounds. The Kirguiſians dreſs in the eaſtern manner, but their clothes are for the moſt part better than thoſe worn by the other Tartars. The decoration of their horſes employs them almoſt as much as that of their perſons; they having generally elegant ſaddles, handſome houſings, and ornamented bridles. They are great eaters; and they alſo ſmoke tobacco to exceſs. Men, women, and children, all ſmoke, and take ſnuff: they keep the latter in little horns faſtened to their girdles. The great and wealthy live in the ſame manner as the reſt of the people, and are diſtinguiſhed only by the numerous train that accompanies them in their calvalcades, and the number of huts which ſurround their quarters, inhabited by their wives, children, and ſlaves.

The *Tunguſians* form one of the moſt numerous nations of Siberia. They are of a middle ſtature, and well made. Their ſight and hearing are of a degree of acuteneſs and delicacy that is almoſt incredible; but their organs of ſmelling and feeling are inferior to ours. They are acquainted with almoſt every tree and ſtone within the circuit of their perambulations; and they can even deſcribe a courſe of ſome hundred miles by the configurations of the trees and ſtones they meet with, and can enable others to take the ſame route by ſuch deſcription. They alſo diſcover the tracts of the game by the compreſſion of the graſs or moſs. They learn foreign languages with eaſe, are alert on horſeback, good hunters, and dexterous at the bow.

The *Kalmucs* are a courageous tribe, and numerous; for the moſt part rawboned and ſtout. Their viſage is ſo flat that the ſkull of a Kalmuc may eaſily be known from others. They have thick lips, a ſmall noſe and a ſhort chin, their complexion a reddiſh and yellowiſh brown. Their women are of a ſimilar ſhape with the men, and their ſkin a wholeſome white and red; they are lively, agreeable, and induſtrious. The character of this tribe is, rough, but leſs diſſolute than is commonly ſuppoſed. They are much attached to their chiefs or maſters, but their active ſpirit, and their improvidence and careleſſneſs, make them thieviſh and dirty. In their robberies, they uſe more ſtratagem than violence, and as they believe in the nocturnal wandering of dead men's ſpirits, are ſeldom guilty of murder. They are ſuperſtitious about good and bad days, and have written laws, which are founded on reaſon, cuſtom, and the will of the prince. Their code is very favourable to females, and never looks upon a woman as the author of any crime. Rape and adultery is puniſhed with a mulct of nine head of cattle. Their ſpeech is a mongrel dialect, with many Tartarian words, but their religious books are in the Tangut or Tibetan. The ſole profeſſion among them is the breeding of cattle; they purſue the chace as an amuſement: their dwelling is in tents, or yourts of felt, which they call *gar*, and the Ruſſians *kibitka*, and much reſemble the Kirguiſians. Their clothing is oriental. Some of their women wear a large golden ring in their noſtrils. Their principal food is animals, tame and wild: even their chiefs will feed upon cattle that have died of diſtemper or age; ſo that in every hord the fleſh-market hath the appearance of a lay-ſtall of carrion: they eat likewiſe the roots and plants of their deſerts. They are great eaters, but can endure want for a long time without complaint. Both ſexes ſmoke continually: during the ſummer they keep to the north, and in winter to the ſouthern deſerts. They ſleep upon felt or carpeting, and cover themſelves with the ſame.

The *Kamtſchadales* have a lively imagination, a ſtrong memory, and a great genius for imitation. Their chief employments are hunting and fiſhing. The chace furniſhes them with ſables, foxes, and other game. They are very expert at fiſhing, and are well acquainted with the proper ſeaſons for it. Their nets are made of the ſtamina of nettles. When they are not engaged in hunting and fiſhing, they ſometimes employ themſelves in building huts, forming different wooden utenſils, cutting wood

for

for fuel and building, and making bows and arrows: but much of their time is paſſed in abſolute idleneſs; for they are naturally extremely indolent. Poverty gives them no concern; and nothing but the calls of hunger can drive them to the chace. They live in villages, conſiſting of a few ſmall houſes, and ſituated in general near ſome river. When a village becomes too populous, they ſeparate and form a new village. They eat and drink great quantities; but as what they eat is always cold, their teeth are very fine. Dogs are their only domeſtic animals, and they put a high value upon them. Some of them travel in ſmall carriages drawn by dogs; and a complete Kamtſchadalian equipage, dogs, harneſs, and all, coſts in that country 4l. 10s. or near twenty rubles. The Kamtſchadales believed the immortality of the ſoul, before they embraced the Chriſtian religion. They are ſuperſtitious to extravagance; and extremely ſingular in the enjoyments of life, particularly their convivial entertainments.

The manners of the *Siberians* were formerly ſo barbarous, that Peter the Great thought he could not inflict a greater puniſhment upon his capital enemies, the Swedes, than by baniſhing them to Siberia. The effect was, that the Swediſh officers and ſoldiers introduced European uſages and manufactures into the country, and thereby acquired a comfortable living. In this forlorn region, ſo long unknown to Europe, ſome new mines have lately been diſcovered, which, upon their firſt opening, have yielded, 45,000 pounds of fine ſilver, ſaid to have been obtained with little difficulty or expence. But Kamtſchatka is now conſidered as the moſt horrid place of exile in the vaſt empire of Ruſſia, and hither ſome of the greateſt criminals are ſent.

RELIGION.] The eſtabliſhed religion of Ruſſia is that of the Greek church, the tenets of which are too numerous and complicated to be diſcuſſed here. They deny the pope's ſupremacy; and though they diſclaim image worſhip, they retain many idolatrous and ſuperſtitious cuſtoms. Their churches are full of pictures of ſaints whom they conſider as mediators. They obſerve a number of faſts and lents, ſo that they live half the year very abſtemiouſly; an inſtitution which is extremely convenient for their ſoil and climate. They have many peculiar notions with regard to the ſacraments and Trinity. They oblige their biſhops and other eccleſiaſtics, but not their ſecular prieſts, to celibacy. Peter the Great ſhewed his profound knowledge of government in nothing more than in the reformation of his church. He declared himſelf the head of the church; and preſerved the ſubordinations of metropolitans, archbiſhops, and biſhops. Their prieſts have no fixed income, but depend for ſubſiſtence upon the benevolence of their flocks and hearers. Peter, after eſtabliſhing this great political reformation, left his clergy in full poſſeſſion of all their idle ceremonies; nor did he cut off the beards of his clergy; that impolitic attempt was reſerved for the late emperor, and greatly contributed to his fatal cataſtrophe. Before his time, an incredible number of both ſexes were ſhut up in convents; nor has it been found prudent entirely to aboliſh thoſe ſocieties. Theſe abuſes are now in a great meaſure removed; for no male can become a monk till he is turned of thirty; and no female a nun, till ſhe is fifty; and even then not without permiſſion of their ſuperiors. The preſent empreſs has annexed the church-lands to the crown, and in return grants penſions to the higher clergy and the monks.

The conquered provinces retain the exerciſe of their religion; but ſuch is the extent of the Ruſſian empire, that many of its ſubjects are Mahometans, and more of them no better than Pagans, in Siberia, and the uncultivated countries. Many ill-judged attempts have been made to convert them by force, which have only tended to confirm them in their infidelity. On the banks of the river Sarpa is a flouriſhing colony of Moravian brethren, to which the founders have given the name of Sarepta: the beginning of the ſettlement was in 1765, with diſtinguiſhed privileges from the imperial court.

LANGUAGE.] The common language of Ruſſia is a mixture of the Poliſh and Sclavonian; their prieſts, and the moſt learned of their clergy, make uſe of what is called modern Greek; and they who know that language in its purity are at no loſs for underſtanding it in its corrupted ſtate. The Ruſſians have at preſent thirty letters, the forms of which have a ſtrong reſemblance to the old Greek alphabet.

LEARNING AND LEARNED MEN.] The Ruſſians hitherto have made but an inconſiderable appearance in the republic of letters; but the great encouragement given by their ſovereigns of late, in the inſtitution of academies, and other literary boards, has produced ſufficient proofs, that they are no way deficient as to intellectual abilities. The papers exhibited by them, at their academical meetings, have been favourably received all other Europe; eſpecially thoſe that relate to aſtronomy, the mathematics, and natural philoſophy. The ſpeeches pronounced by the biſhop of Turer, the metropolitan of Novogorod, the vice-chancellor, and the marſhal, at the late opening of the commiſſion for a new code of laws, are elegant and claſſical; and the progreſs which learning has made in that empire ſince the beginning of this century, with the ſpecimens of literature publiſhed at Peterſburg and Moſcow, is an evidence that the Ruſſians are not unqualified to ſhine in the arts and ſciences. Many of the Greek and Latin claſſics have been tranſlated by natives into the Ruſſian language. However, the efforts to civilize them did not begin with Peter the Great, but were much older. A ſmall glimmering, like the firſt day-break, was ſeen under czar Iwan in the middle of the 16th century. This became more conſpicuous under Alexius Michaelowitz: but under Peter it burſt forth with the ſplendor of a riſing ſun, and hath continued ever ſince to aſcend towards its meridian.

UNIVERSITIES.] Three colleges were founded by Peter the Great at Moſcow; one for claſſical learning and philoſophy, the ſecond for mathematics, and the third for navigation and aſtronomy. To theſe he added a diſpenſary, which is a magnificent building, and under the care of ſome able German chemiſts and apothecaries, who furniſh medicines not only to the army, but all over the kingdom. And within theſe few years, Mr. de Shorealow, high chamberlain to the empreſs Elizabeth, daughter to Peter the Great, has founded an univerſity in this City. The preſent empreſs has alſo founded an univerſity at Peterſburg, and invited ſome of the moſt learned foreigners in every faculty, who are provided with good ſalaries; and alſo a a military academy, where the young nobility and officers' ſons are taught the art of war. It ought alſo to be mentioned to the honour of the ſame royal benefactreſs, that ſhe is actually employed in founding a number of ſchools, for the education of the lower claſſes of her ſubjects, throughout the beſt inhabited parts of the empire; an inſtitution of the moſt benevolent tendency, which, if rightly executed, will intitle the Great Catherine, as much as any of her predeceſſors, to the gratitude of the Ruſſian nation.

CITIES, TOWNS, PALACES, AND OTHER BUILDINGS.] Peterſburg naturally takes the lead in this diviſion. It lies at the junction of the Neva with the lake Ladoga, already mentioned, in latitude 60; but the reader may have a better idea of its ſituation, by being informed that it ſtands on both ſides the river Neva, between that lake and the bottom of the Finland gulf. In the year 1703, this city conſiſted of a few ſmall fiſhing huts, on a ſpot ſo ſwampy, that the ground was formed into nine iſlands; by which its principal quarters are ſtill divided. Without entering into a minute deſcription of this wonderful city, it is ſufficient to ſay that it extends about ſix miles every way; and contains every ſtructure for magnificence, the improvement of the arts, revenue, navigation, war, and commerce, that are to be found in the moſt celebrated cities in Europe. But there is a convent which deſerves particular notice, in which 440 young ladies are educated at the empreſs's

expence; 200 of them of ſuperior rank, and the others, daughters of citizens and tradeſmen, who, after a certain time allotted to their education, quit the convent with improvements ſuitable to their conditions of life, and thoſe of the lower claſs are preſented with a ſum of money as a dowry if they marry, or to procure to themſelves a proper livelihood. Near to this convent is a foundling hoſpital, aſſiſtant to that noble one eſtabliſhed at Moſcow, and where the mother may come to be delivered privately, and then, after the utmoſt attention to her, ſhe leaves the child to the ſtate, as a parent more capable of promoting its welfare.

As Peterſburgh is the emporium of Ruſſia, the number of foreign ſhips trading to it in the ſummer-time is ſurpriſing. In winter, 3000 one-horſe ſledges are employed for paſſengers in the ſtreets. It is ſuppoſed that there are above 130,000 inhabitants in this city; and it is ornamented with thirty-five great churches; for in it almoſt every ſect of the Chriſtian religion is tolerated. It alſo contains five palaces, ſome of which are ſuperb, particularly that which is called the New Summer Palace, near the Triumphal Port, which is an elegant piece of architecture. This magnificent city is defended on that ſide next the ſea by the fortreſs of Cronſtadt; which, conſidering the difficulty and danger of navigating a large naval force through the gulf of Finland, is ſufficient to guard it on that ſide from the attempts of any enemy. Peterſburgh is the capital of the province of Ingria, one of Peter the Great's conqueſts from the Swedes. In the neighbourhood of this city are many country-houſes and gardens.

The city of Moſcow was formerly the glory of this great empire, and it ſtill continues conſiderable enough to figure among the capitals of Europe. It ſtands on the river from whence it takes its name in lat. 55-45, and about 1414 miles north-eaſt of London; and though its ſtreets are not regular, it preſents a very pictureſque appearance; for it contains ſuch a number of gardens, groves, lawns, and ſtreams, that it ſeems rather to be a cultivated country than a city. The ancient magnificence of this city would be incredible, were it not atteſted by the moſt unqueſtionable anthors: but we are to make great allowances for the ſtate of the adjacent provinces, which might have made it appear with a greater luſtre in a traveller's eyes. Buſchin ſpeaks of it as the largeſt city in Europe; but that can be only meant as to the ground it ſtands on, computed to be near 26 miles in circumference. It is generally agreed that Moſcow contains 1600 churches and convents, and forty-three places or ſquares. The merchants' exchange contains about 6000 fine ſhops, which diſplay a vaſt parade of commerce, eſpecially to and from China. No city exhibits a greater contraſt than Moſcow of magnificence and meanneſs in building. The houſes of the inhabitants in general are miſerable timber booths; but their palaces, churches, convents, and other public edifices, are ſpacious and lofty. The Kremlin, or grand imperial palace, is mentioned as one of the moſt ſuperb ſtructures in the world: it ſtands in the interior circle of the city, and contains the old imperial palaces, pleaſure-houſes, and ſtables, a victualling-houſe, the palace which formerly belonged to the patriarch, nine cathedrals, five convents, four pariſh churches, the arſenal, with the public colleges, and other offices. All the churches in the Kremlin have beautiful ſpires, moſt of them gilt, or covered with ſilver: the architecture is in the Gothic taſte; but the inſides of the churches are richly ornamented; and the pictures of the ſaints are decorated with gold, ſilver, and precious ſtones. Mention is made of the cathedral, which has no fewer than nine towers, covered with copper double gilt, and contains a ſilver branch with forty-eight lights, ſaid to weigh 2800 pounds. The ſumptuous monuments of the great dukes and czars, the magazine, the patriarchal palace, the exchequer and chancery, are noble ſtructures. The jewels and ornaments of an image of the virgin Mary, in Kremlin church, and its other furniture, can only be equalled by what is ſeen at Loretto in Italy. Mr. Voltaire ſays, that Peter, who was attentive to every thing,

thing, did not neglect Moſcow at the time he was building Peterſburgh; for he cauſed it to be paved, adorned it with noble edifices, and enriched it with manufactures.

The foundling hoſpital at Moſcow is an excellent inſtitution, and appears to be under very judicious regulations. It was founded by the preſent empreſs, and is ſupported by voluntarily contributions, legacies, and other charitable endowments. It is an immenſe pile of building, of a quadrangular ſhape, and contains 3000 foundlings: when the eſtabliſhment is completed, it is intended to contain 8000. They are taken great care of; and at the age of fourteen, they have the liberty of chooſing any particular branch of trade; and for this purpoſe there are different ſpecies of manufactures eſtabliſhed in the hoſpital. When they have gone through a certain apprenticeſhip, or about the age of twenty, they are allowed the liberty of ſetting up for themſelves: a ſum of money is beſtowed upon each foundling for that purpoſe, and they are permitted to carry on trade in any part of the Ruſſian empire. This is a very conſiderable privilege in Ruſſia, where the peaſants are ſlaves, and cannot leave their villages without the permiſſion of their maſters.

Nothing can be ſaid with certainty as to the population of Moſcow. When lord Carliſle was ambaſſador there, in the reign of Charles II. this city was 12 miles in compaſs, and the number of houſes were computed at 40,000. When Voltaire wrote, Moſcow was twenty miles in circumference, and its inhabitants ſaid to amount to 500,000. Mr. Coxe confirms this account of the circumference of this city, but thinks the ſtatement of its population much exaggerated; according to an account which was given to him by an Engliſh gentleman, which he received from the lieutenant of the police, and which he ſays may be relied on, Moſcow contains within the ramparts 250,000 ſouls, and in the adjacent villages 50,000.

CURIOSITIES.] This article affords no great entertainment, as Ruſſia has but lately been admitted into the rank of civilized nations. She can, however, produce many ſtupenduos monuments of the public ſpirit of her ſovereigns; particularly the canals made by Peter the Great, for the benefit of commerce. Siberia is full of old ſepulchres of an unknown nation, whoſe inſtruments and arms were all made of copper. In the cabinet of natural hiſtory at Peterſburgh is a rhinoceros dug up on the banks of the river Valui, with his ſkin, and the hair upon it perfect. The Ruſſians have a great paſſion for bell-ringing; and we are told, that the great bell of Moſcow, the largeſt in the world, weighs, according to Mr. Coxe, "432,000 pounds, and which exceeds in bigneſs every bell in the known world. Its ſize is ſo enormous, that I could ſcarcely have given credit to the account of its magnitude, if I had not examined it myſelf, and aſcertained its dimenſions with great exactneſs. Its height is nineteen feet, its circumference at the bottom twenty-one yards eleven inches, its greateſt thickneſs twenty-three inches." It was caſt in the reign of the empreſs Anne; but the beam on which it hung being burnt, it fell, and a large piece is broken out of it; ſo that it lately lay in a manner uſeleſs. Mr. Bruce, in his late Memoirs, mentions a bell at Moſcow, founded in czar Boris's time, 19 feet high, 23 in diameter, and two in thickneſs, that weighed 336,000 pounds. The building of Peterſburg, and raiſing it from a few fiſhing huts to be a populous and rich city, is perhaps a curioſity hardly to be paralleled ſince the erection of the Egyptian pyramids. The ſame may be ſaid of the fortreſs of Cronſtadt, in the neighbourhood of Peterſburg, which is almoſt impregnable. This fortreſs and city employed, for ſome years, 300,000 men, in laying its foundations, and driving piles, night and day; a work which no monarch in Europe (Peter excepted) could have executed. The plan, with a very little aſſiſtance from ſome German engineers, was drawn by his own hand. Equally wonderful was the navy which he raiſed to his people, at the time when they could hardly be ſaid to have poſſeſſed a ſhip in any part of the globe. What is more wonderful than all, he often wrought in perſon at all thoſe amazing works, with the ſame aſſiduity as if he had been a common labourer.

COMMERCE, AND MARITIME FORCE. In treating of the Ruſſian commerce, former accounts are of little ſervice, becauſe of its great improvements and variations. By the beſt and ſureſt information, the annual exports of Ruſſia at preſent amount to about 2,400,000l. and her imports do not exceed 1,600,000l. ſo that the balance of trade is yearly 800,000l. ſterling in her favour *.

Ruſſia's productions and exports, in general, are many, and very valuable, viz. furs and peltry of various kinds, red leather, linen and thread, iron, copper, ſail-cloth, hemp and flax, pitch and tar, wax, honey, tallow, iſing-glaſs, linſeed oil, pot-aſh, ſoap, feathers, train-oil, hogs briſtles, muſk, rhubarb, and other drugs; timber, and alſo raw ſilk from China and Perſia. Her foreign commerce is much increaſed ſince her conqueſts from Sweden, eſpecially of Livonia and Ingria; and ſince the eſtabliſhing of her new emporium of Peterſburgh, whereby her naval intercourſe with Europe is made much more ſhort and eaſy. The Ukraine may be called the granaries of the empire; the beſt corn, hemp, flax, honey, and wax, come from this fertile province, and 10,000 horned cattle are annually ſent from its paſtures into Sileſia and Saxony.

Ruſſia carries on a commerce over land, by caravans, to China, chiefly in furs: and they bring back from thence, tea, ſilk, cotton, gold, &c. To Bocharia, near the river Oxus, in Tartary, Ruſſia ſends her own merchandize, in return for Indian ſilks, curled lamb-ſkins, and ready money; and alſo from the annual fair at Samarcand: ſhe likewiſe trades to Perſia by Aſtracan, croſs the Caſpian ſea, for raw and wrought ſilk. The empreſs, in 1784, iſſued an edict, permitting all foreigners to carry on a free trade by ſea and land with the ſeveral countries bordering on the Euxine, which have been lately annexed to the empire. The ſame privileges, religious and civil, are allowed to them in the ports of Cherſon, Sebaſtopolis, Theodoſia (formerly Caffa), in the province of Taurica, as in Peterſburg.

Before the time of Peter the Great, Archangel, which lies upon the White Sea, was the only port of naval communication which Ruſſia had with the reſt of Europe; but it was ſubject to a long and tempeſtuous voyage. They have now 13 ports, Archangel, Peterſburg, Riga, Revel, Perneau, Narva, Wibourg, Fredericſham, Aſtracan, and Kola; and the three opened in their new conqueſts. This town is about three Engliſh miles in length, and one in breadth; built all of wood, excepting the exchange, which is of ſtone. Notwithſtanding the decreaſe of the trade of Archangel, by building Peterſburg, it ſtill exports a conſiderable quantity of merchandize. Their maſts and timber for the dock-yards come chiefly from the foreſts of Kaſan, that border on the province of Aſtracan.

The preſent ſtate of theirnavy, according to a late liſt, is 36 men of war of the line, 25 frigates, 109 galleys, 10 proams, from 50 to 24 guns, two bombs, ſeven pinks, &c.; 15000 ſailors are kept in conſtant pay and ſervice, either on board the ſhips, or in the dock yards. The harbour is at Cronſtadt, ſeven leagues from Peterſburg, defended on one ſide by a fort of four baſtions, and on the other by a battery of 100 pieces of cannon. The canal and large baſon will contain near 600 ſail of ſhips.

GOVERNMENT, LAWS, AND DISTINCTION OF RANK. The ſovereign of the Ruſſian empire is abſolute and deſpotic, and maſter of the lives and properties of all his ſubjects; who, though they are of the firſt nobility, or have been highly inſtrumental in promoting the welfare of the ſtate, may, notwithſtanding, for the moſt trifling offence, or even for no offence at all, be ſent to Siberia, or made to drudge for life on the public works, and have all their goods confiſcated, whenever the ſovereign or his miniſters ſhall think proper. When perſons of any rank are baniſhed into Siberia, their poſſeſſions are confiſcated, and a whole family may

* See Coxe's Travels, vol. ii. p. 247.

at

at once be ruined by the inſinuations of an artful courtier. The ſecret court of chancery, which was a tribunal compoſed of a few miniſters, choſen by the ſovereign, had the lives and fortunes of all families at their mercy; but this court was ſuppreſſed by Peter III.

The ſyſtem of civil laws at preſent eſtabliſhed in Ruſſia is very imperfect, and in many inſtances barbarous and unjuſt; being an aſſemblage of laws and regulations drawn from moſt of the ſtates of Europe, ill digeſted, and in many reſpects not adapted to the genius of the Ruſſian nation. The courts of juſtice were in general very corrupt, and thoſe by whom it was adminiſtered extremely ignorant; but the empreſs hath lately made ſome judicious regulations, and fixed a certain ſalary to the office of judge, which before depended on the contributions of the unhappy clients, and thus the poor were without hope or remedy. It is hoped that the new code of laws, for which ſhe hath given inſtructions, will ſoon be produced, to increaſe the people's liberty, ſecurity, and felicity.

The diſtinctions of rank form a conſiderable part of the Ruſſian conſtitution. The late empreſſes took the title of Autocratrix, which implies that they owed their dignity to no earthly power. Their ancient nobility were divided into knezes or knazeys, boyars, and vaivods. The knezes were ſovereigns upon their own eſtates, till they were reduced by the czar; but they ſtill retain the name. The boyars were nobility under the knezes, and the vaivods were governors of provinces. Thoſe titles, however, ſo often revived the ideas of their ancient power, that the preſent and late empreſſes have introduced among their ſubjects the titles of counts and princes, and the other diſtinctions of nobility that are common to the reſt of Europe.

REVENUE AND EXPENCES.] The revenues of this mighty empire are, at preſent, far ſuperior to what they were, even under Peter the Great. The vaſt exertions for promoting induſtry, made by his ſucceſſors, eſpecially her preſent imperial majeſty, have greatly added to their income, which can ſcarcely be reckoned at leſs than 30,000,000 of rubles, or nearly ſix millions ſterling annually. Thus computed:

	RUBLES.
Capitation tax, - - -	8,500,000
Other taxes and duties, - - -	7,000,000
Her own eſtates, with other dominions taken from the clergy,	6,000,000
Produce of the mines, - - -	1,500,000
Monopoly of diſtilled liquors, - -	4,000,000
Monopoly of ſalt, - - -	1,800,000
	28,800,000

The deficiency of the ſum total may be eaſily made up by the profit ariſing from ſtamp-paper, patents, poſt-office, and other articles omitted in the general calculation, beſides *one* per cent. every Ruſſian merchant is obliged to pay on his yearly capital.

When the reader conſiders this ſum relatively, that is, according to the high value of money in that empire, compared to its low value in Great Britain, he will find it a very conſiderable revenue. That it is ſo, appears from the vaſt armies maintained and paid by the late and preſent empreſs, in Germany, Poland, and elſewhere, when no part of the money returned to Ruſſia; nor do we find that they received any conſiderable ſubſidy from the houſes of Bourbon and Auſtria, who, indeed, were in no condition to grant them any. The other expences, beſides the payment of the army and navy of her preſent majeſty, the number and diſcipline of which are at leaſt equal to thoſe of her greateſt predeceſſors, is very conſiderable. By the peace eſtabliſhment in 1778, the regular troops amounted to about

130,000 effective men. The irregular troops are numerous, but conſiſt of horſe, and of this deſultory body the corps of Coſſacs are eſteemed the moſt excellent. Her court is elegant and magnificent, her guards and attendants ſplendid, and the encouragement ſhe gives to learning, the improvement of the arts, and uſeful diſcoveries, coſt her vaſt ſums, excluſive of her ordinary expences of ſtate.

Some of the Ruſſian revenues ariſe from monopolies, which are often neceſſary in the infancy of commerce. The moſt hazardous enterpriſe undertaken by Peter the Great was his imitating the conduct of Henry the VIIIth of England in ſeizing the revenues of the church. He found, perhaps, that policy and neceſſity required the greateſt part of them ſhould be reſtored, which was accordingly done; his great aim being to deprive the patriarch of his exceſſive power. The clergy are taxed in Ruſſia: but the pecuniary revenues of the crown ariſe from taxes upon eſtates, bagnios, bees, mills, fiſheries, and other particulars.

The Ruſſian armies are raiſed at little or no expence; and, while in their own country, ſubſiſt chiefly on proviſions furniſhed them by the country people, according to their internal valuation. The pay of a ſoldier ſcarcely amounts to 30 ſhillings yearly; in garriſon he receives only five rubles yearly. The pay of a ſailor and a gunner is a ruble a month, and they are found in proviſions when a-ſhore.

ORDERS.] The order of St. *Andrew*, or the blue ribband, inſtituted by Peter the Great in 1698, to animate his nobles and officers in the wars againſt the Turks. He choſe St. Andrew for its patron, becauſe by tradition he was the founder of Chriſtianity in the country. The knights are perſons of the firſt rank in the empire. The badge is the image of St. Andrew on the croſs, enamelled on an imperial eagle. The order of St. *Alexander Newſki* *, or the red ribband, was alſo inſtituted by Peter the Great, and confirmed by the empreſs Catherine I. in the year 1725: the enſign of the order is a croſs pattée enamelled red, and edged with gold; the centre enamelled white, and thereon St Alexander on horſeback. The order of St. *Catharine* was inſtituted by Peter the Great, in honour of his empreſs for her aſſiſtance on the Banks of the Pruth. He declared her ſovereign of it, and though both ſexes were firſt admitted, yet it is now appropriated to the fair alone, and perſons of the firſt diſtinction in Europe: the badge is a medallion enriched with diamonds and charged with the image of St. Catharine, pendant to a broad white ribband worn ſaſhwiſe over the right ſhoulder: on the left ſide of the ſtomacher is embroidered a ſilver ſtar of three points, on the centre of which is a croſs. The order of St. *George*, inſtituted in 1769 by the preſent empreſs Catherine II. in favour of the military officers in her ſervice. The badge is a golden croſs enamelled white, on the centre of which is a medallion with the figure of St. George killing the Dragon: this is worn pendant to a black ribband ſtriped and edged with yellow. The order is divided into four claſſes; the firſt is confined to commanders in chief. The order of St. *Woledemir* was inſtituted about October 3d, 1782, by the empreſs in favour of thoſe who ſerve her in a civil capacity, and nearly on the ſame footing with the order of St. George: there are ten great croſſes of it, twenty of the ſecond claſs, thirty of the third, and ſixty of the fourth, beſides a fifth claſs for thoſe who have ſerved in a civil employment 35 years, which entitles them to wear it. The order of St. *Anne* of Holſtein, in memory of Anne, daughter of Peter the Great, was introduced into Ruſſia by Peter III. and is in the diſpoſal of the great-duke, as ſovereign of Holſtein.

HISTORY.] It is evident, both from ancient hiſtory and modern diſcoveries, that ſome of the moſt neglected parts of the Ruſſian empire at preſent were formerly

* Alexander, ſon of the great-duke Yaroſlaf, was of diſtinguiſhed abilities: he defeated the Tartars, Swedes, &c. and wounded the king of Sweden with his own hand, on the banks of the Neva: from whence his appellation of Newſki: he died in 1262.

rich

rich and populous. The reader who throws his eyes on a general map of Europe and Aſia, may ſee the advantages of their ſituation, and their communication by rivers with the Black Sea, and the richeſt provinces in the Roman and Greek empires. In latter times, the Aſiatic part of Ruſſia bordered with Samarcand in Tartary, once the capital under Jenghis Kan and Tamerlane, of a far more rich and powerful empire than any mentioned in hiſtory; and nothing is more certain than that the conqueſt of Ruſſia was among the laſt attempts made by the former of thoſe princes. The chronicles of this empire reach no higher than the 9th century, but they have vended a tradition, that Kiovia and Novogorod were founded by Kii in the year 430. This Kii is by ſome conſidered as an ancient prince, while others mention him as a ſimple boatman, who uſed to tranſport goods and paſſengers acroſs the Neiper. For a long time the chief or ruler had the title of grand-duke of Kiow. We cannot, with the ſmalleſt degree of probability, carry our conjectures, with regard to the hiſtory of Ruſſia, higher than the introduction of Chriſtianity, which happened about the tenth century; when a princeſs of this country, called Olha, is ſaid to have been baptized at Conſtantinople, and refuſed the hand of the Greek emperor, John Zimiſces, in marriage. This accounts for the Ruſſians adopting the Greek religion, and part of their alphabet. Photius, the famous Greek patriarch, ſent prieſts to baptize the Ruſſians, who were for ſome time ſubject to the ſee of Conſtantinople; but the Greek patriarchs afterwards reſigned all their authority over the Ruſſian church; and its biſhops erected themſelves into patriarchs, who were in a manner independent of the civil power. It is certain, that, till the year 1450, the princes of Ruſſia were but very little conſidered, being chiefly ſubject and tributary to the Tartars. It was about this time, that John, or Iwan Baſilides, conquered the Tartars, and, among others, the duke of Great Novogorod, from whom he is ſaid to have carried 300 cart loads of gold and ſilver. His proſperous reign, of above 40 years, gave a new aſpect to Ruſſia.

His grandſon, the famous John Baſilowitz II. having cleared his country of the intruding Tartars, ſubdued the kingdoms of Kaſan and Aſtracan Tartary, in Aſia, and annexed them to the Ruſſian dominions. He gave to his ſubjects the firſt code of laws, introduced printing, and promoted commerce. By his cruelty, however, he obliged the inhabitants of ſome of his fineſt provinces, particularly Livonia and Eſthonia, to throw themſelves under the protection of the Poles and Swedes. Before the time of this John II. the ſovereign of Ruſſia took the title of Welike Knez, "great prince," great lord, or great chief; which the Chriſtian nations afterwards rendered by that of great-duke. The title of Tzar, or, as we call it, Czar, (an expreſſion which, in the Sclavonian language, ſignifies *king*), was added to that of the Ruſſian ſovereigns. Upon the death of John Baſilowitz, the Ruſſian ſucceſſion was filled up by a ſet of weak, cruel princes, and their territories were torn in pieces by civil wars. In 1597, Boris Godonow, whoſe ſiſter Irene was married to the czar Feodor, according to Voltaire, aſſaſſinated Demetri, or Demetrius, the lawful heir, and uſurped the throne. A young monk took the name of Demetrius, pretending to be that prince who had eſcaped from his murderers; and with the aſſiſtance of the Poles, and a conſiderable party (which every tyrant has againſt him), he drove out the uſurper, and ſeized the crown himſelf. The impoſture was diſcovered as ſoon as he came to the ſovereignty, becauſe the people were not pleaſed with him, and he was murdered. If we except the unjuſtifiable means by which Boris raiſed himſelf to the throne, and his ambition and revenge, he muſt be eſteemed an excellent ſovereign, and his loſs was ſenſibly felt: driven to deſpair he ſwallowed poiſon in the ninth year of his reign, 1605. Mr. Coxe thinks that the perſon who ſtiled himſelf Demetrius was not an impoſtor, but the real ſon of Ivan II. preſerved from the aſſaſſination intended for him, by his mother's ſubſtituting another child in his place, and ſending him privately to a convent. The

public neglect of the Ruſſian cuſtoms and religious ceremonies after his ſucceſſion, alienated the people's affections, and precipitated him from the throne as rapidly as he had aſcended it. After a year's reign he was murdered by an inſurrection in his own palace, and the leader of it, Vaſſili Shuiſki, was elected in his room.

Ruſſia now became by turns a prey to the Poles and the Swedes; but was at length delivered by the good ſenſe of the boyars, impelled by their deſpair, in the year 1613. The independency of Ruſſia was then on the point of being extinguiſhed. Uladiſlaus, ſon to Sigiſmund II. of Poland, had been declared czar; but the tyranny of the Poles was ſuch, that it produced a general rebellion of the Ruſſians, who drove the Poles out of Moſcow, where they had for ſome time defended themſelves with unexampled courage. Philaretes, archbiſhop of Roſtow, whoſe wife was deſcended of the ancient ſovereigns of Ruſſia, had been ſent ambaſſador to Poland, and there was detained priſoner by Sigiſmund III. under pretence that his countrymen had rebelled againſt Uladiſlaus. The boyars met in a body; and ſuch was their veneration for Philaretes and his wife, whom the tyrant had ſhut up in the caſtle of Marienburgh, that they elected their ſon, Michael Fædorowitz, of the houſe of Romanoff, a youth of 16 years of age, to be their ſovereign. The father being exchanged for ſome Poliſh priſoners, returned to Ruſſia; and being created patriarch by his ſon, and inveſted with the adminiſtration of affairs, he governed with great prudence and ſucceſs. He defeated the attempts of the Poles to replace Uladiſlaus upon the throne, and likewiſe the claims of a brother of Guſtavus Adolphus. The claims of the Swedes and Poles upon Ruſſia occaſioned a war between thoſe two people, which gave Michael a breathing-time; and he made uſe of it for the benefit of his ſubjects. Soon after the election of Michael, James I. of England ſent, at his invitation, ſir John Meyrick, as his ambaſſador to Ruſſia, upon ſome commercial affairs, and to reclaim a certain ſum of money which James had advanced to Michael or his predeceſſors. The Engliſh court, however, was ſo ignorant of the affairs of that country, though a Ruſſian company had been eſtabliſhed at London, that James was actually unacquainted with the czar's name and title, for he gave him no other denomination than that of great-duke and lord of Ruſſia. Three years after, James and Michael became much better acquainted; and the latter concluded a commercial treaty with England, which ſhews him to have been not only well acquainted with the intereſts of his own ſubjects, but the laws and uſages of nations. He reigned thirty-three years; and, by his wiſdom and the mildneſs of his character, he reſtored eaſe and tranquillity to his ſubjects. He encouraged them to induſtry, and gave them the example of very commendable behaviour in his own perſon. Before we take leave of Michael, it may be proper to mention the mode of the czar's nuptials, which could not be introduced into the miſcellaneous cuſtoms of their ſubjects, and which are as follow. His czariſh majeſty's intention to marry being known, the moſt celebrated beauties of his dominions were ſent for to court, and there entertained. They were viſited by the czar, and the moſt magnificent nuptial preparations were made, before the happy lady was declared, by ſending her magnificent jewels, and a wedding robe. The reſt of the candidates were then diſmiſſed to their ſeveral homes, with ſuitable preſents. The name of the lady's father, who pleaſed Michael, was Streſchnen; and he was ploughing his own farm when it was announced to him, that he was father-in-law to the czar.

Alexius ſucceeded his father Michael, and was married in the ſame manner. He appears to have been a prince of great genius. He recovered Smolenſko, Kiow, and the Ukraine; but was unfortunate in his wars with the Swedes. When the grand ſignior, Mahomet IV. haughtily demanded ſome poſſeſſions from him in the Ukraine, his anſwer was, "that he ſcorned to ſubmit to a Mahometan dog, and that his ſcymitar was as good as the grand ſignior's ſabre." He promoted agriculture;

ture; introduced into his empire arts and ſciences, of which he was himſelf a lover; publiſhed a code of laws, ſome of which are ſtill uſed in the adminiſtration of juſtice; and greatly improved his army by improving its diſcipline. This he effected chiefly by the help of ſtrangers, moſt of whom were Scotch. He cultivated a polite correſpondence with the other powers of Europe; and even with the court of Rome, though he ordered his ambaſſadors not to kiſs the pope's toe. He ſubdued a chief of the Don Coſſacs, named Stenko Raſin, who endeavoured to make himſelf king of Aſtracan; and the rebel, with 12,000 of his adherents, was hanged on the high roads. He introduced linen and ſilk manufactures into his dominions: and inſtead of putting to death, or enſlaving his Lithuanian, Poliſh, and Tartar priſoners, he ſent them to people the banks of the Wolga and the Kama. Theodore ſucceeded his father Alexius in 1667. He was of a gentle diſpoſition, and weak conſtitution; fond of pomp and magnificence; and, in gratifying this propenſity, contributed to poliſh his ſubjects, by the introduction of foreign manufactures, and articles of elegance, which they ſoon began to adopt and imitate. He delighted much in horſes, and he rendered a real ſervice to his country in the beginning and eſtabliſhing very-fine breeds of them in the Ukraine, and elſewhere. He reigned ſeven years, and having on his death-bed called his boyars round him, in the preſence of his brother and ſiſter, Iwan and Sophia, and of Peter, who was afterwards ſo celebrated, and who was his half-brother, according to Voltaire, he ſaid to them, "Hear my laſt ſentiments; they are dictated by my love for the ſtate, and by my affection for my people. The bodily infirmities of Iwan neceſſarily muſt affect his mental faculties; he is incapable of ruling a dominion like that of Ruſſia; he cannot take it amiſs, if I recommend to you to ſet him aſide, and to let your approbation fall on Peter, who to a robuſt conſtitution joins great ſtrength of mind, and marks of a ſuperior underſtanding." From the moſt authentic records, it appears, that Peter did not owe his elevation to any declaration of Theodore in his favour, but merely to the ſuffrages of thoſe perſons who aſſerted the right of nominating the ſucceſſor. Peter was choſen, and the government entruſted to Natalia, his mother. But the party in oppoſition was very powerful. The Strelitz or Ruſſian regiments of guards, poſſeſſed above 14000 armed votes, and not being ſatisfied with their colonels, or the excluſion of the elder brother from the throne, they ſurrounded the palace, and inſiſted on the execution of the Naraſkins, the czarina's chief relations. Their exceſſes ſurpaſſed all deſcription. The city of Moſcow underwent a general pillage and maſſacre for three days. At laſt, by a compromiſe between the two parties, Iwan and Peter were declared joint-ſovereigns, May 18, 1682; but as one was judged incapable of governing, and Peter was only ten years old, the adminiſtration was veſted in their ſiſter, who was of popular manners and great abilities. However Voltaire and other authors may have blackened Sophia's character, it is now evident, from Muller and other good authorities *, that ſhe was a princeſs of great merit, and by no means deſerving of the reproaches caſt upon her: her adminiſtration was wiſe and vigilant, and much to the advantage of her country. She repoſed much confidence in prince Baſil Galitzin, a conſummate politician. Peter, as he advanced in years, being encouraged by his mother and her adherents, claimed a ſhare in adminiſtration, and took his ſeat in the privy council, Jan. 25, 1688. From this period diſſenſions aroſe between them, and the aſpiring genius of Peter acquired the aſcendancy. Under the pretence of a conſpiracy againſt his life, he arreſted his ſiſter, and impriſoned her for life in the nunnery of Devitz: ſhe died in 1704. Galitzin's life was ſpared, but his great eſtate was confiſcated; and the following curious ſentence was pronounced as his puniſhment. "Thou art commanded by the moſt clement czar to

* Coxe's Travels, 4to. vol. i. p. 395 to 418.

repair to Karga, a town under the pole, and there to continue the remainder of thy days. His majeſty, out of his extreme goodneſs, allows thee three pence per day for thy ſubſiſtence." He died in priſon at Pooſtork in 1713. This left Peter with no other competitor, in the year 1689, than the mild and eaſy Iwan, and upon his death, which happened in 1696, Peter reigned alone, and cruelly provided for his own future ſecurity by the execution of above 3000 Strelitz, and at the ſame time broke the whole body, and aboliſhed their name.

It far exceeds the bounds preſcribed to this work to give even a ſummary detail of this great prince's actions. All that is neceſſary in this place is to give a general view of his power, and the vaſt reformation he introduced into his dominions. Peter, though he had been but very indifferently educated, aſſociated himſelf with Germans and Dutch; with the former for the ſake of their manufactures, which he early introduced into his dominions; and with the latter for their ſkill in navigation, which he practiſed himſelf. His inclination for the arts was encouraged by his favourite Le Fort, a Piedmonteſe; and general Gordon, a Scotchman, diſciplined the czar's own regiment, conſiſting of 5000 foreigners; while Le Fort raiſed a regiment of 12,000, among whom he introduced the French and German exerciſes of arms, with a view of employing them in curbing the inſolence of the Strelitz. Peter, after this, began his travels; leaving his military affairs in the hands of Gordon. He ſet out as an attendant upon his own ambaſſadors; and his adventures in Holland and England, and other courts, are too numerous and too well known to be inſerted here. By working as a common ſhip-carpenter at Deptford and Saardam, he completed himſelf in ſhip-building and navigation; and through the excellent diſcipline introduced among his troops by the foreigners, he not only over-awed or cruſhed all civil inſurrections, but all his enemies on this ſide of Aſia; and at laſt he exterminated, except two feeble regiments, the whole of the Strelitzes. He roſe gradually through every rank and ſervice both by ſea and land; and the many defeats which he received, eſpecially that from Charles XII. at Narva, ſeemed only to enlarge his ambition, and extend his ideas. The battles he loſt rendered him a conqueror upon the whole, by adding experience to his courage; and the generous friendſhip he ſhewed to Auguſtus, king of Poland, both before and after he was dethroned by the king of Sweden, redounds greatly to his honour. He had no regard for rank diſtinct from merit; and he, in 1711, married Catharine, a young Lithuanian woman, who had been betrothed to a Swediſh dragoon at Marienburg. General Bauer, taking that place in 1701, was ſmitten with her, and took her to his houſe. She was ſoon removed into the family of the prince Menzikoff, with whom ſhe lived till 1704, when in the 17th year of her age ſhe became the miſtreſs of Peter, and then his wife; becauſe, after a long cohabition, he found her poſſeſſed of a ſoul formed to execute his plans, and to aſſiſt his councils. Catharine was ſo much a ſtranger to her own country, that her huſband afterwards diſcovered her brother, who ſerved as a common ſoldier in his armies. But military and naval triumphs, which ſucceeded one another after the battle of Pultowa, in 1709, with Charles XII. were not the chief glories of Peter's reign. He applied himſelf with equal aſſiduity to the cultivation of commerce, arts, and ſciences; and upon the whole, he made ſuch acquiſitions of dominion, even in Europe itſelf, that he may be ſaid, at the time of his death, which happened in January, 1725, to have been the moſt powerful prince of his age, but more feared than beloved by his ſubjects.

Peter the Great was unfortunate in his eldeſt ſon, who was called the Czarowitz, and who, marrying without his conſent, entered, as his father alledged, into ſome dangerous practices againſt his perſon and government; for which he was tried and condemned to death. Under a ſovereign ſo deſpotic as Peter was, we can ſay nothing as to the juſtice of the charge. He publicly treated him with inhuman ferocity, and it was undoubtedly his will, that the young prince ſhould be found guilty.

It

It is ſaid, that as ſoon as the ſentence of death was pronounced upon the prince, wherein were the following words, "The divine, eccleſiaſtical, civil, and military laws condemn to death, without mercy, all thoſe whoſe attempts againſt their father and their ſovereign are manifeſt," he fell into the moſt violent convulſions, from which it was with the greateſt difficulty that he regained a little interval of ſenſe, during which he deſired his father would come to ſee him, when he aſked his pardon, and ſoon after died. But the moſt probable opinion is that he was ſecretly executed in priſon, and that marſhal Weyde was the perſon who beheaded him. After this event, in 1724, Peter ordered his wife Catharine to be crowned, with the ſame magnificent ceremonies as if ſhe had been a Greek empreſs, and this was the principal cauſe of her ſubſequent elevation. For juſt before his death he diſcovered a ſecret connection between her and her firſt chamberlain Mons. He ſurpriſed them together in an arbour of the garden, when ſtriking her with his cane, as well as the page, who would have prevented him from entering the arbour, he retired without uttering a ſingle word. But preſently Mons was taken up, and being threatened with the torture, confeſſed, and was beheaded. The day after the execution Peter conveyed Catharine in an open carriage under the gallows to which the head of Mons was nailed. It is ſaid, that the empreſs without changing colour at this dreadful ſight, exclaimed, "What a pity! that there is ſo much corruption among courtiers!" This event was ſoon followed by Peter's death, who probably had deſtined his eldeſt daughter Anne to be his ſucceſſor, but the ſuddenneſs of his death prevented it; and ſome of the nobles and officers being gained by money, jewels, and promiſes, and the two regiments of guards by a largeſs, Catharine mounted the Ruſſian throne. She was in her perſon under the middle ſize, and her abilities have been greatly exaggerated: ſhe could neither read nor write: her daughter Elizabeth uſually ſigned her name for her, and particularly to her laſt will and teſtament. During her ſhort reign, of two years, which may rather be conſidered as the reign of Menzikoff, her life was very irregular. An intemperate uſe of tokay wine, joined to a cancer and dropſy, haſtened her end on the 17th of May, 1727. She was ſucceeded by Peter II. a minor, ſon to the Czarowitz. Many domeſtic revolutions happened in Ruſſia during the ſhort reign of this prince; but none was more remarkable than the diſgrace and exile of prince Menzikoff, the favourite general in the two late reigns, and eſteemed the richeſt ſubject in Europe, the original author of her good fortunes. Peter died of the ſmall-pox, in 1730.

Notwithſtanding the deſpotiſm of Peter and his wife, the Ruſſian ſenate and nobility, upon the death of Peter II. ventured to ſet aſide the order of ſucceſſion which they had eſtabliſhed. The male iſſue of Peter was now extinguiſhed; and the duke of Holſtein, ſon to his eldeſt daughter, was, by the deſtination of the late empreſs, entitled to the crown: but the Ruſſians, for political reaſons, filled their throne with Anne, ducheſs of Courland, ſecond daughter to Iwan, Peter's eldeſt brother; though her eldeſt ſiſter, the ducheſs of Mecklenburgh, was alive. Her reign was extremely proſperous; and though ſhe accepted of the crown under limitations that ſome thought derogatory to her dignity, yet, by the aſſiſtance of the guards, ſhe broke them all, aſſerted the prerogative of her anceſtors, and puniſhed the aſpiring Dolgorucki family, who had impoſed upon her limitations, with a view, as it is ſaid, that they themſelves might govern. She raiſed her favourite Biron to the duchy of Courland, and was obliged to give way to many ſanguinary meaſures and ſevere executions on his account. Upon her death, in 1740, John, the ſon of her niece, the princeſs of Mecklenburgh, by Anthony Ulric of Brunſwic Wolfenbuttel, was by her will, entitled to the ſucceſſion: but being no more than two years old, Biron was appointed to be adminiſtrator of the empire during his nonage. This deſtination was diſagreeable to the princeſs of Mecklenburgh and her huſband, and unpopular among the Ruſſians. Count Munich was employed by the princeſs of Mecklen-

burgh to arreſt Biron, who was tried, and condemned to die, but was ſent in exile to Siberia, where he continued till Peter III. recalled him, and Catharine reſtored him to the duchy of Courland.

The adminiſtration of the princeſs Anne of Mecklenburgh and her huſband was, upon many accounts, but particularly that of her German connections, diſagreeable, not only to the Ruſſians, but to other powers of Europe; and, notwithſtanding a proſperous war they carried on with the Swedes, the princeſs Elizabeth, daughter, by Catharine, to Peter the Great, formed ſuch a party, that in one night's time ſhe was proclaimed empreſs of the Ruſſias; and the princeſs of Mecklenburgh, her huſband, and ſon, were made priſoners.

Elizabeth's reign may be ſaid to have been more glorious than that of any of her predeceſſors, her father excepted. She aboliſhed capital puniſhments; and introduced into all civil and military proceedings a moderation, till her time unknown in Ruſſia: but at the ſame time ſhe puniſhed the counts Munich and Oſterman, who had the chief management of affairs during the late adminiſtration, with exile. Count Munich was confined at Pelin in Siberia, in a priſon, which by his order was erected for Biron; he had a daily allowance of 12s. for himſelf, wife, and a few ſervants. After 21 years impriſonment he was releaſed and reſtored to his ancient rank by Peter III. in 1762, and died in 1765, eighty-three years old. The chief diſgrace of her reign, was the puniſhment of the counteſſes Beſtucheff and Lapuchin: each received 50 ſtrokes of the knout in the open ſquare of Peterſburg, their tongues were cut out, and then baniſhed into Siberia. The real crime of the laſt was her commenting too freely on the empreſs's amours. Having glorioufly finiſhed the war with Sweden, ſhe replaced the natural order of ſucceſſion in her own family, by declaring the duke of Holſtein Gottorp, who was deſcended from her eldeſt ſiſter, to be her heir. She gave him the title of grand-duke of Ruſſia; and ſoon after her acceſſion to the throne, ſhe called him to her court, where he renounced the ſucceſſion to the crown of Sweden, which undoubtedly belonged to him, embraced the Greek religion, and married a princeſs of Anhalt-Zerbſt, by whom he had a ſon, who is now heir to the Ruſſian empire. Few princes have had a more uninterrupted career of glory than Elizabeth. She was completely victorious over the Swedes. Her alliance was courted by Great Britain, at the expence of a large ſubſidy; but many political and ſome private reaſons, it is ſaid, determined her to take part with the houſe of Auſtria againſt the king of Pruſſia in 1756. Her arms gave a turn to the ſucceſs of the war, notwithſtanding that monarch's amazing abilities both in the field and cabinet. Her conqueſts were ſuch as portended the entire deſtruction of the Pruſſian power, which was, perhaps, ſaved only by her critical death, on January 5, 1762.

Elizabeth was ſucceeded by Peter III. grand-duke of Ruſſia, and duke of Holſtein, a prince whoſe conduct has been variouſly repreſented. He mounted the throne poſſeſſed of an enthuſiaſtic admiration of his Pruſſian majeſty's virtues; to whom he gave peace, and whoſe principles and practices he ſeemed to have adopted as the directories of his future reign. Several ſalutary regulations were made during his ſhort reign, and he aboliſhed many prerogatives that were oppreſſive and tyrannical. But he ſoon incurred the general odium by his public contempt of the Ruſſian manners and religion. He might have ſurmounted the effects of many peculiarities, unpopular as they were, but he aimed at eccleſiaſtical reformations in his dominions, which Peter the Great durſt not attempt; and he even ventured to cut off the beards of his clergy. It is alſo alledged, that he had formed a reſolution to deſtroy both his empreſs and her ſon; and the advocates of Peter the Third acknowledge, that he had reſolved to ſhut up his wife in a convent, or rather in the fortreſs of Schluſſelburg, and then to place his miſtreſs, the counteſs of Voronzof, upon the throne, if not to change the order of ſucceſſion. However, the execution

of

of his deſigns was prevented by a conſpiracy being formed againſt him, in which the empreſs took a very active part; and this unfortunate prince ſcarcely knew an interval between the loſs of his crown and his life, of which he was deprived, while under an ignominious confinement at Robſcha, in July, 1762. That his conduct, with regard to Pruſſia, was not the ſole cauſe of his depoſition, ſeems evident from the meaſures of his ſucceſſor, who now reigns by the title of Catharine II. That princeſs, with regard to Pruſſia, trod in her huſband's ſteps.

The moſt remarkable domeſtic occurrence of her reign hitherto is the death of prince Iwan, ſon to the princeſs of Mecklenburgh. This young prince, as ſoon as he came into the world was deſigned, though illegally, to wear the imperial crown of Ruſſia, after the death of his great aunt, the empreſs Anna Iwanona; but by the advancement of the empreſs Elizabeth, he was condemned to lead an obſcure life in the caſtle of Schluſſelburg under a ſtrong guard, who had particular orders, that if any perſon, or any armed force, was employed in attempting to deliver him, they ſhould kill him immediately. He lived quietly in his priſon when the empreſs, Catharine II. mounted the throne; and as the revolution which depoſed her huſband Peter III. had occaſioned a ſtrong ferment in the minds of the people, Catharine was apprehenſive that ſome attempts might be made in favour of Iwan: ſhe therefore donbled the guards of this unhappy prince, and particularly entruſted him to the care of two officers, who were devoted to her intereſt. However, a lieutenant of infantry, who was born in the Ukraine, undertook, or at leaſt pretended ſo, to deliver Iwan by force of arms from the fortreſs of Schluſſelburg; and under this pretence the prince was put to death, the 16th of July, 1764, after an impriſonment of 23 yeats. The lieutenant who attempted to deliver him was arreſted, and afterwards beheaded, and his body burnt with the ſcaffold.

While this event excited the attention of the Ruſſian nation, the flames of civil war broke out with great violence in Poland, which has generally been the caſe when the throne was vacant. And as the internal tranquillity of Poland is a capital object with Ruſſia, the empreſs Catharine ſent a body of troops into Poland, and by her influence count Poniatowſki was raiſed to the throne. She alſo interpoſed in order to ſecure the rights which the treaty of Oliva had given to the Greek and proteſtant ſubjects of Poland. But the umbrage which her imperial majeſty's armies gave to the Roman Catholic Poles, by their reſidence in Poland, increaſed the rage of civil war in that country, and produced confederacies againſt all that had been done during the late election; which rendered Poland a ſcene of blood and confuſion. The conduct of Ruſſia, with regard to Poland, gave ſo much offence to the Ottoman court, that the Grand Signior ſent Obreſkoff, the Ruſſian miniſter, to the priſon of the Seven Towers, declared war againſt Ruſſia, and marched a very numerous army to the confines of Ruſſia and Poland. Hoſtilities ſoon commenced between theſe rival and mighty empires. In the months of February and March, 1769, Crim Gueray, Khan of the Tartars, at the head of a great body of Tartars, ſupported by 10,000 Spahis, having broken the Ruſſian lines of communication, penetrated into the province of New Servia, where he committed great ravages, burning many towns and villages, and carrying off ſome thouſand families captive. In April following, the Grand Vizir, at the head of a great army, began his march from Conſtantinople, and proceeded towards the Danube. In the mean time, prince Galitzin, who commanded the Ruſſian army on the banks of the Neiſter, thought this a proper time to attempt ſomething deciſive, before the arrival of the great Turkiſh force in that quarter. He advanced to Choczim, where he encamped in ſight of a body of 30,000 Turks, commanded by Caraman Pacha, and intrenched under the cannon of the town. The prince attacked the Turks in their entrenchments early in the morning of the 30th of April, and notwithſtanding an obſtinate defence, and a dreadful fire from the fortreſs, at length beat them

out of their trenches, followed them into the ſuburbs of Choczim, and their purſuit was only ſtopped by the palliſadoes of the fortreſs. Soon after, the town was ſet on fire by red-hot balls, and a great number of Jews and Chriſtians took refuge in the Ruſſian camp. From theſe ſucceſſes of the Ruſſians, it might have been expected that Choczim would have immediately fallen; but prince Galitzin thought proper to retire, and to repaſs the Neiſter, not having ſufficient artillery along with him. Indeed, it appears that the Turkiſh cavalry had over-run the neighbouring country, burnt ſome ſmall towns, and deſtroyed ſome Ruſſian magazines.

While the Ruſſians and Turks were attacking each other in different places of their dominions on the ſide of Europe, the Tartar Aſiatic nations, in their different intereſts, extended the rage of war into another quarter of the globe. On the 9th of May a bloody engagement was fought between the Kalmucs and thoſe Tartars that inhabit the banks of the Cuban, lying between the Black and the Caſpian ſeas. This engagement continued from two in the afternoon till ſun-ſet; when the Kalmucs, by the aſſiſtance of ſome Ruſſian officers, with a detachment of dragoons and Coſſacs, and two pieces of cannon, obtained a complete victory, having made a great ſlaughter, as the Kalmucs gave no quarter. On the other hand, the European Tartars penetrated into the Ruſſian Ukraine on the ſide of Backmuth, where they made great devaſtations.

On the 13th of July, a very obſtinate battle was fought, in which the Turks were defeated; the Ruſſians immediately inveſted Choczim, but the garriſon, being numerous, made frequent ſallies, and received great reinforcements from the Grand Vizir's camp, who was now conſiderably advanced on this ſide of the Danube. Several actions enſued, and prince Galitzin was again obliged to retreat and repaſs the Neiſter. It was computed that the ſiege of Choczim, and the actions conſequent to it, coſt the Ruſſians above 20,000 men. In the management of this war, the grand vizir acted with a degree of prudence, which it has been thought would have proved fatal to the deſigns of the Ruſſians, if the ſame conduct had been afterwards purſued. But the army of the Vizir was extremely licentious, and his caution gave offence to the Janizaries: ſo that, in conſequence of their clamours, and the weakneſs of their councils that prevailed in the ſeraglio, he at length became a ſacrifice, and Moldovani Ali Pacha, a man of more courage than conduct, was appointed his ſucceſſor.

During theſe tranſactions, general Romanzow committed great devaſtations on the Turks on the borders of Bender and Oczakow, where he plundered and burnt ſeveral towns and villages, defeated a Turkiſh detachment, and carried off a great booty of cattle. The Tartars alſo committed great ravages in Poland, where they almoſt deſtroyed the palatinate of Bracklaw, beſides doing much miſchief in other places. In the beginning of September, the Ruſſian army was again poſted on the banks of the Neiſter, and defended the paſſage of that river againſt the Turks, whoſe whole army, under the command of the new Vizir, was arrived on the oppoſite ſhore. Having laid three bridges over the Neiſter, the Turkiſh army, without any pretence of ſtratagem or deception, began to paſs the river in the face of the enemy. Prince Galitzin having perceived this motion early in the morning of the 9th of September, immediately attacked thoſe troops that had croſſed the river in the night, who conſequently could neither chooſe their ground, nor have time to extend or form themſelves properly where they were. Notwithſtanding theſe extreme diſadvantages the engagement was very ſevere, and continued from ſeven in the morning till noon. The Turks fought with great obſtinacy, but were totally defeated, and obliged to repaſs the river with great loſs. It was computed that about 60,000 Turks croſſed the river, before and during the time of the engagement. Prince Galitzin charged at the head of five columns of infantry, with fix-

ed bayonets, who deſtroyed the flower of the Turkiſh cavalry. It is ſaid, that the loſs of the Turks, in this battle, amounted to 7000 men killed upon the ſpot, beſides wounded and priſoners, and a great number who were drowned. Though the ill conduct of the Vizir had greatly contributed to this capital misfortune, yet this did not prevent him from engaging in another operation of the ſame nature. He now laid but one bridge over the river, which he had the precaution to cover with large batteries of cannon, and prepared to paſs the whole army over. On the 17th of September eight thouſand Janizaries and four thouſand regular cavalry, the flower of the Ottoman army, paſſed over with a large train of artillery, and the reſt of the army were in motion to follow, when a ſudden and extraordinary ſwell of the waters of the Neiſter totally deſtroyed the bridge. The Ruſſians loſt no time in making uſe of this great and unexpected advantage. A moſt deſperate engagement enſued; not only the field of battle, but the river over which ſome few hundreds of Turks made their eſcape by ſwimming, was for ſeveral miles covered with dead bodies. The Ruſſians took 64 pieces of cannon, and above 150 colours and horſe-tails. The Turks immediately broke up their camp, abandoned the ſtrong fortreſs of Choczim, with all its ſtores and numerous artillery, and retired towards the Danube. They were much exaſperated at the ill conduct of the Vizir; and it was computed that the Turks loſt 28,000 of the braveſt of their troops within little more than a fortnight; and that 48,000 more abandoned the army, and totally deſerted, in the tumultuous retreat to the Danube. Prince Galitzin placed a garriſon of four regiments in the fortreſs of Choczim, ſoon after reſigned the command of the army to general count Romanzow, and returned to Peterſburgh covered with laurels.

The Ruſſians carried on the war with ſucceſs; they over-run the great province of Moldavia, and general Elmpt took poſſeſſion of the capital, Jaſſy, without oppoſition. And as the Greek natives of this province had always ſecretly favoured the Ruſſians, they now took this opportunity of their ſucceſs, and the abſence of the Turks, to declare themſelves openly. The Greek inhabitants of Moldavia, and afterwards thoſe of Wallachia, acknowledged the empreſs of Ruſſia as their ſovereign, and took oaths of fidelity to her. On the 18th of July, 1770, general Romanzow defeated a Turkiſh army, near the river Larga, ſaid to have amounted to 80,000 men, and commanded by the Khan of the Crimea. But on the ſecond of Auguſt, the ſame Ruſſian general obtained a ſtill greater victory over another army of the Turks, commanded by a new Grand Vizir. This army was very numerous, but was totally defeated. It is ſaid that above 7000 Turks were killed on the field of battle, and that the roads to the Danube were covered with dead bodies; a vaſt quantity of ammunition, 143 pieces of braſs cannon, and ſome thouſand carriages loaded with proviſions, fell into the hands of the Ruſſians.

But it was not only by land that the Ruſſians carried on the war ſucceſsfully againſt the Turks. The empreſs ſent a conſiderable fleet of men of war, Ruſſian built, into the Mediterranean, to act againſt the Turks on that ſide; and, by means of this fleet, under count Orlop, the Ruſſians ſpread ruin and deſolation through the open iſlands of the Archipelago, and the neighbouring defenceleſs coaſts of Greece and Aſia; the particulars of which will appear in the hiſtory of Turkey. It is obſervable, that in this attempt of the Ruſſians to act as a maritime power, they were greatly aſſiſted by England; but whether in this the Engliſh government was influenced by principles of ſound policy may very reaſonably be queſtioned.

The war between the Ruſſians and the Turks ſtill continued to be carried on by land, as well as by ſea, to the advantage of the former: but at length ſome attempts were made to negociate a peace between theſe great contending powers; hoſtilities were repeatedly ſuſpended, and afterwards renewed; but a peace was concluded

concluded on the 21ſt of July 1774, highly honourable and beneficial to the Ruſſians, by which they obtained the liberty of a free navigation over the Black Sea, and a free trade with all parts of the Ottoman empire.

Before the concluſion of the war with the Turks, a rebellion broke out in Ruſſia, which gave much alarm to the court of Peterſburg. A Coſſac, whoſe name was Pugatſcheff, aſſumed the name and character of the late unfortunate emperor Peter the Third. He appeared in the province of Kaſan, and pretended, that he made his eſcape, through an extraordinary interpoſition of Providence, from the murderers who were employed to aſſaſſinate him; and that the report of his death was only a fiction invented by the court. His perſon is ſaid to have had a ſtriking reſemblance to that of the late emperor, a circumſtance which firſt induced him to engage in this enterprize. As he poſſeſſed abilities and addreſs, his followers ſoon became very numerous; and he at length found himſelf ſo powerful, that he ſtood ſeveral engagements with the able Ruſſian generals, at the head of large bodies of troops, and committed great ravages in the country. But being totally defeated, and then betrayed by two of his confidents, he was brought to Moſcow in an iron cage, and there beheaded and quartered on the 21ſt of January, 1775.

The preſent empreſs of Ruſſia, notwithſtanding the very unfavourable circumſtances which attended her taking poſſeſſion of the government of that empire, has, from the commencement of her reign, filled her high ſtation with diſtinguiſhed renown. She has encouraged learning and the arts, and endeavoured greatly to extend the commerce of her ſubjects: though the extreme deſpotiſm of the Ruſſian government is a great impediment to the progreſs of the arts and ſciences, and to the real proſperity of the empire. Her imperial majeſty has effected many beneficial and important regulations in the interior police of her vaſt empire, and particularly in the courts of juſtice. She has aboliſhed the uſe of torture; and ſhe has alſo adopted an excellent plan for the reformation of priſons. The new code of laws for which ſhe hath given her inſtructions, is yet wanting to mitigate the rigour of deſpotiſm. One of the moſt remarkable tranſactions of her reign, is her eſtabliſhment of an armed neutrality, for the protection of the commerce of nations not at war, from any attacks or inſults from belligerent powers. By the code, which her imperial majeſty has endeavoured to enforce, neutral ſhips are to enjoy a free navigation, from port to port, and on the coaſts of belligerent powers; and all effects belonging to the ſubjects of ſuch powers are looked upon as free, on board ſuch neutral ſhips, except the goods ſtipulated contraband in her treaty of commerce with Great Britain. It was in 1780, that her imperial majeſty invited the powers at war to accede to this armed neutrality. Thoſe who engaged were to make a common cauſe at ſea againſt any of the powers who ſhould violate, with reſpect to neutral nations, theſe principles of maritime law. The armed neutrality was acceded to, the ſame year, by the kings of Sweden and Denmark, and by the States-General.

Catharine II. empreſs of all the Ruſſias, princeſs of Anhalt Zerbſt, was born in 1729, and aſcended the throne in 1762, upon the depoſition and death of her huſband. She was married to that prince whilſt duke of Holſtein Gottorp, in 1745, by whom ſhe has iſſue Paul Petrowitz, great-duke of Ruſſia, born in 1754, who has been twice married, and by his preſent ducheſs, the princeſs of Wirtemberg, has had two ſons, Alexander and Conſtantine, and a daughter, Alexandrina-Pawleona.

SCOT-

SCOTLAND, AND ITS ADJACENT ISLES.

ISLES OF SCOTLAND.

ACCORDING to the general plan I have laid down, I ſhall treat of the Iſlands belonging to Scotland, before I proceed to the deſcription of that kingdom; and, to avoid prolixity, ſhall comprehend, under one head, thoſe of Shetland, Orkney, and the Hebrides, or Weſtern iſles.

SITUATION AND EXTENT.] The iſles of Shetland lie north-eaſt of the Orcades, or Orkney-iſlands, between 60 and 61 degrees of north latitude; and form part of the ſhire of Orkney.

The Orcades lie north of Dungſby-head, between 59 and 60 degrees of north latitude; divided from the continent by a tempeſtuous ſtrait called Pentland Frith, 24 miles long and 12 broad.

The Hebrides, or Weſtern iſles, are numerous, and ſome of them large; ſituated between 55 and 59 degrees of north latitude.

CLIMATE.] In all theſe iſlands the air is keen, piercing, and ſalubrious; and many of the natives live to a great age. In the Shetland and Orkney iſles they ſee to read at midnight in June and July; and during four of the ſummer months, they have frequent communications, both for buſineſs and curioſity, with each other, and with the continent: the reſt of the year, they are almoſt inacceſſible, through fogs, darkneſs, and ſtorms. It is a certain fact, that a Scotch fiſherman was impriſoned in May for publiſhing the account of the prince and princeſs of Orange being raiſed to the throne of England the preceding November; and he would probably have been hanged, had not the news been confirmed by the arrival of a ſhip.

CHIEF ISLANDS AND TOWNS.] The largeſt of the Shetland iſlands, which are forty-ſix in number (though many of them are uninhabited) is Mainland, which is 60 miles in length, and 20 in breadth. Its principal town is Larwick, which contains 300 families; the whole number of families in the iſland not exceeding 500. Skalloway is another town, where the remains of a caſtle are ſtill to be ſeen, and it is the ſeat of a preſbytery. On this iſland the Dutch begin to fiſh for herrings at midſummer, and their fiſhing-ſeaſon laſts ſix months.

The largeſt of the Orkney iſlands, which are about thirty in number (though ſeveral of them are unpeopled), is called Pomona. Its length is thirty-three miles, and its breadth, in ſome places, nine. It contains nine pariſh churches, and four excellent harbours.

The iſle of Mull, in the Hebrides, is twenty-four miles long, and, in ſome places, almoſt as broad. It contains two pariſhes, and a caſtle, called Duart, which is the chief place in the iſland. The other principal weſtern iſlands are, Lewis or Herries (for they both form but one iſland), which belongs to the ſhire of Roſs, and is 100 miles in length, and 13 or 14 in breadth; its chief town is Stornvay. Sky, belonging to the ſhire of Inverneſs, is 40 miles long, and, in ſome places, 30 broad; fruitful, and well peopled. Bute, which is about ten miles long, and three or four broad, is famous for containing the caſtle of Rothſay, which gave the title of duke to the eldeſt ſons of the kings of Scotland; as it now does to the prince of Wales. Rothſay is likewiſe a royal burgh; and the iſlands of Bute and Arran form the ſhire of Bute. The iſles of Ila and Jura are part of Argyleſhire, and contain together about 370 ſquare miles; but they have no towns

worthy notice. North Uiſt contains an excellent harbour, called Lochmaddy, famous for herring-fiſhing. I ſhall omit the mention of many other of the Hebrides, which are at preſent of ſmall importance, either to the public, or the proprietors, though, probably, they may be of great conſequence to both, by the very improveable fiſheries upon their coaſt. I cannot, however, avoid mentioning the famous iſle of Iona, once the ſeat and ſanctuary of weſtern learning, and the burying-place of many kings of Scotland, Ireland, and Norway. It is ſtill famous for its reliques of ſanctimonious antiquity. Some authors have been at great pains to de-deſcribe the iſland of St. Kilda, or Hirt, for no other reaſon, that I can diſcover, but becauſe it is the remoteſt of all the north-weſt iſlands, and very difficult of acceſs; for it does not contain above thirty-five families, all of which are proteſtant, and know very little of the value of money.

INHABITANTS, CUSTOMS, POPULATION, LANGUAGE, AND RELIGION. The iſlands of Shetland and Orkney were formerly ſubject to the Normans, who conqured them in 1099, a few years after they landed in England under William the Conqueror. In the year 1263 they were in poſſeſſion of Magnus of Norway, who ſold them to Alexander king of Scots, and he gave them as fiefs to a nobleman of the name of Speire. After this, they became ſubject to the crown of Denmark. Chriſtian I. in the reign of James III. conveyed them in property to the crown of Scotland, as a marriage-portion with his daughter Margaret, and all future pretenſions were entirely ceded on the marriage of James VI. of Scotland with Anne of Denmark. The iſles of Shetland and Orkney form a ſtewartry, or ſhire, which ſends a member to parliament. At preſent the people in general differ little from the Lowlanders of Scotland; only, perhaps, their manners are more ſimple, and their minds leſs cultivated. Men of fortune have improved their eſtates wonderfully of late years; and have introduced into their families many elegancies and luxuries. They build their dwellings, and other houſes, in a modern taſte; and are remarkable for the fineneſs of their linen. As to the common people, they live upon butter, cheeſe, fiſh, ſea and land fowl (of which they have great plenty) particularly geeſe: and their chief drink is whey, which they have the art of fermenting, ſo as to give it a vinous quality. In ſome of the northern iſlands, the Norwegian, which is called the Norſe language, is ſtill ſpoken. Their intercourſe with the Dutch, during the fiſhing ſeaſon, renders that language common in the Shetland and Orkney iſlands. The people are as expert as the Norwegians in ſeizing the neſts of ſea-fowls, which build in the moſt frightful precipices and rocks. The people's temperance preſerves them from the diſeaſes incident to luxury. They cure the ſcurvy and the jaundice, to which they are ſubject, with the powder of ſnail-ſhells and ſcurvy-graſs, of which they have plenty. Their religion is proteſtant, according to the diſcipline of the church of Scotland; and their civil inſtitutions are the ſame with thoſe of the country to which they belong.

Nothing certain can be mentioned as to the population of theſe three diviſions of iſlands. We have the moſt undoubted evidences of hiſtory, that about 400 years ago they were much more populous than they are now: for the Hebrides themſelves were often known to ſend 10,000 fighting men into the field, without prejudice to their agriculture. At preſent, their numbers are ſaid not to exceed 48,000. The people of the Hebrides are clothed, and live like the Scotch Highlanders. They are ſimilar in perſons, conſtitutions, cuſtoms, and prejudices; with this difference, that the more poliſhed manners of the Lowlanders are every day gaining ground in the Highlands: perhaps the deſcendants of the ancient Caledonians, in a few years, will be diſcernible only in the Hebrides.

Thoſe iſlands alone retain the ancient uſages of the Celts, as deſcribed by the oldeſt and beſt authors; with a ſtrong tincture of the feudal conſtitution. Their ſhanachies or ſtory-tellers ſupply the place of the ancient bards, ſo famous in hiſtory;

and are the hiſtorians, or rather the genealogiſts, as well as poets, of the nation and family. The chief is likewiſe attended, when he appears abroad, with his muſician, who is generally a bagpiper, and dreſſed in the manner, but, as it is ſaid, more ſumptuouſly than the Engliſh minſtrels of former times*. Notwithſtanding the contempt into which that muſic is fallen, it is almoſt incredible with what care and attention it was cultivated among theſe iſlanders ſo late as the beginning of the preſent century. They had regular colleges and profeſſors, and the ſtudents took degrees according to their proficiency. Many of the Celtic rites, ſome of which were too barbarous to be retained, or even mentioned, are now aboliſhed. The inhabitants, however, ſtill preſerve the moſt profound reſpect and affection for their ſeveral chieftains, notwithſtanding all the pains that have been taken by the Britiſh legiſlature to break thoſe connexions. The common people are but little better lodged than the Norwegians and Laplanders; though they certainly fare better, for they have oatmeal, plenty of fiſh and fowl, cheeſe, butter-milk, and whey; and alſo mutton, beef, goat, kid, and veniſon. They indulge themſelves, like their fore-fathers, in a romantic poetical turn, and the agility of both ſexes, in the exerciſes of the field, and in dancing to their favourite muſic, is remarkable.

The reader would not pardon an author who ſhould omit that remarkable mantology, or gift of prophecy, which diſtinguiſhes the inhabitants of the Hebrides under the name of the *ſecond ſight*. It would be equally abſurd to attempt to diſprove the reality of ſome inſtances of this kind that have been brought by reputable authors, and to admit all that has been ſaid upon the ſubject. The adepts of the ſecond ſight pretend that they have certain revelations, or rather preſentations, either really or typically, which ſwim before their eyes, of certain events that are to happen in the compaſs of 24 or 48 hours. But, from the beſt information, no two of thoſe adepts agree as to the manner and forms of theſe revelations, or that they have any fixed method for interpreting their typical appearances. The truth ſeems to be, that thoſe iſlanders, by indulging themſelves in lazy habits, acquire viſionary ideas, and overheat their imaginations, till they are preſented with thoſe phantaſms, which they miſtake for fatidical or prophetic manifeſtations. They inſtantly begin to propheſy; and it would be abſurd to ſuppoſe, that amidſt many thouſands of predictions, ſome did not happen to be fulfilled; and theſe, being well atteſted, gave a ſanction to the whole.

Many learned men have been of opinion, that the Hebrides, being the moſt weſterly iſlands planted by the Celts, their language muſt remain there in its greateſt purity. This opinion, though plauſible, is not juſtified by experience. Many Celtic words, as well as cuſtoms, are there found; but the intercourſe which the Hebrides had with the Danes, Norwegians, and other northern nations, whoſe language is mixed with the Sclavonian and Teutonic, which laſt has no affinity with the Celtic, has rendered their language a compound; ſo that it approaches in no degree to the purity of the Celtic, commonly called Erſe, which was ſpoken by their neighbours in Lochaber and the coaſts of Scotland, the undoubted deſcendants of the Celts, among whom their language remains more unmixed.

The religion profeſſed in the Hebrides is chiefly preſbyterian, as eſtabliſhed in the church of Scotland; but popery and ignorance ſtill prevail among ſome of the iſlanders, whilſt ſuperſtitious practices and cuſtoms ſeem to be almoſt grafted in their nature.

SOIL, MINES, AND QUARRIES.] The ſurface of theſe iſlands has undergone great alterations. Many of them were habitations of the Druids, whoſe temples are ſtill viſible; and thoſe temples were ſurrounded by groves, though little or no timber now grows in the neighbourhood. The ſtumps of former trees are diſcernible, as

* See Percy's Reliques of Ancient Engliſh Poetry.

are many veſtiges of buildings erected ſince the introduction of Chriſtianity, which prove the decreaſe of the riches, power, and population of the inhabitants. Experience daily ſhews, that if the ſoil of the northern and weſtern iſlands till of late were barren, cold, and uncomfortable, it was owing to their want of culture; for ſuch ſpots as are now cultivated produce corn and vegetables more than ſufficient for the inhabitants; and fruit-trees are now brought to maturity. Tin, lead, and ſilver mines; marl, ſlate, free-ſtone, and even quarries of marble, have been found upon theſe iſlands. They are not deſtitute of fine freſh water; nor of lakes and rivulets that abound with excellent trout. At the ſame time it muſt be owned, that the preſent face of the ſoil is ſtill bare, and unornamented with trees, excepting a few that were reared in gardens.

TRADE AND MANUFACTORIES.] Theſe are all in their infancy in thoſe iſlands. Their ſtaple commodities conſiſt of fiſh, eſpecially herrings, which, when properly cured, are equal to thoſe of the Dutch. They carry on likewiſe a conſiderable trade in down and feathers; their ſheep afford them wool, which they manufacture into coarſe cloths; and their linen manufactures begin to make ſome progreſs among them. They carry their black cattle alive to the adjacent parts of Scotland, where they are diſpoſed of in ſale or barter; as are large quantities of their mutton, which they ſalt in the hide. Upon the whole, application and induſtry, with ſome portion of public encouragement, are only wanting to render theſe iſlands, not only comfortable for their inhabitants, but ornamental and beneficial to their mother-country.

BEASTS, BIRDS, AND FISHES.] In the neighbouring countries already deſcribed, mention has been made of moſt of the birds and fiſhes that have been diſcovered here; only it is thought that they contain a ſpecies of falcon or hawk, of a more noble and docile nature than any that are to be found elſewhere. The Shetland iſles are famous for a ſmall breed of horſes, which are incredibly active, ſtrong, and hardy, and frequently ſeen in the ſtreets of London, yoked to the ſplendid carriages of the curious or wealthy. The coaſts of thoſe iſlands, till within theſe 20 years, ſeemed, however, to have been created, not for the inhabitants, but for ſtrangers. The latter furniſh the former with wines, ſtrong liquors, ſpice, and luxuries of all kinds, for their native commodities, at the gain of above 100 per cent. But it is to be hoped that this pernicious traffic now draws to an end. Three thouſand buſſes have been known to be employed in one year by the Dutch in the herring fiſhery, beſides thoſe fitted out by the Hamburghers, Bremeners, and other northern ports.

RARITIES AND CURIOSITIES, ARTIFICIAL AND NATURAL.] Theſe iſlands exhibit many proofs, in their churches, the veſtiges of old forts, and other buildings both ſacred and civil, that they were anciently more populous than they are now. The uſe and conſtruction of ſome of thoſe works are not eaſily accounted for. In a gloomy valley belonging to Hoy, one of the weſtern iſlands, is a kind of hermitage, cut out of a ſtone called a dwarf-ſtone, 36 feet long, 18 broad, and nine thick; in which is a ſquare hole, about two feet high, for an entrance, with a ſtone of the ſame ſize for a door. Within this entrance is the reſemblance of a bed, with a pillow cut out of the ſtone, big enough for two men to lie on: at the other end is a couch, and in the middle a hearth, with a hole cut out above for a chimney. It would be endleſs to recount the various veſtiges of Druidical temples, ſome of which muſt have required equal labour with the famous Stonehenge near Saliſbury. Others ſeem to be memorials of particular perſons, or actions, conſiſting of one large ſtone, ſtanding upright: ſome have been ſculptured, and others have ſerved as ſepulchres, and are compoſed of ſtones cemented together. Barrows, as they are called in England, are frequent in theſe iſlands; and the monuments of Daniſh and Norwegian fortifications might long employ an able anti-

antiquary to deſcribe. The gigantic bones found in many burial-places here give room to believe, that the former inhabitants were of larger ſize than the preſent. It is likewiſe probable, from ſome ancient remains, particularly catacombs, and nine ſilver fibulæ or claſps, found at Stennis, one of the Orkneys, that the Romans were well acquainted with theſe parts.

The cathedral of Kirkwall, the capital of the Orkneys, is a fine Gothic building, dedicated to St. Magnus, but now converted into a pariſh church. Its roof is ſupported by 14 pillars on each ſide, and its ſteeple, in which is a good ring of bells, by four pillars. The three gates of the church are chequered with red and white poliſhed ſtones, emboſſed and elegantly flowered.

The Hebrides are ſtill more diſtinguiſhed than the Orkney or Shetland iſles for their remains of antiquity; and it would exceed the bounds allotted to this head, to mention every noted monument found upon them, dedicated to civil, religious, or warlike purpoſes. We cannot, however, avoid taking particular notice of the celebrated iſle of Iona, called St. Columb-Kill. Not to enter into the hiſtory or origin of the religious edifices upon this iſland, it is ſufficient to ſay, that it ſeems to have ſerved as a ſanctuary for St. Columba, and other holy perſons, while Ireland, England, and Scotland were deſolated by barbariſm. It appears that the northern pagans often landed here, and paid no regard to the ſanctity of the place. The church of St. Mary, which is built in form of a cathedral, is a beautiful fabric. It contains the bodies of ſome Scotch, Iriſh, and Norwegian kings, with ſome Gaëlic inſcriptions. The tomb of Columba, who lies buried here, is uninſcribed. The ſteeple is large, the cuppola 21 feet ſquare, the doors and windows are curiouſly carved, and the altar is of the fineſt marble. Innumerable inſcriptions, referring to ancient cuſtoms and ceremonies, are diſcernible in this iſland; which gives countenance to the well-known obſervation, that when learning was nearly extinct on the continent of Europe, it found a refuge in Scotland, or rather in theſe iſlands.

The iſlands belonging to Scotland contain likewiſe ſome natural curioſities peculiar to themſelves: the phaſeoli, or Molucca beans, have been found in the Orkneys, driven as is ſuppoſed, from the Weſt Indies, by the weſterly winds, which often force aſhore many curious ſhells and marine productions, highly eſteemed by naturaliſts. In the pariſh of Harn, a large piece of ſtag's horn was found very deep in the earth, by the inhabitants, who were digging for marl; and certain bituminous effluvia produce ſurpriſing phænomena, which the natives believe to be ſupernatural. But ſome of the moſt aſtoniſhing appearances in nature have remained undeſcribed, and, till lately, unobſerved, even by the natives. A diſcovery reſerved for the inquiſitive genius of ſir Joſeph Banks, who, in relating his voyage through the Hebrides, anno 1772, ſays, "We were no ſooner arrived than we were ſtruck with a ſcene of magnificence which exceeded our expectations, the whole of that end of the iſland (viz. Staffa, a mile in length, and half a mile in breadth) ſupported by ranges of natural pillars, moſtly above fifty feet high, ſtanding in colonnades upon a firm baſis of rock; above theſe the ſtratum which reaches to the ſoil or ſurface of the iſland, varied in thickneſs as the iſland itſelf formed into hills or vallies; each hill, which hung over the columns below, compoſed an ample pediment; ſometimes ſixty feet in thickneſs from the baſe to the point, and formed, by the ſloping of the hill on each ſide, almoſt into the ſhape of thoſe uſed in architecture.

"Compared to this, what are the cathedrals or palaces built by men? mere models or play-things. Imitations as diminutive, as his works will always be, when compared to thoſe of nature. Where is now the boaſt of the architect? regularity, the only part in which he fancied himſelf to exceed his miſtreſs nature, is

is here found in perfection; though undeſcribed.—Proceeding farther to the N. W. you meet with the higheſt ranges of pillars, the magnificent appearance of which ſurpaſſes deſcription: here they are bare to their very baſes, and the ſtratum below them is alſo viſible."——Sir Joſeph Banks particulariſes ſundry other appearances in this, and a neigbouring iſland, which is wholly compoſed of pillars without any ſtratum. In ſome parts of Staffa, inſtead of being placed upright, the pillars were obſerved to lie on their ſides, each forming a ſegment of a circle; but the moſt ſtriking object in this pictureſque ſcene is Fingal's Cave, which he deſcribes in the following manner:—" With our minds full of ſuch reflections, we proceeded along the ſhore, treading upon another *Giant's Cauſeway*, every ſtone being regularly formed into a certain number of ſides and angles; till, in a ſhort time, we arrived at the mouth of a cave, the moſt magnificent, I ſuppoſe, that has ever been deſcribed by travellers *. The mind can hardly form an idea more magnificent than ſuch a ſpace, ſupported on each ſide by ranges of columns, and roofed by the bottoms of thoſe which have been broken off in order to form it; between the angles of which, a yellow ſtalagtitic matter has exuded, which ſerves to define the angles preciſely, and at the ſame time vary the colour, with a great deal of elegance; and to render it ſtill more agreeable, the whole is lighted from without; ſo that the fartheſt extremity is very plainly ſeen from without; and the air within being agitated by the flux and reflux of the tide is perfectly dry and wholeſome, free entirely from the damp of vapours with which natural caverns in general abound."

Mr. Pennant, who alſo made a voyage to theſe iſlands in the ſame year, had a glance of Staffa, in his paſſage from Iona to Mull, but was prevented by ſtormy weather from approaching it. " On the weſt," ſays he, " appears the beautiful groupe of the Treaſhuniſh iſles. Neareſt lies Staffa, a new Giant's Cauſeway, riſing amidſt the way, but with columns of double the height of that in Ireland; gloſſy and reſplendent, from the beams of the eaſtern ſun."—And in the iſle of Sky, a conſiderable way northward, he reſumes the ſubject: " We had in view a fine ſeries of genuine baſaltic columns, reſembling the Giant's Cauſeway; the pillars were above twenty feet high, conſiſting of four, five, and ſix angles, but moſtly of five. At a ſmall diſtance from theſe, on the ſlope of a hill, is a tract of ſome roads entirely formed of the tops of ſeveral ſeries of columns, even and cloſe ſet, forming a reticulated ſurface of amazing beauty and curioſity. This is the moſt northern baſaltes I am acquainted with; the laſt of four in the Britiſh dominions, all running from ſouth to north, nearly in a meridian; the Giant's Cauſeway appears firſt: Staffa, &c. ſucceeds; the rock Humbla about twenty leagues farther, and finally, thoſe columns of Sky: the depth of the ocean, in all probability, conceals the vaſt links of this chain."

LEARNING, LEARNED MEN, AND HISTORY.] See Scotland.

* The dimenſions of the cave are thus given by ſir J. Banks.

	Feet		Feet
Length of the cave from the arch without	371	At the end - - -	70

SCOTLAND.

Extent and Situation.

	Miles.		Degrees.
Length	300	between	54 and 59 North latitude.
Breadth	190		1 and 6 Weſt longitude.

Name.] THE Celtæ or Gauls are ſuppoſed to have been the original inhabitants of this country. The Scots, a Scythian tribe, invaded it about the beginning of the fourth century, and having conquered the Picts, the territories of both were called Scotland. The word Scot being no other than a corruption of Scuyth, or Scythian, being originally from that immenſe country, called Scythia by the ancients. It is termed by the Italians, Scotia; by the Spaniards, Eſcotia; by the French, Eſcoſſe; and Scotland by the Scots, Germans, and Engliſh.

Boundaries.] Scotland, which contains an area of 27,794 ſquare miles, is bounded on the ſouth by England; and on the north, eaſt, and weſt, by the Deucaledonian, German, and Iriſh ſeas, or more properly the Atlantic Ocean.

Divisions and subdivisions.] Scotland is divided into the countries ſouth of the Frith of Forth, the capital of which, and of all the kingdom, is Edinburgh; and thoſe to the north of the ſame river, where the chief town is Aberdeen. This was the ancient national diviſion; but ſome modern writers, with leſs accuracy, have divided it into Highlands and Lowlands, on account of the different habits, manners, and cuſtoms of the inhabitants.

Eighteen counties, or ſhires, are allotted to the ſouthern diviſions, and 15 to the northern; and thoſe counties are ſubdivided into ſheriffdoms, ſtewartries, and bailiwicks, according to the ancient tenures, and privileges of the landholders.

Shires.		Sheriffdoms and other ſubdiviſions.	Chief Towns.

CLIMATE, SOIL, AIR, AND WATER.] In the northern parts, day-light, at Midſummer, laſts 18 hours and five minutes; which proportion of day to night is reverſed in winter. The air of Scotland is more temperate than could be expected in ſo northerly a climate. This ariſes partly from the variety of its hills, vallies, rivers, and lakes; but ſtill more, as in England, from the vicinity of the ſea, which affords thoſe warm breezes, that not only ſoften the natural keenneſs of the air, but, by keeping it in perpetual agitation, render it pure and healthful, and prevent thoſe epidemic diſtempers that prevail in many other countries. In the neighbourhood of ſome high mountains, however, which are generally covered

with ſnow, the air, is keen and piercing for about nine months in the year. The ſoil in general is not ſo fertile as that of England; and in many places leſs fitted for agriculture than for paſture. At the ſame time, there are particular plains and vallies of the moſt luxuriant fertility. The finer particles of earth, inceſſantly waſhed down from the mountains, and repoſited in theſe vallies, afford them a ſtrong vegetative nouriſhment: though experience has proved that hortulane productions do not come ſo ſoon to maturity in this country as in England. There is, indeed, a great variety of ſoils in Scotland, the face of which is agreeably diverſified by an intermixture of natural objects. The inequalities of the ground, if unfavourable to the labours of the huſbandman, are particularly pleaſing to a traveller, and afford thoſe delightful ſituations for country-houſes, of which many of the Scottiſh nobility and gentry have availed themſelves. It is their ſituation as much as their magnificence, that occaſions the ſeats of the dukes of Argyle and Athol, of lord Hopetoun, and many others, to fix the attention of every traveller. The water in Scotland, as every where elſe, depends on the qualities of the ſoil. Water paſſing through a heavy ſoil is turbid and noxious, but filtrating through ſand or gravel, is clear, light, and ſalutary to the ſtomach. This laſt is commonly the caſe in Scotland, where the water is better than that of more ſouthern climates, in proportion as the land is worſe.

MOUNTAINS.] The principal mountains in Scotland are the Grampian hills, which run from eaſt to weſt, from near Aberdeen to Cowal in Argyleſhire, almoſt the whole breadth of the kingdom. Another chain of mountains, called the Pentland-hills, runs through Lothian and joins thoſe of Tweedale. A third, called Lammer-Muir, riſes near the eaſtern coaſt, and runs weſtward through the Merſe. Beſides thoſe continued chains, among which we may reckon the Cheviot or Tiviot-Hills, on the borders of England, Scotland contains many detached mountains, ſometimes of great height, which, from their conical figure, have been diſtinguiſhed by the Celtic appellation of *Lawſ*.

RIVERS, LAKES, AND FORESTS.] The largeſt river in Scotland is the Forth, which riſes in Monteith near Callendar, and paſſing Stirling, after a number of beautiful meanders, diſcharges itſelf near Edinburgh into that arm of the German ſea, to which it gives the name of Firth of Forth. Second to the Forth is the Tay, which iſſues out of Loch Tay, in Broadalbin, and running ſouth-eaſt, paſſes the town of Perth, and falls into the ſea at Dundee. The Spey, the moſt rapid river in Scotland, iſſues from a lake of the ſame name in Badenoch, and running from ſouth-weſt to north-eaſt, falls into the ſea near Elgin; as do the rivers Dee and Don, which run from weſt to eaſt, and diſembogue themſelves at Aberdeen. The Tweed riſes on the borders of Lanerkſhire, and after many ſerpentine turnings, diſcharges itſelf into the ſea at Berwick, where it ſerves as a boundary between Scotland and England, on the eaſtern ſide. The Clyde is a large river on the weſt of Scotland, has its riſe in Annandale, runs north-weſt through the valley of that name, and, after paſſing by Lanerk, Hamilton, the city of Glaſgow, Renfrew, Dumbarton, and Greenock, falls into the Frith of Clyde, oppoſite to the iſle of Bute. Beſides thoſe capital rivers, Scotland contains many of an inferior ſort, well provided with ſalmon, trout, and other fiſhes, which equally enrich and beautify the country. Several of thoſe rivers go by the name of *Eſk*, which is the old Celtic name for water. The greateſt improvement for inland navigation that has been attempted in this part of Great Britain, was undertaken at a very conſiderable expence by a ſociety of public-ſpirited gentlemen, for joining the rivers Forth and Clyde; by which a communication has been opened between the eaſt and weſt ſeas, to the advantage of the whole kingdom.

The lakes of Scotland (there called *Lochs*) are too many to be particularly deſcribed. Loch Tay, Loch Lomond, Lochneſs, Loch Au, and ſome others,

preſent us with ſuch pictureſque ſcenes as are ſcarcely equalled in any other country of Europe. Several of theſe lakes are beautifully fringed with woods, and contain plenty of freſh-water fiſhes. The Scots ſometimes give the name of a loch to an arm of the ſea; for example, Loch Fyn, which is 60 miles long and four broad, and is famous for its herrings. The Loch of Spinie, near Elgin, is remarkable for ſwans and cygnets, which often darken the air with their flights: owing, as ſome think, to the plant *olorina*, which grows in its waters, with a ſtraight ſtalk and a cluſter of ſeeds at the top. Near Lochneſs is a hill almoſt two miles perpendicular, on the top of which is a lake of cold freſh water, about 30 fathoms in length, too deep ever yet to be fathomed, and which never freezes: whereas, but 17 miles from thence, the lake Lochanwyn, or Green Lake, is covered with ice all the year round. The ancient province of Lochaber receives that name from being the mouth of the lochs, by means of which the ancient Caledonians, the genuine deſcendants of the Celts, were probably enabled to preſerve themſelves independent of and unmixed with the Lowlanders. Beſides theſe rivers and lochs, the coaſts of Scotland are indented with large, bold, and navigable bays or arms of the ſea; as the bay of Glenluce and Wigtown bay; ſometimes they are called Friths, as the Solway Frith, which ſeparates Scotland from England on the weſt; the Frith of Forth, Murray Frith, and thoſe of Cromarty and Dornoch.

The face of Scotland, even where it is moſt uninviting, preſents us with the moſt incontrovertible evidences of its having been formerly over-run with timber. The deepeſt moſſes, or moraſſes, contain large logs of wood; and their waters being impregnated with turpentine have a preſerving quality, as appears by the human bodies which have been diſcovered in thoſe moſſes. The Sylva Caledonia, or Caledonian Foreſt, the remains of which are now thought to be Ettrick wood, in the ſouth of Scotland, is famous in antiquity for being the retreat of the Caledonian wild boars; but ſuch an animal is not now to be ſeen. Several woods, however, ſtill remain; and many attempts have been made for reducing them into charcoal, for the uſe of furnaces and founderies; but lying at great diſtance from water-carriage, though the work ſucceeded in the execution, there was little encouragement to continue it. Fir trees grow in great perfection almoſt all over Scotland, and form beautiful plantations. The Scotch oak is excellent in the Highlands, where ſome woods reach 20 or 30 miles in length, and four or five in breadth; but, through the inconveniency already mentioned, without being of much emolument to the proprietors.

METALS AND MINERALS.] Though Scotland cannot now boaſt of its gold mines, yet it is certain, that it formerly afforded a quantity of that metal for its coinage. James V. and his father contracted with certain Germans for working the mines of Crawford-Moor; and when that prince married the French king's daughter, a number of covered diſhes, filled with coins of Scotch gold, were preſented to the gueſts by way of deſert. The civil wars and troubles which followed, under his daughter, and in the minority of his grandſon, drove thoſe foreigners, the chief of whom was called Cornelius, from their works, which ſince that time have never been reſumed. Some ſmall pieces of gold have been found in thoſe parts waſhed down by the floods. It likewiſe appears by the public records, that thoſe beautiful coins ſtruck by James V. called bonnet-pieces, were fabricated of gold found in Scotland, as were other medals of the ſame metal.

Several landholders in Scotland derive a large profit from their lead mines, which are ſaid to be very rich, and to produce large quantities of ſilver; but we know of no ſilver mines that are worked at preſent. Some copper mines have been found near Edinburgh; and many parts of Scotland, in the eaſt, weſt, and northern counties, produce excellent coal of various kinds, large quantities of which are export-

ed. Lime-ſtone is here in great plenty, as is free-ſtone; ſo that the houſes of the better ſort are conſtructed of good materials. The indolence of the inhabitants of many places in Scotland, where no coal is found, prevented them from ſupplying that defect by plantations of wood; and the peat-moſſes being in many parts, of the north eſpecially, almoſt exhauſted, the inhabitants are put to great difficulty for fuel; however, the taſte for plantations, of all kinds, that now prevails, will ſoon remedy that inconveniency.

Lapis lazuli is ſaid to be dug up in Lanerkſhire; alum mines have been found in Bamffſhire; cryſtal, variegated pebbles, and other tranſparent ſtones, which admit of the fineſt poliſh for ſeals, are found in various parts; as are talc, flint, ſea-ſhells, potters clay, and fullers earth. The ſtones which the country people call elf-arrow-heads, and to which they aſſign a ſupernatural origin and uſe, were probably the flint-heads of arrows made uſe of by the Caledonians and ancient Scots. No country produces greater plenty of iron-ore, both in mines and ſtones, than Scotland; of which the proprietors now begin to reap the advantage, in their founderies, and other metalline manufactures.

VEGETABLE AND ANIMAL PRODUCTIONS, BY SEA AND LAND. The ſoil of Scotland may be rendered, in many parts, nearly as fruitful as that of England. It is even ſaid, that ſome tracts of the low countries at preſent exceed in value Engliſh eſtates of the ſame extent, becauſe they are far leſs exhauſted than thoſe of the ſouthern parts of the iſland; and agriculture is now perhaps as well underſtood, among many of the Scotch landlords and farmers, as in any part of Europe.

Such is the mutability of things, and the influence of commerce, that a very conſiderable part of the landed property has lately (perhaps happily for the public) fallen into new hands. The merchants and manufacturers of Glaſgow, who are the life and ſoul of that part of the kingdom, while they are daily introducing new branches of induſtry, are no leſs attentive to the progreſs of agriculture, by which they do their country in particular, and the whole iſland in general, the moſt eſſential ſervice. The active genius of theſe people extends even to moors, rocks and marſhes, which, being hitherto reckoned uſeleſs, were conſequently neglected, but are now brought to produce certain ſpecies of grain or timber, for which the ſoil is beſt adapted. The fruits of ſkill and induſtry are chiefly perceivable in the counties lying upon the river Forth, called the Lothians, where, as well as in Angus, the farmers, who generally rent from 3 to 500l. per annum, are well fed, well clothed, and comfortably lodged. The reverſe, however, may be obſerved of a very conſiderable part of Scotland, which ſtill remains in a ſtate of nature, and where the landlords, ignorant of their real intereſt, refuſe to grant ſuch leaſes as would encourage the tenant to improve the farm. In ſuch places, the huſbandman barely exiſts upon the gleanings of a ſcanty farm, ſeldom exceeding 20 or 30l. per ann. the cattle are lean and ſmall, the houſes mean, and the face of the country exhibits the moſt deplorable marks of poverty and oppreſſion. Indeed, from a miſtaken notion of the landed people in general, the greateſt part of the kingdom lies naked and expoſed, for want of ſuch hedge-rows and planting as are common in England. They conſider hedges as uſeleſs and cumberſome, occupying more room than ſtone-incloſures, which, except in the Lothians, are generally low paltry walls, huddled up of looſe ſtones, without lime or mortar, and have a bleak and mean appearance.

The ſoil in general produces wheat, rye, barley, oats, hemp, flax, hay, and paſture. In the ſouthern counties, the fineſt garden fruits are ſaid to fall little ſhort of thoſe in England; and the ſame may be ſaid of the common fruits. The uncultivated parts of the Highlands abound in various kinds of ſalubrious and pleaſant-taſted berries; while many extenſive tracts are covered with a ſtrong heath.

The ſea-coaſt produces the alga-marina, dulſe or duliſh, in great quantities, and other marine plants, which are eat for nouriſhment or pleaſure.

The fiſhes on the coaſt of Scotland are much the ſame with thoſe of the iſlands and countries already deſcribed; but the Scotch have improved in their fiſheries as much as they have in their manufactures and agriculture: for ſocieties have been formed, which have carried that branch of national wealth to a perfection that never was before known in that country; and the bill paſſed in 1786, bids fair to enable them to emulate the Dutch, in curing, as well as catching, their fiſh. In former times, the Scotch ſeldom ventured to fiſh above a league's diſtance from the land; but they now ply in the deep waters as boldly as any of their neighbours. Their ſalmons, which they can ſend more early, when prepared, to the Levant and ſouthern markets than the Engliſh or Iriſh can, are of great ſervice to the nation, as the returns are generally made in ſpecie, or beneficial commodities.

This country contains few or no kinds, either of wild or domeſtic animals, that are not common with their neighbours. The red-deer and the roe-buck are found in the Highlands, but their fleſh is not comparable to Engliſh veniſon. Hares, and other animals for game, are here plentiful; alſo the grouſe and heath-cock: the capperkaily, and the ptarmacan, birds of an exquiſite flavour, but which are ſcarce even in the Highlands, and when diſcovered are very ſhy. The numbers of black cattle upon the hills of Scotland towards the Highlands, and ſheep that are fed upon the mountains of Tweedale, and other parts of the ſouth, are almoſt incredible, and formerly brought large ſums into the country; the black cattle eſpecially, which, when fattened on the ſouthern paſtures, have been reckoned ſuperior to Engliſh beef. This trade is now on its decline, by the increaſe of manufacturers, whoſe demand for butcher's meat muſt leſſen the exportation of cattle into England. Some are of opinion, that a ſufficient ſtock, by proper methods, may be raiſed to ſupply both markets, to the great emolument of the nation.

Formerly the kings of Scotland were at infinite pains to mend the breed of the Scotch horſes, by importing a larger and more generous kind from the continent: but, notwithſtanding all the care that was taken, it was found that the climate and ſoil of Scotland were unfavourable to that noble animal, for they diminiſhed both in ſize and ſpirit; ſo that about the time of the union, few horſes, natives of Scotland, were of much value. Great efforts have been made of late to introduce the Engliſh and foreign breeds, and ſuch pains have been taken for providing them with proper food and management, that ſucceſs has anſwered the moſt ſanguine expectations.

POPULATION, INHABITANTS, MANNERS, AND CUSTOMS. } The population of Scotland is generally fixed at about a million and a half of ſouls. This calculation reſts merely upon vague conjectures, as no attempt has been made to ſupport even its probability. If we form an eſtimate upon any known principle, the inhabitants of Scotland are far more numerous. It is to be regretted that ſome public encouragement has not been given to bring this matter nearer to a certainty, which might be done by the returns of the clergy from their ſeveral pariſhes. The only records at preſent that can be appealed to, are thoſe of the army; and, by the beſt information, they make the number of ſoldiers, furniſhed by Scotland in the war in 1755, amount to 80,000 men. We are to obſerve, that above 60,000 of theſe were raiſed in the iſlands and Highlands, which form by far the leaſt populous part of Scotland. It belongs, therefore, to political calculation to compute whether the population of Scotland does not exceed two millions, as no country in the world, excluſive of the army, ſends abroad more of its inhabitants. If we conſult the moſt ancient and credible hiſtories, the population of Scotland, in the thirteenth century, muſt have been exceſſive, as it afforded ſo many thouſands to fall by the ſwords of the Engliſh, without any very ſenſible decreaſe of the inhabitants.

The

The people of Scotland are generally raw-boned; they are lean, but clean limbed, and can endure incredible fatigues. Their adventuring ſpirit was chiefly owing to their laws of ſucceſſion, which inveſted the elder brother, as the head of the family, with the inheritance, and left but a ſcanty portion for the other ſons. This obliged the latter to ſeek their fortunes abroad, though no people have more affection for their native ſoil. It is true, this diſparity of fortune among the ſons of one family prevails in England likewiſe; but the reſources which younger brothers have in England are numerous, compared to thoſe of a country ſo narrow, and ſo little improved, either by commerce or agriculture, as Scotland was formerly.

An intelligent reader may eaſily perceive, that family pride, which is not yet entirely extinguiſhed in Scotland, was owing to the feudal inſtitutions which prevailed there in all their horrors of barbarity. Their family differences, eſpecially the Highlanders, familiarized them to blood and ſlaughter; and the death of an enemy, however effected, was always a matter of triumph. Theſe paſſions did not live in the breaſts of the common people only, but were authorized and cheriſhed by their chieftains, many of whom were men who had ſeen the world, were converſant in the courts of Europe, maſters of polite literature, and amiable in all the duties of civil and ſocial life. Their kings, except ſome who were endowed with extraordinary virtues, were conſidered in no other light than commanders of their army in time of war: for in peace their civil authority was ſo little felt, that every clan, or family, even in the moſt civilized part of Scotland, looked upon its own chieftain as the ſovereign. Theſe ideas were confirmed even by the laws, which gave thoſe petty tyrants a power of life and death upon their own eſtates; and they generally executed their haſty ſentences in four and twenty hours after the parties were apprehended. The pride which thoſe chieftains had of outvying each other in the numbers of their followers, created perpetual animoſities, which ſeldom or never ended without bloodſhed; ſo that the common people, whoſe beſt qualification was a blind devotion to the will of their maſter, and the aggrandiſement of his name, lived in a ſtate of continual hoſtility. The late Archibald, duke of Argyle, was the firſt chieftain who had the patriotiſm to attempt to reform his dependents, and to baniſh thoſe barbarous ideas. His example had been followed by others; and there can ſcarcely be a doubt, but that a very few years will reconcile the Highlanders to all the milder habits of ſociety.

Scotch gentlemen, who formerly piqued themſelves upon their family, or the antiquity of their deſcent, were very diſagreeable members of ſociety; becauſe, forgetting all the virtues of their anceſtors, they imitated them only in their capricious vanity and revenge. Thoſe who go abroad, and endeavour by induſtry to raiſe the lowneſs of their circumſtances, excel in the civil, commercial, and military duties. There is a kind of ſimilarity in their perſonal characters, and by ſeeing one Scotchman who acquires a fortune abroad, you ſee the whole. They are in general hoſpitable, open, communicative, and charitable. They aſſimilate to the manners of the people with whom they live with more eaſe and freedom than the natives of moſt other countries; and they have a ſurpriſing facility in acquiring languages, particularly the French.

It remains perhaps a queſtion, whether that lettered education, for which the Scots were noted by the neighbouring nations, was not of prejudice to their country, while it was of the utmoſt ſervice to many of its natives. Their literature, however ſlight, rendered them acceptable and agreeable among foreigners; but at the ſame time it drained the nation of that order of men, who are the beſt fitted for forming and executing the great plans of commerce and agriculture for the public emolument.

From

From what has been ſaid, it appears that the ancient modes of living among the Scotch nobility and gentry are as far from being applicable to the preſent time, as the forms of a Roman ſenate are to that of a popiſh conclave; and no nation, perhaps, ever underwent ſo quick and ſo ſudden a tranſition of manners.

With regard to gentlemen who live at home, upon eſtates of 300l. a year and upwards, they differ little or nothing in their manners and ſtile of living, from their Engliſh neighbours of the like fortunes. The peaſantry have their peculiarities; their ideas are confined; but no people can conform their tempers better than they do to their ſtations. They are taught from their infancy to bridle their paſſions, to behave ſubmiſſively to their ſuperiors, and live within the bounds of the moſt rigid œconomy. Hence they ſave their money and their conſtitutions, and few inſtances of murder, perjury, robbery, and other atrocious vices, occur at preſent in Scotland. They ſeldom enter ſingly upon any daring enterprize; but when they act in concert, the ſecrecy, ſagacity, and reſolution, with which they carry on any deſperate undertaking, is not to be paralleled; and their fidelity to one another, under the ſtrongeſt temptations ariſing from their poverty, is ſtill more extraordinary. Their mobs are managed with all the caution of conſpiracies; witneſs that which put Porteous to death in 1736, in open defiance of law and government, and in the midſt of 20,000 people; and, though the agents were well known, and ſome of them tried, with a reward of 500l. annexed to their conviction, yet no evidence could be found ſufficient to bring them to puniſhment. The fidelity of the Highlanders of both ſexes, under a ſtill greater temptation, to the young Pretender, after his defeat at Culloden, could ſcarcely be believed were it not well atteſted.

The lower claſs are not ſo much accuſtomed as the Engliſh to convivial entertainments; but when they partake of them, they ſeem, for that very reaſon, to enjoy them more completely. One teſtimony there is, at once ſocial and charitable, and that is, the contributions raiſed for celebrating the weddings of people of an inferior rank. Thoſe feſtivities partake of the ancient Saturnalia; but though the company conſiſts promiſcuouſly of the high and the low, the entertainment is as decent as it is jovial. The gueſts pay according to their inclination or ability, for which they have a wedding dinner and dancing. When the parties happen to be ſervants in reſpectable families, the contributions are ſo liberal that they often eſtabliſh the young couple in the world.

The inhabitants of thoſe parts of Scotland, who live chiefly by paſture, have a natural vein of poetry; and the beautiful ſimplicity of the Scotch tunes is reliſhed by all true judges of muſic. Love is generally the ſubject, and many of the airs have been brought upon the Engliſh ſtage with variations, under new names, but with this diſadvantage, that, though rendered more conformable to the rules of art, they are moſtly altered for the worſe, being ſtripped of that original ſimplicity, which, however irregular, is their moſt eſſential characteriſtic, ſo agreeable to the ear, and poſſeſſing ſuch powers over the human breaſt. Thoſe of a more lively ſtrain have had better fortune, being introduced into the army in their native dreſs by the fifes, an inſtrument for which they are remarkably well ſuited. It has been ridiculouſly ſuppoſed that Rizzio, the unhappy Italian ſecretary of Mary queen of Scots, reformed the Scotch muſic. This is a falſehood invented by his countrymen, in envy to the Scots. Their fineſt tunes exiſted in their church muſic, long before Rizzio's arrival; nor does it appear that Rizzio, who was chiefly employed by his miſtreſs in foreign diſpatches, ever compoſed an air during the ſhort time he lived in Scotland; but, were there no other evidence to confute this report, the original character of the muſic is ſufficient.

The common people retain the ſolemn decent manner of their anceſtors at burials.

When

When a relation dies in a town, the pariſh beadle is ſent round with a paſſing bell; but he ſtops at certain places, and with a ſlow melancholy tone announces the name of the party deceaſed, and the time of his interment, to which he invites all his countrymen. At the hour appointed, if the deceaſed was beloved in the place, vaſt numbers attend. The proceſſion is ſometimes preceeded by the magiſtrates and their officers, and the deceaſed is carried in his coffin, covered by a velvet pall, with chairpoles, to the grave, where it is interred without farther ceremony than the neareſt relation thanking the company for their attendance. The funerals of the nobility and gentry are performed in much the ſame manner as in England, but without any burial ſervice. The Highland funerals were generally preceded by bagpipes, which played certain dirges, called *coronachs*, and were accompanied by the voices of both ſexes.

Dancing is a favourite amuſement in this country, but little regard is paid to art or gracefulneſs: the whole conſiſts in agility, and in keeping time to their own tunes, which they do with great exactneſs. One of the peculiar diverſions practiſed by the gentlemen is the Goff, which requires an equal degree of art and ſtrength: it is played by a bat and a ball; the latter is ſmaller and harder than a cricket ball; the bat is of a taper conſtruction till it terminates in the part which ſtrikes the ball, which is loaded with lead, and faced with horn. The diverſion itſelf reſembles that of the Mall, which was common in England, in the middle of the laſt century. An expert player will ſend the ball an amazing diſtance at one ſtroke; each party follows his ball upon an open heath, and he who ſtrikes it in feweſt ſtrokes into a hole, wins the game. The diverſion of Curling is, perhaps, peculiar to the Scots. It is performed upon ice, with large flat ſtones, often from twenty to two hundred pounds weight each, which they hurl from a common ſtand to a mark at a certain diſtance; and whoever is neareſt the mark is the victor. Theſe two may be called the ſtanding ſummer and winter diverſions of Scotland. The natives are expert at all the other diverſions common in England, cricket excepted, which the gentlemen conſider as too athletic and mechanical.

LANGUAGE AND DRESS.] I place theſe two articles under the ſame head, becauſe they had formerly an intimate relation to each other; both of them being evidently Celtic. The Highland plaid is compoſed of a woollen ſtuff, ſometimes very fine, called *tartan*. This ſtuff is of various colours, forming ſtripes which croſs each other at right angles; and the natives value themſelves upon the judicious arrangement, or what they call ſets, of thoſe ſtripes and colours, which, where ſkilfully managed, produce a pleaſing effect to the eye. Above the ſhirt, the Highlander wears a waiſtcoat of the ſame compoſition with the plaid, which commonly conſiſts of twelve yards in width, and which they throw over the ſhoulder into very near the form of a Roman toga, as repreſented in ancient ſtatues: ſometimes it is faſtened round the middle with a leathern belt, ſo that part of the plaid hangs down before and behind like a petticoat, and ſupplies the want of breeches. This they call being dreſſed in a *phelig*, which the Lowlanders call a *kilt*, and which is, probably the ſame word with Celt. Sometimes they wear a kind of petticoat of the ſame variegated ſtuff, buckled round the waiſt, and this they term the *philebeg*, which ſeems to be of Mileſian extraction. Their ſtockings are likewiſe of tartan, tied below the knee with tartan garters formed into taſſels. The poorer people wear upon their feet brogues made of untanned or undreſſed leather; for their heads a blue flat cap is uſed, called a bonnet, of a particular woollen manufacture. From the belt of the philibeg hung generally their knives, and a dagger, which they called a dirk, and an iron piſtol, ſometimes of fine workmanſhip, and curiouſly inlaid with ſilver. The introduction of the broad ſword of Andrea Ferrara, ſeems to be no earlier than the reign of James III. who invited that excellent workman to Scotland. A large leathern

leathern purſe, richly adorned with ſilver, hanging before them, was always part of a Highland chieftain's dreſs.

The dreſs of the Highland women conſiſted of a petticoat and jerkin, with ſtrait ſleeves, trimmed or not trimmed, according to the quality of the wearer; over this they wore a plaid, which they either held cloſe under their chins with the hand, or faſtened with a buckle of a particular faſhion. On the head they wore a kerchief of fine linen of different forms. The woman's plaid has been but lately diſuſed in Scotland by the ladies, who wore it in a graceful manner, the drapery falling towards the feet in large folds. A curious virtuoſo may find a ſtrong reſemblance between the plaids and the variegated and fimbriated draperies of the ancients, eſpecially the Tuſcans, who were probably of Celtic original.

The attachment of the Highlanders to this dreſs rendered it a bond of union, which often proved dangerous to government. Many efforts were made by the legiſlature, after the rebellion in 1715, to diſarm, and oblige them to conform to the Low-country dreſſes. The diſarming ſcheme was the moſt ſucceſsful, for when the rebellion in 1745 broke out, the common people had ſcarcely any other arms than thoſe which they took from the king's troops. Their overthrow at Culloden rendered it no difficult matter for the legiſlature to force them into a total change of their dreſs. Its conveniency, however, for the purpoſes of the field, is ſo great, that the Highland regiments ſtill retain it. Even the common people have of late reſumed the uſe of it; and many of the Highland gentlemen wear it in the ſummer time. The dreſs of the higher and middling ranks in the Low-country, differs little from the Engliſh; but many of the peaſantry ſtill retain the bonnet, for the cheapneſs and lightneſs of the wear. The dreſs of the women of all ranks is much the ſame in both kingdoms, but not ſo as to their neatneſs, and the cleanlineſs of the female ſervants.

The language of the Highlanders, eſpecially towards Lochaber and Badenoch, is radically Celtic. The Engliſh ſpoken by the Scots, notwithſtanding its provincial articulations, which are as frequent there as in the more ſouthern counties, is written in the ſame manner in both kingdoms. The pronunciation of a Scotchman is now improving, and with ſome does not differ from the pronounciation of a Londoner more than that of a Londoner does from an inhabitant of Somerſetſhire, and ſome other counties.

PUNISHMENTS.] Theſe are much the ſame in Scotland as in England, only that of beheading is performed by an inſtrument called the Maiden: the model of which was brought from Halifax in England to Scotland by the regent earl of Morton; and it was firſt uſed for the execution of himſelf.

RELIGION.] Ancient Scottiſh hiſtorians, with Bede, and other writers, generally agree that Chriſtianity was firſt taught in Scotland by ſome of the diſciples of St. John the Apoſtle, who fled to this northern corner to avoid the perſecution of Domitian, the Roman emperor; though it was not publicly profeſſed till the beginning of the third century, when a prince, whom Scottiſh hiſtorians call Donald the Firſt, his queen, and ſeveral of his nobles, were ſolemnly baptized. It was farther confirmed by emigration from South Britain, during the perſecutions of Aurelius and Diocleſian, when it became the eſtabliſhed religion of Scotland, under the management of certain learned and pious men, named Culdees, who ſeem to have been the firſt regular clergy in Scotland, and were governed by overſeers or biſhops choſen by themſelves, from their own body, and who had no pre-eminence over their brethren.

Thus, independent of the church of Rome, Chriſtianity ſeems to have been taught, planted, and confirmed in Scotland, where it flouriſhed in its native ſimplicity, till the arrival of Palladius, a prieſt ſent by the biſhop of Rome, in the fifth

century, who found means to introduce the ceremonies of the Romiſh church, which at laſt prevailed, and Scotland became involved in that darkneſs which for many ages overſpread Europe; though its dependence upon the pope was very ſlender, when compared to the blind ſubjection of other countries.

The Culdees long retained their original manners, and remained a diſtinct order, notwithſtanding the oppreſſion of the Romiſh clergy, ſo late as the age of Robert Bruce, in the 14th century, when they diſappeared. The oppoſition to popery in this iſland, though it ceaſed in Scotland upon the extinction of the Culdees, was in the ſame age revived in England by John Wickliffe, a man of parts and learning, who was the forerunner in the work of reformation to John Huſs and Jerome of Prague, as the latter were to Martin Luther and John Calvin. But though the doctrines of Wickliffe were nearly the ſame with thoſe propagated by the reformers in the 16th century, and the age ſeemed ſtrongly diſpoſed to receive them, affairs were not fully ripe for this great revolution; and the finiſhing blow to popery in England was reſerved for the age of Henry VIII.

Soon after that important event took place in England, when learning, arts, and ſciences began to revive in Europe, the abſurdities of the church of Rome, as well as the profligate lives of her clergy, did not eſcape the notice of a free and inquiring people, but gave riſe to the Reformation in Scotland. It began in the reign of James V. made great progreſs under that of his daughter Mary, and was completed through the preaching of John Knox, who had adopted the doctrines of Calvin, and was the chief reformer of Scotland. It was natural for his brethren to imagine, that upon the abolition of the Roman Catholic religion, they were to ſucceed to the revenues of that clergy. The great nobility, whoſe imaginations had already ingroſſed theſe poſſeſſions, did not at firſt diſcourage this notion; but no ſooner had Knox ſucceeded in his deſigns, which, through the fury of the mob, deſtroyed ſome of the fineſt eccleſiaſtical buildings in the world, than the parliament, or rather the nobility, monopolized all the church-livings, and moſt ſcandalouſly left the reformed clergy to live almoſt in a ſtate of beggary; nor could all their efforts produce any great alteration in their favour.

The great landholders left the doctrine and diſcipline of the church to be modelled by the preachers, and they were confirmed by parliament. Succeeding events rendered the preſbyterian clergy of great importance to the ſtate; and their revenues have been ſo much mended, that though no ſtipend there exceeds 150l. a year, few fall ſhort of 60l. and none of 50l. If the preſent expenſive mode of living continues in Scotland, the eſtabliſhed clergy will have many unanſwerable reaſons to urge for the increaſe of their revenues.

The bounds of this work admit not of entering upon the doctrinal and œconomical part of the church of Scotland. It is ſufficient to ſay, that its firſt principle is a parity of eccleſiaſtical authority among all its preſbyters; that it agrees in its cenſures with the reformed churches abroad in the chief heads of oppoſition to popery; but that it is modelled principally after the Calviniſtical plan eſtabliſhed at Geneva. This eſtabliſhment at various periods proved ſo tyrannical, by having the power of the greater and leſſer excommunication, which were attended by a forfeiture of eſtate, and ſometimes of life, that the kirk ſeſſions, and other bodies, have been abridged of their dangerous powers over the laity. That relic of popery, the obliging fornicators of both ſexes to ſit upon what they call a repenting-ſtool, in the church, and in full view of the congregation, begins to wear out; it having been found, that the Scotch women, on account of that penance, were the greateſt infanticides in the world. The power of the Scotch clergy is at preſent very moderate, or at leaſt very moderately exerciſed; nor are they accountable for the extravagancies of their predeceſſors. They have been, ever ſince the Revolution, firm

adherents

adherents to civil liberty, and the houſe of Havover; and acted with remarkable intrepidity during the rebellion in 1745. They dreſs without clerical robes: but ſome of them appear in the pulpit in gowns and bands, after the Geneva form. They make no uſe of ſet forms in worſhip, but they freely uſe the Lord's Prayer. The rents of the biſhops, ſince the abolition of epiſcopacy, are paid to the king, who commonly appropriates them to pious purpoſes. A thouſand pounds a year is always ſent by his majeſty for the uſe of the proteſtant ſchools erected by act of parliament in North-Britain and the Weſtern Iſles; and the Scotch clergy, of late, have planned out funds for the ſupport of their widows and orphans. The number of pariſhes in Scotland are eight hundred and ninety, whereof thirty-one are collegiate churches, that is, where the cure is ſerved by more than one miniſter.

The higheſt eccleſiaſtical authority in Scotland is the general aſſembly, which may be called the eccleſiaſtical parliament of Scotland. It conſiſts of commiſſioners, ſome of which are laymen, under the title of ruling elders, from preſbyteries, royal burghs, and univerſities. A preſbytery, conſiſting of under twelve miniſters, ſends two miniſters and one ruling elder: if it contains between twelve and eighteen miniſters, it ſends three, and one ruling elder: if it contains between eighteen and twenty-four miniſters, it ſends four miniſters and two ruling elders: but if the preſbytery has twenty-four miniſters, it ſends five miniſters and two ruling elders. Every royal burgh ſends one ruling elder, and Edinburgh two; whoſe election muſt be atteſted by the reſpective kirk-ſeſſions of their own burghs. Every univerſity ſends one commiſſioner. The commiſſioners are choſen yearly, ſix weeks before the meeting of the aſſembly. The ruling elders are often perſons of the firſt quality of the country. The king preſides by his commiſſioner (who is always a nobleman) in this aſſembly, which meets annually, in May: but he has no voice in their deliberations. The order of their proceedings is regular, though the number of members often creates a confuſion; which the moderator, who is choſen by them to be ſpeaker, has not ſufficient authority to prevent. Appeals are brought from all the other eccleſiaſtical courts in Scotland to the general aſſembly; and no appeal lies from its determinations in religious matters.

Provincial ſynods are next in authority. They are compoſed of a number of the adjacent preſbyteries, over whom they have a power; and there are fifteen of them in Scotland; but their acts are reverſible by the general aſſembly.

Subordinate to the ſynods are preſbyteries, ſixty-nine in number, each conſiſting of ſeveral contiguous pariſhes. The miniſters of theſe pariſhes, with one ruling elder, choſen half-yearly out of every kirk-ſeſſion, compoſe a preſbytery. Theſe preſbyteries meet in the head town of that diviſion; but have no juriſdiction beyond their own bounds, though within theſe they have cogniſance of all eccleſiaſtical matters. A chief part of their buſineſs is the ordination of candidates for livings, in which they are regular and ſolemn. The patron of a living is bound to nominate or preſent in ſix months after a vacancy, otherwiſe the preſbytery fills the place *jure devoluto*; but that privilege does not hold in royal burghs.

A kirk-ſeſſion is the loweſt eccleſiaſtical judicatory in Scotland, and its authority does not extend beyond its own pariſh. The members conſiſt of the miniſter, elders, and deacons. The deacons are laymen, and act much as church-wardens do in England, by having the ſuperintendency of the poor, and taking care of other parochial affairs. The elder, or ruling elder, is a place of great parochial truſt, and he is generally a lay perſon of quality or intereſt in the pariſh. They are ſuppoſed to act in a kind of co-ordinancy with the miniſter, and to be aſſiſting to him in many of his clerical duties, particularly in catechiſing, viſiting the ſick, and at the communion-table.

The office of miniſters, or preaching preſbyters, includes the offices of deacons and ruling-elders; they alone can preach, adminiſter the ſacraments, catechiſe, pronounce church cenſures, ordain deacons and ruling elders, aſſiſt at the impoſition of hands upon other miniſters, and moderate or preſide in all eccleſiaſtical judicatories.

The eſtabliſhed religion in Scotland was formerly of a rigid nature, and partook of all the auſterities of Calviniſm, and of too much of the intolerance of popery: at preſent it is mild and gentle; and the ſermons and other theological writings of many of the modern Scotch divines, are equally diſtinguiſhed by good ſenſe and moderation. It is to be wiſhed, however, that this moderation was not too often interrupted by the fanaticiſm not only of lay ſeceders, but of regular miniſters. Theſe are induſtrious to fix upon the abſurdities of former divines and viſionaries, and eccleſiaſtical ordinances and diſcipline, which were ſuppoſed to be incompatible with the nature of government. They maintain their own preachers; though ſcarcely any two congregations agree either in principle or practice.

A different ſet of diſſenters in Scotland conſiſts of the epiſcopalians, a few quakers, many papiſts, and other ſectaries, who are denominated from their preachers. Epiſcopacy, from the time of the Reſtoration, in 1660, to that of the Revolution, in 1688, was the eſtabliſhed church of Scotland; and would probably have continued ſo, had not the biſhops, who were in general very weak men, and creatures of the duke of York, afterwards James VII. and II. refuſed to recogniſe king William's title. A Scotch epiſcopalian thus becoming another name for a Jacobite, they received ſome checks after the rebellion in 1715; but at the breaking out of the rebellion in 1745, they became again numerous, after which the government found means to invalidate the acts of their clerical order. Their meetings, however, ſtill ſubſiſt, but thinly. The decline of the nonjurors is far from having ſuppreſſed epiſcopacy in Scotland: the Engliſh biſhops ſupply them with clergy qualified according to law, whoſe chapels are chiefly filled by the Engliſh, and ſuch Scotch hearers of that perſuaſion as have places under the government. The defection of ſome great families from the cauſe of popery, and the extinction of others, have rendered its votaries inconſiderable in Scotland. They are chiefly confined to the northern parts, and the iſlands: and though a violent oppoſition has lately been raiſed againſt them, they appear to be as quiet and inoffenſive as proteſtant ſubjects.

Scotland, during the time of epiſcopacy, contained two archbiſhopricks, St. Andrew's and Glaſgow; and twelve biſhopricks, which are Edinburgh, Dunkeld, Aberdeen, Murray, Brechin, Dumblain, Roſs, Caithneſs, Orkney, Galloway, Argyle, and the Iſles.

LEARNING, AND LEARNED MEN.] For this article we may refer to the literary hiſtory of Europe for 1400 years paſt. The weſtern parts and iſles of Scotland produced St. Patrick, the celebrated apoſtle of Ireland, and many others ſince, whoſe bare names would make a long article. The writings of Adamnarus, ſtill extant, and of ſome others, who lived before, and at the time of the Norman invaſion, afford ſpecimens of their learning. Charles the Great, or Charlemagne, moſt unqueſtionably held a correſpondence by letters with the kings of Scotland, with whom he entered into league; and employed Scotchmen in planning, ſettling, and ruling his favourite univerſities, and other ſeminaries of learning, in France, Italy, and Germany. It is an undoubted truth, though a ſeeming paradoxical fact, that Barbour, a Scotch poet, philoſopher, and hiſtorian, though prior in time to Chaucer, having flouriſhed in the year 1368, wrote, according to the modern ideas, as pure Engliſh as that bard, and his verſification is perhaps more harmonious. The deſtruction of the Scotch monuments of learning and antiquity have rendered their early annals lame, and often fabulous; but the Latin ſtyle

of

of Buchanan's Hiſtory is to this day the moſt claſſical of all modern productions. The letters of the Scotch kings to the neighbouring princes are incomparably the fineſt compoſitions of the times in which they were written, and are free from the barbariſms of thoſe ſent them in anſwer. This has been conſidered as a proof that claſſical learning was more cultivated at the court of Scotland than at any other in Europe.

The diſcovery of the logarithms, a diſcovery which, in point of ingenuity and utility, may vie with any that has been made in modern times, is the indiſputable right of Napier of Merchiſton; and ſince, his time, the mathematical ſciences have been cultivated in Scotland with great ſucceſs. Keil, in his phyſico-mathematical works, to the clearneſs of his reaſoning has added the colouring of a poet, which is the more remarkable, not only as the ſubject is little ſuſceptible of ornament, but as he wrote in an ancient language. Of all writers on aſtronomy, Gregory is allowed to be one of the moſt perfect and elegant. Maclaurin, the companion and the friend of Sir Iſaac Newton, was endowed with all that preciſion and force of mind, which rendered him peculiarly fitted for bringing down the ideas of that great man to the level of ordinary apprehenſions, and for diffuſing that light through the world which Newton had confined within the ſphere of the learned. His Treatiſe on Fluxions is regarded, by the beſt judges in Europe, as the cleareſt account of the moſt refined and ſubtile ſpeculations on which the human mind ever exerted itſelf with ſucceſs. While Maclaurin purſued this new career, a geometrician no leſs famous diſtinguiſhed himſelf in the almoſt deſerted tract of antiquity. This was the late Dr. Simſon, well known for his illuſtration of the ancient geometry. His Elements of Euclid, and his Conic Sections, are ſufficient to eſtabliſh the ſcientific reputation of his native country. This, however, does not reſt on the character of mathematicians and aſtronomers. The fine arts have been called ſiſters, to denote their affinity. There is the ſame connection between the ſciencs, particularly thoſe which depend on obſervation. Mathematics and phyſics, properly ſo called, were in Scotland accompanied by the other branches of ſtudy to which they are allied. In medicine particularly, the names of Pitcairn, Arbuthnot, Monro, Whytt, Cullen, &c. hold a diſtinguiſhed place.

Nor have the Scots been unſucceſsful in cultivating the Belles Lettres. Foreigners who inhabit warmer climates, and conceive the northern nations incapable of tenderneſs and feeling, are aſtoniſhed at the poetic genius and delicate ſenſibility of Thomſon. But of all literary purſuits, that of rendering mankind more virtuous and happy, which is the proper object of what is called *morals*, ought to be regarded with peculiar honour and reſpect. The philoſophy of Dr. Hutcheſon, not to mention other works more ſubtile and elegant, but leſs convincing and leſs inſtructive, deſerves to be read by all who would know their duty, or who would wiſh to practiſe it. Next to Locke's Eſſay on the Human Underſtanding, it is perhaps the beſt diſſection of the human mind, that hath appeared in modern times; and it is likewiſe a moſt uſeful ſupplement to that eſſay. It would be endleſs to mention all the individuals who have diſtinguiſhed themſelves in the various branches of literature; particularly as thoſe who are alive (ſome of them in high eſteem for hiſtorical compoſition) diſpute the palm of merit with the dead, and cover their country with laurels.

UNIVERSITIES.] The Univerſities of Scotland are four, viz. St. Andrews *,

CITIES, TOWNS, AND OTHER EDIFICES, PUBLIC AND PRIVATE. Edinburgh, the capital of Scotland, naturally claims our firſt attention in this diviſion. Its caſtle, before the uſe of artillery, was deemed impregnable; and was probably built by the Saxon king Edwin, whoſe territories reached to the Frith of Forth, and who gave his name to Edinburgh, as it certainly did not fall into the hands of the Scots till the reign of Indulphus, who lived in the year 953. The town was built for the benefit of protection from the caſtle, and a more inconvenient ſituation for a capital can ſcarcely be conceived; the high-ſtreet, which is on the ridge of a hill, lying eaſt and weſt; and the lanes running down its ſides, north and ſouth. In former times the town was ſurrounded by water, except towards the eaſt; ſo that when the French landed in Scotland, during the regency of Mary of Guiſe, they gave it the name of Liſlebourg. This ſituation ſuggeſted the idea of building very lofty houſes divided into ſtories, each of which contains a ſuite of rooms, generally large and commodious, for the uſe of a family; ſo that the high-ſtreet of Edinburgh, which is chiefly of hewn ſtone, broad, and well-paved, makes a moſt auguſt appearance, eſpecially as it riſes a full mile in a direct line and gradual aſcent from the palace of Holyrood-houſe on the eaſt, and is terminated on the weſt by the rude majeſty of its caſtle, built upon a lofty rock, inacceſſible on all ſides, except where it joins to the city. The inconveniences ariſing from this crowded population being ſo very apparent, the modern houſes are generally built in the Engliſh taſte, of a moderate height, and accommodated to the uſe of a ſingle family. This improvement particularly prevails in the new town. The caſtle not only overlooks the city, its environs, gardens, the new town, and a rich neighbouring country, but commands a moſt extenſive proſpect of the river Forth, the ſhipping, the oppoſite coaſt of Fife, and even ſome hills at the diſtance of forty or fifty miles, which border upon the Highlands. The caſtle has ſome good apartments, a tolerable train of artillery, a large magazine of arms and ammunition, and contains the regalia, which were depoſited here under the moſt ſolemn legal inſtruments of their never being removed from thence. All that is known at preſent of thoſe regalia is contained in the inſtrument which was taken at the time of their being depoſited, where they are fully deſcribed.

Facing the caſtle, at a mile's diſtance, ſtands the abbey, or rather palace of Holyrood-houſe. The inner quadrangle of this palace, begun by James V. and finiſhed by Charles I. is of magnificent modern architecture, built according to the plan, and

under the direction of ſir William Bruce, a Scotch gentleman of family, and one of the greateſt architects of that age. Round the quadrangle runs an arcade, adorned with pilaſters; and the inſide contains good apartments for the duke of Hamilton, who is hereditary keeper of the palace, and for other noblemen. Its long gallery contains figures, ſome of which are from portraits, but all of them painted by modern hands, of the kings of Scotland down to the time of the Revolution. James VII. when duke of York, intended to have adorned the neighbourhood of this palace, which is ſituate at the bottom of bleak crags and bare mountains. The chapel belonging to the palace, as it ſtood when repaired and ornamented by that prince, is thought to have been a moſt elegant piece of Gothic architecture. It had a very lofty roof, and two rooms of ſtone galleries ſupported by curious pillars. It was the conventual church of the old abbey. Its inſide was demoliſhed and rifled of all its rich ornaments, by the fury of the mob at the Revolution, which even broke into the repoſitories of the dead, and diſcovered a vault till that time unknown, which contained the bodies of James V. his firſt queen, and Henry Darnley. The walls and roof of this ancient chapel fell down on the 2d and 3d of December, 1768, occaſioned by the enormous weight of a new ſtone roof, laid over it ſome years ago which the walls were unable to ſupport.

The hoſpital, founded by George Herriot, goldſmith to James VI. ſtands to the ſouth-weſt of the caſtle, in a good ſituation. It is the fineſt and moſt regular ſpecimen which Inigo Jones (who went to Scotland as architect to queen Anne, wife of king James VI.) has left us of his Gothic manner, and is, upon the whole, a delightful fabric, and adorned with gardens, not inelegantly laid out. It was built for the maintenance and education of poor children belonging to the citizens of Edinburgh, and is under the direction of the city magiſtrates.

Among the public edifices of Edinburgh is the college, which claims the privileges of an univerſity, founded by king James VI. and by him put under the direction of the magiſtrates, who have the power of chancellor and vice-chancellor. Little can be ſaid of its buildings, which were calculated for the ſober literary manners of thoſe days. What is of more importance, it is ſupplied with excellent profeſſors in the ſeveral branches of learning; and its ſchools for every part of the medical art are reckoned equal to any in Europe. This college is provided with a library, founded by Clement Little, which is ſaid to have been of late greatly augmented; and a muſeum belonging to it was given by ſir Andrew Balfour, a phyſician. It contains ſeveral natural, and ſome literary curioſities. The magiſtrates of Edinburgh intend to erect a new and elegant ſtructure upon the preſent ſituation, as ſoon as a fund can be formed adequate to the expence.

The Parliament-ſquare, or, as it is there called, Cloſe, was formerly the moſt ornamental part of the city; it is formed into a quadrangle, part of which conſiſts of lofty buildings; and in the middle is a fine equeſtrian ſtatue of Charles II. The room built by Charles I. for the parliament-houſe, though not ſo large, is ſaid to be better proportioned than Weſtminſter-hall; and its roof, though executed in the ſame manner, has been by good judges held to be ſuperior. It is now converted into a court of law, where a ſingle judge, called the lord ordinary, preſides by rotation; in a room near it, ſit the other judges; and adjoining are the public offices of the law, exchequer, chancery, ſhrievalty, and magiſtracy of Edinburgh; and the valuable library of the lawyers. This equals any thing of the kind to be found in England, or perhaps in any part of Europe, and was at firſt founded and furniſhed by lawyers. The number of printed books it contains is amazing; and the collection has been made with taſte and judgment. It contains likewiſe the moſt valuable manuſcript remains of the Scotch hiſtory, chartularies, and other papers of antiquity, with a ſeries of medals. Adjoining to the library is the room where the public records are kept; but both, though lofty in the roof, are dark

dark and diſmal. It is ſaid that preparations are now carrying on for lodging the books and papers in rooms better ſuited to their importance and value.

The High Church of Edinburgh, called that of St. Giles, is now divided into four churches, and a room where the general aſſembly ſits. It is a large Gothic building, and its ſteeple is ſurmounted by arches formed into an imperial crown, which has a good effect. The churches, and other edifices of the city, erected before the Union, contain little but what is common to ſuch buildings; but the excellent pavement of the city, which was begun two centuries ago by one Merlin, a Frenchman, deſerves particular attention. This pavement has been lately much improved.

The modern edifices in and near Edinburgh, ſuch as the exchange, public offices, its hoſpitals, bridges, and the like, demonſtrate the improvement of the taſte of the Scots in their public works. Parallel to the city of Edinburgh, on the north, the nobility, gentry, and others, have almoſt completed a new town, upon a plan which does honour to the preſent age. The ſtreets and ſquares are laid out with regularity, and the houſes are built of ſtone, in an elegant taſte, with all the conveniences that render thoſe of England ſo delightful and commodious. The fronts of ſome are ſuperbly finiſhed, diſplaying at the ſame time the judgment of the builder, and the public ſpirit of the proprietors.

Between the old and the new town lies a narrow bottom or vale, which, agreeably to the original plan, was to have been formed into a ſheet of water, bordered by a terrace walk, and the aſcent towards the new town covered with pleaſure gardens, ſhrubberies, &c. But this elegant deſign has not yet taken place. At the weſt, or upper end of this vale, the caſtle, a ſolid rock, not leſs than twenty ſtories high, looks down with awful magnificence. The eaſtern extremity is bounded by a ſtriking object of art, a lofty bridge *, the middle arch being ninety feet high, which joins the new buildings to the city, and renders the deſcent on each ſide the vale (there being no water in this place) more commodious for carriages. I am the more particular in deſcribing this place, that the reader may form ſome idea of its pleaſant ſituation, ſtanding on an eminence, with a gentle declivity on each ſide, in the heart of a rich country; the view ſouthward, that of a romantic city, its more romantic caſtle, and diſtant hills riſing to an amazing height; while the proſpect northward gives full ſcope to the eye, pleaſes the imagination, and fills the mind with ſuch ideas as the works of nature alone can inſpire.

This city may be conſidered, notwithſtanding its caſtle, and a wall which encloſes it on the ſouth ſide, of a very modern fabric but in the Roman manner, as an open town; ſo that it would have been impracticable for its inhabitants to have defended it againſt the rebels, who took poſſeſſion of it in 1745. Edinburgh contains a playhouſe, which has now the ſanction of an act of parliament; and concerts, aſſemblies, balls, muſic-meetings, and other polite amuſements, are as frequent and brilliant here, as in any part of his majeſty's dominions, London and Bath excepted. In the new town are ſeveral handſome and convenient hotels, and the coffeehouſes and taverns in the old town are much improved.

Edinburgh is governed by a lord provoſt, four baillies, a dean of guild, and a treaſurer, annually choſen from the common-council. Every company, or incorporated trade, chooſes its own deacon, and here are 14; viz. ſurgeons, goldſmiths, ſkinners furriers, hammer-men, wrights or carpenters, maſons, taylors, bakers, butchers, cordwainers, weavers, fullers, and bonnet-makers. The lord provoſt is colonel of the town-guard, a military inſtitution to be found in no part of his ma-

* A bridge has been lately erected towards the ſouth, which not only connects the buildings in that quarter with the old and new towns, but admits of an eaſy acceſs to the country. This South Bridge forms a moſt elegant ſtreet, with magnificent buildings on each ſide, and is directly oppoſite to that over the North Loch, and will be productive of many advantages, and afford a great increaſe of revenue to the city of Edinburgh.

jeſty's dominions, but at Edinburgh: they ſerve for the city watch, and patrole the ſtreets, are uſeful in ſuppreſſing ſmall commotions, and attend the execution of ſentences upon delinquents. They are divided into three companies, and wear an uniform; they are commanded by three officers, under the name of captains. Beſides this guard, Edinburgh raiſes 16 companies of trained bands, which ſerve as militia. The revenues of the city conſiſt chiefly of that tax which is now common in moſt of the bodies corporate of Scotland, of two Scotch pennies, amounting in the whole to two thirds of a farthing, laid upon every Scotch pint of ale (containing two Engliſh quarts) conſumed within the precincts of the city. This is a judicious impoſt, as it renders the pooreſt people inſenſible of the burden. Its product has been ſufficient to defray the expence of ſupplying the city with excellent water, brought in leaden pipes at the diſtance of four miles; of erecting reſervoirs, enlarging the harbour of Leith, and completing other public works, of great expence and utility.

Leith, though near two miles diſtant, may be properly called the harbour of Edinburgh, being under the ſame juriſdiction. It contains the remains of two citadels (if they are not the ſame), which were fortified and bravely defended by the French, under Mary of Guiſe, againſt the Engliſh, and afterwards repaired by Cromwell. The neighbourhood of Edinburgh is adorned with noble ſeats, which are increaſing; particularly, the earl of Abercorn's, a ſhort way from the city, the duke of Buccleugh's houſe at Dalkeith, that of the marquis of Lothian at Newbottle, and Hopetoun-houſe, ſo called from the earl its owner. About four miles from Edinburgh is Roſlin, noted for a ſtately Gothic chapel, counted one of the moſt curious pieces of workmanſhip in Europe; founded in the year 1440 by William St. Clair, prince of Orkney, and duke of Oldenburgh.

Glaſgow, in the ſhire of Lanerk, ſituated on a gentle declivity ſloping towards the river Clyde, 44 miles weſt of Edinburgh, is, for population, commerce, and riches, the ſecond city of Scotland, and conſidering its ſize, the firſt perhaps in Europe, as to elegance, regularity, and the materials of its buildings. The ſtreets croſs each other at right angles, and are broad, ſtraight, well paved, and conſequently clean. The houſes make a grand appearance, and are in general four or five ſtories high, and many of them, towards the centre of the city, are ſupported by arcades, which form piazzas, and give the whole an air of magnificence. Some of the modern built churches are in a good ſtyle of architecture; and the cathedral is a Gothic building. It contains three churches, one of which ſtands above another, and is furniſhed with a fine ſpire ſpringing from a tower; the whole being reckoned a maſterly fabric. It was dedicated to St. Mungo or Kentigern, who was biſhop of Glaſgow in the 6th century. The cathedral is upwards of 600 years old, and was preſerved from the fury of the rigid reformers by the reſolution of the citizens. The town houſe is a loſty building, and has noble apartments for the magiſtrates. The univerſity is eſteemed the beſt built of any in Scotland, is at preſent in a thriving ſtate, and its buildings will be much improved and extended in conſequence of the liberal donations bequeathed by the late Dr. Hunter. In this city are ſeveral well-endowed hoſpitals; it is well ſupplied with inns; and, near the moſt populous part of the town, where the traders aſſemble, is a hotel, tavern, and ſpacious coffee-houſe, named the *Tontine*, ſupported by ſubſcription. It is, perhaps, equal to any thing of the kind, and well calculated for the accommodation of ſtrangers and the inhabitants of this commercial city. They have lately built a handſome bridge acroſs the river Clyde; but our bounds do not allow us to particularize that and the other public-ſpirited undertakings of this city carrying on by the inhabitants, who do honour to the benefits ariſing from their commerce, both foreign and internal, which they carry on with amazing ſucceſs. In Glaſgow are ſeven

churches, and eight or ten meeting-houſes for ſectaries of various denominations. Its inhabitants have been eſtimated at 50,000.

Aberdeen is the third town in Scotland for improvement and population. It is the capital of a ſhire, to which it gives name, and contains two towns, New and Old Aberdeen; the former is the ſhire-town, and evidently built for the purpoſe of commerce. It is a large well-built city, and has a good quay, or tide-harbour: in it are three churches, and ſeveral epiſcopal meeting-houſes, a conſiderable degree of foreign commerce and much ſhipping, a well-frequented univerſity, and above 25,000 inhabitants. Old Aberdeen, near a mile diſtant, though almoſt joined to the New, by means of a long village, has no dependence on the other: it is a moderately large market-town, but has no haven. In each of theſe places there is a well-endowed college, both together being termed the univerſity of Aberdeen, though independent of each other. There is, at preſent, a proſpect of their being united.

Perth, the capital town of Perthſhire, lying on the river Tay, trades to Norway and the Baltic: is finely ſituated, has an improving linen manufactory, and lies in the neighbourhood of one of the moſt fertile ſpots in Great Britain, called the Carſe of Gowry. Dundee, by the general computation, contains about 20,000 inhabitants: it lies near the mouth of the river Tay; is a town of conſiderable trade, exporting much linen, grain, herrings, and peltry, to foreign parts; and has three churches. Montroſe, Aberbrothick, and Brechin, lie in the ſame county of Angus: the trade of the firſt has declined, but the manufactures of the other two are in an improving ſtate.

It may be neceſſary again to mention, that I write with great uncertainty with regard to the population of Scotland. Edinburgh certainly contains more than 60,000 ſouls, which is the common computation, to which I all along conform myſelf: but the influx of people, and the increaſe of matrimony in proportion to that of property, muſt create great alterations for the better, and few for the worſe, becauſe the inhabitants who are diſpoſed to induſtry may always find employment. This uncertainty is the reaſon why a particular deſcription of Dumfries, Air, Greenock, Paiſley, Stirling, and about 50 other burghs and towns of very conſiderable trade in Scotland, is omitted.

The ancient Scots valued themſelves upon truſting to their own valour, and not to fortifications, for the defence of their country. This was a maxim more heroical perhaps than prudent, as they have often experienced. The caſtles of Edinburgh, Stirling, and Dumbarton, formerly thought places of great ſtrength, could not hold out 48 hours, if beſieged by 6000 regular troops, with proper artillery. Fort William, which lies in the Weſt Highlands, is ſufficient to bridle the inhabitants of the neighbourhood; as are Fort George and Fort Auguſtus, in the north and north-weſt: but none of them can be conſidered as defences againſt a foreign enemy.

It is needleſs to give a deſcription of the edifices that, within the courſe of this and the laſt century, have been erected by private perſons in Scotland, becauſe they are ſo numerous. It is ſufficient to ſay, that many of them are equal to ſome of the moſt ſuperb buildings in England and foreign countries: and the reader's ſurpriſe at this will ceaſe, when he is informed that the genius of no people in the world is more devoted to architecture than that of the nobility and gentry in Scotland; and that there is no country in Europe, on account of the cheapneſs of materials, where it can be gratified at ſo moderate an expence. This may likewiſe account for the ſtupendous Gothic cathedrals, and other religious edifices which anciently abounded in Scotland: but at the time of the Reformation they were moſtly demoliſhed, by a furious and tumultuous mob, who, in theſe practices, received too much countenance from the reforming clergy, exaſperated at the long ſuffering they had endured from the popiſh party.

ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL. The Roman and other antiquities found in Scotland, have furniſhed matter for large volumes. The ſtations of the Roman legions, their caſtella, their pretentures or walls reaching acroſs the iſland, have been traced with great preciſion by antiquaries and hiſtorians; ſo that without ſome freſh diſcoveries, an account of them could afford no inſtruction to the learned, and but little amuſement to the ignorant; becauſe at preſent they can be diſcovered only by critical eyes. Some mention of the chief, however, may be proper. The courſe of the Roman wall (or, as it is called by the country people, *Graham's dyke*, from a tradition that a Scottiſh warrior of that name firſt broke over it) between the Clyde and Forth, which was firſt marked out by Agricola, and completed by Antoninus Pius, is ſtill diſcernible, as are ſeveral Roman camps in the neighbourhood *. Agricola's camp, at the bottom of the Grampian hills, is a remain of Roman antiquity. It is ſituated at Ardoch, in Perthſhire, and is generally thought to have been the camp occupied by Agricola, before he fought the battle, ſo well recorded by Tacitus, with the Caledonian king Galgacus, who was defeated. Some writers think, that this remain of antiquity at Ardoch was, on account of the numerous Roman coins and inſcriptions found near it, a Roman caſtellum or fort. It is the moſt entire and beſt preſerved of any Roman antiquity of that kind in North Britain, having no leſs than five rows of ditches and ſix ramparts on the ſouth ſide; and of the four gates which lead into the area, three are very diſtinct and plain, viz. the prætoria, decumana, and dextra.

The Roman temple, or building in the form of the Pantheon at Rome, or the dome of St. Paul's at London, ſtood upon the banks of the river Carron, in Stirlingſhire, but has been lately barbarouſly demoliſhed by a neighbouring Goth, for the purpoſe of mending a mill-pond. Its height was twenty-two feet, and its external circumference at the baſe was eighty-eight feet; ſo that, upon the whole, it was one of the moſt complete Roman antiquities in the world. It is thought to have been built by Agricola, or ſome of his ſucceſſors, as a temple to the god Terminus, as it ſtood near the pretenture which bounded the Roman empire in Britain to the north. Near it are ſome artificial conical mounts of earth, which ſtill retain the name of Duni-pace, or Duni pacis: which ſerve to evince that there was a kind of compromiſe between the Romans and Caledonians, that the former ſhould not extend their empire farther to the northwards. Innumerable are the coins, urns, utenſils, inſcriptions, and other remains of the Romans, that have been found in different parts of Scotland; ſome of them to the north of the wall, where, however, it does not appear that they made any eſtabliſhment. By the inſcriptions found near the wall, the names of the legions that built it, and how far they carried it on, may be learned. The remains of the Roman highways are frequent in the ſouthern parts.

Daniſh camps and fortifications are diſcernible in ſeveral northern counties, and are known by their ſquare figures and difficult ſituations. Some houſes of ſtupendous fabrics remain in Roſs-ſhire, but whether they are Daniſh, Pictiſh, or Scottiſh,

* Near the weſtern extremity of this wall, at Duntocher, in Dumbartonſhire, a countryman, in digging a trench upon the declivity of a hill, upon which are ſeen the remains of a Roman fort, turned up ſeveral uncommon tiles, which exciting the curioſity of the peaſantry in that neigbourhood, it was not long before they broke in upon an entire ſubterraneous building, from which they dug out a cart load of theſe materials. A gentleman found means, upon the ſecond day, to ſtop all farther proceedings, in hopes that ſome public-ſpirited perſons would, by taking off the ſurface, explore the whole without demoliſhing it. The tiles are of ſeven different ſizes; the ſmalleſt being ſeven, and the largeſt twenty-one inches ſquare. They are from two to three inches in thickneſs, of a reddiſh colour, and in a perfectly ſound condition. The leſſer ones compoſe ſeveral rows of pillars, which form a labyrinth of paſſages about eighteen inches ſquare: and the larger tiles being laid over the whole, ſerve as a roof to ſupport the earth above, which is found to be two feet in depth. The building is ſurrounded by a ſubterraneous wall of hewn ſtone.

does not appear. The elevations of two of them are to be ſeen in Gordon's Itinerarium Septentrionale. I am of opinion that they are Norwegian or Scandinavian ſtructures, and built about the fifth century to favour the deſcents of that people upon thoſe coaſts. Two Pictiſh monuments, of a very extraordinary conſtruction, were lately ſtanding in Scotland; one of them at Abernethy in Perthſhire, the other at Brechin in Angus: both of them are columns, hollow in the inſide, and without a ſtair-caſe; that of Brechin is the moſt entire, being covered at the top with a ſpiral roof of ſtone, with three or four windows above the cornice: it conſiſts of ſixty regular courſes of hewn freeſtone, laid circularly and regularly, and tapering towards the top *.

The veſtiges of erections by the ancient Scots are not only curious but inſtructive, as they regard many important events of their hiſtory. That people had a rude notion of ſculpture, in which they tranſmitted the actions of their kings and heroes. At a place called Aberlemno, near Brechin, four or five ancient obeliſks are ſtill to be ſeen, called the Daniſh ſtones of Aberlemno. They were erected as commemorations of the Scotch victories over that people; and are adorned with basreliefs of men on horſeback, and many emblematical figures and hieroglyphics, now inexplicable. Many other hiſtorical monuments of the Scots have been diſcovered, and the obſcurity of their ſculptures has encouraged a field of boundleſs and frivolous conjectures. It would be unpardonable, not to mention the ſtone near the town of Forres, or Fortroſe, in Murray, which far ſurpaſſes all the others in magnitude, "and is (ſays Mr. Gordon) perhaps one of the moſt ſtately monuments of that kind in Europe. It riſes about 23 feet in height, above ground, and is, as I am credibly informed, no leſs than 12 or 15 feet below; ſo that the whole height is at leaſt 35 feet, and its breadth near five. It is all one ſingle and entire ſtone; great variety of figures in relievo are carved thereon, and ſome of them ſtill diſtinct and viſible; but the injury of the weather has obſcured thoſe towards the upper part." Though this monument has been generally looked upon as Daniſh, yet I have little doubt of its being Scotch, and that it was erected in commemoration of the final expulſion of the Danes out of Murray, where they held their laſt ſettlement in Scotland, after the defeat they received from Malcolm a few years before the Norman invaſion.

At Sandwick, in Roſs-ſhire, is a ſplendid ancient obeliſk, ſurrounded at the baſe with large, well cut flag ſtones, formed like ſteps. Both ſides of the column are covered with various enrichments, in well finiſhed carved work. The one face preſents a ſumptuous croſs, with a figure of St. Andrew on each hand, and ſome uncouth animals and flowerings underneath. The central diviſion, on the reverſe, exhibits a variety of curious figures, birds, and animals. The remains of the cathedral of Elgin diſplay much grandeur and dignity. The weſt door is highly ornamented, there is much elegance in the carvings, and the whole edifice exhibits very elaborate workmanſhip.

Among the remains of ancient caſtles may be mentioned Kildrumy caſtle in the north of Scotland, formerly a place of great ſtrength and magnificence, and often uſed as an aſylum to noble families in periods of civil war. Inverurie caſtle, the ancient ſeat of the earl-mareſchals of Scotland, is alſo a large and lofty pile, ſituated on the ſteep bank of the river; two high towers bound the front, and, even in their decaying ſtate, give the caſtle an air of grandeur and antiquity. Rows of venerable trees, incloſing the adjoining garden, add to the effect of the decayed buildings. Near the town of Huntley are the ruins of Huntley caſtle. On the avenue that leads to it, are two large ſquare towers, which had defended the gateway.

* If theſe columns, which ſtand in the ancient dominions of the Picts, be really the work of that nation, their architects muſt have been equal to any at that time in Europe.

The

The caſtle ſeems to be very old, and great part of it is demoliſhed; but there is a maſſy building of a more modern date, in which ſome of the apartments, and their curious cielings, are ſtill in tolerable preſervation. They are painted with a great variety of ſubjects, in ſmall diviſions, in which are contained many emblematical figures.

Beſides theſe remains of Roman, Pictiſh, Daniſh, and Scotch antiquities, many Druidical monuments and temples are diſcernible in the northern parts of Scotland, as well as in the iſles, where we may ſuppoſe that paganiſm took its laſt refuge. They are eaſily perceived by their circular forms; but though equally regular, yet none of them are ſo ſtupendous as the Druidical monuments in South-Britain. There is in Perthſhire a barrow which ſeems to be Britiſh; it exactly reſembles the figure of a ſhip with the keel uppermoſt. The common people call it Ternay, which ſome interpret to be *terræ navis*, the ſhip of earth. It appears to be of the moſt remote antiquity, and perhaps was erected to the memory of ſome Britiſh prince, who acted as auxiliary to the Romans; for it lies near Auchterarder, not many miles diſtant from the great ſcene of Agricola's operations.

The traces of ancient volcanoes are not unfrequent in Scotland. The hill of Finehaven is one inſtance; and the hill of Bergonium, near Dunſtaffage caſtle, is another, yielding vaſt quantities of pummices or ſcoria of different kinds, many of which are of the ſame ſpecies with thoſe of the volcanic Iceland. Among other natural curioſities, mention is made of a heap of white ſtones, moſt of them clear like cryſtal, together with great plenty of oyſter and other ſea-ſhells, that are found on the top of a mountain called Skorna Lappich, in Roſs-ſhire, twenty miles diſtant from the ſea. Slains, in Aberdeenſhire, is ſaid to be remarkable for a petrifying cave, called the Dropping-cave, where water oozing through a ſpungy porous rock at the top, quickly conſolidates after it drops to the bottom. Other natural curioſities belonging to Scotland have their deſcriptions and hiſtories, but they generally owe their extraordinary qualities to the credulity of the vulgar. Some caverns in Fifeſhire are probably natural, and of extraordinary dimenſions.

COMMERCE AND MANUFACTURES.] In theſe reſpects Scotland has, for ſome years paſt, been in a very improving ſtate. Without entering into the diſputed point, how far Scotland was benefited by its union with England, it is certain that the expedition of the Scots to take poſſeſſion of Darien, and to carry on an Eaſt and Weſt-India trade, was founded upon true principals of commerce, and (ſo far as it went) executed with a noble ſpirit of enterprize. The miſcarriage of that ſcheme, after receiving the higheſt and moſt ſolemn ſanctions, is a diſgrace to the annals of that reign in which it happened. The diſguſt conceived by the nation on that account made commerce languiſh, until Mr. Pelham, after the extinction of the rebellion in 1745, diſcovered the true value of Scotland. All the benefits received by that country, for the relief of the people from their feudal tyranny, were effected by that great man. The bounties and encouragement granted by the Scots, for the benefit of trade and manufactures, during his adminiſtration, made them ſenſible of their own importance. Mr. Pitt, a ſucceeding miniſter, purſued Mr. Pelham's wiſe plan; and juſtly boaſted in parliament, that he availed himſelf of the courage, good ſenſe, and ſpirit of the Scots, in carrying on the moſt extenſive war that Great Britain was ever engaged in. Let it be remarked, to the honour of the Britiſh government, that the Scots have been ſuffered to avail themſelves of all the benefits of commerce and manufactures they can claim, either in right of their former independency, the treaty of union, or poſterior acts of parliament. This is manifeſt from the extenſive trade they lately carried on with the Britiſh ſettlements in America and the Weſt Indies, and with all the nations to which the Engliſh themſelves trade; ſo that the increaſe of their ſhipping within theſe 40 years paſt has been

very conſiderable. The exports of thoſe ſhips are compoſed chiefly of Scotch manufactures, fabricated from the produce of the ſoil, and the induſtry of its inhabitants. In exchange they import rice, cotton, ſugar, and rum, from the Britiſh plantations; and from other countries their products, to the immenſe ſaving of their nation. The proſperity of Glaſgow and its neighbourhood hath been greatly owing to the connection and trade with Virginia and the Weſt-Indies. The fiſheries of Scotland are not confined to their own coaſts, for they have a great concern in the whale fiſhery carried on upon the coaſt of Spitſbergen. Their other fiſheries are increaſing, their cured fiſh being preferred by foreigners, and the Engliſh planters in America, to thoſe of Newfoundland.

The buſſes or veſſels employed in the great herring fiſhery on the weſtern coaſts of Scotland, are fitted out from the north-weſt parts of England, the north of Ireland, as well as the numerous ports of the Clyde and neighbouring iſlands. The grand rendezvous is at Campbeltown, a commodious port in Argyleſhire, facing the north of Ireland, where ſometimes 300 veſſels have been aſſembled. They clear out the 12th of September, and muſt return to their different ports by the 13th of January. They are alſo under certain regulations reſpecting the number of tons, men, nets, &c. the whole being calculated to promote the beſt of national purpoſes, its ſtrength and its commerce. Notwithſtanding the political exiſtence of Great Britain depends upon the number and bravery of our ſeamen, this noble inſtitution ſtill labours under many difficulties.

To encourage this fiſhery, a bounty of 50s. per ton was granted by parliament, but whether from the inſufficiency of the fund appropriated for this purpoſe, or any other cauſe, the bounty was withheld from year to year, while in the mean time the adventurers were not only ſinking their fortunes, but alſo borrowing to the utmoſt limits of their credit. The bounty has ſince been reduced from 50, to 30s, with the ſtrongeſt aſſurances of its being regularly paid when due. Upon the ſtrength of theſe promiſes they have again embarked in the fiſhery; and it is to be wiſhed, that no conſideration whatever may tend to withdraw an inducement ſo requiſite to place this fiſhery on a permanent footing.

The benefits of theſe fiſheries are perhaps equalled by manufactures carrying on at land; particularly that of iron at Carron, in Stirlingſhire. Their linen manufactory is in a flouriſhing ſtate. The thread manufacture of Scotland is equal to any in the world; it has been ſaid, ſome years ago, that the exports from Scotland to England, and the Britiſh plantations, in linen, cambrics, checks, Oſnaburgs, inckle, and the like commodities, amounted annually to 400,000l. excluſive of their home conſumption: and there is reaſon to believe that the ſum is conſiderably larger at preſent. The Scots are making very promiſing efforts for eſtabliſhing woollen manufactures; and their exports of caps, ſtockings, mittens, and other articles of their own wool, begin to be very conſiderable. It is true, that they cannot pretend to rival the Engliſh in their finer cloths; but they make ſome broad cloth proper for the wear of people of faſhion in an undreſs, and in quality and fineneſs equal to what is commonly called Yorkſhire cloth. Among their late improvements, we are not to forget the progreſs they have made in working the mines, and ſmelting the ores of their country. The coal trade to England is well known; and of late they have turned even their ſtones to account, by their contract for paving the ſtreets of London. If the great trade in cattle, which the Scots carried on of late with the Engliſh, is now diminiſhed, it is owing to the beſt of national cauſes, that of an increaſe of home conſumption.

The trade carried on by the Scots with England, is chiefly from Leith, and the eaſtern ports of the nation; but Glaſgow was the great emporium for the American commerce, before the commencement of the late war. The late junction of the Forth to the Clyde will render the benefits of trade mutual to both parts of

Scotland.

Scotland. In ſhort, the more that the ſeas, the ſituation, the ſoil, harbours, and rivers of this country are known, the better adapted it appears for all the purpoſes of commerce. With regard to other manufactures, ſome of them are yet in their infancy. The town of Paiſley employs an incredible number of hands, in fabricating a particular kind of flowered and ſtriped lawns, which are a reaſonable and elegant wear. Sugar-houſes, glaſs-works of every kind, delft-houſes, and paper-mills, are erected every where. The Scotch carpeting makes neat and laſting furniture; and ſome eſſays have been lately made, with no inconſiderable degree of ſucceſs, to carry that branch of manufacture to as great perfection as in any part of Europe. There are undoubtedly ſome diſadvantages under which both the commercial and landed intereſt of Scotland lies, from her nobility and great landholders having too fond an attachment for England and foreign countries, where they ſpend their ready money. This is one of the evils ariſing to Scotland from the union, which removed the ſeat of her legiſlature to London; but it is greatly augmented by the reſort of volunteer abſentees to that capital. While this partiality ſubſiſts, the Scots will probably continue to be diſtreſſed for a currency of ſpecie. How far paper can ſupply that defect, depends upon an attention to the balance of trade; and the evil may, perhaps, be ſomewhat prevented, by money remitted from England, for the ſupport of government, and for carrying on the manufactures and works now ſet on foot in Scotland. The gentlemen who reſide in Scotland have, in ſome meaſure, abandoned the uſe of French brandy and claret, for port and rum produced in the Britiſh plantations; their own malt-liquors are now come nearly to as great perfection as thoſe in England; and it is ſaid, that they have lately exported large quantities of their ale to London, Dublin, and the Plantations.

REVENUES.] See England.

COINS.] In the reign of Edward II. of England, the value and denominations of coins were the ſame in Scotland as in England. Towards the reign of James II. a Scotch ſhilling anſwered to about an Engliſh ſix-pence; and about the reign of queen Mary of Scotland, it was not more than an Engliſh groat. It continued diminiſhing in this manner till after the union of the two crowns under her ſon James VI. when the reſort of the Scotch nobility and gentry to the Engliſh court, occaſioned ſuch a drain of ſpecie from Scotland, that by degrees a Scotch ſhilling ſell to the value of one twelfth of an Engliſh ſhilling, and their pennies in proportion. A Scotch penny is now very rarely to be found; and they were ſucceeded by bodles, which was double the value of a Scotch penny, and are ſtill current, but daily wearing out. A Scotch halfpenny was called a babie; ſome ſay, becauſe it was firſt ſtamped with the head of James III. when he was a babe or baby; but perhaps it is only the corruption of two French words *bas piece*, ſignifying a low piece of money. The ſame obſervation made of the Scotch ſhilling holds of their pounds or marks; which are not coins, but money of account. In all other reſpects, the currency of money in Scotland and England is the ſame; as very few people now reckon by the Scotch computation.

ORDER OF THE THISTLE.] This is a military order, inſtituted, as the Scotch writers aſſert, by their king Achaius, in the ninth century, upon his making a league with Charlemagne, king of France. It has been frequently neglected, and as often reſumed. It conſiſts of the ſovereign and 12 companions, who are called Knights of the Thiſtle, and have on their enſign this ſignificant motto, *Nemo me impune laceſſit*. "None ſhall ſafely provoke me."

LAWS AND CONSTITUTION.] The ancient conſtitution of government in Scotland has been applauded, as excellently adapted to the preſervation of liberty; and it is certain, that the power of the king was greatly limited, and that there were many checks in the conſtitution, which were well calculated to prevent his aſſuming

or

or exerciſing a deſpotic authority; but the Scottiſh conſtitution of government was too much of the ariſtocratic kind, to afford the common people that equal liberty which they had a right to expect. The king's authority was ſufficiently reſtrained; but the nobles, chieftains, and great landholders, had it too much in their power to oppreſs their tenants and the common people.

The ancient kings of Scotland, at their coronation, took the following oath, containing three promiſes, viz. "In the name of Chriſt, I promiſe theſe three things to the Chriſtian people my ſubjects: Firſt, That I ſhall give order, and employ my force and aſſiſtance, that the church of God, and the Chriſtian people, may enjoy true peace during our time, under our government. Secondly, I ſhall prohibit and hinder all perſons, of whatever degree, from violence and injuſtice. Thirdly, In all judgments I ſhall follow the preſcriptions of juſtice and mercy, to the end that our clement and merciful God may ſhew mercy unto me and to you."

The parliament of Scotland anciently conſiſted of all who held any portion of land, however ſmall, of the crown, by military ſervice. This parliament appointed the times of its own meeting and adjournment, and committees to ſuperintend the adminiſtration during the intervals of parliament; it had a controuling power in all matters of government; it appropriated the public money, ordered the keeping of it, and called for the accounts; it armed the people, and appointed commanders; it named and commiſſioned ambaſſadors; it granted and limited pardons; it appointed judges and courts of judicature: it named officers of ſtate and privy-counſellors; it annexed and alienated the revenues of the crown, and reſtrained grants by the king. The king of Scotland had no negative voice in parliament; nor could he declare war, make peace, or conclude any other public buſineſs of importance, without the advice and approbation of parliament. The prerogative of the king was ſo bounded, that he was not even intruſted with the executive power. And ſo late as the minority of James IV. who was cotemporary with, and ſon-in-law to, Henry VII. of England, the parliament pointed out to him his duty, as the firſt ſervant of his people; as appears by the acts ſtill extant; in ſhort, the conſtitution was rather ariſtocratical than monarchical. The abuſe of theſe ariſtocratical powers, by the chieftains and great landholders, gave the king a very conſiderable intereſt among the lower ranks; and a prince, who had ſenſe and addreſs to retain the affections of his people, was generally able to humble the moſt over grown of his ſubjects; but when, on the other hand, a king of Scotland, like James III. ſhewed a direſpect to his parliament, the event was commonly fatal to the crown. The kings of Scotland, notwithſtanding this paramount power in the parliament, found means to weaken and elude its force; and in this they were aſſiſted by their clergy, whoſe revenues were immenſe, and who had very little dependence upon the pope, and were always jealous of the powerful nobility. This was done by eſtabliſhing a ſelect body of members, who were called *the lords of the articles*. They were choſen from the clergy, nobility, knights, and burgeſſes. The biſhops, for inſtance, choſe eight peers, and the peers eight biſhops; and theſe ſixteen choſe eight barons (or knights of the ſhire), and eight commiſſioners for burghs; to whom were added eight great officers of ſtate, the chancellor being preſident of the whole.

Their buſineſs was to prepare all queſtions and bills, and other matters brought into parliament; ſo that, though the king could give no negative, yet being by his clergy, and the places he had to beſtow, always ſure of the lords of articles, nothing could come into parliament that could call for his negative. It muſt be acknowledged, that this inſtitution ſeems to have prevailed by ſtealth; nor was it ever brought into any regular ſyſtem; even its modes varied; and the greateſt lawyers are ignorant when it took place. The Scots, however, never loſt ſight of their original principles: and though Charles I. endeavoured to form theſe lords of the articles into

into regular machines for his own deſpotic purpoſes, he found it impracticable; and the melancholy conſequences are well known. At the Revolution, the Scots gave a freſh inſtance how well they underſtood the principles of liberty, by omitting all pedantic debates about *abdication*, and the like terms, and voting king James at once to have forfeited his crown, which they conferred on the prince and princes of Orange. This ſpirit of reſiſtance was the more remarkable, as the people had groaned under the moſt inſupportable miniſterial tyranny ever ſince the Reſtoration. It is aſked, Why did they ſubmit to that tyranny? The anſwer is, In order to preſerve that independency upon England, which Cromwell and his parliament endeavoured to deſtroy, by uniting them with England; they therefore choſe to ſubmit to a temporary evil; but they took the firſt opportunity to get rid of their oppreſſors.

Scotland, when it was a ſeparate kingdom, cannot be ſaid to have had any peers in the Engliſh ſenſe of the word. The nobility, who were dukes, marquiſſes, earls, and lords, were by the king made hereditary members of parliament; but they formed no diſtinct houſe, for they ſat in the ſame room with the commons, who had a deliberate and deciſive vote with them in all public matters. A baron, though not a baron of parliament, might ſit upon a lord's aſſize in matters of life and death; nor was it neceſſary for the aſſizers, or jury, to be unanimous in their verdict. The feudal cuſtoms, even at the time of the Reſtoration, were ſo prevalent, and the reſcue of a great criminal was commonly ſo much apprehended, that ſeldom above two days paſſed between the ſentence and the execution.

Great uncertainty occurs in the Scotch hiſtory, by confounding parliaments with conventions; the difference was, that a parliament could enact laws as well as lay on taxes: a convention, or meeting of the ſtates aſſembled for the purpoſes of taxation only. Before the Union, the kings of Scotland had four great and four leſſer officers of ſtate; the great, were the lord high-chancellor, high-treaſurer, privy-ſeal, and ſecretary; the four leſſer were, the lords regiſter, advocate, treaſurer-depute, and juſtice-clerk. The offices of privy-ſeal, regiſter, advocate, and juſtice-clerk ſtill continue; a third ſecretary of ſtate has occaſionally been nominated by the king for Scottiſh affairs, but under the ſame denomination as the other two ſecretaries. The above officers of ſtate ſat officially in the Scotch parliament.

The officers of the crown were, the high-chamberlain, conſtable, admiral, and marſhal. The offices of conſtable and marſhal were hereditary. A nobleman has ſtill a penſion as admiral; and the office of marſhal is exerciſed by a knight marſhal. The office of chancellor in Scotland differed little from that in England; the ſame may be ſaid of the lords treaſurer, privy-ſeal, and ſecretary. The lord-regiſter was head-clerk to the parliament, convention, treaſury, exchequer, and ſeſſion, and keeper of all public records. Though his office was only during the king's pleaſure, yet it was very lucrative, by diſpoſing of his deputation, which laſted during life. He acted as teller to the parliament; and it was dangerous for any member to diſpute his report of the numbers upon a diviſion. The lord-advocate's office reſembles that of the attorney-general in England, only his powers are far more extenſive; becauſe, by the Scotch laws, he is the proſecutor of all capital crimes before the juſticiary, and likewiſe concurs in all purſuits before ſovereign courts for breaches of the peace; and alſo in all matters civil, wherein the king or his donator hath intereſt. Two ſolicitors are named by his majeſty, by way of aſſiſtants to the lord-advocate. The office of juſtice-clerk entitles the poſſeſſor to preſide in the criminal court of juſtice, when the juſtice-general is abſent.

The ancient conſtitution of Scotland admitted of many other officers both of the crown and ſtate; but they are either now extinct, or too inconſiderable to be deſcribed. That of Lyon king at arms, or the rex fæcialium, or grand herald of

Scotland, is ſtill in being; and it was formerly a place of great ſplendor and importance, inſomuch that the ſcience of heraldry was preſerved there in a greater purity than in any other country, except Germany. He was even crowned ſolemnly in parliament with a golden circle; and his authority, in all armorial affairs, might be carried into execution by the civil law.

The privy-council of Scotland before the Revolution, had or aſſumed inquiſitorial powers, even that of torture; but it is now ſunk in the parliament and privy-council of Great-Britain; and the civil and criminal cauſes in Scotland are chiefly cognizable by two courts of judicature.

The firſt is that of the college of juſtice, which was inſtituted by Jame V. after the model of the French parliament, to ſupply an ambulatory committee of parliament, who took the names of the lords of council and ſeſſion, which the preſent members of the college of juſtice ſtill retain. This court conſiſts of a preſident and fourteen ordinary members, beſides extraordinary ones named by the king, who may ſit and vote, but have no ſalaries, and are not bound to attendance. This court may be called a ſtanding jury in all matters of property that lie before them. The civil law is their directory in all matters that come not within the municipal laws of the kingdom. It has been matter of ſurpriſe, that the Scots were ſo tenacious of the forms of their courts, and the eſſence of their laws, as to reſerve them by the articles of the Union. This, however, can be eaſily accounted for, becauſe thoſe laws and forms were eſſential to the poſſeſſion of eſtates and lands, which in Scotland are often held by modes incompatible with the laws of England. The lords of council and ſeſſion act likewiſe as a court of equity; but their decrees are (fortunately perhaps for the ſubject) reverſible by the Britiſh Houſe of Lords, to which an appeal lies. The ſupreme criminal judge was named the Juſticiar, and the court of Juſticiary ſucceeded to his power.

The juſtice court is the higheſt tribunal in Scotland; but in its preſent form it was inſtituted ſo late as the year 1672, when a lord juſtice general, removeable at the king's pleaſure, was appointed. This lucrative office ſtill exiſts in the perſon of one of the chief nobility; but the ordinary members of the court, are the juſtice-clerk and five other judges, who are always nominated from the lords of ſeſſion. The verdict of a jury condemns or acquits, but without the neceſſity of their being unanimous. Twice in the year, during the ſpring and harveſt vacations, the judges of this court hold circuits in certain boroughs appointed by ſtatute.

Beſides theſe two great courts of law, the Scots, by the articles of the Union, have a court of exchequer. This court has the ſame power, authority, and juriſdiction, over the revenue of Scotland, as the court of exchequer in England has over the revenues there; and all matters competent to the court of exchequer of England, are likewiſe competent to the exchequer of Scotland. The judges of the exchequer in Scotland exerciſe certain powers which formerly belonged to the treaſury, and are ſtill veſted in that of England.

The court of admiralty in Scotland was, in the reign of Charles II. by act of parliament, declared to be a ſupreme court, in all cauſes competent to its own juriſdiction; and the lord high-admiral is declared to be the king's lieutenant and juſtice-general upon the ſeas, and in all ports, harbours, and creeks of the ſame; and upon freſh waters and navigable rivers, below the firſt bridge, or within flood-mark; ſo that nothing competent to his juriſdiction can be meddled with, in the firſt inſtance, but by the lord high-admiral and the judges of his court. Sentences paſſed in all inferior courts of admiralty, may be brought again before his court; but no appeal lies from it to the lords of the ſeſſion, or any other judicatory, unleſs in caſes not maritime. Cauſes are tried in this court by the civil law, which, in ſuch caſes is likewiſe the common law of Scotland, as well as by the laws of Oleron, Wiſby, and the Hanſe towns, and other maritime practices and deciſions common upon the continent.

continent. The place of lord admiral of Scotland is little more than nominal, but the ſalary is reckoned worth 1000l. a year; and the judge of the admiralty is commonly a lawyer of diſtinction, with conſiderable perquiſites pertaining to his office.

The college or faculty of advocates, which anſwers to the Engliſh inns of court, may be called the ſeminary of Scotch lawyers. They are an orderly court, and their forms require great preciſion and examination to qualify its candidates for admiſſion. Subordinate to them is a body of inferior lawyers, or attorneys, who are named writers to the ſignet, becauſe they alone can ſubſcribe the writs that paſs the ſignet; they likewiſe have a bye government for their own regulation.

The government of the counties of Scotland was formerly veſted in ſheriffs and ſtewards, courts of regality, baron courts, commiſſaries, juſtices of the peace, and coroners.

Formerly ſheriffdoms were generally hereditable; but, by a late act of parliament, they are now all veſted in the crown; it being enacted, that all high-ſheriffs, or ſtewards, ſhall, in future, be nominated and appointed annually by his majeſty, his heirs and ſucceſſors. In regard to the ſheriff-deputes and ſteward deputes, it is enacted, that there ſhall only be one in each county, or ſtewartry, who muſt be an advocate, of three years ſtanding at leaſt. For the ſpace of ſeven years, theſe deputies are to be nominated by the king, with ſuch continuance as his majeſty ſhall think fit; after which they are to enjoy their offices for life, unleſs guilty of ſome offence. Some other regulations have been likewiſe introduced, highly for the credit of the ſheriff courts.

Stewartries were formerly part of the ancient royal domain; and the ſtewards had much the ſame power in them, as the ſheriff had in his county.

Courts of regality of old were held by virtue of a royal juriſdiction veſted in the lord, with particular immunities and privileges; but theſe were ſo dangerous, and ſo extravagant, that all the Scotch regalities are now diſſolved by an act of parliament.

Baron courts belong to every perſon who holds a barony of the king. In civil matters, they extend to cauſes not exceeding forty ſhillings ſterling; and in criminal caſes, to petty actions of aſſault and battery; but the puniſhment is not to exceed twenty ſhillings ſterling, or ſetting the delinquent in the ſtocks for three hours, in the day-time. Theſe courts were, in former days, inveſted with the power of life and death, which they have now loſt.

The courts of commiſſaries in Scotland anſwer to thoſe of the Engliſh dioceſan chancellors, the higheſt of which is kept at Edinburgh; wherein, before four judges, actions are pleaded concerning matters relating to wills and teſtaments; the right of patronage to eccleſiaſtical benefices, tythes, divorces, and cauſes of that nature; but in other parts of the kingdom, there ſits but one judge on theſe cauſes.

According to the preſent inſtitution, juſtices of the peace in Scotland exerciſe the ſame powers as thoſe in England. In former times their office, though of old ſtanding, was inſignificant, being cramped by the powers of the great feudal tyrants, who obtained an act of parliament that they were not to take cognizance of riots till fifteen days after the fact.

The inſtitution of coroners is as old as the reign of Malcolm II. the great legiſlator of Scotland, who lived before the Norman invaſion of England. They took cognizance of all breaches of the king's peace; and they were required to have clerks to regiſter the depoſitions and matters of fact, as well as verdicts of jurors: the office is now but ſeldom exerciſed.

From the above ſhort view of the Scotch laws and inſtitutions, it is plain that they were radically the ſame with thoſe of the Engliſh. The latter allege, indeed,

that the Scots borrowed the contents of their *Regiam Majeſtatem*, the oldeſt law-book, from the work of Glanville, who was a judge under Henry II. The Scots, on the other hand, ſay, that Glanville's work was copied from their *Regiam Majeſtatem*, even with the peculiarities of the latter, which do not now, and never did, exiſt in the laws of England.

The royal burghs in Scotland form, as it were, a commercial parliament, which meets once a year, conſiſting of a repreſentative from each burgh, to conſult upon the common good of the whole. Their powers are extenſive, and before the Union they made laws relating to ſhipping, to maſters and owners of ſhips, to mariners and merchants by whom they were freighted; to manufactures; to the curing of ſalmon, and herrings; and to the importing and exporting ſeveral commodities. The trade between Scotland and the Netherlands is ſubject to their regulation: they fix the ſtaple-port, which was formerly at Dort, and is now at Campvere. Their conſervator is nominated by the crown, but then their convention regulates his power, approves his deputies, and appoints his ſalary: ſo that the whole ſtaple trade is ſubjected to their management. This is a very ſingular inſtitution, and proves the attention which the government of Scotland formerly paid to trade. It took its preſent form in the reign of James III. 1487, and had excellent conſequences for the benefit of commerce.

Such are the laws and conſtitution of Scotland, as they exiſt at preſent, in their general view. The conformity between the practice of the civil law of Scotland, and that in England, is remarkable. The Engliſh law reports are of the ſame nature with the Scotch practices; and their acts of ſederunt anſwer to the Engliſh rules of court; the Scottiſh wadſets and reverſions, to the Engliſh mortgages and defeaſances; their poinding of goods, after letters of horning, is much the ſame as the Engliſh executions upon outlawries; and an appeal againſt the king's pardon, in caſes of murder, by the next of kin to the deceaſed, is admitted in Scotland as well as in England. Many other uſages are the ſame in both kingdoms. One obſervation proves the ſimilarity between the Engliſh and Scotch conſtitutions, which I believe has been mentioned by no author. In old times, all the freeholders in Scotland met together in preſence of the king, who was ſeated on the top of a hillock, which, in the old Scotch conſtitutions, is called the Moot, or Mute-hill: here all national affairs were tranſacted, judgments given, and differences ended. This Moot-hill I apprehend to be of the ſame nature as the Saxon Folc mote, and to ſignify no more than the hill of meeting.

HISTORY.] Though the writers of ancient Scotch hiſtory are too fond of ſyſtem and fable, yet it is eaſy to collect, from the Roman authors, and other evidences, that Scotland was formerly inhabited by different people. The Caledonians were the firſt inhabitants; the Picts were Britons, forced northwards by the Belgic Gauls, above fourſcore years before the deſcent of Julius Cæſar; and who ſettling in Scotland were joined by great numbers of their countrymen, driven northwards by the Romans. The Scots probably were a nation of adventurers from the ancient Scythia, who had ſerved in armies on the continent, and, after conquering the other inhabitants, gave their own name to the country. The tract lying ſouthward of the Forth appears to have been inhabited by Saxons, and by the Britons who formed the kingdom of Alcuith, the capital of which was Dumbarton: but all theſe people, in proceſs of time, were ſubdued by the Scots.

It is unneceſſary to inveſtigate the conſtitution of Scotland from its fabulous, or even its early ages. It is ſufficient to obſerve that they ſeem to have been as forward as any of their ſouthern neighbours in the arts of war and government. It does not appear that the Caledonians, the ancient Celtic inhabitants of Scotland, were attacked by any of the Roman generals before Agricola, anno 79. The name of the prince he fought with was Galdus, by Tacitus named Galgacus; and the hiſtory

tory of that war is not only tranſmitted with great preciſion, but corroborated by the remains of the Roman encampments and forts, raiſed by Agricola in his march towards Dunkeld, the capital of the Caledonians. The brave ſtand made by Galdus againſt that great general does honour to the valour of both nations; and the ſentiments of the Caledonian, concerning the freedom and independency of his country, appear to have warmed the noble hiſtorian with the ſame generous paſſion. It is plain, however, that Tacitus thought it for the honour of Agricola, to conceal ſome part of this war; for though he makes his countrymen victorious, yet they certainly returned ſouthward, to the province of the Horeſti, which was the county of Fife, without improving their advantage.

Galdus, otherwiſe called Corbred, was, according to the Scotch hiſtorians, the 21ſt in a lineal deſcent from Fergus I. the founder of their monarchy; and though this genealogy has of late been diſputed, yet nothing can be more certain, from the Roman hiſtories, than that the Caledonians, or Scots, were governed by a ſucceſſion of brave and wiſe princes during the abode of the Romans in Britain. Their reſiſtance obliged Agricola, and after him the emperors Adrian and Severus, to build two famous pretentures or walls, one between the Frith of Clyde and Forth; and the other between Tinmouth and the Solway Frith, to defend the Romans from the Caledonians and Scots; and which prove that the independence of the latter was never ſubdued.

Chriſtianity was introduced into Scotland about the year 201 of the Chriſtian æra by Donald I. The Picts, who were the deſcendants of the ancient Britons, had at that time gained a footing in Scotland; and being often defeated by the ancient inhabitants, they joined with the Romans againſt the Scots and Caledonians, who were of the ſame original, and conſidered themſelves as one people; ſo that the Scotch monarchy ſuffered a ſhort eclipſe: but it broke out with more luſtre than ever under Fergus II. who recovered his crown; and his ſucceſſors gave many ſevere overthrows to the Romans and Britons.

When the Romans left Britain in 448, the Scots, as appears by Gildas a Britiſh hiſtorian, were a powerful nation, and, in conjunction with the Picts, invaded the Britons; and having forced the Roman walls, drove them to the very ſea; ſo that the Britons applied to the Romans for relief: and, in the famous letter, which they called *their groans*, they tell them, that they had no choice left, but that of being ſwallowed up by the ſea, or periſh by the ſwords of the barbarians; for ſo all nations were called who were not Roman, or under the Roman protection. Dongard was then king of Scotland; and it appears from the oldeſt hiſtories, even thoſe the leaſt favourable to monarchy, that the ſucceſſion to the crown of Scotland ſtill continued in the family of Fergus, but generally devolved on collaterals; till the inconveniencies of that mode of ſucceſſion were ſo much felt, that it fell into diſuſe, and was at laſt ſettled in the deſcending line.

About the year 726, the Scots were governed by Achaius, a prince ſo much reſpected, that his friendſhip was courted by Charlemagne, and a league was concluded between them, which long continued inviolate. No fact of equal antiquity is better atteſted than this league, together with the great ſervice performed by the learned men of Scotland, in civilizing the dominions of that great conqueror. The Picts ſtill remained in Scotland, as a ſeparate nation, and were powerful enough to make war upon the Scots; who, about the year 843, when Kenneth Mac Alpin was king of Scotland, finally ſubdued them; but not in the ſavage manner mentioned by ſome hiſtorians, by extermination: for he obliged them to incorporate themſelves with their conquerors, by taking their name, and adopting their laws. The ſucceſſors of Kenneth Mac Alpin maintained almoſt perpetual wars with the Saxons on the ſouthward, and the Danes and other barbarous nations towards the Eaſt; who, being maſters of the ſea, haraſſed the Scots by powerful invaſions.

The

The latter, however, were more fortunate than the Engliſh; for while the Danes were erecting a monarchy in England, they were every where overthrown in Scotland, and at laſt driven out of the kingdom. The Saxon and Daniſh monarchs, who then governed England, were not more ſucceſsful againſt the Scots, who aſſerted their freedom and independency againſt foreign invaders and domeſtic uſurpers. The feudal law was introduced among them by Malcolm II.

Malcolm III. commonly called Malcolm Canmore, from two Gaelic words, which ſignify a *large head*, was the eighty-ſixth king of Scotland, from Fergus I. the ſuppoſed founder of the monarchy; the forty-ſeventh from its reſtorer, Fergus II. and the twenty-ſecond from Kenneth III. who conquered the kingdom of the Picts. Every reader who is acquainted with the tragedy of Macbeth, as written by the inimitable Shakſpeare, who keeps cloſe to the facts delivered by hiſtorians, can be no ſtranger to the fate of Malcolm's father, and his own hiſtory previous to his mounting the throne in 1057. He was a wiſe and magnanimous prince, not inferior to his contemporary the Norman conqueror, with whom he was often at war. He married Margaret, daughter to Edward, ſurnamed the Outlaw, ſon to Edmund Ironſide, king of England. By the death of her brother Edgar Atheling, the Saxon right to the crown of England devolved upon the poſterity of that princeſs, who was one of the wiſeſt and worthieſt women of the age; and her daughter Maud was married to Henry I. of England. Malcolm, after a glorious reign, was killed, with his ſon, treacherouſly, it is ſaid, at the ſiege of Alnwic, by the beſieged.

Malcolm III. was ſucceeded by his brother Donald VII. and he was dethroned by Duncan II. whoſe legitimacy was diſputed. Edgar, the ſon of Malcolm III. a wiſe and valiant prince, aſſumed the government; he was ſucceeded by Alexander I. and upon his death, David I. mounted the throne. Notwithſtanding the endeavours of ſome hiſtorians to conceal what they cannot deny, viz. the glories of this reign, it appears, that David was one of the greateſt princes of his age, whether we regard him as a man, a warrior, or a legiſlator. The actions he performed in the ſervice of his niece, the empreſs Maud, in her competition with king Stephen for the Engliſh crown, give us the higheſt idea of his virtues, as they could be the reſult only of duty and principle. To him Henry II. the mightieſt prince of his age, owed his crown; and his poſſeſſions in England, joined to the kingdom of Scotland, placed David's power nearly on an equality with that of England, when confined to this iſland. His actions and the reſources he found in his own courage, prove him to have been a real hero. If he appeared to be too laviſh to churchmen, we are to conſider, that by them only he could hope to civilize his kingdom: and the code of laws drawn up by him do his memory immortal honour. They are ſaid to have been compiled under his inſpection by learned men, whom he aſſembled from all parts of Europe in his magnificent abbey of Melroſs. He was ſucceeded by his grandſon Malcolm IV. and he by William, ſurnamed from his valour, the Lion. William's ſon Alexander II. was ſucceeded in 1249 by Alexander III. who was a good king. He married, firſt, Margaret, daughter to Henry III. of England, by whom he had Alexander, the prince who married the earl of Flanders' daughter; David, and Margaret who married Hangowan, or, as ſome call him, Eric, ſon to Magnus IV. king of Norway, who bore to him a daughter named Margaret, commonly called the Maiden of Norway: in whom king William's poſterity failed, and the crown of Scotland returned to the deſcendants of David, earl of Huntingdon, brother to king Malcolm IV. and king William.

I have entered into this detail, becauſe it is connected with great events. Upon the death of Alexander III. John Baliol, who was great-grandſon to David, earl of Huntingdon, by his elder daughter Margaret, and Robert Bruce, grandſon to the ſame earl of Huntingdon, by his younger daughter Iſabel, became competitors for the

the crown of Scotland. The laws of ſucceſſion, which were not then ſo well eſtabliſhed in Europe as they are at preſent, rendered the caſe very difficult. Both parties were almoſt equally matched in intereſt; but after a confuſed interregnum of ſome years, the great nobility agreed in referring the deciſion to Edward I. of England, the moſt ambitious prince of his age. He accepted the office of arbiter: but having long had an eye to the crown of Scotland, he revived ſome obſolete claims of its dependency upon that of England; and finding that Baliol was diſpoſed to hold it by that diſgraceful tenure, Edward awarded it to him: but afterwards dethroned, and treated him as a ſlave, without Baliol's reſenting it.

After this, Edward uſed many bloody endeavours to annex the crown of Scotland to his own; but though they were often defeated, and he for a ſhort time made himſelf maſter of Scotland, yet the Scots were ready to revolt on every favourable opportunity. Thoſe who were ſo zealouſly attached to the independence of their country, as to be reſolved to hazard every thing, were but few, compared to thoſe in the intereſt of Edward and Baliol, which was the ſame; and for ſome time they were obliged to temporize. Edward availed himſelf of their weakneſs and his own power. He accepted of a formal ſurrender of the crown of Baliol, to whom he allowed a penſion, but detained him in England; and ſent every nobleman in Scotland, whom he in the leaſt ſuſpected, to different priſons in or near London. He then forced the Scots to ſign inſtruments of their ſubjection to him; and moſt barbarouſly carried off, or deſtroyed, all the monuments of their hiſtory, and the evidences of their independency; and particularly the famous fatidical or prophetic ſtone, which is ſtill to be ſeen in Weſtminſter-Abbey.

Theſe ſevere proceedings, while they rendered the Scots ſenſible of their ſlavery, revived the deſire of freedom; and Edward, finding their ſpirits were not to be ſubdued, affected to treat them on the foot of equality with his own ſubjects, by projecting an union, the chief articles of which have ſince taken place between the two kingdoms. The Scotch patriots treated this project with diſdain, and united under the brave William Wallace, the trueſt hero of his age, to expel the Engliſh. Wallace performed actions that entitle him to eternal renown, in executing this ſcheme. Being, however, no more than a private gentleman, and his popularity daily increaſing, the Scotch nobility, among whom was Robert Bruce, the ſon of the firſt competitor, began to ſuſpect that he aimed at the crown, eſpecially after he had defeated the earl of Surry, Edward's viceroy of Scotland, in the battle of Stirling, and had reduced the garriſons of Berwick and Roxburgh, and was declared by the ſtates of Scotland their protector. Their jealouſy operated ſo far, that they formed violent cabals againſt the brave Wallace. Edward, upon this once more invaded Scotland, at the head of the moſt numerous and beſt diſciplined army England had ever ſeen, for it conſiſted of 80,000 foot, 3000 horſemen completely armed, and 4000 light armed; attended by a fleet to ſupply it with proviſions. Theſe, beſides the troops who joined him in Scotland, formed an irreſiſtible body: Edward was obliged to divide his army, reſerving the command of 40,000 of his beſt troops to himſelf. With theſe he attacked the Scotch army under Wallace at Falkirk, while their diſputes ran ſo high, that the brave regent was deſerted by Cumming, the moſt powerful nobleman in Scotland, and at the head of the beſt diviſion of his countrymen. Wallace, whoſe troops did not exceed 30,000, being thus betrayed, was defeated with great loſs, but made an orderly retreat; during which he found means to have a conference with Bruce, and to convince him of his error in joining with Edward. Wallace ſtill continued in arms, and performed many gallant actions againſt the Engliſh, but he was betrayed and ungenerouſly put to death at London as a traitor. Edward died himſelf, as he was preparing to renew his invaſion of Scotland with a ſtill more deſolating

ſpirit of ambition, after having deſtroyed, according to the beſt hiſtorians, 100,000 of her inhabitants.

Bruce died ſoon after the battle of Falkirk; but not before he had inſpired his ſon, who was a priſoner at large about the Engliſh court, with the glorious reſolution of vindicating his own rights, and his country's independency. He eſcaped from London, and with his own hand killed Cumming, for his attachment to Edward; and after collecting a few patriots, among whom were his four brothers, he aſſumed the crown; but was defeated by the Engliſh (who had a great army in Scotland) at the battle of Methven. After this defeat, he fled with one or two friends to the Weſtern Iſles of Scotland, where his fatigues and ſufferings were as inexpreſſible as the courage with which he and his few friends bore them (the lord Douglas eſpecially) was incredible. Though his wife and daughter were ſent priſoners to England, where his beſt friends, and two of his brothers, were put to death, yet ſuch was his perſevering ſpirit, that he recovered all Scotland, except the caſtle of Stirling, and improved every advantage that was given him by the diſſipated conduct of Edward II. who at laſt raiſed an army more numerous and better appointed than that of his father, to make a total conqueſt of Scotland. It is ſaid that it conſiſted of 100,000 men, though this has been ſuppoſed an exaggeration: however, it is admitted that the army of Bruce did not exceed 30,000; but all veterans, bred up in a deteſtation of tyranny. Edward led his hoſt towards Stirling, then beſieged by Bruce; who had choſen, with the greateſt judgement, a camp near Bannockburn. The chief officers under Edward were, the earls of Glouceſter, Hereford, Pembroke, and Sir Giles Argenton; thoſe under Bruce were, his own brother Sir Edward, who, next to himſelf, was reckoned the beſt knight in Scotland; his nephew Randolf, earl of Murray, and the young lord Walter, high-ſteward of Scotland. Edward's attack of the Scotch army was exceedingly furious, and required all the courage and firmneſs of Bruce and his friends to reſiſt it, which they did ſo effectually, that they gained one of the moſt complete victories recorded in hiſtory. The Scotch writers make the loſs of the Engliſh to amount to 50,000 men, while their own exceeded not 4000. The flower of the Engliſh nobility were killed or taken priſoners. Their camp, immenſely rich, and calculated for the purpoſe rather of a triumph than a campaign, fell into the hands of the Scots: and Edward himſelf, with a few followers, were purſued by Douglas to the gates of Berwick, from whence he eſcaped in a fiſhing-boat. This great and deciſive battle happened in the year 1314*.

The remainder of Robert's reign was a ſeries of glorious ſucceſſes; and ſo well did his nobility underſtand the principles of civil liberty, and ſo unfettered were they by religious conſiderations, that, in a letter they ſent to the pope, they acknowledged that they had ſet aſide Baliol for debaſing the crown by holding it of England; and that they would do the ſame by Robert, if he ſhould make the like attempt. Robert having thus delivered Scotland, ſent his brother Edward to Ireland, at the head of an army, with which he conquered the greateſt part of that kingdom, and was proclaimed its king; but by expoſing himſelf too much, he was killed. Robert, before his death, made an advantageous peace with England; and died, in 1328, with the reputation of being the greateſt hero of his age.

The glory of the Scots may be ſaid to have been in its zenith under Robert I. who was ſucceeded by his ſon David II. He was a virtuous prince, but his abi-

* That the Scots of thoſe days were better acquainted with Mars than the Muſes, may be ſeen from a ſcoffing ballad, made on this victory, which begins as follows:

Maydens of England ſore may ye mourn,
For zour lemmons zou have loſt at Bannockburn.
With heve a low!

What ho! ween'd the king of England,
So ſoon to have won all Scotland.
With a rumby low!

lities, both in war and peace, were eclipſed by his brother-in-law and enemy Edward III. of England, whoſe ſiſter he married. Edward, who was as ambitious as any of his predeceſſors of making the conqueſt of Scotland, eſpouſed the cauſe of Baliol, ſon to Baliol the original competitor. His progreſs was at firſt amazingly rapid; and he and Edward defeated the royal party in many bloody battles; but Baliol was at laſt driven out of his uſurped kingdom by the Scotch patriots. David, however, had the misfortune to be taken priſoner by the Engliſh at the battle of Durham: and after continuing above eleven years in captivity, he paid 100,000 marks for his ranſom; and died in peace without iſſue, in the year 1371.

The crown of Scotland then devolved upon the family of Stuart, by its head having been married to the daughter of Robert I. The firſt king of that name was Robert II. a wiſe and brave prince. He was ſucceeded by his ſon Robert III. whoſe age and infirmities diſqualified him from reigning; ſo that he was forced to truſt the government to his brother, the duke of Albany, an ambitious prince, who ſeems to have had an intention to ſeize the crown. Robert, on this, attempted to ſend his ſecond ſon to France; but he was ungenerouſly intercepted by Henry IV. of England; and after ſuffering a long captivity, he was obliged to pay an exorbitant ranſom. During the impriſonment of James in England, the military glory of the Scots was carried to its greateſt height in France, where they ſupported that tottering monarchy againſt England, and their generals obtained ſome of the firſt titles of the kingdom.

James, the firſt of that name, upon his return to Scotland, diſcovered great talents for government, enacted many wiſe laws, and was beloved by the people. He had received an excellent education in England during the reigns of Henry IV. and V. where he ſaw the feudal ſyſtem refined from many of the imperfections which ſtill adhered to it in his own kingdom; he determined, therefore, to abridge the overgrown power of the nobles, and to recover ſuch lands as had been unjuſtly wreſted from the crown during his minority and the preceding reigns: but the execution of theſe deſigns coſt him his life, he being murdered in his bed by ſome of the chief nobility in 1437, and the 44th year of his age.

A long minority ſucceeded; but James II. promiſed to equal the greateſt of his anceſtors in warlike and civil virtues, when he was killed by the accidental burſting of a cannon, in the thirteenth year of his age, as he was beſieging the caſtle of Roxburgh, which was defended by the Engliſh. Suſpicion, indolence, immoderate attachment to females, and many of the errors of a feeble mind, are viſible in the conduct of James III. and his turbulent reign was cloſed by a rebellion of his ſubjects, during which he was ſlain in battle in 1488, aged thirty-five.

His ſon, James IV. was the moſt accompliſhed prince of the age: he was naturally generous and brave; loved magnificence, delighted in war, and was eager to obtain fame. He encouraged and protected commerce, which greatly increaſed in his reign; and the court of James, at the time of his marriage with Henry VII's daughter, was ſplendid and reſpectable. Even this alliance could not cure him of his family-diſtemper, a predilection for the French, in whoſe cauſe he was killed, with the flower of his nobility, by the Engliſh, in the battle of Flodden, anno 1513, and the fortieth year of his age.

The minority of his ſon, James V. was long and turbulent: and when he grew up, he married two French ladies; the firſt a daughter of the king of France, and the latter of the houſe of Guiſe. He inſtituted the court of ſeſſion, enacted many ſalutary laws, and greatly promoted the induſtry of Scotland, particularly the working of the mines. At this time the balance of power was ſo equally poiſed between the contending princes of Europe, that James's friendſhip was courted by the pope, the emperor, the king of France, and his uncle Henry VIII. of England, from all whom he received magnificent preſents. But James took little ſhare in foreign

affairs; he ſeemed rather to imitate his predeceſſors in their attempts to hunble the nobility; and the doctrines of the reformation beginning to be propagated in Scotland, he gave way, at the inſtigation of the clergy, to a religious perſecution, though it is generally believed that, had he lived longer, he would have ſeized all the church-revenues, in imitation of Henry. Having ſlighted ſome friendly overtures made to him by the king of England, and thereby given great umbrage to that prince, a war at length broke out between them. A large army, under the command of the duke of Norfolk, entered Scotland, and ravaged the country north of the Tweed. After this ſhort expedition, the Engliſh army retired to Berwick. Upon its retreat, James ſent ten thouſand men to the weſtern borders, who entered England at Solway Frith; and he followed at a ſmall diſtance, ready to join them. Soon after, he gave great offence to the nobility and the army, by imprudently depriving their general, lord Maxwell, of his commiſſion, and conferring the command on his favourite, Oliver Sinclair, a private gentleman. The army were ſo much diſguſted with this alteration, that they were ready to diſband, when a ſmall body of Engliſh appeared, not exceeding five hundred. A panic ſeized the Scots, who immediately took to flight, ſuppoſing themſelves to be attacked by the whole Engliſh army. The Engliſh cavalry, ſeeing them fly with ſuch precipitation, cloſely purſued, and ſlew great numbers, taking priſoners ſeven lords, two hundred gentlemen, and eight hundred ſoldiers, with twenty-four pieces of ordnance. This diſaſter ſo much affected king James, that it threw him into a fit of illneſs, of which he died, on the 14th of December, 1542.

His daughter and ſucceſſor, Mary, was but a few hours old at the time of her father's death. Her beauty, her imprudence, and her misfortunes, are alike famous in hiſtory. It is ſufficient to ſay, that during her minority, and while ſhe was wife to Francis II. of France, the reformation advanced in Scotland: that being called to the throne of her anceſtors while a widow, ſhe married her couſin-german, lord Darnley, whoſe untimely death hath given riſe to much controverſy. The conſequence of her huſband's death, and of her marriage with Bothwell, who was conſidered as his murderer, was an inſurrection of her ſubjects, from whom ſhe fled into England, where ſhe was detained a priſoner for eighteen years; and, afterwards, on motives of ſtate policy, beheaded by queen Elizabeth, in 1587, in the forty-ſixth year of her age.

Mary's ſon, James VI. of Scotland, ſucceeded in right of his blood from Henry VII. upon the death of queen Elizabeth, to the Engliſh crown, after ſhewing conſiderable abilities in the government of Scotland. This union of the two crowns, deſtroyed the independency, as it impoveriſhed the people of Scotland; for the ſeat of government being removed to England, their trade was checked, their agriculture neglected, and their gentry obliged to ſeek for bread in other countries. James, after a ſplendid, but troubleſome reign over his three kingdoms, left them, in 1635, to his ſon, the unfortunate Charles I. That prince, by his deſpotic principles and conduct, induced both his Scottiſh and his Engliſh ſubjects to take up arms againſt him: and, indeed, it was in Scotland that the ſword was firſt drawn againſt Charles. But when the royal party was totally defeated in England, the king put himſelf into the power of the Scottiſh army; they at firſt treated him with reſpect, but afterwards delivered him up to the Engliſh parliament, on condition of their paying 400,000 pounds to the Scots, which was ſaid to be due to them for arrears. However, the Scots afterwards made ſeveral unſucceſsful attempts to reſtore his ſon, Charles II. That prince was finally defeated by Cromwell, at the battle of Worceſter, 1651, after which, to the time of his reſtoration, the commonwealth of England, and the protector, gave law to Scotland.

The ſtate of parties in England, at the acceſſion of queen Anne, was ſuch, that the Whigs once more had recourſe to the Scots, and offered them their own

terms, if they would agree to the Union as it now ſtands. It was long before the majority of the Scotch parliament would liſten to the propoſals; but at laſt, partly from conviction, and partly through the force of money diſtributed among the needy nobility, it was agreed to; ſince which event, the hiſtory of Scotland becomes the ſame with that of England.

ENGLAND.

Extent and Situation.

	Miles.		Degrees.
Length	380	between	50 and 56 North latitude.
Breadth	300		2 East and 6-20 Weſt longitude.

Climate and boundaries. THE longeſt day, in the northern parts, contains 17 hours 30 minutes; and the ſhorteſt in the ſouthern, near 8 hours. It is bounded, on the North, by that part of the iſland called Scotland; on the Eaſt, by the German Ocean; on the Weſt, by St. George's Channel; and on the South, by the Engliſh Channel, which parts it from France, and contains 49,450 ſquare miles.

The ſituation, by the ſea waſhing it on three ſides, renders England liable to a great uncertainty of weather; ſo that the inhabitants on part of the ſea-coaſts are often viſited by agues and fevers. On the other hand, it prevents the extremes of heat and cold, to which other places, lying in the ſame degree of latitude, are ſubject; and it is, on that account, friendly to the longevity of the inhabitants in general, eſpecially thoſe who live on a dry ſoil. To this ſituation likewiſe we are to aſcribe that perpetual verdure for which England is remarkable, occaſioned by refreſhing ſhowers and the warm vapours of the ſea.

Name and divisions, ancient and modern. Antiquaries are divided with regard to the etymology of the word *England*: ſome derive it from a Celtic word, ſignifying a level country; but I prefer the common etymology, of its being derived from Anglen, a province now ſubject to his Daniſh majeſty, which poured a great part of the original Saxon adventurers into this iſland. In the time of the Romans, the whole iſland went by the name of *Britannia*. The word *Brit*, according to Mr. Camden, ſignified painted or ſtained; the ancient inhabitants being famous for painting their bodies: other antiquaries, however, do not agree to this etymology. The weſtern tract of England, which is almoſt ſeparated from the reſt by the rivers Severn and Dee, is called Wales, or the *land of ſtrangers*, becauſe inhabited by the Belgic Gauls, who were driven thither by the Romans, and were ſtrangers to the old natives.

When the Romans provinciated England they divided it into,

1. Britannia Prima, which contained the ſouthern parts of the kingdom;
2. Britannia Secunda, containing the weſtern parts, Wales included; and,
3. Maxima Cæſarienſis, which reached from the Trent as far northward as the wall of Severus, between Newcaſtle and Carliſle, and ſometimes as far as that of Adrian in Scotland, between the Forth and Clyde.

To theſe diviſions ſome add the Flavia Cæſarienſis, which they ſuppoſe to contain the midland counties.

When the Saxons invaded England, about the year 450, and eſtabliſhed themſelves there, in the year 582, their leaders appropriated, after the manner of the other northern conquerors, the countries which each had been the moſt inſtrumental in acquiring; and the whole formed a heptarchy, or political confederacy, conſiſt-

ing of ſeven kingdoms. In time of war, a chief was choſen from the ſeven kings by public conſent; ſo that the Saxon heptarchy nearly reſembled the conſtitution of Greece during the heroic ages.

Kingdoms erected by the Saxons, uſually ſtyled the Saxon Heptarchy.

Kingdoms.	Counties.	Chief Towns.
1. Kent founded by Hengiſt in 475, and ended in 823.	Kent — —	Canterbury.
2. South Saxons, founded by Ella in 491, and ended in 600.	Suſſex — —	Chicheſter
	Surry — —	Southwark.
3. Eaſt Angles, founded by Uffa in 575, and ended in 793.	Norfolk — —	Norwich
	Suffolk — —	Bury St. Edmund's
	Cambridge — —	Cambridge
	With the Iſle of Ely	Ely.
4. Weſt-Saxons, founded by Cerdic in 512, and ended in 1060.	Cornwall — —	Launceſton
	Devon — —	Exeter
	Dorſet — —	Dorcheſter
	Somerſet — —	Bath
	Wilts — —	Saliſbury
	Hants — —	Wincheſter
	Berks — —	Abingdon.
5. Northumberland, founded by Ida in 574, and ended in 792.	Lancaſter —	Lancaſter
	York — —	York
	Durham — —	Durham
	Cumberland — —	Carliſle
	Weſtmoreland —	Appleby
	Northumberland, and Scotland to the Frith of Edinburgh —	Newcaſtle.
6. Eaſt-Saxons, founded by Erchewin in 527, and ended in 746.	Eſſex — —	London.
	Middleſex, and part of Hertford — —	
7. Mercia, founded by Cridda in 582, and ended in 874.	The other part of Hertford	Hertford
	Glouceſter — —	Glouceſter
	Hereford — —	Hereford.
	Worceſter — —	Worceſter
	Warwick — —	Warwick
	Leiceſter — —	Leiceſter
	Rutland — —	Oakham
	Northampton —	Northampton
	Lincoln — —	Lincoln
	Huntingdon —	Huntingdon
	Bedford — —	Bedford
	Buckingham —	Ayleſbury
	Oxford — —	Oxford
	Stafford — —	Stafford
	Derby — —	Derby
	Salop — —	Shrewſbury
	Nottingham —	Nottingham
	Cheſter — —	Cheſter.

I have

I have beeen the more ſolicitous to preſerve theſe diviſions, as they account for different local cuſtoms, and many very eſſential modes of inheritance, which to this day prevail in England, and which took their riſe from different Saxon inſtitutions. Since the Norman invaſion, England has been divided into counties, a certain number of which, except Middleſex and Cheſhire, are comprehended in ſix circuits, or annual progreſſes of the judges, for adminiſtering juſtice to the ſubjects who are at a diſtance from the capital. Theſe circuits are:

Circuits.	Counties.	Chief Towns.
1. Home Circuit.	Eſſex	Chelmsford, Colcheſter, Harwich, Malden, Saffron-Walden, Bocking, Braintree, and Stratford.
	Hertford	Hertford, St. Alban's, Ware, Hitchin, Baldock, Biſhop's-Stortford, Berkhamſted, Hemſted, and Barnet.
	Kent	Maidſtone, Canterbury, Chatham, Rocheſter, Greenwich, Woolwich, Dover, Deal, Deptford, Feverſham, Dartford, Romney, Sandwich, Sheerneſs, Tunbridge, Margate, Graveſend, and Milton.
	Surry	Southwark, Kingſton, Guildford Croydon, Epſom, Richmond, Wandſworth, Batterſea, Putney, Farnham, Godalmin, Bagſhot, Egham, and Darking.
	Suſſex	Chicheſter, Lewes, Rye, Eaſt-Grinſtead, Haſtings, Horſham, Midhurſt, Shoreham, Arundel, Winchelſea, Battel, Brighthelmſtone, and Petworth.
2. Norfolk Circuit.	Bucks	Ayleſbury, Buckingham, High-Wickham, Great-Marlow, Stoney Stratford, and Newport Pagnel.
	Bedford	Bedford, Ampthill, Wooburn, Dunſtable, Luton, Biggleſwade.
	Huntingdon	Huntingdon, St. Ives, Kimbolton, Godmancheſter, St. Neot's, Ramſey, and Yaxley.
	Cambridge	Cambridge, Ely, Newmarket, Royſton, and Wiſbich.
	Suffolk	Bury, Ipſwich, Sudbury, Leoſtoff, part of Newmarket, Aldborough, Bungay, Southwold, Brandon, Haleſworth, Mildenhall, Beccles, Framlingham, Stowmarket, Woodbridge, Lavenham, Hadley, Long-Melford, Stratford, and Eaſtbergholt.
	Norfolk	Norwich, Thetford, Lynn, and Yarmouth.
3. Oxford Circuit.	Oxon	Oxford, Banbury, Chipping-Norton, Henley, Burford, Whitney, Dorcheſter, Woodſtock, and Tame.
	Berks	Abingdon. Windſor, Reading, Wallingford, Newbury, Hungerford, Maidenhead, Farringdon, Wantage, and Oakingham.
	Glouceſter	Glouceſter, Tewkſbury, Cirenceſter, part of Briſtol, Campden, Stow, Berkeley, Durſley, Leechdale, Tetbury, Sudbury, Wotton, and Marſhfield.
	Worceſter	Worceſter, Eveſham, Droitwich, Bewdley, Stourbridge, Kidderminſter, and Perſhore.

Monmouth

Circuits.	Counties.	Chief Towns.
3. Oxford Circuit continued.	Monmouth	Monmouth, Chepſtow, Abergavenny, Caerleon, and Newport.
	Hereford	Hereford, Lemſter, Weobley, Ledbury, Kyneton, and Roſs.
	Salop —	Shrewſhury, Ludlow, Bridgnorth, Wenlock, Biſhop's Caſtle, Whitchurch, Oſweſtry, Wem, and Newport.
	Stafford —	Stafford, Litchfield, Newcaſtle under Line, Wolverhampton, Rugeley, Burton, Utoxeter, and Stone.
4. Midland Circuit.	Warwick	Warwick, Coventry, Birmingham, Stratford upon Avon, Tamworth, Aulceſter, Nuneaton, and Atherton.
	Leiceſter	Leiceſter, Melton-Mowbray, Aſhby-de-la-Zouch, Boſworth, and Harborough.
	Derby —	Derby, Cheſterfield, Wirkſworth, Aſhbourne, Bakewell, Balſover, and Buxton.
	Nottingham	Nottingham, Southwell, Newark, Eaſt and Weſt Retford, Mansfield, Tuxford, Workſop, and Blithe.
	Lincoln —	Lincoln, Stamford, Boſton, Grantham, Croyland, Spalding, New Sleaford, Great Grimſby, Gainſborough, Louth, and Horncaſtle.
	Rutland	Oakham and Uppingham.
	Northampton	Northampton, Peterborough, Daventry, Higham-Ferrers, Brackley, Oundle, Wellingborough, Thrapſton, Towceſter, Rockingham, Kettering, and Rothwell.
5. Weſtern Circuit.	Hants —	Wincheſter, Southampton, Portſmouth, Andover, Baſingſtoke, Chriſtchurch, Petersfield, Lymington, Ringwood, Rumſey, Arlesford, and Newport, Yarmouth, and Cowes, in the Iſle of Wight.
	Wilts —	Saliſbury, Devizes, Marlborough, Malmſbury, Wilton, Chippenham, Calne, Cricklade, Trowbridge, Bradford, and Warminſter.
	Dorſet —	Dorcheſter, Lime, Sherborn, Shaftſbury, Poole, Blandford, Bridgeport, Weymouth, Melcombe, Wareham, and Winburn.
	Somerſet —	Bath, Wells, Briſtol in part, Taunton, Bridgewater, Ilcheſter, Minehead, Milbourn-port, Glaſtonbury, Wellington, Dulverton, Dunſter, Wachet, Yeovil, Somerton, Axbridge, Chard, Bruton, Shepton-Mallet, Croſcomb, and Froome.
	Devon —	Exeter, Plymouth, Barnſtable, Biddeford, Tiverton, Honiton, Dartmouth, Taviſtock, Topſham, Okehampton, Aſhburton, Crediton, Moulton, Torrington, Totneſs, Axminſter, Plympton, and Ilfracomb.
	Cornwall —	Launceſton, Falmouth, Truro, Saltaſh, Bodmyn, St. Ives, Padſtow, Tregony, Fowey, Penryn, Kellington, Leſkard, Leſtwithiel, Helſton, Penzance, and Redruth.

York

Circuits.	Counties.	Chief Towns.
6. Northern Circuit*.	York —	York, Leeds, Wakefield, Halifax, Rippon, Pontefract, Hull, Richmond, Scarborough, Boroughbridge, Malton, Sheffield, Doncaster, Whitby, Beverly, Northallerton, Burlington, Knaresborough, Barnesly, Sherborn, Bradford, Tadcaster, Skipton, Wetherby, Ripley, Heydon, Howden, Thirske, Gisborough, Pickering, and Yarum.
	Durham —	Durham, Stockton, Sunderland, Stanhope, Barnard-Castle, Darlington, Hartlepool, and Aukland.
	Northumb.	Newcastle, Tinmouth, North-Shields, Morpeth, Alnwick, and Hexham.
	Lancaster	Lancaster, Manchester, Preston, Liverpool, Wigan, Warrington, Rochdale, Bury, Ormskirk, Hawkshead, and Newton.
	Westmorel.	Appleby, Kendal, Lonsdale, Kirkby-Stephen, Orton, Ambleside, Burton, and Milthorpe.
	Cumberland.	Carlisle, Penrith, Cockermouth, Whitehaven, Ravenglass, Egremont, Keswick, Workington, and Jerby.

Middlesex is not comprehended; and Cheshire, being a county palatine, enjoys municipal laws and privileges. The same may be said of Wales, which is divided into four circuits.

Circuits.	Counties.	Chief Towns.
Counties not included in the Circuits.	Middlesex	LONDON, first meridian, N. Lat. 51-30. Westminster, Uxbridge, Brentford, Chelsea, Highgate, Hamstead, Kensington, Hackney, and Hampton-Court.
	Chester —	Chester, Nantwich, Macclesfield, Malpas, Northwich, Middlewich, Sandach, Congleton, Knotsford, Frodisham, and Haulton.

CIRCUITS OF WALES.

North-East Circuit.	Flint —	Flint, St. Asaph, and Holywell.
	Denbigh —	Denbigh, Wrexham, and Ruthen.
	Montgom.	Montgomery, Llanvylin, and Welchpool.
North-West Circuit.	Anglesey —	Beaumaris, Holyhead, and Newburgh.
	Caernarvon	Bangor, Conway, Caernarvon, and Pullilly.
	Merioneth	Dolgelly, Bala, and Harlegh.
South-East Circuit.	Radnor	Radnor, Prestean, and Knighton.
	Brecon	Brecknock, Built, and Hay.
	Glamorgan	Llandaff, Cardiff, Cowbridge, Neath, and Swansey.

* In the Lent or Spring Assizes, the Northern Circuit extends only to York and Lancaster; the Assizes at Durham, Newcastle, Appleby, and Carlisle, being held only in the Autumn, and distinguished by the appellation of the *Long Circuit*.

South-

Circuits.	Counties.	Chief Towns.
South-Weſt Circuit.	Pembroke	St. David's, Haverfordweſt, Pembroke, Tenby, Fiſcard, and Milfordhaven.
	Cardigan	Cardigan, Aberiſtwith, and Llanbadarn-vawer.
	Caermarth.	Caermarthen, Kidwelly, Lanimdovery, Llandilobawr, Langharn, and Lanelthy.

In ENGLAND.

40	Counties, which ſend up to parliament — —	80 knights.
25	Cities (Ely none, London four) ——	50 citizens.
167	Boroughs, two each — —	334 burgeſſes.
5	Boroughs (Abingdon, Banbury, Bewdley, Higham-Ferrars, and Monmouth), one each —	5 burgeſſes.
2	Univerſities —— ——	4 repreſentatives.
8	Cinque ports (Haſtings, Dover, Sandwich, Romney, Hythe, and their three dependents, Rye, Winchelſea, and Seaford, two each — —	16 barons.

WALES.

12	Counties —— —— ——	12 knights.
12	Boroughs (Pembroke two, Merioneth none), one each	12 burgeſſes.

SCOTLAND.

33	Shires —— ——	30 knights.
67	Cities and Boroughs —— ——	15 burgeſſes.
	Total	558

Beſides the 52 counties into which England and Wales are divided, there are counties corporate, conſiſting of certain diſtricts, to which the liberties and juriſdictions peculiar to a county have been granted by royal charter. Thus the city of London is a county diſtinct from Middleſex; the cities of York, Cheſter, Briſtol, Norwich, Worceſter, and the towns of Kingſton upon Hull, and Newcaſtle upon Tyne, are counties of themſelves, diſtinct from thoſe in which they lie. The ſame may be ſaid of Berwick upon Tweed, which lies in Scotland, and hath within its juriſdiction a ſmall territory of two miles on the north ſide of the river.

Under the name of a town, boroughs and cities are contained: for every borough or city is a town, though every town is not a borough or city. A borough is ſo called, becauſe it ſends up burgeſſes to parliament; and this makes the difference between a village or town, and a borough. Some boroughs are corporate, and ſome not corporate; and though decayed, as Old Sarum, they ſtill ſend burgeſſes to parliament. A city is a corporate borough, that hath had, or at preſent hath, a biſhop; for if the biſhoprick be diſſolved, yet the city remains. To have ſuburbs proves it to be a city.

SOIL, AIR, SEASONS, AND WATER.] The ſoil of England and Wales differs in each country, not ſo much from the nature of the ground, though that muſt be admitted to occaſion a very conſiderable alteration, as from the progreſs which the inhabitants of each county have made in the cultivation of lands and gardens, the draining of marſhes, and many other local improvements, which are here carried to a much greater degree of perfection than they are perhaps in any other part of the world, if we except China. We cannot enter upon particular proofs of theſe improvements. All that can be ſaid is in general, that if no unkindly ſeaſons hap-

pen, England produces corn, not only ſufficient to maintain her own inhabitants, but to bring in large ſums of ready money for her exports. The benefits from theſe exports have ſometimes tempted the inhabitants to carry out of the kingdom more grain than could be conveniently ſpared; for which reaſon exportations have been properly regulated. No nation exceeds England in the productions of the garden, which have come to ſuch perfection, that the rareſt of foreign fruits have been cultivated here with ſucceſs. If any farther proof of this ſhould be required, let it be remembered, that London and its neighbourhood, though peopled by 1,000,000 of inhabitants, is plentifully ſupplied with all kinds of fruits and vegetables from grounds within a few miles diſtance.

The plantations of trees round the houſes of noblemen and gentlemen, and even of peaſants, are delightful and aſtoniſhing at the ſame time. Some have obſerved a decay of that oak timber which anciently formed the fleets that England put to ſea; but it is ſuppoſed, with great probability, that great ſtores are ſtill in reſerve.

As to air, little can be added to what has been already ſaid concerning the climate *. In many places it is certainly loaded with vapours wafted from the Atlantic ocean; but theſe are ventilated by winds and ſtorms, ſo that in this reſpect England is to foreigners, and people of delicate conſtitutions, rather diſagreeable than unhealthy. It cannot, however, be denied, that the weather is exceſſively capricious, and ſo unfavourable to certain conſtitutions, that many of the inhabitants are induced to repair to foreign countries, in hopes of obtaining a renovation of their health.

After what we have obſerved in the Engliſh air, the reader may form ſome idea of its ſeaſons, which are ſo uncertain, that they admit of no deſcription. Spring, ſummer, autumn, and winter, ſucceed each other, but in what month their different appearances take place is very undetermined. The ſpring begins ſometimes in February, and ſometimes in April. In May the face of the country is often covered with hoary froſt inſtead of bloſſoms. The beginning of June is ſometimes as cold as in the middle of December, yet at other times the thermometer riſes in that month as high as it does in Italy. Even Auguſt has its viciſſitudes of heat and cold; and upon an average September, and next to it October, are two of the moſt agreeable months in the year. The natives ſometimes experience all the four ſeaſons within the compaſs of one day, cold, temperate, hot, and mild weather. This inconſtancy, however, is not attended with the effects that might be naturally apprehended. A fortnight, or at moſt three weeks, generally make up the difference with regard to the maturity of the fruits of the earth: and it is hardly ever obſerved that the inhabitants ſuffer by a hot ſummer. Even the greateſt irregularity, and the moſt unfavourable appearances of the ſeaſons, are not, as in other countries, attended with famine, and very ſeldom with ſcarcity.

In ſpeaking of water, I do not include rivers, brooks, or lakes; I mean waters for the common conveniences of life, and thoſe that have mineral qualities. The

* The climate of England has more advantages than are generally allowed it, if we admit the opinion of king Charles the Second upon this ſubject, which is corroborated by that of ſir William Temple: and it may be obſerved, that they were both travellers. 'I muſt needs add one thing '(ſays ſir William, in his *Miſcellanea*, part ii. 'p. 114. edit. 8vo. 1690.) in favour of our cli-'mate, which I heard the king ſay, and I thought 'new and right, and truly like a king of England, 'that loved and eſteemed his own country. It was 'in reply to ſome company that were reviling our 'climate, and extolling thoſe of Italy and Spain, 'or at leaſt of France. He ſaid, "He thought "that was the beſt climate where he could be "abroad in the air with pleaſure, or at leaſt without trouble or inconvenience, the moſt days in "the year, and the moſt hours in the day; and "this he thought he could be in England, more "than in any country he knew in Europe." And 'I believe (adds ſir William) it is true, not only 'of the hot and the cold, but even among our 'neighbours in France and the Low Countries 'themſelves, where the heats or the colds, and 'changes of ſeaſons are leſs treatable (or moderate) 'than they are with us.'

champaign parts of England are generally ſupplied with excellent ſprings and fountains; though a diſcerning palate may perceive, that they frequently contain ſome mineral impregnation. In ſome very high lands, the inhabitants are diſtreſſed for water, and ſupply themſelves by trenches, or digging deep wells. The conſtitutions of the Engliſh, and the diſeaſes to which they are liable, have rendered them extremely inquiſitive after ſalubrious waters, for the recovery and preſervation of their health; ſo that England contains as many mineral wells, of known efficacy, as perhaps any country in the world. The moſt celebrated are the hot baths of Bath and Briſtol in Somerſetſhire, and of Buxton and Matlock in Derbyſhire; the mineral waters of Cheltenham, Tunbridge, Epſom, Harrowgate, and Scarborough. Sea water is uſed as commonly as any other for medicinal purpoſes; and ſo delicate are the tones of the Engliſh fibres, that the patients can perceive, both in drinking and bathing, a difference between the ſea-water of one coaſt and that of another.

FACE OF THE COUNTRY AND MOUNTAINS. The induſtry of the Engliſh ſupplies the abſence of thoſe favours which nature has ſo laviſhly beſtowed upon ſome foreign climates, and in many reſpects even exceeds them. No nation in the world can equal the cultivated parts of England in beautiful ſcenes. The variety of high-lands and low-lands, the former gently ſwelling, and both forming proſpects ſurpaſſing the pictures of fancy; the corn and meadow ground, the intermixtures of encloſures and plantations, the noble ſeats, cheerful villages, and well-ſtocked farms, often riſing in the neighbourhood of populous towns and cities, decorated with the moſt vivid colours of nature, are objects of which an adequate idea cannot be conveyed by deſcription. The moſt barren ſpots are not without their verdure; but nothing can better prove the extent of Engliſh induſtry, than obſerving that ſome of the pleaſanteſt counties in the kingdom are naturally the moſt barren, but rendered fruitful by labour; and, it may be ſafely affirmed, that no country in Europe equals England in the beauty of its proſpects, or the opulence of its inhabitants.

Though England is full of delightful riſing-grounds, and the moſt enchanting ſlopes, yet it contains few mountains of great altitude. The moſt noted are the Peak in Derbyſhire, the Endle in Lancaſhire, the Wolds in Yorkſhire, the Cheviot-hills on the borders of Scotland, Skiddaw in Cumberland, Malvern in Worceſterſhire, Cotſwold in Glouceſterſhire, the Wrekin in Shropſhire; with thoſe of Plinlimmon and Snowdon, in Wales. In general, however, Wales, and the northern parts, may be termed mountainous.

RIVERS AND LAKES.] The rivers in England add greatly to its beauty, as well as its opulence. The Thames riſes on the confines of Glouceſterſhire, a little S. W. of Cirenceſter, and after receiving many ſtreams of other rivers, it paſſes to Oxford, then by Abingdon, Wallingford, Reading, Marlow, and Windſor. From thence to Kingſton, where formerly it met the tide, which, ſince the building of Weſtminſter-bridge, is ſaid to flow no higher than Richmond; then it flows to London, and, after dividing the counties of Kent and Eſſex, it widens in its progreſs, till it falls into the ſea at the Nore, from whence it is navigable for large ſhips to London-bridge. It was formerly a reproach to England, among foreigners, that ſo capital a river ſhould have ſo few bridges; thoſe of London and Kingſton being the only two it had, from the Nore to the laſt mentioned place. This inconveniency was in ſome meaſure owing to the dearneſs of materials for building ſtone bridges; but perhaps more to the fondneſs which the Engliſh, in former days, had for water-carriage, and the encouragement of navigation. The great increaſe of riches, commerce, and inland trade, is now multiplying bridges, and the world cannot parallel, for commodiouſneſs, architecture, and workmanſhip, thoſe lately erected at Weſtminſter and Black Friars. Batterſea, Putney, Kew, Richmond, Walton, and Hampton-

Hampton-court have now bridges likewiſe over the Thames, and others are projecting by public-ſpirited proprietors of the grounds on both ſides. The river Medway, which riſes near Tunbridge, falls into the Thames at Sheerneſs, and is navigable for the largeſt ſhips as far as Chatham.

The Severn, reckoned the ſecond river for importance in England, and the firſt for rapidity, riſes at Plinlimmon-hill in North Wales, becomes navigable at Welch-Pool, runs eaſt to Shrewſbury, then turning ſouth, viſits Bridgenorth, Worceſter, and Tewkeſbury, where it receives the Upper Avon; after having paſſed Glouceſter, it takes a ſouth-weſt direction, is near its mouth increaſed by the Wye and Uſtre, and diſcharges itſelf into the Briſtol-channel, near King-road; and there lie the great ſhips which cannot get up to Briſtol. The Trent riſes in the Moorlands of Staffordſhire, and running ſouth-eaſt by Newcaſtle under Line, divides that county into two parts; then turning north-eaſt on the confines of Derbyſhire, viſits Nottingham, running the whole length of that county to Lincolnſhire, and being joined by the Ouſe, and ſeveral other rivers towards the mouth, obtains the name of the Humber, falling into the ſea ſouth-eaſt of Hull.

The other principal rivers in England are the Ouſe (a Gaelic word ſignifying *water* in general), which falls into the Humber, after receiving the water of many other rivers. Another Ouſe riſes in Bucks, and falls into the ſea near Lynn in Norfolk. The Tine runs from weſt to eaſt through Northumberland, and falls into the German Sea at Tinmouth, below Newcaſtle. The Tees runs from weſt to eaſt, dividing Durham from Yorkſhire, and falls into the German Sea below Stockton. The Tweed runs from weſt to eaſt on the borders of Scotland, and falls into the German Sea at Berwick. The Eden runs from ſouth to north through Weſtmoreland and Cumberland, and paſſing by Carliſle, falls into Solway Frith below that city. The Lower Avon runs weſt through Wiltſhire to Bath, and then dividing Somerſetſhire from Glouceſterſhire, runs to Briſtol, falling into the mouth of the Severn below that city. The Derwent, which runs from eaſt to weſt through Cumberland, and paſſing by Cockermouth, falls into the Iriſh Sea a little below. The Ribble, which runs from eaſt to weſt through Lancaſhire, and paſſing by Preſton diſcharges itſelf into the Iriſh ſea. The Merſey, which runs from the ſouth-eaſt to the north-weſt through Cheſhire, and then dividing Cheſhire from Lancaſhire, paſſes by Liverpool, and falls into the Iriſh Sea a little below that town; and the Dee riſes in Wales, and divides Flintſhire from Cheſhire, falling into the Iriſh channel below Cheſter.

The lakes of England are few; though it is plain from hiſtory and antiquity, and indeed, in ſome places from the face of the country, that meres and fens were frequent in England, till drained and converted into arable land. The chief lakes remaining are Soham mere, Wittleſea mere, and Ramſay mere, in the iſle of Ely, in Cambridgeſhire. Theſe meres in a rainy ſeaſon unite, and form a lake of 40 or 50 miles in circumference. The northern counties of Cumberland, Weſtmoreland, and Lancaſhire, contain ſeveral ſmall lakes, which are remarkable for their beauty. The various diſpoſition of their banks, ſometimes cultivated, often covered with wood, or enlivened by herds, the intermixture of hill and dale, rude rocks and green mountains, render the ſcenery of this part of England ſcarcely inferior to that of Switzerland and Italy.

Forests.] The firſt Norman kings of England, partly for political purpoſes, that they might the more effectually enſlave their new ſubjects, and partly from the wantonneſs of power, converted immenſe tracts of grounds into foreſts, for the benefit of hunting, and theſe were governed by laws peculiar to themſelves: ſo that it was neceſſary, about the time of paſſing the Magna Charta, to form a code of the foreſt-laws; and juſtices in eyre, ſo called from their ſitting in the open air, were appointed to ſee them obſerved. By degrees thoſe tracts were diſforeſted; and the chief foreſts, properly ſo called, remaining out of no fewer than 69, are

thoſe of Windſor, New Foreſt, Dean, and Sherwood. Theſe foreſts produced formerly great quantities of excellent oak, elm, aſh, and beech, beſides walnut-trees, poplar, maple, and other kinds of wood. In ancient times England contained large foreſts of cheſnut trees, which exceeded all other kinds of timber for the purpoſes of building, as appears from many great houſes ſtill ſtanding, in which the cheſnut beams and roofs remain freſh and undecayed, though ſome of them are above 600 years old.

METALS AND MINERALS.] Among the minerals, the tin mines of Cornwall are the principal. They were known to the Greeks and Phœnicians, the latter eſpecially, ſome ages before the Chriſtian æra; and ſince the Engliſh have manufactured their tin into plates, and white iron, they are of immenſe benefit to the nation. An ore called mundic is found in the beds of tin, which was very little regarded till about 80 years ago. Sir Gilbert Clark diſcovered the art of manufacturing it, and it is ſaid now to bring in 150,000l. a-year, and to equal in goodneſs the beſt Spaniſh copper, yielding a proportionable quantity of lapis caliminaris for making braſs. Thoſe tin-works are under peculiar regulations, by what are called the ſtannary laws; and the miners have parliaments and privileges of their own, which are in force at this time. The number of Corniſh miners are ſaid to amount to 100,000. Some gold has likewiſe been diſcovered in Cornwall, and the lead is impregnated with ſilver. The Engliſh coined ſilver is particularly known by roſes, and that of Wales by that prince's cap of feathers. Devonſhire, and other counties of England, produce marble; but the beſt kind, which reſembles Egyptian granite, is exceſſively hard to work. Quarries of free-ſtone are found in many places. Northumberland and Cheſhire yield alum and ſalt pits. The Engliſh fullers earth is of ſuch conſequence to the clothing trade, that its exportation is prohibited under ſevere penalties. Pit and ſea-coal is found in many counties of England: but the city of London, to encourage the nurſery of ſeamen, is chiefly ſupplied from the pits of Northumberland, and the biſhoprick of Durham. The cargoes are ſhipped at Newcaſtle and Sunderland, and the exportation of coals to other countries is very conſiderable.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND. This is ſo copious a ſubject, and ſuch improvements have been made in gardening and agriculture, even ſince the beſt printed accounts we have ſeen, that much muſt be left to the reader's own obſervation and experience. Nothing can be ſaid with any certainty concerning the quantities of wheat, barley, rye, peas, beans, vetches, oats, and other grains growing in the kingdom. Excellent inſtitutions for the improvement of agriculture are now common in England, and their members are ſo public-ſpirited as to print periodical accounts of their diſcoveries and experiments, which ſerve to ſhew that agriculture and gardening may be carried to a much higher ſtate of perfection. Honey and ſaffron are natives of England. It is almoſt needleſs to mention in what plenty the moſt excellent fruits, apples, pears, plums, cherries, peaches, apricots, nectarines, currants, gooſeberries, raſberries, and other hortulan productions, grow here, and what quantities of cyder, perry, metheglin, and the like liquors, are made in ſome counties. The cyder of Devon and Herefordſhire, when kept, and made of proper apples, and in a particular manner, is by many preferred to French white wine. The Engliſh have made the different fruits of the world their own, ſometimes by ſimple culture, but often by hot beds and other artificial means. The Engliſh pine-apples are delicious, and now plentiful. The ſame may be ſaid of other natives of the Eaſt and Weſt Indies, Perſia, and Turkey. The Engliſh grapes are pleaſing to the taſte, but their flavour is not exalted enough for making wine; and indeed wet weather injures the flavour of all the other fine fruits raiſed here. Our kitchen gardens abound with all ſorts of greens, roots, and ſallads.

Woad for dying is cultivated in Bucks and Bedfordſhire, as hemp and flax are in other counties. In nothing have the Engliſh been more ſucceſsful than in the cultivation of graſſes for meliorating the ſoil. It belongs to a botaniſt to recount the various kinds of uſeful and ſalutary herbs, ſhrubs, and roots, that grow in different parts of England. The ſoil of Kent, Eſſex, Surry, and Hampſhire, is moſt favourable to the difficult and tender culture of hops, which now form a conſiderable article of trade.

With regard to ANIMAL PRODUCTIONS, I ſhall begin with the quadrupeds. The Engliſh oxen are large and fat, but ſome prefer for the table the ſmaller breed of the Scotch and the Welch cattle, after grazing in Engliſh paſtures. The Engliſh horſes are the beſt in the world. Incredible have been the pains taken, by all ranks, for improving the breed of this favourite and noble animal, and the ſucceſs has been anſwerable; for they now unite all the qualities and beauties of Indian, Perſian, Arabian, Spaniſh, and other foreign horſes. The irreſiſtible ſpirit and weight of the Engliſh cavalry render them ſuperior to all others in war: and an Engliſh hunter will perform incredible things in a fox or ſtag-chace. Thoſe which draw equipages on the ſtreets of London are often particularly beautiful. The exportation of horſes has become a conſiderable article of commerce. The breed of aſſes and mules begin likewiſe to be improved and encouraged in England.

The Engliſh ſheep are generally divided into two kinds; thoſe that are valuable for their fleece, and thoſe that are proper for the table. The former are very large, and their fleeces conſtitute the original ſtaple commodity of England. In ſome counties the inhabitants are as curious in their breed of rams, as in thoſe of their horſes and dogs; and in Lincolnſhire particularly, it is not uncommon for one of thoſe animals to ſell for 50l. It is thought that in England, twelve millions of fleeces are ſhorn annually, which, at a medium of 2s. a fleece, makes 1,200,000l. The other kind of ſheep which are fed upon the downs, where they have what the farmers call a ſhort bite, is little inferior in flavour and ſweetneſs to veniſon.

The Engliſh maſtiffs and bull-dogs are ſaid to be the ſtrongeſt and fierceſt of the canine ſpecies; but, either from the change of ſoil, or feeding, they degenerate in foreign climates. James I. of England, by way of experiment, turned out two Engliſh bull-dogs upon one of the fierceſt lions in the Tower, and they ſoon conquered him. The maſtiff has all the courage of the bull-dog, without its ferocity, and is particularly diſtinguiſhed for his fidelity and docility. All the different ſpecies of dogs that abound in other countries, for the field as well as domeſtic uſes, are to be found in England. What is obſerved of the degeneracy of the Engliſh dogs in foreign countries is applicable to the Engliſh game cocks, which afford much barbarous diverſion to our ſportſmen. The courage of theſe birds is aſtoniſhing, and one of the true breed never leaves the pit alive, without victory. The proprietors and feeders of this animal are extremely curious as to his blood and pedigree.

Tame fowls are much the ſame in England as in other countries; turkies, peacocks, common poultry, ſuch as cocks, pullets and capons, geeſe, ſwans, ducks, and tame pigeons. The wild ſort are buſtards, wild geeſe, wild ducks, teal, wigeon, plover, pheaſants, partridges, woodcocks, growſe, quail, landrail, ſnipe, woodpigeons, hawks of different kinds, kites, owls, herons, crows, rooks, ravens, magpies, jackdaws and jays, blackbirds, thruſhes, nightingales, goldfinches, linnets, larks, and a great variety of ſmall birds; Canary birds alſo breed in England. The wheat-ear is by many preferred to the ortolan, for the delicacy of its fleſh and flavour, and is peculiar to England.

Few countries are better ſupplied than England with river and ſea-fiſh. Her rivers and ponds contain plenty of ſalmon, trout, eels, pike, perch, ſmelts, carp, tench, barble, gudgeons, roach, dace, grey mullet, bream, plaice, flounders, and

and craw-fiſh, beſides a delicate lake fiſh, called char, which is found in ſome freſh water lakes of Wales and Cumberland, and, as ſome ſay, no where elſe. The ſea-fiſh are cod, mackarel, haddock, whiting, herrings, pilchards, ſkate, ſoles. The john dory, found towards the weſtern coaſt, is reckoned a great delicacy, as is the red mullet. Several other fiſh are found on the ſame coaſts. As to ſhell-fiſh, they are chiefly oyſters, the propagation of which, upon their proper banks, requires a peculiar culture. Lobſters, crabs, ſhrimps, and eſcallops, one of the moſt delicious of ſhell-fiſhes, cockles, wilks, periwinkles, and muſcles, with many other ſmall ſhell-fiſh, abound in the Engliſh ſeas. The whales chiefly viſit the northern coaſt; but great numbers of porpoiſes and ſeals appear in the channel. The Engliſh have been, perhaps, with great juſtice, accuſed of not paying proper atttention to their fiſheries. The beſt fiſh that comes to the tables of the great in London are ſold by the Dutch to Engliſh boats, and that induſtrious people even take them upon the Engliſh coaſts. Great attention, it is true, has been paid within theſe forty years paſt to this important concern. Many public-ſpirited noblemen and gentlemen formed themſelves into a company for carrying on a Britiſh fiſhery. Large ſums were ſubſcribed, and paid with unbounded generoſity. Buſſes and other veſſels were built, and the moſt pleaſing proſpects of ſucceſs preſented themſelves to the public. But they were unaccountably diſappointed, though it is hard to ſay from what cauſe; perhaps the price of Engliſh labour was too dear for bringing the commodity to the market upon the ſame terms as the Dutch.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. The exemption of the Engliſh conſtitution from the deſpotic powers exerciſed in foreign nations, not excepting republics, is one great reaſon why it is very difficult to aſcertain the number of inhabitants in England; and yet it is certain that this might occaſionally be done by parliament, without any violation of public liberty, and probably ſoon will take place. With regard to political calculations, they muſt be very fallible, when applied to England. The prodigious influx of foreigners, the emigrations of natives to the colonies, their return from thence, and the great number of hands employed in ſhipping, are matters that render any calculation extremely precarious. Upon the whole, I am apt to think that England is more populous than the eſtimators of her inhabitants are willing to allow. The war with France and Spain, before the laſt, annually employed about 200,000 Engliſhmen, excluſive of Scots and Iriſh by ſea and land; and its progreſs carried off, by various means, very near that number. The decay of population was indeed ſenſibly felt, but not ſo much as during the wars in queen Anne's reign, though not half of the numbers were then employed in the ſea and land ſervice. At the ſame time, I am not of opinion, that England is at preſent naturally more populous than ſhe was in the reign of Charles I. though ſhe is accidentally ſo. The Engliſh of former ages were ſtrangers to the exceſſive uſe of ſpirituous liquors, and other modes of living deſtructive of propagation. On the other hand, the vaſt quantities of cultivated lands in England, ſince thoſe times, it might reaſonably be preſumed, would be favourable to mankind; but this advantage has been ſaid to be more than counterbalanced by the practice of engroſſing farms. I will take the liberty to make another obſervation, which falls within the cogniſance of almoſt every man, and that is, the incredible increaſe of foreign names upon our pariſh books, and public liſts, compared to what they were even in the reign of George I.

After what has been premiſed, it would be preſumptuous to aſcertain the number of inhabitants in England and Wales; but, in my opinion, they muſt exceed ſeven millions. Some may ſuppoſe this to be too large a calculation: and it muſt be admitted, that England has been exceedingly drained by the late war. From the continual acceſſion of ſtrangers, and other obvious cauſes, it is impoſſible to eſtimate

mate the population of London according to rules derived from the proportions of births and burials. Beſides, at the very gates of this metropolis, 100,000 inhabitants are not included within the bills of mortality.

Engliſhmen, in their perſons, are generally well ſized, regularly featured, moſt commonly fair and florid in their complexions. It is to be preſumed, that the vaſt numbers of foreigners intermarried with the natives have given a caſt to their perſons and complexions different from thoſe of their anceſtors 150 years ago. The women, in their ſhapes, features, and complexions, appear ſo graceful and lovely, that England may be termed the native country of female beauty. But beſide the external graces ſo peculiar to the women in England they are ſtill more to be valued for their prudent behaviour, thorough cleanlineſs, and a tender affection for their huſbands and children, and all the engaging duties of domeſtic life. Of all European nations, the Engliſh keep themſelves the moſt cleanly. Their nerves are ſo delicate, that people of both ſexes are ſometimes forcibly, nay mortally, affected by imagination; inſomuch, that before the practice of inoculation for the ſmall pox took place, it was thought improper to mention that loathſome diſeaſe by its true name in any polite company. This over-ſenſibility has been conſidered as one of the ſources of thoſe ſingularities, which ſo ſtrongly characteriſe the Engliſh nation. They ſometimes magnify the ſlighteſt appearances into realities, and bring the moſt diſtant dangers immediately home to themſelves; and yet when real danger approaches, no people face it with greater reſolution or conſtancy of mind. In ſhort, many of the Engliſh feel, as if it really exiſted, every evil in mind, body, and eſtate, which they form in their imagination. At particular intervals they are ſenſible of this abſurdity, and run into a contrary extreme, ſtriving to baniſh it by diſſipation, riot, intemperance, and diverſions. They are fond, for the ſame reaſon, of convivial aſſociations; and when theſe are kept within the bounds of temperance and moderation, they prove the beſt cures for the mental evils, which are ſo peculiar to the Engliſh, that foreigners have pronounced them to be national.

The ſame obſervations hold with regard to the higher orders of life, which muſt be acknowledged to have undergone a remarkable change ſince the acceſſion of the Houſe of Hanover. The Engliſh nobility and gentry of great fortunes now aſſimilate their manners to thoſe of foreigners, with whom they cultivate a more frequent intercourſe than their forefathers did. They do not now travel only as pupils, to bring home the vices of the countries they viſit, but they travel for the purpoſes of ſociety, and at more advanced periods of life, while their judgments are mature, and their paſſions regulated. This has enlarged ſociety in England, which foreigners now viſit as commonly as Engliſhmen viſited them, and the effects of this intercourſe become daily more viſible, eſpecially as it is not now, as formerly, confined to one ſex.

Such of the Engliſh noblemen and gentlemen, who do not ſtrike into high walks of life, affect rather what is called a ſnug way of living. They underſtand, perhaps, better than any people in the world, conveniency in their houſes, gardens, equipages, and eſtates, which they ſpare no coſt to purchaſe; it has, however, been obſerved, that this turn renders them leſs communicative than they ought to be: but, on the other hand, the few connections they form are ſincere, cheerful, and indiſſoluble. The like habits deſcend into the lower ranks, and are often diſcernable among tradeſmen. This love of conveniency may be called the ruling paſſion of the Engliſh, and the ultimate end of all their application, labours, and fatigues. A good œconomiſt, with a briſk run of trade, is generally, when turned of 50, in a condition to retire from buſineſs; that is, either to purchaſe an eſtate, or to ſettle his money in the funds. He then commonly reſides in a comfortable houſe in the country, often his native county, and expects to be treated on the footing

footing of a gentleman; but his ſtyle of living is always judiciouſly ſuited to his circumſtances.

Few people know better than tradeſmen, and men of buſineſs in England, how to pay court to their cuſtomers and employers. Thoſe arts they conſider only as the means of acquiring that independence, the pride of which too often leads them into a contrary extreme. This carries them to that petulance, which is ſo offenſive to ſtrangers, and though encouraged, through the want of education, has its root in the nobleſt of principles badly underſtood, I mean that right which the laws of England give to every man over his own property.

The humanity of the Engliſh is diſcovered in nothing more than in the ſubſcriptions for public charities. An Engliſhman feels all the pains which a fellow-creature ſuffers, and poor and miſerable objects are relieved in England with a liberality, that may prove injurious to induſtry; becauſe it takes from the lower ranks the uſual motives of labour, that they may ſave ſomewhat for themſelves and families, againſt the days of age or ſickneſs. The very people who contribute to thoſe collections, are aſſeſſed in proportion to their property for their parochial poor, who have a legal demand for a maintenance; and upwards of three millions is ſaid to be collected yearly in this country for charitable purpoſes. The inſtitutions of extra-parochial infirmaries, hoſpitals, and the like, are in ſome caſes reprehenſible. The ſums beſtowed on building them, the contracts made by their governors, and even the election of phyſicians, who thereby acquire credit, which is the ſame as profit, often begets heat and cabals, very different from the purpoſes of diſintereſted charity, owing to the attachments and prepoſſeſſions of friends, and even to party conſiderations. Notwithſtanding thoſe proviſions, which would baniſh poverty from any other country, the ſtreets of London, and the highways of England, abound with objects of diſtreſs, who beg in defiance of the laws, which render the practice puniſhable.

The Engliſh, though iraſcible, are the moſt placable people in the world, and will often ſacrifice part of their intereſt rather than proceed to extremity. They are eaſily prevailed upon to forgive injuries, and they carry this lenity too far, by accepting of profeſſions of ſorrow publiſhed in advertiſements by thoſe who offend them, and who often laugh at the eaſineſs of their proſecutors for diſmiſſing them ſo gently. The unſuſpecting nature of the Engliſh and their honeſt open manners, eſpecially of thoſe in the mercantile way, often render them dupes. They liſten to the voice of misfortunes in trade, whether real or pretended, deſerved or accidental, and generouſly contribute to the relief of the parties, ſometimes even by placing them in a more creditable condition than ever. The loweſt of the people are capable of generous actions; but they often make an oſtentatious diſplay of their own merits, which diminiſhes their value. There is among perſons of all ranks an unpardonable preference given to wealth, above moſt other conſiderations. This offenſive failing ariſes partly from the people being ſo much addicted to trade and commerce, the great object of which is gain; and partly from the democratical part of their conſtitution, which makes the poſſeſſion of property a qualification for the legiſlature, and for almoſt every other ſpecies of magiſtracy, government, honours, and diſtinctions.

The ſame attention to property operates in many other ways among the lower claſſes, who think it gives them a right to be rude and diſregardful of all about them: nor are the higher orders exempt from the ſame failing. The ſame principle often influences their exterior appearances. Noblemen of the firſt rank have been ſeen laying bets with butchers and coblers at horſe-races, and boxing-matches. Gentlemen and merchants of great property are ſometimes not to be diſtinguiſhed, either by their dreſs or converſation, even from their ſervants; and a wager offered to be ſtaked in ready money againſt a pennyleſs antagoniſt has been often

often thought a deciſive argument in public company; but the practice of laying wagers has become much leſs prevalent than it uſed to be.

An Engliſhman, of education and reading, is the moſt accompliſhed gentleman in the world. He is however ſhy and reſerved in his communications, and a man may be in company with him for months, without diſcovering that he knows any thing beyond the verge of a farm-yard, or above the capacity of a horſe-jockey. This coldneſs is ſo far from being affected, that it is a part of their natural conſtitution. Learning and genius often meet not with ſuitable regard even from the firſt-rate Engliſhmen: and it is not unuſual for them to throw aſide the beſt productions of literature, if they are not acquainted with the author. While the ſtate-diſtinction of Whig and Tory ſubſiſted, the heads of each party affected to patronize men of literary abilities; but the pecuniary encouragements given them were but very moderate, and the few who met with preferments in the ſtate might have earned them by a competent knowledge of buſineſs, and that pliability which the dependents in office generally poſſeſs. We ſcarcely have an inſtance, even in the munificent reign of Queen Anne, or of her predeceſſors, who owed ſo much to the preſs, of a man of genius, as ſuch, being made eaſy in his circumſtances. Mr. Addiſon had about 300l. a year of the public money, to aſſiſt him in his travels; and Mr. Pope, though a Roman Catholic, was offered, but did not accept of, the like penſion from Mr. Craggs, the Whig ſecretary of ſtate; and it was remarked, that his Tory friend and companion the earl of Oxford, when ſole miniſter, did nothing for him, but bewail his misfortune in being a Papiſt. Indeed, a few men of diſtinguiſhed literary abilities, as well as ſome without, have of late received penſions from the crown; but, from the conduct of ſome of them, it ſhould ſeem, that ſtate and party ſervices have been expected in return.

The unevenneſs of the Engliſh in their converſation is very remarkable: ſometimes it is delicate, ſprightly, and replete with true wit; ſometimes it is ſolid, ingenious, and argumentative; ſometimes it is cold and phlegmatic in the extreme. In many of their convivial meetings they are noiſy, and their wit is often offenſive, while the loudeſt are the moſt applauded. This is particularly the caſe in large companies; but in ſmaller and more ſelect parties, all the pleaſures of rational converſation, and agreeable ſociety, are enjoyed in England in a very high degree. Courage is a quality that ſeems to be congenial to the nation. Boys, before they can ſpeak, diſcover that they know the proper guards in boxing with their fiſts; a quality that perhaps is peculiar to the Engliſh, and is ſeconded by a ſtrength of arm that few other people can exert. This gives their ſoldiers an infinite ſuperiority in all battles that are to be decided by the bayonet ſcrewed upon the muſket. Their paſſive courage is not leſs conſpicuous than their active. The Engliſh are not remarkable for invention, but for improving the invention of others; and in the mechanical arts, they excell all other nations. The intenſe application which an Engliſhman gives to a favourite ſtudy is incredible, it abſorbs all his other ideas. This creates the numerous inſtances of mental abſences that are to be found in the nation,

All that I have ſaid concerning the Engliſh is to be underſtood of them in general; for it is not to be diſſembled, that every day produces ſtrong indications of alterations in their manners. The great fortunes made during the late and the preceding wars, the immenſe acquiſitions of territory by the peace of 1763, and, above all, the amazing increaſe of territory as well as commercial property in the Eaſt Indies, introduces a ſpecies of people, who have become rich without induſtry, and, by diminiſhing the value of gold and ſilver, have created a new ſyſtem of finances. Time alone can ſhew the event: hitherto the conſequences ſeem to have been unfavourable, as it has occaſioned a ſpirit of luxury and gaming attended with the moſt fatal effects, and an emulation among merchants and

traders to equal, or ſurpaſs, the nobility and the courtiers. The plain frugal manners of men of buſineſs, which prevailed ſo lately as the acceſſion of the preſent family to the crown, are now diſregarded for taſteleſs extravagance in dreſs and equipage, and the moſt expenſive amuſements and diverſions, not only in the capital, but all over the trading towns of the kingdom.

The cuſtoms of the Engliſh have, ſince the beginning of this century, undergone a conſiderable change. Their ancient hoſpitality has much decayed; many of their favourite diverſions are now diſuſed. Thoſe remaining, are operas, dramatic exhibitions, ridottos, and ſometimes maſquerades in or near London; but concerts of muſic, and card and dancing aſſemblies, are common all over the kingdom. I have already mentioned ſtag and fox-hunting and horſe races, of which many Engliſhmen are fond even to infatuation. Somewhat, however, may be offered, by way of apology, for thoſe diverſions: the intenſe application which the Engliſh give to buſineſs, their ſedentary lives, and luxurious diet, require exerciſe; and ſome think that their excellent breed of horſes is increaſed and improved by thoſe amuſements. Next to horſe-racing and hunting, cock-fighting, to the reproach of the nation, is a favourite diverſion among the great as well as the vulgar. Multitudes of both claſſes aſſemble round the pit at one of thoſe matches, and enjoy the pangs and death of the generous animal, every ſpectator being concerned in a bet, ſometimes of high ſums. The athletic diverſion of cricket is ſtill kept up in many parts of England, and is ſometimes practiſed by people of the higheſt rank. Many other paſtimes are common in England, ſome of them of a very robuſt nature, ſuch as cudgelling, wreſtling, bowls, ſkittles, quoits, and priſon-baſe; not to mention duck-hunting, foot and aſs-races, dancing, puppet-ſhews, May garlands, and, above all, ringing of bells, a ſpecies of muſic which the Engliſh boaſt of having carried to perfection. The barbarous diverſions of boxing and prize-fighting, which were as frequent in England as the ſhews of gladiators in Rome, are now prohibited, though often practiſed; and all places of public diverſions, except the royal theatres, are under regulations by act of parliament. Other diverſions, which are common to other countries, ſuch as tennis, fives, billiards, cards, ſwimming, angling, fowling, courſing, and the like, are familiar to the Engliſh. Two kinds, and thoſe highly laudable, are perhaps peculiar to them, and theſe are rowing and ſailing. The latter, if not introduced, was patronized and encouraged by his preſent majeſty's father, the late prince of Wales, and may be conſidered as a national improvement. The game acts have taken from the common people a great fund of diverſion though without anſwering the purpoſes of the rich: for the farmers and country people deſtroy the game in their neſts, which they dare not kill with the gun. This monopoly of game, among ſo free a people as the Engliſh, has been often attacked, and as often defended.

Dress.] In the dreſs of both ſexes, before the preſent reign of George III. they followed the French; but that of the military officers partook of the German, in compliment to his late majeſty. The Engliſh, at preſent, bid fair to be the dictators of dreſs to the French themſelves, at leaſt with regard to elegance, neatneſs, and richneſs of attire. People of quality and fortune, of both ſexes, appear on high occaſions, in cloth of gold and ſilver, the richeſt brocades, ſatins, ſilks, and velvets, both flowered and plain, all which are now manufactured at home. The quantities of jewels that appear on public occaſions are incredible, eſpecially ſince the vaſt acquiſitions of the Engliſh in the Eaſt Indies. The ſame nobility, and perſons of diſtinction, on ordinary occaſions dreſs like creditable citizens, that is, neat, clean, and plain, in the fineſt cloth, and the beſt of linen. The full dreſs of a clergyman conſiſts of his gown, caſſock, ſcarf, beaver-hat and roſe, all of black: his undreſs is a dark grey frock, and plain. The phyſicians,

the formality of whoſe dreſs, in large tye perukes and ſwords, was formerly remarkable, if not ridiculous, begin now to dreſs like other gentlemen, and men of buſineſs. Few Engliſhmen, tradeſmen, merchants and lawyers, as well as men of landed property, are without ſome paſſion for the ſports of the field, on which occaſions they dreſs with remarkable propriety. The people of England love rather to be neat than fine in their apparel; and the appearance of an artiſan or manufacturer in holiday times is commonly an indication of his induſtry and morals.

RELIGION.] Euſebius, and other ancient writers, poſitively aſſert, that Chriſtianity was firſt preached in South-Britain by the apoſtles and their diſciples; and it is reaſonable to ſuppoſe, that the ſucceſs of the Romans paved the way for the triumphs of the Goſpel of peace. It is certain alſo, that many of the ſoldiers and officers in the Roman armies were Chriſtians; and as their legions were repeatedly ſent over to England to extend as well as to preſerve their conqueſts, it is probable that thus Chriſtianity was diffuſed among the natives. If any of the apoſtles viſited this country and our heathen anceſtors, it was St. Paul, whoſe zeal, diligence, and fortitude were abundant. But who was the firſt preacher, or the preciſe year and period, the want of records leaves us in doubt; for the belief of Joſeph of Arimathea and St. Peter's preaching the Goſpel in Britain, and Simon Zelotes ſuffering martyrdom here, reſts on no better foundation than monkiſh legends. We have good authority to ſay, that about the year 150, a great number of perſons profeſſed the Chriſtian faith, and, according to Archbiſhop Uſher, in the year 182, there was a ſchool of learning to provide the Britiſh churches with proper teachers; and from that period it ſhould ſeem that Chriſtianity advanced its benign and ſalutary influences among the inhabitants, in their ſeveral diſtricts. It is unneceſſary to repeat what has been ſaid in the Introduction, reſpecting the riſe and fall of the church of Rome in Europe. John Wickliffe, an Engliſhman, educated at Oxford in the reign of Edward III. has the honour of being the firſt perſon in Europe who publicly called in queſtion, and boldly refuted thoſe doctrines which had paſſed for certain during ſo many ages. The conſtitution of the church is epiſcopal, and is governed by biſhops, whoſe benefices were converted by the Norman conqueror into temporal baronies, in right of which, every biſhop has a ſeat and vote in the houſe of peers. The benefices of the inferior clergy are now freehold, but in many places their tithes have been *impropriated*, i. e. conferred on the laity. The œconomy of the church of England has been accuſed for the inequality of its livings; ſome of them extending from three hundred to fourteen hundred a year, and many, particularly in Wales, being two ſmall to maintain a clergyman, eſpecially if he has a family, with any tolerable decency: but this ſeems not eaſy to be remedied, unleſs the dignified clergy would adopt and ſupport the reforming ſcheme. The crown, as well as private perſons, has done great things towards the augmentations of poor livings.

The dignitaries of the church of England, ſuch as deans, prebendaries, and the like, have generally large incomes; ſome of them exceeding in value thoſe of biſhopricks, for which reaſon the revenues of a rich deanery, or other livings, is often annexed to a poor biſhoprick. At preſent, the clergy of the church of England, as to temporal matters, are in a moſt flouriſhing condition, becauſe the value of their tithes increaſes with the improvements of lands, which of late have been amazing in England. The ſovereigns of England, ever ſince the reign of Henry VIII. have been called, in public writs, the ſupreme heads of the church; but this title conveys no ſpiritual meaning, as it only denotes the regal power, to prevent any eccleſiaſtical differences; or, in other words, to ſubſtitute the king in place of the pope before the Reformation, with regard to temporalities, and the internal œconomy of the church. The kings of England never intermeddle in eccleſiaſtical

diſputes, unleſs by preventing the convocation from ſitting to agitate them, and are contented to give a ſanction to the legal rights of the clergy.

The church of England, under this deſcription of the monarchical power over it, is governed by two archbiſhops, and twenty-four biſhops, beſides the biſhop of Sodor and Man, who, not being poſſeſſed of an Engliſh barony, does not ſit in the houſe of peers*. The two archbiſhops, are thoſe of Canterbury and York, who are both dignified with the addreſs of "Your Grace." The former is the firſt peer of the realm, as well as metropolitan of the Engliſh church. He takes precedence, next to the royal family, of all dukes and officers of ſtate. He is enabled to hold eccleſiaſtical courts upon all affairs that were formerly cogniſable in the court of Rome, when not repugnant to the law of God, or the king's prerogative. He has the privilege conſequently of granting, in certain caſes, licences and diſpenſations, together with the probate of wills, when the party dying is worth upwards of five pounds. Beſides his own dioceſe, he has under him the biſhops of London, Wincheſter, Ely, Lincoln, Rocheſter, Litchfield and Coventry, Hereford, Worceſter, Bath and Wells, Saliſbury, Exeter, Chicheſter, Norwich, Glouceſter, Oxford, Peterborough, Briſtol; and, in Wales, St. David's, Landaff, St. Aſaph, and Bangor.

The archbiſhop of Canterbury has, by the conſtitution and laws of England, ſuch extenſive powers, that ever ſince the death of archbiſhop Laud, government has thought proper to raiſe to that dignity men of moderate principles; and generally men of conſiderable learning and abilities. This practice has been attended with excellent effects, with regard to the public tranquillity of the church, and conſequently of the ſtate.

The archbiſhop of York takes place of all dukes, not of the blood royal, and of all officers of ſtate, the lord chancellor excepted. He has in his province, beſides his own dioceſe, the biſhopricks of Durham, Carliſle, Cheſter, and Sodor and Man. In Northumberland, he has the power of a palatine, and juriſdiction in all criminal proceedings.

The biſhops are addreſſed by the appellation of your lordſhips, ſtiled "Right reverend fathers in God," and take the precedence of all temporal barons. They have the privileges of peers, and the biſhopricks of London, Wincheſter, Durham, Saliſbury, Ely, and Lincoln, require no additional revenues to ſupport their prelates in the rank of noblemen. Engliſh biſhops are to examine and ordain prieſts and deacons, to conſecrate churches and burying-places, and to adminiſter the rite of confirmation. Their juriſdiction relates to the probation of wills; to grant admi-

* To the following liſt, I have ſubjoined the ſum each ſee is charged in the king's books; for though that ſum is far from being the real annual value of the ſee, yet it aſſiſts in forming a comparative eſtimate between the revenues of each ſee with thoſe of another.

niſtration

niſtration of goods to the heirs of ſuch as die inteſtate; to take care of periſhable goods when no one will adminiſter; to collate to benefices; to grant inſtitutions to livings; to defend the liberties of the church; and to viſit their own dioceſes once in three years.

Deans and prebendaries of cathedrals have been already mentioned; but it would perhaps be difficult to aſſign their utility in the church, farther than to add to the pomp of worſhip, and to make proviſion for clergymen of eminence and merit, but intereſt often prevails over merit in the appointment. England contains about ſixty archdeacons, whoſe office is to viſit the churches twice or thrice every year, but their offices are leſs lucrative than they are honourable. Subordinate to them are the rural deans, formerly ſtyled arch-preſbyters, who ſignify the biſhop's pleaſure to his clergy, the lower claſs of which conſiſts of prieſts and deacons.

The eccleſiaſtical government of England is properly ſpeaking, lodged in the convocation, which is a national repreſentative or ſynod, correſponding pretty nearly to the ideas we have of a parliament. They are convoked at the ſame time with every parliament, and their buſineſs is to conſider of the ſtate of the church, and to call thoſe to an account who have advanced new opinions, inconſiſtent with the doctrines of the church of England. Some high-flying clergymen, during the reign of queen Anne, and in the beginning of that of George I. raiſed the powers of the convocation to a height that was inconſiſtent with the principles of religious toleration, and indeed of civil liberty; ſo that the crown was obliged to exert its prerogative of calling the members together, and ever ſince they have not been permitted to ſit any length of time ſufficient to do buſineſs.

The court of arches is the moſt ancient conſiſtory of the province of Canterbury, and all appeals in church-matters, from the judgment of the inferior courts, are directed to this. The proceſſes run in the name of the judge, who is called dean of the arches; and the advocates, who plead in this court, muſt be doctors of the civil law. The court of audience has the ſame authority with this, to which the archbiſhop's chancery was formerly joined. The prerogative court is that wherein wills are proved, and adminiſtrations taken out. The court of peculiars, relating to certain pariſhes, have a juriſdiction among themſelves, for the probate of wills, and are therefore exempt from the biſhop's courts. The ſee of Canterbury has no leſs than fifteen of theſe peculiars. The court of delegates receives its name from its conſiſting of commiſſioners delegated or appointed by the royal commiſſion; but it is no ſtanding court. Every biſhop has alſo a court of his own, called the conſiſtory court. Every archdeacon has likewiſe his court, as well as the dean and chapter of every cathedral.

The church of England is now beyond any other national church, tolerant in its principles. Moderation is its governing character, and in England, no religious ſect is prevented from worſhipping God in that manner which their conſciences approve. Some ſevere laws were, indeed, lately in force againſt thoſe proteſtant diſſenters who rejected the doctrinal articles of the church of England; but theſe laws were ſeldom executed; and, in 1779, religious liberty received a conſiderable augmentation, by an act which was then paſſed for granting a legal toleration to diſſenting miniſters and ſchoolmaſters. Not to enter upon the motives of the reformation under Henry VIII. it is certain, that epiſcopal government, excepting the few years from the civil wars under Charles I. to the reſtoration of his ſon, has ever ſince prevailed in England. The wiſdom of acknowledging the king the head of the church, is conſpicuous in diſcouraging all religious perſecution and intolerancy, and if religious ſectaries have multiplied in England, it is from the ſame principle that civil licentiouſneſs has prevailed; I mean a tenderneſs in matters that affect either conſcience or liberty. The bias which the clergy had towards popery in the reign of Henry VIII. and his ſon, and even ſo late as that of Elizabeth,

beth, occaſioned an interpoſition of the civil power, for a farther reformation. Thence aroſe the *puritans*, ſo called from their maintaining a ſingular purity of life and manners. Many of them were worthy pious men, and ſome of them good patriots. Their deſcendants are the modern preſbyterians, who retain the ſame character, and have true principles of civil and religious liberty; but their theological ſentiments have undergone a conſiderable change. Their doctrine, like the church of Scotland, was originally derived from the Geneva plan, inſtituted by Calvin, and tended to an abolition of epiſcopacy, and to veſting the government of the church in a parity of preſbyters. But the modern Engliſh preſbyterians, in their ideas of church-government, differ little from the independents, or congregationaliſts, who are ſo called from holding the independency of congregational churches; and in this ſenſe almoſt all the *diſſenters* in England are now become *independents*. As to points of doctrine, the preſbyterians are generally Arminians. Many of their miniſters have greatly diſtinguiſhed themſelves by their learning and abilities, and ſome of their writings are held in high eſtimation by the clergy and other members of the eſtabliſhed church. The ſame may be ſaid of ſome of the independent and baptiſt-miniſters. The independents are generally Calviniſts. The baptiſts do not believe that infants are proper objects of baptiſm, and in the baptiſm of adults they practiſe immerſion into water. They are divided into two claſſes, which are ſtyled general baptiſts, and particular baptiſts. The general baptiſts are Arminians, and the particular baptiſts are Calviniſts. The moderate clergy of the church of England treat the proteſtant diſſenters with affection and friendſhip: and though the hierarchy of their church, and the character of biſhops, are capital points in their religion, they conſider their differences with the preſbyterians, and even with the baptiſts, as not material to ſalvation; nor indeed do many of the eſtabliſhed church think that they are ſtrictly and conſcientiouſly bound to believe the doctrinal parts of the thirty-nine articles, which they are obliged to ſubſcribe before they can enter into holy orders. Several of them have of late contended in their writings, that all ſubſcriptions to religious ſyſtems are repugnant to the ſpirit of Chriſtianity, and to reformation. Some doctrines which were formerly generally conſidered as too ſacred to be oppoſed, or even examined, are now publicly controverted, particularly the doctrine of the Trinity. Places of worſhip have been eſtabliſhed in which that doctrine has been openly renounced; and ſeveral clergymen have thrown up valuable livings in the church, and aſſigned their diſbelief of that doctrine as the motive of their conduct.

The *Methodiſts* are a ſect of a late inſtitution, and their founder is generally looked upon to be Mr. George Whitfield, a divine of the church of England; but it is difficult to deſcribe the tenets of this numerous ſect. All we know is, that they pretend to great fervor and devotion, and their founder thought that the form of eccleſiaſtical worſhip, and prayers, whether taken from a common prayer book, or poured forth extempore, was a matter of indifference, and he accordingly made uſe of both theſe methods. His followers are rigid obſervers of the doctrinal articles of the church of England, and profeſs themſelves to be Calviniſts. But even the ſect of methodiſts are divided: not to mention a variety of ſubordinate ſects (ſome of whom are from Scotland, particularly the *Sandemanians*) who have their ſeparate followers, but very few at London and other places in England. Mr. Whitfield died ſome years ſince; but the places of worſhip erected by him, near London, are ſtill frequented by perſons of the ſame principles, and they profeſs a great reſpect for his memory. Mr. Weſley and his followers oppoſe ſome of the Calviniſtic doctrines, particularly that of predeſtination; but they appear ſtill to retain the greater part. He has erected a place of public worſhip near Moorfields, and has under him a conſiderable number of preachers, who appear to ſubmit to their

their leader implicitly, propagate his opinions, and make proſelytes with great induſtry.

The Quakers are a religious ſect which took its riſe about the middle of the laſt century; a ſummary account of their tenets having been publiſhed by themſelves, the following is abſtracted from it.

"They believe in one eternal God, the Creator and preſerver of the univerſe, and in Jeſus Chriſt his Son, the Meſſiah and Mediator of the new covenant.

"When they ſpeak of the miraculous conception, birth, life, miracles, death, reſurrection and aſcenſion of our Saviour, they uſe Scriptural terms, and acknowledge his divinity.

"To Chriſt alone they give the title of the word of God and not to the Scriptures, although they highly eſteem theſe ſacred writings, in ſubordination to the Spirit, from which they were given forth.

"They believe (and it is their diſtinguiſhing tenet), that every man coming into the world, is endued with a meaſure of the light, grace, or good ſpirit of Chriſt, by which, as it is attended to, he is enabled to diſtinguiſh good from evil, and to correct the corrupt propenſities of his nature, which mere reaſon is altogether inſufficient to overcome.

"They think the influence of the Spirit eſpecially neceſſary to the performance of worſhip; and conſider as obſtructions to pure worſhip, all forms which divert the attention of the mind from the ſecret influence of this unction from the Holy One. They think it incumbent on Chriſtians to meet often together, and to wait in ſilence to have a true ſight of their condition beſtowed upon them; believing even a ſingle ſigh ariſing from ſuch a ſenſe to be more acceptable to God, than any performances, however ſpecious, which originate in the will of man.

"As they do not encourage any miniſtry but that which is believed to ſpring from the influence of the Holy Spirit, ſo neither do they reſtrain this influence to perſons of any condition in life, or to the male ſex alone; but as male and female are one in Chriſt, they allow ſuch of the female ſex, as are endued with a right qualification for the miniſtry, to exerciſe their gifts for the general edification of the church.

"Reſpecting Baptiſm, and what is termed the Lord's Supper, they believe, that the baptiſm with water, adminiſtered by John, belonged to an inferior and decreaſing diſpenſation.

"With reſpect to the other rite, they believe that communion between Chriſt and his church is not maintained by any external performance; but only by a real participation of his divine nature through faith.

"They declare againſt oaths and war; abiding literally by Chriſt's poſitive injunction, "Swear not at all." From the precepts of the Goſpel, from the example of our Lord, and from his ſpirit in their hearts, they maintain that wars and fightings are repugnant to the goſpel.

"They diſuſe the names of the months and days, which were given in honour of the heroes or falſe gods of the heathens; and the cuſtom of ſpeaking to a ſingle perſon in the plural number, as having ariſen alſo from motives of adulation. Compliments, ſuperfluity of apparel, and furniture, outward ſhews of rejoicing, and mourning, and obſervations of days and times, they eſteem to be incompatible with the ſimplicity and ſincerity of a Chriſtian life; and public diverſions, gaming, and other vain amuſements of the world, they condemn as a waſte of time, and diverting the attention of the mind from the ſober duties of life.

"This ſociety hath a diſcipline eſtabliſhed among them, the purpoſes of which

are

are, the relief of the poor—the maintenance of good order—the ſupport of the teſtimonies which they believe it is their duty to bear to the world—and the help and recovery of ſuch as are overtaken in faults.

"It is their decided judgment that it is contrary to the goſpel to ſue each other at law. They enjoin all to end their differences by ſpeedy and impartial arbitration according to rules laid down. If any refuſe to adopt this mode, or having adopted it, to ſubmit to the award, it is the rule of the ſociety that ſuch be diſowned."

"It is well known that William Penn, one of this ſociety, founded the province of Pennſylania, and introduced therein a plan of civil and religious liberty, particularly of the latter, at that time unexampled. The government of the province was at firſt, and for many years, chiefly in the hands of the Quakers; but as perſons of other perſuaſions increaſed, and became partakers of power, they grew uneaſy at the pacific plan of the Quakers, and at length ſucceeding to eſtabliſh ſuch modes of defence for their country as did not accord with the principles of the latter, theſe gradually withdrew themſelves from active employments of the ſtate. For ſome time previous to the late revolution, few of them were found in any other ſtation that that of private citizens; and during its progreſs, their refuſing to arm expoſed them to much ſuffering, by diſtraints levied on them, in order to procure their quota in ſupport of the war.

Many families in England ſtill profeſs the Roman catholic religion, and its exerciſe is under very mild and gentle reſtrictions. Though the penal laws againſt Papiſts in England appear at firſt to be ſevere, yet they are either not executed, or with ſo much lenity, that a Roman catholic feels himſelf under few hardſhips. Legal evaſions are found out for their double taxes upon their landed property, and as they are ſubject to none of the expences and troubles (unleſs voluntary) attending public offices, parliamentary elections, and the like burdens, the Engliſh Papiſts are in general in good circumſtances, as to their private fortunes. Some of the penal laws againſt them have alſo lately been repealed, much to the ſatisfaction of all liberal-minded men, though a vehement outcry was afterwards raiſed againſt the meaſure by ignorance and bigotry. They now ſeem to be convinced, that a change of government would hurt their ſituation, becauſe it would increaſe the jealouſy of the legiſlature, which muſt undoubtedly expoſe them daily to greater burdens and heavier penalties. This conſideration has of late made the Roman catholics as dutiful and zealous ſubjects as any his majeſty has. Scarcely any Engliſh Papiſts, excepting thoſe who were bred, or had ſerved abroad, were engaged in the rebellion of the year 1745; and though thoſe at home were carefully obſerved, few of them were found guilty of diſloyal practices.

As England has been remarkable for the variety of its religious ſects, ſo it has been famous for its *Freethinkers*; but that term has been applied in very different ſenſes. It has ſometimes been uſed to denote oppoſers of religion in general, and in particular of revealed religion; but it has alſo been applied to thoſe who have been far from diſbelieving Chriſtianity, and who have only oppoſed ſome of thoſe doctrines which are to be found in public creeds and formularies, but which they conceived to be no part of the original Chriſtian ſyſtem. As to thoſe who are truly *Deiſts*, or *Infidels*, there is abundant reaſon to believe, that this claſs of men is much more numerous in ſome Popiſh countries than in England. Chriſtianity is ſo much obſcured and diſfigured by the fopperies and ſuperſtitions of the Romiſh church, that men who think freely are naturally apt to be prejudiced againſt it, when they ſee it in ſo diſadvantageous a form: and this appears to be very much the caſe

abroad. But in England, where men have every opportunity of ſeeing it exhibited in a more rational manner, they have leſs cauſe to be prejudiced againſt it; and therefore are more ready to enter into an examination of the evidence of its divine origin. Nor does it appear that the writings of the Deiſts againſt Chriſtianity have been of any real diſſervice to it. On the contrary, they have cauſed the arguments in its favour to be examined with greater force and clearneſs, and have been the means of producing ſuch defences of it, as all the acuteneſs of modern infidelity has been unable to overthrow.

LANGUAGE.] The Engliſh language is known to be a compound of almoſt every other language in Europe, particularly the Saxon, the French, and the Celtic. The Saxon predominates; and the words that are borrowed from the French, being radically Latin, are common to other nations, particularly the Spaniards and the Italians. To deſcribe it abſtractedly would be ſuperfluous to an Engliſh reader, but relatively it enjoys all the properties, without many of the defects, of other European languages. It is more energetic, manly, and expreſſive, than either the French or the Italian; more copious than the Spaniſh, and more harmonious than the German, or the other northern tongues. It is, however, ſubject to provincialities in its accent, there being much difference in the pronunciation of the inhabitants of different counties; but this chiefly affects the loweſt of the people; for as to well-educated and well-bred perſons, there is little difference in their pronunciation. People of fortune and education in England, of both ſexes, alſo commonly either ſpeak, or underſtand the French, and many of them the Italian and Spaniſh: but it has been obſerved, that foreign nations have great difficulty in underſtanding the Engliſh who talk Latin, which is perhaps the reaſon why that language is much diſuſed in England, even by the learned profeſſions.

LEARNING AND LEARNED MEN.] England may be looked upon as another word for the ſeat of learning and the Muſes. Her great Alfred cultivated both, in the time of the Saxons, when barbariſm and ignorance overſpread the reſt of Europe; nor has there ſince his time been wanting a continual ſucceſſion of learned men, who have diſtinguiſhed themſelves by their writings or ſtudies. Theſe are ſo numerous, that a bare catalogue of their names, down to this day, would form a moderate volume. The Engliſh inſtitutions, for the benefit of ſtudy, partake of the character of their learning. They are ſolid and ſubſtantial, and provide for the eaſe, the diſencumbrance, the peace, the plenty, and the conveniency of its profeſſors; witneſs the two univerſities of Oxford and Cambridge, inſtitutions that are not to be equalled in the world, and which were reſpected amidſt the barbarous rage of civil war. The induſtrious Leland, himſelf a moving library, was the firſt who publiſhed a ſhort collection of the lives and characters of thoſe learned perſons, who preceded the reign of his maſter Henry VIII. among whom he has inſerted ſeveral of the blood-royal of both ſexes, particularly a ſon and daughter of the great Alfred, Editha, the queen of Edward the Confeſſor, and other Saxon princes, ſome of whom were equally devoted to Mars and the Muſes.

In ſpeaking of the dark ages, it would be unpardonable to omit the mention of that prodigy of learning and natural philoſophy, Roger Bacon, who was the forerunner in ſcience to the great Bacon lord Verulam, as the latter was to ſir Iſaac Newton. Among the other curious works written by this illuſtrious man, we find treatiſes upon grammar, mathematics, phyſics, the flux and reflux of the Britiſh ſea, optics, geography, aſtronomy, chronology, chemiſtry, logic, metaphyſics, ethics, medicine, theology, philology, and upon the impediments of knowledge. He lived under Henry III. and died at Oxford, about the year 1294. Mr. Walpole has preſerved the memory of ſome noble and royal Engliſh authors, who have done honour to learning and the Muſes, and to this work I muſt refer. Since the Reforma-

tion, England reſembles a galaxy of literature*; and it is but doing juſtice to the memory of cardinal Wolſey, though otherwiſe a dangerous and profligate miniſter, to acknowledge, that his example and encouragement laid the foundation of the polite arts, and greatly contributed to the revival of claſſical learning in England. As many of the Engliſh clergy had different ſentiments in religious matters at the time of the Reformation, encouragement was given to learned foreigners to ſettle in England. Edward VI. during his ſhort life, encouraged theſe foreigners, and ſhewed diſpoſitions for cultivating the moſt uſeful parts of learning. Learning, as well as liberty, ſuffered an almoſt total eclipſe in England during the bigoted reign of queen Mary. Elizabeth was herſelf a learned princeſs. She advanced many perſons of conſummate abilities to high ranks, both in church and ſtate; but ſhe ſeems to have conſidered their literary accompliſhments as ſecondary to their civil. In this ſhe ſhewed herſelf a great politician, but ſhe would have been a more amiable queen, had ſhe raiſed genius from obſcurity; for though ſhe was no ſtranger to Spenſer's Muſe, ſhe ſuffered herſelf to be ſo much impoſed upon by a taſteleſs miniſter, that the poet languiſhed to death in obſcurity. Though ſhe taſted the beauties of the divine Shakſpeare, yet we know not that they were diſtinguiſhed by any particular acts of her munificence; but her parſimony was nobly ſupplied by her favourite the earl of Eſſex, the politeſt ſcholar of his age, and his friend the earl of Southampton, both liberal patrons of genius.

The encouragement of learned foreigners in England continued to the reign of James I. who was very munificent to Caſaubon, and other foreign authors of diſtinction, even of different principles. He was himſelf no great author, but his example had an effect upon his ſubjects; for in his reign were formed thoſe great maſters of polemic divinity, whoſe works are almoſt inexhauſtible mines of knowledge. Nor muſt it be forgotten, that the ſecond Bacon, whom I have already mentioned, was by him created viſcount Verulam, and lord high chancellor of England. He was likewiſe the patron of Camden, and other hiſtorians, as well as antiquaries, whoſe works are ſtill ſtandards in thoſe ſtudies. Upon the whole, it cannot be denied, that Engliſh learning is under obligations to James I. though, as he had a very pedantic taſte himſelf, he was the means of diffuſing a ſimilar taſte among his ſubjects.

His ſon Charles I. cultivated the polite arts, eſpecially ſculpture, painting, and architecture. He was the patron of Rubens, Vandyke, Inigo Jones, and other eminent artiſts; ſo that, had it not been for the civil wars, he would probably have converted his court and capital into a ſecond Athens; and the collection he made for that purpoſe, conſidering his pecuniary difficulties, were ſtupendous. His favourite, the duke of Buckingham, imitated him in that reſpect, and laid out the amazing ſum of 400,000l. upon his cabinet of paintings and curioſities.

The earl of Arundel was, however, the great Mæcenas of that age, and by the immenſe acquiſitions he made of antiquities, eſpecially his famous marble inſcriptions, he may ſtand upon a footing, as to the encouragement and utility of literature, with the greateſt of the Medicean princes. Charles and his court had little reliſh for poetry; but ſuch was his generoſity in encouraging genius and merit of every kind, that he increaſed the ſalary of his poet laureat, the famous Ben Jonſon, from 100 marks to 100l. per annum, and a tierce of Spaniſh wine; which ſalary is continued to the preſent time.

The public encouragement of learning and the arts ſuffered indeed an eclipſe, during the time of the civil wars, and the ſucceeding interregnum. Many learned men, however, found their ſituations under Cromwell, though he was no ſtranger to their political ſentiments, ſo eaſy, that they purſued their ſtudies, to the benefit of

* See the Biographia Britannica.

every

every branch of learning; and many works of literary merit appeared even in thoſe times of diſtraction. Uſher, Walton, Willes, Harrington, Wilkins, and a number of other great names, were unmoleſted and even favoured by that uſurper; and he would even have filled the univerſities with literary merit, could he have done it with any degree of ſafety to his government.

The reign of Charles II. was diſtinguiſhed by the great proficiency to which it carried natural knowledge, eſpecially by the inſtitution of the Royal Society. The king was a good judge of thoſe ſtudies, and though irreligious himſelf, England never abounded more with learned and able divines than in his reign. He loved painting and poetry, but was far more munificent to the former than the latter. The incomparable Paradiſe Loſt, by Milton, was publiſhed in his reign, but was not read or attended to in proportion to its merit; though it was not diſregarded ſo much as has been apprehended. The reign of Charles II. notwithſtanding the bad taſte of his own court in ſeveral of the polite arts, by ſome is reckoned the Auguſtan age in England, and is dignified with the names of Boyle, Halley, Hooke, Sydenham, Harvey, Temple, Tillotſon, Barrow, Butler, Cowley, Waller, Dryden, Wycherley, and Otway. The pulpit aſſumed more majeſty, a better ſtyle, and truer energy, than it had ever known before. Claſſic literature recovered many of its native graces; and though England could not under him boaſt of a Jones and a Vandyke, yet ſir Chriſtopher Wren introduced a more general regularity in architecture than had before prevailed. Nor was ſir Chriſtopher Wren merely diſtinguiſhed by his ſkill as an architect*. His knowledge was very extenſive, and his diſcoveries in philoſophy, mechanics, &c. contributed much to the reputation of the Royal Society. Some excellent Engliſh painters (for Lely and Kneller were foreigners) alſo flouriſhed in this reign.

That of James II. though he likewiſe had a taſte for the fine arts, is chiefly diſtinguiſhed in the province of literature by thoſe compoſitions that were publiſhed by the Engliſh divines againſt popery, and which, for ſtrength of reaſoning and depth of erudition never were equalled in any age or country.

The names of Newton and Locke adorned the reign of William III. and he had a particular eſteem for the latter, as he had alſo for Tillotſon and Burnet, though he was far from being liberal to men of genius. Learning flouriſhed, however, in his reign merely by the excellency of the ſoil in which it had been planted.

The moſt uninformed readers are not unacquainted with the improvements which learning, and all the polite arts, received under the auſpices of queen Anne, and which put her court at leaſt on a footing with that of Lewis XIV. in its moſt ſplendid days. Many of the great men who had figured in the reigns of the Stuarts and William were ſtill alive, and in the full exerciſe of their faculties, when a new race ſprung up, in the republic of learning and the arts. Addiſon, Prior, Pope, Swift, lord Bolingbroke, lord Shafteſbury, Arbuthnot, Congreve, Steele, Rowe, and many other excellent writers, both in verſe and proſe, need but to be mentioned to be admired; and the Engliſh were as triumphant in literature as in war. Natural and moral philoſophy kept pace with the polite arts, and even religious and political diſputes contributed to the advancement of learning, by the liberty which the laws of England allow in ſpeculative matters, and which has been found highly advantageous in the promotion of valuable knowledge.

The miniſters of George I. were the patrons of erudition, and ſome of them were

* Mr. Horace Walpole ſays, that a variety of knowledge proclaims the univerſality, a multiplicity of works the abundance, and St. Paul's the greatneſs, of ſir Chriſtopher's genius. So many great architects as were employed on St. Peter's have not left, upon the whole, a more perfect edifice than this work of a ſingle mind. The nobleſt temple, one of the largeſt palaces, and the moſt ſumptuous hoſpital in Britain, are all the works of the ſame hand. He reſtored London, and recorded its fall. He built above fifty pariſh churches, and deſigned the monument.

no mean proficients themſelves. George II. was himſelf no Mæcenas, yet his reign yielded to none of the preceding in the numbers of learned and ingenious men it produced. The bench of biſhops was never known to be ſo well provided with able prelates, as it was in the early years of his reign; a proof that his nobility and miniſters were judges of literary qualifications. In other departments of erudition, the favour of the public generally ſupplied the coldneſs of the court. After the rebellion in the year 1745, when Mr. Pelham was conſidered as firſt miniſter, this ſcreen between government and literature was in a great meaſure removed, and men of genius began then to taſte the royal bounty. Since that period, a great progreſs has been made in the polite arts in England. The Royal Academy has been inſtituted, ſome very able artiſts have ariſen, and the annual public exhibitions of painting and ſculpture have been extremely favourable to the arts, by promoting a ſpirit of emulation, and exciting a greater attention to works of genius of this kind among the public in general. Notwithſtanding theſe favourable circumſtances, the fine arts (except muſic, the encouragement of which becomes daily more extravagant) have been far from meeting with that public patronage to which they have ſo juſt a claim. Few of our public edifices are adorned with paintings or with ſtatues. The ſculptors meet with little employment, nor is the hiſtorical painter much patronized; though the Britiſh artiſts of the preſent age have proved their genius not inferior to that of any other nation.

Beſides learning, and the fine arts in general, the Engliſh excel in what we call the learned profeſſions. Their courts of juſtice are adorned with greater abilities and virtues, perhaps, than thoſe which any other country can boaſt of. A remarkable inſtance of which occurs in the appointments, for the laſt 200 years, of their lord chancellors, who hold the higheſt and the moſt uncontrolable judicial ſeat in the kingdom, and yet it is acknowleged, that, during that time, their bench has remained unpolluted by corruption or partial affections. The few inſtances that may be alledged to the contrary fix no imputation of wilful guilt upon the parties. The great lord chancellor Bacon was cenſured indeed for corrupt practices, but malevolence itſelf does not ſay that he was guilty any farther than in too much indulgence to his ſervants. The caſe of one his ſucceſſors is ſtill more favourable to his memory, as his cenſure reflects diſgrace only upon his enemies; and his lordſhip was, in the judgment of every man of candour and conſcience, fully acquitted. Even Jefferies, infernal as he was in his politics, was never accuſed of partiality in the cauſes that came before him as chancellor.

It muſt be acknowledged, that neither pulpit nor bar-eloquence have been ſufficiently ſtudied in England; but this is owing to the genius of the people, and their laws. The ſermons of their divines are often learned, and always ſound as to the practical and doctrinal part; for the many religious ſects in England require to be oppoſed rather by reaſoning than eloquence. An unaccountable notion has, however, prevailed even among ſome of the clergy themſelves, that the latter is incompatible with the former, as if the arguments of Cicero and Demoſthenes were weakened by thoſe powers of language with which they are adorned. A ſhort time, perhaps, may remove this prepoſſeſſion, and convince the clergy, as well as the laity, that true eloquence is the firſt and faireſt handmaid of argumentation. The reader is not to imagine, that I am inſinuating that the preachers of the Engliſh church are deſtitute of the graces of elocution: no clergy in the world can equal them in purity and perſpicuity of language, though I think that if they ſtudied more than they do the power of expreſſion, they would preach with more effect. If the reſemblance of thoſe powers coming from the mouths of ignorant enthuſiaſts, are attended with the amazing effects we daily ſee, what muſt not be the conſequence if they were exerted and ſupported with ſpirit and learning?

The laws of England are of ſo peculiar a caſt that the pleadings at the bar do not admit,

admit, or but very ſparingly, of the flowers of ſpeech: and I am apt to think, that a pleading in the Ciceronian manner would produce a ridiculous effect in Weſtminſter-hall. The Engliſh lawyers, however, though they deal little in eloquence, are well verſed in rhetoric and reaſoning.

Parliamentary ſpeaking, not being bound down to that precedent which is required in the courts of law, no nation in the world can produce ſo many examples of true eloquence as the Engliſh ſenate; witneſs the fine ſpeeches made by both parties in parliament, in the reign of Charles I. and thoſe that have been printed ſince the acceſſion of the preſent family.

Medicine and ſurgery, botany, anatomy, chemiſtry, and all the arts or ſtudies for preſerving life, have been carried to a great degree of perfection by the Engliſh. Even agriculture and mechaniſm are now reduced in England to ſciences, and that too without any encouragement but ſuch as is given by private noblemen and gentlemen, who aſſociate themſelves for that purpoſe. In ſhip-building, clock-work, and the various branches of cutlery, they ſtand unrivalled.

Universities.] I have already mentioned the two univerſities of Oxford and Cambridge, which have been the ſeminaries of more learned men than any in Europe. It is certain that their buildings, which in ſplendor and architecture rival the moſt ſuperb royal edifices, the endowments, the liberal eaſe and tranquillity enjoyed by thoſe who inhabit them, ſurpaſs all the ideas which foreigners, who viſit them, conceive of literary ſocieties. So reſpectable are they in their foundations, that each univerſity ſends two members to parliament, and their chancellors and officers have a civil juriſdiction over their ſtudents, the better to ſecure their independency. Their colleges, in their revenues and buildings, exceed thoſe of many other univerſities. In Oxford there are twenty colleges and five halls: the former are very liberally endowed, but in the latter the ſtudents chiefly maintain themſelves. This univerſity is of great antiquity: it is ſuppoſed to have been a conſiderable place even in the time of the Romans; and Camden ſays, that "wiſe antiquity did, even in the Britiſh age, conſecrate this place to the Muſes." It is ſaid to have been ſtyled an univerſity before the time of king Alfred; and the beſt hiſtorians admit, that this moſt excellent prince was only a reſtorer of learning here. Alfred built three colleges at Oxford; one for divinity, another for philoſophy, and a third for grammar.

The number of officers, fellows, and ſcholars, maintained at preſent by the revenues of this univerſity, is about 1000, and the number of ſuch ſcholars as live at their own charge is uſually about 2000; the whole amounting to 3000 perſons, beſides a great number of inferior officers and ſervants belonging to the ſeveral colleges and halls. Here are four terms every year for public exerciſes, lectures, and diſputations, and particular days and hours when the profeſſors of every faculty read their lectures; and in ſome of the colleges are public lectures, to which all perſons are admitted.

There are libraries belonging to the ſeveral colleges; but beſides theſe, there are two other public libraries, the univerſity library and the Radcliffe library. The univerſity library is uſually called the Bodleian library, from ſir Thomas Bodley, its principal founder. It is a large lofty ſtructure, in the form of a Roman H, and is ſaid to contain the greateſt number of books of any library in Europe, except perhaps the Vatican. The original library has been prodigiouſly increaſed, by many large and valuable collections of Greek and Oriental manuſcripts, as well as other choice and curious books. The Radcliffe library is a ſumptuous pile of building; and was built at the ſole expence of that eminent phyſician Dr. John Radcliffe, who bequeathed forty thouſand pounds for this purpoſe. The theatre at Oxford is alſo a very magnificent ſtructure, which was erected by ſir Chriſtopher Wren, at the expence of archbiſhop Sheldon. In this edifice are performed the public

acts.

acts of the univerſity: on which occaſions the vice-chancellor being ſeated in the centre of the ſemi-circular part, the noblemen and doctors on his right and left-hand, the proctors and curators in their robes, the maſters of arts, batchelors and under-graduates, in their reſpective habits and places, together ſometimes with a great concourſe of ſtrangers of both ſexes, it makes a moſt auguſt appearance.

The colleges of Oxford are,

Univerſity, which is ſituated near, or on the ſpot, where the colleges or halls which were erected by king Alfred ſtood.

Baliol, founded by ſir John de Baliol, in 1263.

Merton, founded by Walter de Merton, biſhop of Rocheſter, and high chancellor of England, in 1267.

Exeter, founded in 1316, by Walter Stapleton, biſhop of Exeter, and lord treaſurer of England.

Oriel, founded by Edward II. in the year 1324.

Queen's, founded by Robert Eglesfield, chaplain to queen Philippa, conſort to Edward III. in her honour.

New College, founded in 1386, by William of Wykeham, biſhop of Wincheſter, but finiſhed by Thomas de Rotheram, archbiſhop of York, and lord high chancellor, in the year 1475.

All Souls, founded by Henry Chichely, archbiſhop of Canterbury, in 1437.

Magdalen, founded by William Patten, alias Wainfleet, biſhop of Wincheſter, and lord chancellor, in the year 1458.

Brazen Noſe, founded in 1516, by William Smith, biſhop of Lincoln.

Corpus Chriſti, founded in 1516, by Richard Fox, biſhop of Wincheſter.

Chriſt Church, founded by cardinal Wolſey, in 1515, but completed by others, and is now the cathedral of the dioceſe.

Trinity, founded by ſir Thomas Pope, ſoon after the Reformation.

St. John Baptiſt was founded, in 1555, by ſir Thomas White, lord mayor of London.

Jeſus was begun by Dr. Hugh Price, prebendary of Rocheſter, and appropriated chiefly to the Welch.

Wadham, ſo called from its founder Nicholas Wadham, of Somerſetſhire, eſq. It was begun by him in the year 1609, but finiſhed after his death, by his lady, in 1613.

Pembroke, ſo called in honour of the earl of Pembroke, then lord high chancellor, was founded by Thomas Tefdal, eſq. and Richard Whitwicke, B. D. in 1624.

Worceſter was erected into a college by ſir Thomas Cooke, of Aſtley, in Worceſterſhire.

Lincoln college, which was founded by two biſhops of Lincoln.

To theſe 19 may be added Hertford college, formerly Hart-Hall; but a patent having paſſed the great ſeal in the year 1740 for erecting it into a college, that deſign is now carried into execution.

The five halls are theſe following: Alban-hall, Edmund-hall, St. Mary's-hall, New-Inn-hall, and St. Mary Magdalen-hall.

The Univerſity of Cambridge conſiſts of twelve colleges, and four halls; but though they are diſtinguiſhed by different names, the privileges of the colleges and halls are in every reſpect the ſame. They are the following:

Peter-houſe, founded by Hugh Balſham, prior of Ely, in 1257, who was afterwards biſhop of that ſee.

Clare-hall founded in 1340 by Richard Badew and lady Elizabeth Clare, counteſs of Ulſter.

Pembroke-hall, founded ſeven years after by a counteſs of Pembroke.

St. Bennet's or Corpus Chriſti, founded about the ſame time by the united guilds, or fraternities, of Corpus Chriſti and the bleſſed Virgin.

Trinity-hall, founded by William Bateman, biſhop of Norwich, about the year 1548.

Gonvil and Caius, founded by Edmund de Gonvil, in 1448, completed by biſhop Bateman, and additionally endowed, 200 years after, by John Caius, a phyſician.

King's college, founded by Henry VI. and completed by his ſucceſſors.

Queen's college was founded by the ſame king's conſort, but finiſhed by Elizabeth, wife to Edward IV.

Catharine-hall, founded by Richard Woodlark, in 147.

Jeſus college, founded by John Alcock, biſhop of Ely, in the reign of Henry VII.

Chriſt college was founded about the ſame time, by that king's mother, Margaret, counteſs of Richmond.

St. John's college was founded by the ſame lady.

Magdalen college was founded by Thomas Audley, baron of Walden, and lord high chancellor, in the reign of Henry VIII.

Trinity college was founded by Henry VII.

Emanuel college, by ſir Walter Mildmay, in 1584.

Sidney college was founded by Thomas Radcliff, earl of Suſſex, in 1588, and had its name from his wife Frances Sidney.

The whole number of fellows in the Univerſity of Cambridge are four hundred, and ſix hundred and ſixty-ſix ſcholars, with about two hundred and thirty-ſix officers and ſervants of various kinds, who are maintained upon the foundation. Theſe, however, are not all the ſtudents of the univerſity; there are alſo two ſorts of ſtudents, called penſioners, the greater and the leſs; the greater penſioners are ſons of the nobility, and of gentlemen of large fortunes, and are called fellow-commoners, becauſe, though they are ſcholars, they dine with the fellows; the leſſer penſioners dine with the ſcholars that are on the foundation, but live at their own expence. There are alſo a conſiderable number of poor ſcholars, called ſizars, who wait upon the fellows and ſcholars and the penſioners of both ranks, by whom they are in a great degree maintained; but the number of penſioners and ſizars cannot be aſcertained, as it is in a ſtate of perpetual fluctuation.

The ſenate-houſe at Cambridge is an elegant edifice, executed in the Corinthian order, and is ſaid to have coſt ſixteen thouſand pounds. Trinity college library is alſo a very magnificent ſtructure, and in Corpus Chriſti college library is a valuable collection of ancient manuſcripts, which were preſerved at the diſſolution of the monaſteries, and given to this college by archbiſhop Parker.

ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL. The antiquities of England are either Britiſh, Roman, Saxon, Daniſh, and Anglo-Normanic; but theſe, excepting the Roman, throw no great light upon ancient hiſtory. The chief Britiſh antiquities are thoſe circles of ſtones, particularly that called Stonehenge, in Wiltſhire, which probably were places of worſhip in the times of the Druids. Stonehenge is, by Inigo Jones, Dr. Stukeley, and others, deſcribed as a regular circular ſtructure. The body of the work conſiſts of two circles and two ovals, which are thus compoſed: the upright ſtones are placed at three feet and a half diſtance from each other, and joined at the top by over-thwart ſtones, with tenons fitted to the mortiſes in the uprights, for keeping them in their due poſition. Some of theſe ſtones are vaſtly large, meaſuring two yards in breadth, one in thickneſs, and above ſeven in height; others are leſs in proportion. The uprights

rights are wrought a little with a chiſſel, and ſometimes tapered; but the tranſoms, or over-thwart ſtones, are quite plain. The outſide circle is near one hundred and eighty feet in diameter; between which and the next circle there is a walk of three hundred feet in circumference, which has a ſurpriſing and awful effect upon the beholders. After all the deſcriptions of and diſſertations upon this celebrated antiquity by ingenious writers, it is not to be denied, that it has given riſe to many extravagant ridiculous conjectures, from the time of Leland, who has been very particular on the ſubject, down to Stukely, who on a favourite point of antiquity ſometimes formed the moſt enthuſiaſtic conjectures. The barrows that are near this monument were certainly graves of perſons of both ſexes, eminent in peace or war; ſome of them having been opened, and bones, arms, and ancient trinkets, found within them.

Monuments of the ſame kind as that of Stonehenge are to be met with in Cumberland, Oxfordſhire, Cornwall, Devonſhire, and many other parts of England, as well as in Scotland and the iſles.

The Roman antiquities in England conſiſt chiefly of altars and monumental inſcriptions, which inſtruct us as to the legionary ſtations of the Romans in Britain, and the names of ſome of their commanders. The Roman military ways give us the higheſt idea of the civil as well as military policy of thoſe conquerors. Their veſtiges are numerous; one is mentioned by Leland, as beginning at Dover, and paſſing through Kent to London, from thence to St. Albans, Dunſtable, Stratford, Towceſter, Littleburn, St. Gilbert's Hill near Shrewſbury, then by Stratton, and ſo through the middle of Wales to Cardigan. The great *via militaris*, called Hermen-ſtreet, paſſed from London through Lincoln, where a branch of it from Pontrefract to Doncaſter ſtrikes out to the weſtward, paſſing through Tadcaſter to York, and from thence to Aldby, where it again joined Hermen-ſtreet. Many veſtiges of the Roman roads in England ſerve as foundations to our preſent highways. The earl of Arundel, the celebrated Engliſh antiquary, had formed a plan for deſcribing thoſe which paſs through Suſſex and Surry towards London; but the civil war breaking out put an end to the undertaking. The remains of many Roman camps are diſcernible all over England; one particularly very little defaced, near Dorcheſter, in Dorſetſhire, where alſo is a Roman amphitheatre. Their ſituations are generally ſo well choſen, and their fortifications appear to have been ſo complete, that there is ſome reaſon to believe, that they were the conſtant habitations of the Roman ſoldiers in England; though it is certain, from the baths and teſſelated pavements that have been found in different parts, that their chief officers or magiſtrates lived in towns or villas. Roman walls have likewiſe been found in England; and, perhaps, upon the borders of Wales, many remains of their fortifications and caſtles are blended with thoſe of a later date; and it is difficult for the moſt expert architect to pronounce that ſome halls and courts are not entirely Roman. The private cabinets of noblemen and gentlemen, as well as the public repoſitories, contain a vaſt number of Roman arms, coins, fibulæ, and trinkets, which have been found in England; but the moſt amazing monument of the Roman power in England is the prætenture, or wall of Severus, commonly called the Picts Wall, running through Northumberland and Cumberland; beginning at Tinmouth, and ending at Solway Frith, being about eighty miles in length. The wall at firſt conſiſted only of ſtakes and turf, with a ditch; but, Severus built it with ſtone forts, and turrets at proper diſtances, ſo that each might have a ſpeedy communication with the other. This prodigious work, however, was better calculated to ſtrike the Scots and Picts with terror than to give any real ſecurity to the Roman poſſeſſions. In ſome places, the wall, the vallum, and the road, are plainly diſcernible. A critical account of the Roman antiquities

antiquities in England is among the desiderata of history; but perhaps it is too great a design for any one man to execute, as it cannot be done without visiting every place and every object in person.

The Saxon antiquities in England consist chiefly in ecclesiastical edifices and places of streng h. At Winchester is shewn the round table of king Arthur, with the names of his knights. The antiquity of this table has been disputed by Camden and later writers, perhaps with reason; but if it be not British, it certainly is Saxon. The cathedral of Winchester served as the burying place of several Saxon kings, whose bones were collected by bishop Fox, in six large wooden chests. Many monuments of the Saxons present themselves in different parts of the kingdom, though they are often not to be discerned from the Normanic; and the British Museum contains several striking original specimens of their learning. Many Saxon charters, signed by the king and his nobles, with a plain cross instead of their names, are still to be met with. The writing is neat and legible, and was always performed by a clergyman, who affixed the name and quality of every donor, or witness, to his respective cross. The Danish erections in England are hardly discernible from the Saxon. The form of their camps is round, and they are generally built upon eminences, but their forts are square.

England is full of Anglo-Normanic monuments, which I chuse to call so, because, though the princes under whom they were raised were of Norman original, the expence was defrayed by Englishmen. York-minster and Westminster-hall and abbey are perhaps the finest specimens to be found in Europe of that Gothic manner which prevailed in building, before the recovery of the Greek and Roman architecture. All the cathedrals and old churches in the kingdom are, more or less, in the same taste, if we except St. Paul's. In short, these erections are so common, that they scarcely deserve the name of curiosities. It is uncertain, whether the artificial excavations, found in some part of England, are British, Saxon, or Norman. That under the old castle of Ryegate in Surry is very remarkable, and seems to have been designed for secreting the cattle and effects of the natives, in time of war and invasion. It contains an oblong square hall, round which runs a bench, cut out of the same rock, for sitting upon; and tradition says, that this was the room in which the barons of England met during their wars with king John. The rock is soft, and very practicable; but it is hard to say where the excavation, which is continued in a square passage, about six feet high, and four wide, terminates.

The natural curiosities of England are so various, that I can touch upon them only in general. The medicinal waters and springs which are found in many parts of the country, have been analysed with great accuracy and care by several learned naturalists, who, as their interests or inclinations led them, have not been sparing in recommending their salubrious qualities. The most remarkable of these wells have been divided into those for bathing, and those for drinking. The chief of the former lie in Somersetshire and Derbyshire; and the Bath and Buxton waters are famous, both for drinking and bathing. Spaws of the same kind are found at Scarborough, and other parts of Yorkshire; at Tunbridge, in Kent; Epsom and Dulwich, in Surry; and at Acton and Islington, in Middlesex. There also are many remarkable springs, whereof some are impregnated with salt, as that of Droitwich in Worcestershire; or sulphur, as the famous well of Wigan in Lancashire; or bituminous matter, as that at Pitchford in Shropshire. Others have a petrifying quality, as that near Lutterworth in Leicestershire; and a dropping well in the west-riding of Yorkshire. And finally, some ebb and flow, as those of the Peak in Derbyshire, and Laywell near Torbay, whose waters rise and fall several times in an hour. To these we may add that remarkable fountain near Richard's castle in Herefordshire, commonly called Bonewell, which is generally

full of ſmall bones, like thoſe of frogs or fiſh, though often cleared out. At Ancliff, near Wigan, in Lancaſhire, is the famous burning well; the water is cold, neither has it any ſmell; yet there is ſo ſtrong a vapour of ſulphur iſſuing out with the ſtream, that upon applying a light to it, the top of the water is covered with a flame, like that of burning ſpirits, which laſts ſeveral hours, and emits ſo fierce a heat that meat may be boiled over it. The fluid itſelf will not burn when taken out of the well*.

Derbyſhire is celebrated for many natural curioſities. The Mam Tor, or Mother Tower, is ſaid to be continually mouldering away, but never diminiſhes. The Elden Hole, about four miles from the ſame place, is a chaſm in the ſide of a mountain, near ſeven yards wide, and fourteen long, diminiſhing in extent within the rock, but of what depth is not known. A plummet once drew 884 yards of line after it, whereof the loweſt eighty were wet, without finding a bottom. The entrance of Poole's Hole near Buxton, for ſeveral paces is very low, but ſoon opens into a very lofty vault, like the inſide of a Gothic cathedral. The height is certainly very great, yet much ſhort of what ſome have aſſerted, who reckon it a quarter of a mile perpendicular, though in length it exceeds that dimenſion: a current of water, which runs along the middle, adds, by its ſounding ſtream, re-echoed on all ſides, very much to the aſtoniſhment of all who viſit this vaſt concave. The drops of water which hang from the roof and on the ſides have an amuſing effect; for they not only reflect numberleſs rays from the candles carried by the guides, but as they are of a petrifying quality, they harden in ſeveral places into various forms, which, with the help of a ſtrong imagination, may paſs for lions, fonts, organs, and the like. The entrance into that natural wonder at Caſtleton, which is from its hideouſneſs named the Devil's Arſe, is wide at firſt, and upwards of thirty feet perpendicular. Several cottagers dwell under it, who ſubſiſt by rope-making, and by guiding ſtrangers into the cavern, which is croſſed by four ſtreams of water, and terminates, at the diſtance of half a mile from the mouth, in a ſubterranean lake. The vault, in ſeveral places, makes a noble appearance, and is particularly beautiful by being chequered with various coloured ſtones.

Some ſpots of England are ſaid to have a petrifying quality. We are told, that near Whitby in Yorkſhire are found certain ſtones, reſembling the folds and wreaths of a ſerpent; alſo other ſtones of ſeveral ſizes, and ſo exactly round, as if artificially made for cannon balls, which being broken, commonly contain the likeneſs of ſerpents, wreathed in circles, but generally without heads. In ſome parts of Glouceſterſhire ſtones are found, reſembling cockles, oyſters, and other teſtaceous marine animals.

CITIES, TOWNS, FORTS, AND OTHER EDIFICES, PUBLIC AND PRIVATE. } This head is ſo very extenſive, that I can only touch upon objects that may aſſiſt in giving the reader ſome idea of its importance, grandeur, or utility.

London †, the metropolis of the Britiſh empire, is the firſt in this diviſion. It appears to have been founded between the reigns of Julius Cæſar and Nero, but by whom is uncertain; for we are told by Tacitus, that it was a place of great trade in Nero's time, and ſoon after became the capital of the iſland. London was firſt walled about with hewn ſtones and Britiſh bricks by Conſtantine the Great, and the walls formed an oblong ſquare, in compaſs about three miles, with ſeven principal gates. The ſame emperor made it a biſhop's ſee; for it appears that the

* This extraordinary heat has been found to proceed from a vein of coals, which has been ſince dug from under this well; at which time the uncommon warmth ceaſed.

† London is ſituated in 51° 31′ north latitude, 400 miles ſouth of Edinburgh, and 270 ſouth-eaſt of Dublin; 180 miles weſt of Amſterdam, 210 north-weſt of Paris, 500 ſouth-weſt of Copenhagen, 600 north-weſt of Vienna, 790 ſouth-weſt of Stockholm, 800 north-eaſt of Madrid, 820 north-weſt of Rome, 850 north-eaſt of Liſbon, 1360 north-weſt of Conſtantinople, and 1414 ſouth-weſt of Moſcow.

biſhops of London and York, and another Engliſh biſhop, were at the council of Arles, in the year 314: he alſo ſettled a mint in it, as is plain from ſome of his coins.

London, in its large ſenſe, including Weſtminſter, Southwark, and part of Middleſex, is a city of ſurpriſing extent, of prodigious wealth, and of the moſt extenſive trade. This city, when conſidered with all its advantages, is now what ancient Rome once was; the ſeat of liberty, the encourager of arts, and the admiration of the world. London is the centre of trade; it has an intimate connection with all the counties in the kingdom; it is the grand mart of the nation, to which all parts ſend their commodities, from which theſe commodities are again returned. From hence innumerable carriages by land and water are conſtantly employed: and from hence ariſes that circulation in the national body, which renders every part healthful, vigorous, and in a proſperous condition; a circulation that is equally beneficial to the head and the moſt diſtant members. Merchants are here as rich as noblemen, witneſs their loans to government; and there is no place in the world where the ſhops of tradeſmen make ſuch an elegant appearance, or are better ſtocked.

It is ſituated on the banks of the Thames, a river, which, though not the largeſt, is the richeſt and moſt commodious for commerce of any in the world; it being continually filled with fleets, ſailing to or from the moſt diſtant climates; and its banks extend from London-bridge to Blackwall, almoſt one continued magazine of naval ſtores, containing three large wet docks, 32 dry docks, and 33 yards for the building of merchant-ſhips, beſides the places allotted for the building of boats and lighters, and the king's yards lower down the river for the building of men of war. As this city is about ſixty miles diſtant from the ſea, it enjoys, by means of this beautiful river, all the benefits of navigation, without the danger of being ſurpriſed by foreign fleets, or of being annoyed by the moiſt vapours of the ſea. It riſes regularly from the water-ſide, and extending itſelf on both ſides along its banks, reaches a prodigious length from eaſt to weſt in a kind of amphitheatre towards the north, and is continued for near 20 miles on all ſides, in a ſucceſſion of magnificent villas, and populous villages, the country-ſeats of gentlemen and tradeſmen. The regard paid by the legiſlature to the property of the ſubject has hitherto prevented any bounds being fixed for its extenſion.

The irregular form of this city makes it difficult to aſcertain its extent. However, its length from eaſt to weſt, is generally allowed to be above ſeven miles from Hyde-park corner to Poplar, and its breadth in ſome places three, in others two; and in others again not much above half a mile. According to a modern meaſurement, the extent of continued buildings is 35 miles two furlongs and 39 roods. But it is much eaſier to form an idea of the magnitude of a city ſo irregularly built, by the number of the people, who are computed to be above a million, and from the number of edifices devoted to the ſervice of religion.

Of theſe, beſide St. Paul's cathedral, and the collegiate church at Weſtminſter, here are 102 pariſh churches, and 69 chapels of the eſtabliſhed religion; 21 French proteſtant chapels; 11 chapels belonging to the Germans, Dutch, Danes, &c. 26 independent meetings; 34 preſbyterian meetings; 20 baptiſt meetings; 19 popiſh chapels, and meeting-houſes for the uſe of foreign ambaſſadors, and people of various ſects; and 3 Jews ſynagogues. So that there are 305 places devoted to religious worſhip, in the compaſs of this vaſt pile of buildings, without reckoning the 21 out-pariſhes uſually included in the bills of mortality, and a great number of methodiſt tabernacles.

There are alſo in and near this city 100 alms-houſes, about 20 hoſpitals and infirmaries, 3 colleges, 10 public priſons, 15 fleſh-markets; 1 market for live cattle,

2 other markets more particularly for herbs; and 23 other markets for corn, coals, hay, &c. 15 inns of court, 27 public ſquares, beſides thoſe within ſingle buildings, as the Temple, &c. 3 bridges, 49 halls for companies, 8 public ſchools, called free-ſchools; and 131 charity-ſchools, which provide education for 5034 poor children; 207 inns, 447 taverns, 551 coffee-houſes, 5975 alehouſes; 1000 hackney-coaches; 400 ditto chairs; 7000 ſtreets, lanes, courts, and alleys, and 150,000 dwelling-houſes, containing, as has been already obſerved, above 1,000,000 inhabitants, who, according to a late eſtimate, conſume annually the following articles of proviſions:

Black cattle	98,244
Sheep and lambs	711,123
Calves	194,760
Swine	186,932
Pigs	52,000
Poultry, and wild fowl innumerable	
Mackarel ſold at Billingſgate	14,740,000
Oyſters, buſhels	115,536
Small boats with cod, haddock, whiting, &c. beſides thoſe brought by land-carriage, and great quantities of river and ſalt-fiſh	1,398
Butter, pounds weight, about	16,000,000
Cheeſe, ditto, about	20,000,000
Gallons of milk	7,000,000
Barrels of ſtrong beer	1,172,494
Barrels of ſmall beer	798,495
Tons of foreign wines	30,044
Gallons of rum, brandy, and other diſtilled waters, above	11,000,000
Pounds weight of candles, above	11,000,000

London-bridge was firſt built of ſtone in the reign of Henry II. about the year 1163, by a tax laid upon wool, which in courſe of time gave riſe to the notion that it was built upon wool-packs; from that time it has undergone many alterations and improvements, particularly ſince the year 1756, when the houſes were taken down, and the whole rendered more convenient and beautiful. The paſſage for carriages is 31 feet broad, and 7 feet on each ſide for foot paſſengers. It croſſes the Thames where it is 915 feet broad, and has 19 arches of about 20 feet wide each, but the centre one is conſiderably larger.

Weſtminſter bridge is reckoned one of the moſt complete and elegant ſtructures of the kind in the known world. It is built entirely of ſtone, and extended over the river at a place where it is 1223 feet broad; which is above 300 feet broader than at London-bridge. On each ſide is a fine balluſtrade of ſtone with places of ſhelter from the rain. The width of the bridge is 44 feet, having on each ſide a fine foot-way for paſſengers. It conſiſts of 14 piers, and 13 large and two ſmall arches, all ſemicircular, that in the centre being 76 feet wide, and the reſt decreaſing four feet each from the other; ſo that the two leaſt arches of the 13 great ones are each 52 feet. It is computed that the value of 40,000 l. in ſtone, and other materials, is always under water. This magnificent ſtructure was begun in 1738, and finiſhed in 1750, at the expence of 389,000 l. defrayed by the parliament.

Black-friars bridge is not inferior to that of Weſtminſter in magnificence or workmanſhip; but the ſituation of the ground on the two ſhores obliged the architect

to

to employ elliptical arches; which, however, have a very fine effect. This bridge was begun in 1760, and finiſhed in 1770, at the expence of 152,840 l. which has been diſcharged by a toll upon the paſſengers. It is ſituated almoſt at an equal diſtance between thoſe of Weſtminſter and London, commands a view of the Thames from the latter to Whitehall, and diſcovers the majeſty of St. Paul's in a very ſtriking manner.

The cathedral of St. Paul's is the moſt capacious, magnificent, and regular Proteſtant church in the world. The length within is 500 feet; and its height, from the marble pavement to the croſs, on the top of the cupola, is 340. It is built of Portland ſtone, according to the Greek and Roman orders, in the form of a croſs, after the model of St. Peter's at Rome, to which in ſome reſpects it is ſuperior. St. Paul's church is the principal work of ſir Chriſtopher Wren, and undoubtedly the only work of the ſame magnitude that ever was completed by one man. He lived to a great age, and finiſhed the building 37 years after he laid the firſt ſtone. It takes up ſix acres of ground, though the whole length of this church meaſures no more than the width of St. Peter's. The expence of rebuilding it after the fire of London was defrayed by a duty on coals, and is computed at near a million ſterling.

Weſtminſter-abbey, or the collegiate church of Weſtminſter, is a venerable pile of building in the Gothic taſte. It was firſt built by Edward the Confeſſor; king Henry III. rebuilt it from the ground, and Henry VII. added a fine chapel to the eaſt end of it; this is the repoſitory of the deceaſed Britiſh kings and nobility; and here are alſo monuments erected to the memory of many great and illuſtrious perſonages, commanders by ſea and land, philoſophers, poets, &c. In the reign of queen Anne 4000l. a year, out of the coal-duty, was granted by parliament for keeping it in repair.

The inſide of the church of St. Stephen's Walbrook is admired for its lightneſs and elegance, and does honour to the memory of ſir Chriſtopher Wren. The ſame may be ſaid of the ſteeples of St. Mary-le-Bow and St. Bride's, which are ſuppoſed to be the moſt complete in their kind of any in Europe, though architecture has laid down no rules for ſuch erections. Few churches in or about London are without ſome beauty. The ſimplicity of the portico in Covent Garden is worthy the pureſt ages of ancient architecture. That of St. Martin's in the Fields would be noble and ſtriking, could it be ſeen from a proper point of view. Several of the new churches are built in an elegant taſte, and even ſome of the chapels have gracefulneſs and proportion to recommend them. The Banqueting houſe at Whitehall is but a ſmall part of a ſplendid palace deſigned by Inigo Jones for the royal reſidence, and as it now ſtands, under all its diſadvantages, its ſymmetry and ornaments are in the higheſt ſtyle and execution of architecture.

Weſtminſter-hall, though on the outſide it makes no very advantageous appearance, is a noble Gothic building, and ſaid to be the largeſt room in the world, whoſe roof is not ſupported by pillars, it being 220 feet long, and 70 broad. Its roof is the fineſt of its kind that can be ſeen. Here are held the coronation feaſts of our kings and queens; alſo the courts of chancery, king's bench, common-pleas, and exchequer.

The monument, erected at the charge of the city to perpetuate the memory of its being deſtroyed by fire, is worthy of notice. This column, which is of the Doric order, exceeds all the obeliſks and pillars of the ancients, it being 202 feet high, with a ſtair-caſe in the middle to aſcend to the balcony, from whence there are other ſteps, made for perſons to look out at the top, which is faſhioned like an urn, with a flame iſſuing from it. On the baſe of the monument next the ſtreet, the deſtruction of the city, and the relief given to the ſufferers by Charles II.

and

and his brother, is emblematically repreſented in bas relief. The north and ſouth ſides of the baſe have each a Latin inſcription, the one deſcribing it dreadful deſolation *, and the other its ſplendid reſurrection; and on the eaſt ſide is an inſcription, ſhewing when the pillar was begun and finiſhed. The charge of erecting this monument, which was begun by ſir Chriſtopher Wren in 1671, and finiſhed by him in 1677, amounted to upwards of 13000 l.

The Royal Exchange, a large and commodious building, is ſaid to have coſt above 80,000 l.

The terrace in the Adelphi is a very fine piece of architecture, and has laid open one of the fineſt proſpects in the world.

We might here give a particular deſcription of the Tower †, Bank of England, the New Treaſury, the Admiralty-office, and the Horſe-guards at Whitehall, the Manſion-

* Which may be thus rendered: "In the year of Chriſt, in 1666, Sept. 2. eaſtward from hence at the diſtance of 202 feet (the height of this column) a terrible fire broke out about midnight; which, driven on by a high wind, not only waſted the adjacent parts, but alſo very remote places, with incredible crackling and fury. It conſumed 89 churches, the city-gates, Guildhall, many public ſtructures, hoſpitals, ſchools, libraries, a vaſt number of ſtately edifices, 13,000 dwelling-houſes, and 400 ſtreets. Of the 26 wards it utterly deſtroyed 15, and left eight others ſhattered and half burnt. The ruins of the city were 436 acres, from the Tower by the Thames ſide to the Temple church; and from the north-eaſt along the wall to Holborn-bridge. To the eſtates and fortunes of the citizens it was mercileſs, but to their lives very favourable, that it might in all things reſemble the laſt conflagration of the world. The deſtruction was ſudden, for in a ſmall ſpace of time the city was ſeen moſt flouriſhing and reduced to nothing. Three days after, when this fatal fire had baffled all human counſels and endeavours, in the opinion of all, it ſtopped, as it were by a command from heaven, and was on every ſide extinguiſhed."

† In examining the curioſities of the Tower of London, it will be proper to begin with thoſe on the outſide the principal gate; the firſt thing a ſtranger uſually goes to viſit is the wild beaſts; which, from their ſituation, firſt preſent themſelves: for having entered the outer gate, and paſſed what is called the ſpur-guard, the keeper's houſe preſents itſelf before you, which is known by a painted lion on the wall, and another over the door which leads to their dens. By ringing a bell, and paying ſix pence each perſon, you may eaſily gain admittance.

The next place worthy of obſervation is the Mint, which comprehends near one-third of the Tower, and contains houſes for all the officers belonging to the coinage. On paſſing the principal gate you ſee the White Tower, built by William the Conqueror. This is a large, irregular ſtone building, ſituated almoſt in the centre, no one ſide anſwering to another, nor any of its watch towers, of which there are four at the top, built alike. One of theſe towers is now converted into an obſervatory. In the firſt ſtory are two noble rooms, one of which is a ſmall armoury for the ſea-ſervice, it having various ſorts of arms, very curiouſly laid up, for above 10,000 ſeamen. In the other room are many cloſets and preſſes, all filled with warlike engines and inſtruments of death. Over this are two other floors, one principally filled with arms, the other with arms and other warlike inſtruments, as ſpades, ſhovels, pick-axes, and chevaux de frize. In the upper ſtory, are kept match, ſheep-ſkins, tanned hides, &c. and in a little room, called Julius Cæſar's chapel, are depoſited ſome records, containing perhaps the ancient uſages and cuſtoms of the place. In this building are alſo preſerved the models of the new-invented engines of deſtruction, that have from time to time been preſented to the government. Near the ſouth-weſt angle, of the White-Tower, is the Spaniſh armoury, in which are depoſited the ſpoils of what was vainly called the Invincible Armada; in order to perpetuate, to lateſt poſterity, the memory of that ſignal victory, obtained by the Engliſh over the whole naval power of Spain, in the reign of Philip II.

You next come to the grand ſtore-houſe, a noble building to the northward of the White Tower, that extends 245 feet in length, and 60 in breadth. It was begun by king James II. who built it to the firſt floor; but it was finiſhed by king William III. who erected that magnificent room, called the New, or Small Armoury, in which that prince, with queen Mary, his conſort, dined in great form, having all the warrant-workmen and labourers to attend them, dreſſed in white gloves and aprons, the uſual badges of the order of maſonry. To this noble room you are led by a folding-door, adjoining to the eaſt-end of the Tower-chapel, which leads to a grand ſtair-caſe of 50 eaſy ſteps. On the left ſide of the uppermoſt landing-place is the workſhop, in which are conſtantly employed about 14 furbiſhers, in cleaning, repairing, and new-placing the arms. On entering the armoury, you ſee what they call a wilderneſs of arms, ſo artfully diſpoſed, that at one view you behold arms for near 80,000 men, all bright, and fit for ſervice; and beſides thoſe expoſed to view, there were, before the late war ſixteen cheſts ſhut up, each cheſt holding about 1000 muſkets. The arms were originally diſpoſed by Mr. Harris, who contrived

Manſion-houſe of the lord-mayor, the Cuſtom-houſe, Exciſe-office, India-houſe, and many other public buildings; beſides the magnificent edifices raiſed by our nobility; as lord Spencer's houſe, Marlborough-houſe, and Buckingham-houſe in St.

trived to place them in this beautiful order, both here and in the guard-chamber of Hampton-court. He was a common gunſmith; but after he had performed this work, which is the admiration of people of all nations, he was allowed a penſion from the crown for his ingenuity,

Upon the ground floor, under the ſmall armoury, is a large room of equal dimenſions with that, ſupported by 20 pillars, all hung round with implements of war. This room, which is 24 feet high, has a paſſage in the middle 16 feet wide.

The horſe armoury is a plain brick-building, a little to the eaſtward of the White-Tower; and is an edifice rather convenient than elegant, where the ſpectator is entertained with a repreſentation of thoſe kings and heroes of our own nation, with whoſe gallant actions it is to be ſuppoſed he is well acquainted; ſome of them equipped and ſitting on horſeback, in the ſame bright and ſhining armour they were uſed to wear when they performed thoſe glorious actions which give them a diſtinguiſhed place in the Britiſh annals.

You now come to the line of kings, which your conductor begins by reverſing the order of chronology; ſo that in following them we muſt place the laſt firſt.

In a dark, ſtrong ſtone-room, about 20 yards to the eaſtward of the grand ſtore-houſe, or new-armory, the crown jewels are depoſited. I. The imperial crown, with which it is pretended that all the kings of England have been crowned ſince Edward the Confeſſor, in 1040. It is of gold, enriched with diamonds, rubies, emeralds, ſapphires and pearls; the cap within is of purple velvet, lined with white taffety, turned up with three rows of ermine. They are, however, miſtaken in ſhewing this as the ancient imperial diadem of St, Edward; for that, with the other moſt ancient regalia of this kingdom, was kept in the arched room in the cloiſters in Weſtminſter-Abbey, till the civil war; when, in 1642, Harry Martin, by order of the parliament, broke open the iron cheſt in which it was ſecured, took it thence, and ſold it, together with the robes, ſword, and ſceptre of St. Edward. However, after tne Reſtoration, king Charles II. had one made in imitation of it, which is that now ſhewn. II. The golden orb, or globe, put into the king's right hand before he is crowned; and borne in his left hand with the ſceptre in his right, upon his return into Weſtminſter-Hall after he is crowned. It is about ſix inches in diameter, edged with pearl, and enriched with precious ſtones. On the top is an amethyſt, of a violet colour, near an inch and an half in height, ſet with a rich croſs of gold, adorned with diamonds, pearls, and precious ſtones. The whole height of the ball and cup is 11 inches. III. The golden ſceptre, with its croſs, ſet upon a large amethyſt of great value, garniſhed round with table diamonds. The handle of the ſceptre is plain; but the pummel is ſet round with rubies, emeralds, and ſmall diamonds. The top riſes into a *fleur de lis* of ſix leaves, all enriched with precious ſtones, from whence iſſues a mound or ball, made of the amethyſt already mentioned. The croſs is quite covered with precious ſtones. IV. The ſceptre, with the dove, the emblem of peace, perched on the top of a ſmall Jeruſalem croſs, finely ornamented with table diamonds and jewels of great value. This emblem was firſt uſed by Edward the Confeſſor, as appears by his ſeal; but the ancient ſceptre and dove was ſold with the reſt of the regalia, and this now in the Tower was made after the Reſtoration. V. St. Edward's ſtaff, four feet ſeven inches and an half in length, and three inches three quarters in circumference, all of beaten gold, which is carried before the king at his coronation. VI. The rich crown of ſtate, worn by his majeſty in parliament; in which is a large emerald ſeven inches round; a pearl eſteemed the fineſt in the world, and a ruby of ineſtimable value. VII. The crown belonging to his royal highneſs the prince of Wales. The king wears his crown on his head while he ſits upon the throne; but that of the prince of Wales is placed before him, to ſhew that he is not yet come to it. VIII. The late queen Mary's crown, globe, and ſceptre, with the diadem ſhe wore at her coronation with her conſort king William III. IX. An ivory ſceptre, with a dove on the top, made for king James II.'s queen, whoſe garniture is gold, and the dove on the top gold, enamelled with white. X. The *curtana*, or ſword of mercy, which has a blade of thirty-two inches long, and near two broad, is without a point, and is borne naked before the king at his coronation, between the two ſwords of juſtice, ſpiritual and temporal. XI. The golden ſpurs, and the armillas, which are bracelets for the wriſts. Theſe, though very antique, are worn at the coronation. XII. The *ampulla*, or eagle of gold, finely engraved, which holds the holy oil the kings and queens of England are anointed with: and the golden ſpoon that the biſhop pours the oil into. Theſe are two pieces of great antiquity. The golden eagle, including the pedeſtal, is about nine inches high, and the wings expand about ſeven inches. The whole weighs about ten ounces. The head of the eagle ſcrews off about the middle of the neck, which is made hollow, for holding the holy oil; and when the king is anointed by the biſhop, the oil is poured into the ſpoon out of the bird's bill. XIII. A rich ſalt-ſeller of ſtate, in form like the ſquare White Tower, and ſo exquiſitely wrought, that the workmanſhip of modern times is in no degree equal to it. It is of gold, and uſed only on the king's table at the coronation. XIV. A noble ſilver font, double gilt, and elegantly wrought, in which the royal family are chriſtened. XV. A large ſilver fountain, preſented to king Charles II. by the town of Plymouth, very curi-

ouſly,

St James's park; the earl of Chesterfield's house near Hyde-park; the duke of Devonshire's, and the late earl of Bath's, in Piccadilly; lord Shelburne's, in Berkley Square; Northumberland-house in the Strand; the duke of Bedford's, and Montague-house *, in Bloomsbury; with a number of others of the nobility and gentry; but these would be sufficient to fill a large volume.

This great city is supplied with abundance of fresh water from the Thames and the New River; which is not only of inconceivable service to every family, but by means of fire-plugs, the keys of which are deposited with the parish-officers, the city is in a great measure secured from the spreading of fire.

This plenty of water has been attended with another advantage: it has given rise to several companies, who insure houses and goods from fire; an advantage that is not to be met with in any other nation: the premium is small †, and the re-

ously wrought; but much inferior in beauty to the above. Besides these, which are commonly shewn, there are in the jewel-office, all the crown jewels worn by the princes and princesses at coronations, and a great variety of curious old plate.

The record-office consists of three rooms, one above another, and a large round room, where the rolls are kept. These are all handsomely wainscoted, the wainscot being framed into presses round each room, within which are shelves and repositories for the records; and for the easier finding of them, the year of each reign is inscribed on the inside of these presses, and the records placed accordingly. Within these presses, which amount to 56 in number, are deposited all the rolls, from the first year of the reign of king John to the beginning of the reign of Richard III. but those after this last period are kept in the Rolls Chapel. The records in the Tower, among other things, contain the foundation of abbies, and other religious houses; the ancient tenures of all the lands in England, with a survey of the manors; the original of laws and statutes; proceedings of the courts of common law and equity; the rights of England to the dominion of the British seas; leagues and treaties with foreign princes; the atchievements of England in foreign wars; the settlement of Ireland, as to law and dominion; the forms of submission of some Scottish kings for territories held in England; ancient grants of our kings to their subjects; privileges and immunities granted to cities and corporations during the period above mentioned; enrollments of charters and deeds made before the Conquest; the bounds of all the forests in England, with the several respective rights of the inhabitants to common pasture, and many other important records, all regularly disposed, and referred to in near a thousand folio indexes. This office is kept open, and attendance constantly given, from seven o'clock, till one, except in the months of December, January and February, when it is open only from eight to one, Sundays and holidays excepted. A search here is half a guinea, for which you may peruse any one subject a year.

* The British Museum is deposited in Montague house. Sir Hans Sloane, bart. (who died in 1753) may not improperly be called the founder of the British Museum; for its being established by parliament, was only in consequence of his leaving by will his noble collection of natural history, his large library, and his numerous curiosities, which cost him 50,000l. to the use of the public, on condition that the parliament would pay 20,000l. to his executors. To this collection were added the Cottonian library, the Harleian manuscripts collected by the Oxford family, and purchased likewise by the parliament, and a collection of books, given by the late major Edwards. His late majesty, in consideration of its great usefulness, was graciously pleased to add thereto the royal libraries of books and manuscripts collected by the several kings of England.

The Sloanian collection consists of an amazing number of curiosities; among which are, the library, including books of drawings, manuscripts, and prints, amounting to about 50,000 volumes. Medals, and coins, ancient and modern, 20,000. Cameos and intaglios, about 700. Seals 268. Vessels, &c. of agate, jasper, &c. 542. Antiquities, 1125. Precious stones, agates, jasper, &c. 2256. Metals, minerals, ores, &c. 2725. Crystal, spars, &c. 1864. Fossils, flints, stones, 1275. Earths, sands, salts, 1035. Bitumens, sulphurs, ambers, &c. 399. Talcs, micæ, &c. 388. Corals, spunges, &c. 1421. Testacea, or sheils, &c. 5843. Echini, echinitæ, &c. 659. Asteriæi trochi, entrochi, &c. 241. Crustaceæ, crabs, lobsters, &c. 363. Stellæ marinæ, starfishes, &c. 173. Fish, and their parts, &c. 1555. Birds, and their parts, eggs, and nests, of different species, 1172. Quadrupeds, &c. 1888. Vipers, serpents, &c. 521. Insects, &c. 5439. Vegetables, 12,506. Hortus siccus, or volumes of dried plants, 334. Humani, as calculi, anatomical preparations, 756, Miscellaneous things, natural, 2098. Mathematical instruments, 55. A catalogue of all the above is written in a number of large volumes.

† The terms of insurance are as follows, viz.

	s.	d.
Every person insuring shall pay annually for every 100l. insured on goods, inclosed in brick or stone —	2	0
If half hazardous, as to situation, or kind of goods — —	3	0
If hazardous — —	4	0
If hazardous, and half hazardous —	5	0
If hazardous, and hazardous —	6	0
For every 100l. insured on goods, inclosed in part brick and part timber —	2	6
If half hazardous, as to situation, or kind of goods — — —	3	9

covery, in caſe of loſs, eaſy and certain. Every one of theſe offices keep a ſet of men in pay, who are ready at all hours to give their aſſiſtance; and are extremely bold, dexterous, and diligent: but though their labours ſhould prove unſucceſsful, the perſon who ſuffers by this devouring element, has the comfort that muſt ariſe from a certainty of being paid the value (upon oath) of what he has inſured.

Before the conflagration in 1666, London was inelegant, inconvenient, and unhealthy, of which latter misfortune many melancholy proofs are authenticated in hiſtory, and which, without doubt, proceeded from the narrowneſs of the ſtreets, and the unaccountable projections of the buildings, that confined the putrid air, and joined with other circumſtances, ſuch as the want of water, rendered the city ſeldom free from peſtilential devaſtation. The fire which conſumed the greateſt part of the city, dreadful as it was to the inhabitants at that time, was productive of conſequences, which made ample amends for the loſſes ſuſtained by individuals; a new city aroſe on the ruins of the old; but, though more regular, open, convenient, and healthful than the former, yet it is ever to be lamented that the magnificent and uſeful plan of the great ſir Chriſtopher Wren was ſacrificed to the mean and ſelfiſh views of private property. Views which did irreparable injury to the citizens themſelves, and to the nation in general; for had the great architect's plan been followed, what has often been aſſerted muſt have been the reſult; the metropolis of this kingdom would have been the moſt elegant city in the univerſe, and of conſequence muſt, from the prodigious reſort of foreigners of diſtinction and taſte who would have viſited it, have become a fund of riches to this nation. But as the deplorable blindneſs of that age has deprived us of ſo valuable an acquiſition, it is become abſolutely neceſſary that ſome efforts ſhould be made to render the preſent plan in a greater degree anſwerable to the national character.

The plan of London, in its preſent ſtate, will in many inſtances appear, to very moderate judges, to be as injudicious a diſpoſition as can eaſily be conceived for a city of trade and commerce, on the borders of ſo noble a river as the Thames. The wharfs and quays on its banks are extremely mean and inconvenient. And the want of regularity and uniformity in the ſtreets, and the mean avenues leading to many of them, are alſo circumſtances that greatly leſſen the grandeur of its appearance. Many of the churches, and other public buildings, are likewiſe thruſt up in corners in ſuch a manner as might tempt foreigners to believe that they were deſigned to be concealed. The improvements of the city of London for ſome years paſt have, however, been great; and the new ſtreets, which are numerous, are in general more ſpacious, and built with greater regularity.

In the centre of the town, and upon the banks of the Thames, was a number of inelegant, ruinous houſes, known by the names of Durham-Yard, the Savoy, and Somerſet-Houſe. The firſt, being private property, engaged the notice of the ingenious Adams, who opened the way to a piece of ſcenery, which no city in Europe can equal. On the ſcite of Durham-Yard was raiſed upon arches the pile of the Adelphi, celebrated for its enchanting proſpect, the utility of its wharfs, and its ſubterraneous apartments anſwering a variety of purpoſes of general benefit. Contiguous to the Adelphi ſtands the Savoy, the property of government, hitherto a nuiſance; and, adjoining to the Savoy, towards the Temple, ſtood Somerſet-Houſe, where, being the property of government alſo, a new pile of buildings for public offices has been erected; and here, in a very magnificent edifice, are ele-

The premium is double upon any ſum between one and two thouſand, and treble between two and three thouſand pounds.

gant apartments appropriated for the uſe of the Royal Society, the Royal Academy of Painting and Sculpture, and the Society of Antiquaries.

Though a variety of circumſtances have hitherto been diſadvantageous to the embelliſhment of the metropolis, it muſt at the ſame time be acknowledged, that a ſpirit of improvement ſeems univerſal amongſt all degrees of people. The very elegant and neceſſary method of paving and lighting the ſtreets is felt in the moſt ſenſible manner by all ranks. The roads are continued for ſeveral miles around upon the ſame model; and, excluſive of lamps regularly placed on each ſide, at ſhort diſtances, are rendered more ſecure by watchmen ſtationed within call of each other. Nothing can appear more brilliant than thoſe lights when viewed at a diſtance, eſpecially where the roads run acroſs; and even the principal ſtreets, ſuch as Pall-Mall, New Bond-ſtreet, Oxford-ſtreet, &c. convey an idea of elegance and magnificence.

Among the liſt of improvements worthy notice may be included the Six Clerks Office, in Chancery-lane, and that very ſubſtantial building in the Old Bailey, which does honour to a people celebrated for their cleanlineſs, and for their humanity. Here the unfortunate debtor will no longer be annoyed by the dreadful rattle of chains, or by the more horrid ſounds iſſuing from the lips of thoſe wretched beings, who ſet defiance to all laws, divine and human; and here alſo the offender, whoſe crime is not capital, may enjoy all the benefits of a free open air.

Foreigners are ſurpriſed that the monarchs of the richeſt nation in Europe ſhould be ſo indifferently lodged; eſpecially as Charles I. whoſe finances were but low, compared to ſome of his ſucceſſors, had he lived undiſturbed, would probably have completed the plan which Inigo Jones drew for a royal palace, and which would have been every way ſuitable to the dignity of an Engliſh monarch. The truth is, his ſon Charles II. though he had a fine taſte for architecture, diſſipated his revenues upon his pleaſures. The reign of his brother was too ſhort for ſuch an undertaking. Perpetual wars, during the reigns of king William and queen Anne, left the parliament no money to ſpare for a palace. The two ſucceeding monarchs were indifferent as to ſuch a piece of grandeur; and though ſeveral ſchemes were drawn up for that purpoſe, yet they were never carried into execution, on account of the enormous expence.

Windſor caſtle is the only fabric that deſerves the name of a royal palace in England; and that chiefly through its beautiful and commanding ſituation, which, with the form of its conſtruction, rendered it, before the introduction of artillery, impregnable. Hampton Court was the favourite reſidence of king William. It is built in the Dutch taſte, and has ſome good apartments, and, like Windſor, lies near the Thames. Both theſe palaces have ſome good pictures, but nothing equal to the magnificent collection made by Charles I. and diſſipated in the time of the civil wars. The cartoons of Raphael, which for deſign and expreſſion are reckoned the maſter-pieces of painting, have by his preſent majeſty been removed from the gallery built for them at Hampton Court, to the queen's palace, formerly Buckingham-houſe, in St. James's Park. The palace of St. James's is commodious, but has the air of a convent; and that of Kenſington, which was purchaſed from the Finch family by king William, is remarkable only for its gardens. Other houſes, though belonging to the king, are far from deſerving the name of royal *.

Next to theſe, if not ſuperior, in magnificence and expenſive decorations, are many private ſeats in the neighbourhood of London, and all over the kingdom,

* The ſituations that have been deemed the moſt eligible for a town and country reſidence, are Hyde Park, and Richmond Park, near Peterſham. A palace in the laſt mentioned place, if executed upon a liberal plan, would at once aſtoniſh the beholder with all that is great and noble in nature and art.

wherein the opulence of the Engliſh nation is fully diſplayed. Herein alſo the princely fortunes of the nobility are made ſubſervient to the fineſt claſſical taſte; witneſs the ſeats of the marquis of Buckingham, and earl Pembroke. At the ſeat of the latter more remains of antiquity are to be found than are in the poſſeſſion of any other ſubject in the world. But thoſe houſes of the Engliſh nobility and gentry have an excellency diſtinct from what is to be met with in any other part of the globe, which is, that they are complete erections, the apartments and members being ſuitable to each other, both in conſtruction and furniture, and kept in the higheſt preſervation. It often happens, that the houſe, however elegant and coſtly, is not the principal object of the ſeat, which conſiſts in its hortulane and rural decorations, viſtas, opening landſcapes, temples, all the reſult of that enchanting art of imitating nature, and uniting beauty with magnificence. Of which the following are the moſt diſtinguiſhed, viz.

The earl of Pembroke's, at Wilton, in Wiltſhire.
Lord Clifford's, King's-Weſton, Glouceſterſhire.
Duke of Beaufort's, Badmington-Magna, ditto.
Earl Spenſer's, Wimbledon, Surry.
The late ſir Gregory Page's, Blackheath, Kent.
Sir James Tylney Long's, Epping Foreſt, Eſſex.
Duke of Grafton's, Euſton-Hall, Suffolk.
Earl of Orford's, Houghton, Norfolk.
Duke of Marlborough's, Blenheim, Oxfordſhire.
Earl of Litchfield's, Ditchley, ditto.
Marquis of Buckingham's, Stowe, Buckinghamſhire.
Earl of Bute's, Luton Hoo, Bedfordſhire.
Earl of Winchelſea's, Okeham, Rutlandſhire.
Earl of Stafford's, Broughton, Northamptonſhire.
Earl of Pomfret's, Eaſton, ditto.
Earl Spenſer's, Althorp, ditto.
Earl of Exeter's, Stamford, ditto.
Duke of Norfolk's, Workſop, Nottinghamſhire.
Duke of Devonſhire's, Chatſworth, Derbyſhire.
Lord Scarſdale's, near Derby.
Mr. Aiſlabie's, Studley-Park, Yorkſhire.
Earl of Carliſle's, at Caſtle-Howard, ditto.
Duke of Northumberland's, at Alnwick, Northumberland, and Sion-Houſe, Middleſex.
Lord Clive's, Claremont, Surry.
Earl of Inchiquin's, Cliefden-houſe, Buckinghamſhire.
Earl of Harrington's, at Peterſham, Surry.
The late counteſs of Leiceſter, Holkham Houſe, Norfolk.
Lord Deſpencer's, Mereworth Caſtle, Kent.
Lord Edgecumbe's, Mount Edgecumbe, Cornwall.
Lord Byron's, Newſtead Abbey, Nottinghamſhire.
Mr. Hoare's, Stourton Park, Wiltſhire.
The late marquis of Rockingham's, Wentworth Houſe, Yorkſhire.
Lord Petre's, Thornton, Eſſex.

It cannot be expected that I ſhould here enter into a particular detail of all the cities and towns of England, which would far exceed the limits of this work; I ſhall, therefore, only touch upon the moſt conſiderable.

Briſtol is reckoned the ſecond city in England for wealth and populouſneſs; but in trade and ſhipping, Liverpool rivals, and perhaps ſurpaſſes it. The former ſtands

upon the north and ſouth ſides of the river Avon, and the two parts of the city are connected by a ſtone-bridge. The city is not well-built; but it is ſuppoſed to contain 15,000 houſes, and 95,000 inhabitants. Here is a cathedral and eighteen pariſh-churches, beſides ſeven or eight places of worſhip. On the north ſide of a large ſquare, called Queen's ſquare, which is adorned with rows of trees, and an equeſtrian ſtatue of William the Third, there is a cuſtom-houſe, with a quay half a mile in length, ſaid to be one of the moſt commodious in England, for ſhipping and landing of merchants' goods. The exchange, wherein the merchants and traders meet, is of free-ſtone, and one of the beſt of its kind in Europe.

York is a city of great antiquity, pleaſantly ſituated on the river Ouſe; it is populous, and ſurrounded with a good wall, through which are four gates, and five poſterns. Here are ſeventeen pariſh-churches, and a cathedral, or minſter, one of the fineſt Gothic buildings in Europe. It extends in length 525 feet, and in breadth 110 feet. The nave, which is the largeſt of any in the world, excepting that of St. Peter's church at Rome, is four feet and a half wider, and eleven feet higher, than that of St. Paul's cathedral at London. At the weſt end are two towers, connected and ſupported by an arch which forms the weſt entrance, and is reckoned the largeſt Gothic arch in Europe. The windows are finely painted; and the front of the choir is adorned with ſtatues of the kings of England from William the Norman to Henry VI. and here are thirty-two ſtalls, all of fine marble, with pillars, each conſiſting of one piece of alabaſter. Here is alſo a very neat Gothic chapter-houſe. Near the cathedral is the aſſembly-houſe, an elegant ſtructure, deſigned by the late earl of Burlington. This city has a ſtone bridge of five arches over the river Ouſe.

The city of Exeter was for ſome time the ſeat of the Weſt Saxon kings; and the walls which at this time encloſe it were built by king Athelſtan, who encompaſſed it with a ditch. It is one of the firſt cities in England, as well on account of its buildings and wealth, as its extent and the number of its inhabitants. It has ſix gates, and, including its ſuburbs, is more than two miles in circumference. There are ſixteen pariſh churches, beſides chapels, and five large meeting-houſes, within the walls of this city. The trade of Exeter in ſerges, perpetuans, long-ells, druggets, kerſeys, and other woollen goods, is very great. Ships come up to the city by means of ſluices. There was a long and very ancient bridge over the river Ex, with houſes on both ſides; one half of it is now demoliſhed, and an arm turned to join it to the new bridge built on a line with the fore ſtreet.

The city of Glouceſter ſtands on a pleaſant hill, with houſes on every deſcent, and is clean and well-built, with the Severn on one ſide, a branch of which brings ſhips up to it. The cathedral is an ancient and magnificent ſtructure, and there are alſo five pariſh-churches. Here is a good ſtone bridge over the river, beſides a quay, a wharf, and a cuſtom-houſe: but the trade of this city is not ſo conſiderable as formerly.

Litchfield ſtands in a valley, three miles ſouth of the Trent, divided by a ſtream which runs into that river. The cathedral was founded in 1148: it was much damaged during the civil war, but was ſo completely repaired after the Reſtoration, that it is now one of the nobleſt Gothic ſtructures in England.

Cheſter is a large, populous, and wealthy city, with a bridge that has a gate at each end, and twelve arches over the Dee, which falls into the ſea. It has eleven pariſhes, and nine well-built churches. The ſtreets are generally even and ſpacious, and, croſſing one another in ſtraight lines, meet in the centre. The walls were erected by Edelfleda, a Mercian lady, in the year 908, and join on the ſouth ſide of the city to the caſtle, from whence there is a pleaſant walk round the city upon the walls, except where it is intercepted by the towers over the gates; from hence there is a proſpect of Flintſhire, and the mountains of Wales.

War-

Warwick is a town of great antiquity, and appears to have been of eminence, even in the time of the Romans. It ſtands upon a rock of free-ſtone, on the banks of the Avon; and a way is cut to it through the rock from each of the four cardinal points. The town is populous, the ſtreets ſpacious and regular, and all meet in the centre of the town. The principal ornament of the place is a caſtle belonging to the earl of Warwick, ſtanding upon the banks of the Avon, on a rock which riſes 40 feet perpendicularly above the level of that river; and adjoining to the caſtle is a fine terrace, 50 feet above the ſame level, from whence there is a beautiful and extenſive proſpect of the river, and of the country beyond. The apartments of the caſtle are adorned with many original pictures of Vandyke and other great maſters.

The city of Coventry is large and populous, has an handſome town-houſe, and twelve gates. Here is alſo a ſpacious market-place, with a croſs in the middle, 60 feet high, adorned with ſtatues of ſeveral kings of England as large as the life.

Saliſbury is a large, neat, and well-built city, ſituated in a valley, and watered by the Upper Avon on the weſt and ſouth, and by the Bourne on the eaſt. The ſtreets are generally ſpacious, and built at right angles. The cathedral, which was finiſhed in 1258, at the expence of above 26,000 pounds, is, for a Gothic building, the moſt elegant and regular in the kingdom. It is in the form of a lantern, with a beautiful ſpire of free-ſtone in the middle, which is 410 feet high. The length of the church is 478 feet, the breadth is 76 feet, and the height of the vaulting 80 feet. This church has a cloiſter, which is 150 feet ſquare, and of fine workmanſhip. The chapter-houſe, which is an octagon, is 150 feet in circumference; and yet the roof bears all upon one ſmall pillar in the centre, ſo much too weak in appearance for the ſupport of ſuch a prodigious weight, that the conſtruction of this building is thought one of the greateſt curioſities in England.

The city of Bath took its name from ſome natural hot baths, for the medicinal waters of which this place has been long celebrated and much frequented. The ſeaſon for drinking the Bath waters are the ſpring and autumn: the ſpring ſeaſon begins with April, and ends with June; the autumn ſeaſon begins with September, and laſts till December, and ſome patients remain here all the winter. In the ſpring, this place is moſt frequented for health, and in the autumn for pleaſure, when at leaſt two-thirds of the company, conſiſting chiefly of perſons of rank and fortune, come to partake of the amuſements of the place. In ſome ſeaſons there have been 8000 perſons at Bath, beſides its inhabitants. Some of the buildings are extremely elegant, particularly Queen's-ſquare, the North and South Parade, the Royal Forum, the Circus, and Creſcent.

Nottingham is pleaſantly ſituated on the aſcent of a rock, overlooking the river Trent, which runs parallel with it about a mile to the ſouth, and is navigable. It is one of the neateſt places in England, and has a conſiderable trade.

No nation in the world has ſuch dock-yards, and all conveniencies for the conſtruction and repairs of the royal navy, as Portſmouth (the moſt regular fortification in England), Plymouth, Chatham, Woolwich, and Deptford. The royal hoſpital at Greenwich, for ſuperannuated ſeamen, is ſcarcely exceeded by any royal palace for its magnificence and expence. In ſhort, every town in England is noted for ſome particular production or manufacture, to which its building and appearance are generally fitted; and though England contains many excellent and commodious ſea-ports, yet all have an immediate connection with London, the common centre of national commerce.

COMMERCE AND MANUFACTURES.] It is well known that commerce and manufactures have raiſed the Engliſh to be a great and powerful people. Hiſtorical reviews,

reviews, on this head, would be tedious. It is ſufficient then to ſay, that it was not till the reign of Elizabeth that England began to feel her true weight in the ſcale of commerce. She planned ſome ſettlements in America, particularly Virginia, but left the expence to be defrayed by her ſubjects; and indeed ſhe was too parſimonious to carry her own ſyſtem into execution. James I. entered upon great and beneficial ſchemes for the Engliſh trade. The Eaſt-India company owes to him its ſucceſs, and Britiſh America ſaw her moſt flouriſhing colonies riſe under him and his family. The ſpirit of commerce went hand in hand with that of liberty, and though the Stuarts were not friendly to the latter, yet, during the reigns of the princes of that family, the trade of the nation greatly increaſed. It is not within my deſign to follow commerce through all her fluctuations. The nature of a geographical work requires only a general repreſentation of the ſtate of commerce; and, in this light, I flatter myſelf that I ſhall be able to treat of it with a proper degree of preciſion.

The preſent ſyſtem of Engliſh politics may properly be ſaid to have taken riſe in the reign of queen Elizabeth. At this time the Proteſtant religion was eſtabliſhed, which naturally allied us to the reformed ſtates, and made all the Popiſh powers our enemies. We began in the ſame reign to extend our trade, by which it became neceſſary to watch the commercial progreſs of our neighbours, and, if not to incommode and obſtruct their traffic, to hinder them from impairing ours. We then likewiſe ſettled colonies in America, which was become the great ſcene of European ambition; for, ſeeing with what treaſures the Spaniards were annually enriched from Mexico and Peru, every nation imagined that an American conqueſt or plantation would fill the mother-country with gold and ſilver. The diſcoveries of new regions, which were then every day made, the profit of remote traffic, and the neceſſity of long voyages, produced in a few years a great increaſe of ſhipping. The ſea was conſidered as the wealthy element; and by degrees a new kind of ſovereignty aroſe, called *naval dominion*.

As the chief trade of Europe, ſo the chief maritime power was at firſt in the hands of the Portugueſe and Spaniards, who, by a compact, to which the conſent of other princes was not aſked, had divided the newly diſcovered countries between them: but the crown of Portugal having fallen to the king of Spain, or being ſeized by him, he was maſter of the naval power of the two nations, with which he kept all the coaſts of Europe in alarm, till the Armada, he had raiſed at a vaſt expence for the conqueſt of England, was deſtroyed; which put almoſt an end to the naval power of the Spaniards.

At this time the Dutch, who were oppreſſed by the Spaniards, and feared yet greater evils than they felt, reſolved no longer to endure the inſolence of their maſters: they revolted; and after a ſtruggle, in which they were aſſiſted by the money and forces of queen Elizabeth, erected an independent and powerful commonwealth. When the inhabitants of the Low Countries had formed their ſyſtem of government, and ſome remiſſion of the war gave them leiſure to form ſchemes of future proſperity, they eaſily perceived that as their territories were narrow, and their numbers ſmall, they could preſerve themſelves only by that power, which is the conſequence of wealth; and that by a people whoſe country produced only the neceſſaries of life, wealth was not to be acquired but from foreign dominions, and by tranſportation of the products of one country into another. From this neceſſity, thus juſtly eſtimated, aroſe a plan of commerce, which was for many years proſecuted with an induſtry and ſucceſs perhaps never ſeen in the world before; and by which the poor tenants of mud-walled villages and impaſſable bogs erected themſelves into high and mighty ſtates, who ſet the greateſt monarchs at defiance, whoſe alliance was courted by the proudeſt, and whoſe power was dreaded by the fierceſt nations.

tions. By the eſtabliſhment of this ſtate there aroſe to England a new ally, and a new rival.

In the beginning of the ſeventeenth century, which ſeems to be the period deſtined for the change of the face of Europe, France began firſt to riſe into power, and, from defending her own provinces with difficulty and fluctuating ſucceſs, to threaten her neighbours with incroachments and devaſtations. Henry IV. having, after a long ſtruggle, obtained the crown, found it eaſy to govern nobles, exhauſted and wearied by a long civil war; and having compoſed the diſputes between the Proteſtants and Papiſts, ſo as to obtain at leaſt a truce for both parties, was at leiſure to accumulate treaſure, and raiſe forces, which he propoſed to have employed in a deſign of ſettling for ever the balance of Europe. Of this great ſcheme he lived not to ſee the vanity or feel the diſappointment. The French, however, were in this reign taught to know their own power; and the great deſigns of a king, whoſe wiſdom they had ſo long experienced, even though they were not brought to actual experiment, diſpoſed them to conſider themſelves as maſters of the deſtiny of their neighbours; and from that time he, who ſhall nicely examine their ſchemes and conduct, will find that they began to aſſume an air of ſuperiority to which they had never pretended before; and that they have been always employed more or leſs openly in ſchemes of dominion, though with frequent interruptions from domeſtic troubles.

When queen Elizabeth entered upon the government, the cuſtoms produced only 36,000 l. a year; at the Reſtoration they were let to farm for 400,000 l. and produced conſiderably above double that ſum before the Revolution. The people of London, before we had any plantations, and when our trade was inconſiderable, were computed at about 100,000: at the death of queen Elizabeth, they were increaſed to 150,000, and are now above ſix times that number. In thoſe days we had not only naval ſtores, but ſhips from our neighbours. Germany furniſhed us with all things made of metals, even to nails; wine, paper, linen, and a thouſand other things, came from France. Portugal ſupplied us with ſugars; all the produce of America was poured on us from Spain; and the Venetians and Genoeſe retailed to us the commodities of the Eaſt Indies at their own price. The legal intereſt of money was 12 per cent. and the common price of our land 10 or 12 years purchaſe. We may add, that our manufactures were few, and thoſe but indifferent; the number of Engliſh merchants very ſmall, and our ſhipping inferior to what belonged in the late war to the ſingle county of Lancaſter.

Great Britain is the moſt proper country for trade; as well from its ſituation as an iſland, as from the freedom and excellency of its conſtitution, its natural products, and conſiderable manufactures. For exportation it produces many of the moſt ſubſtantial and neceſſary commodities; as butter, cheeſe, corn, cattle, wool, iron, lead, tin, copper, leather, copperas, pit-coal, alum, ſaffron, &c. Our corn ſometimes preſerves other countries from ſtarving. Our horſes are the moſt ſerviceable in the world, and highly valued by all nations for their hardineſs, beauty, and ſtrength. We victual not only our own fleets, but many foreign veſſels. Our iron we export manufactured in great guns, carcaſſes, bombs, &c. Prodigious, and almoſt incredible, is the value likewiſe of other goods from hence exported; viz. hops, flax, hemp, hats, ſhoes, houſehold-ſtuff, ale, beer, red-herrings, pilchards, ſalmon, oyſters, liquorice, watches, ribbands, toys, &c.

There is ſcarcely a manufacture in Europe but what is brought to great perfection in England; and therefore it is unneceſſary to enumerate them all. The woollen manufacture is the moſt conſiderable, and exceeds in goodneſs and quantity that of any other nation. Hardware is another capital article; locks, edge-tools, guns, ſwords, and other arms, exceed any thing of the kind; houſehold utenſils of

braſs, iron, and pewter, are alſo very great articles; and our clocks and watches are in great eſteem.

Of the Britiſh commerce, that branch which we enjoyed excluſively, viz. the commerce with our colonies, was long regarded as the moſt advantageous. Yet ſince the ſeparation of the American States from Great Britain, the trade, the induſtry, and manufactures of the latter have continually increaſed. New markets have opened, the returns from which are more certain and leſs tedious than thoſe from America. By ſupplying a greater variety of markets, the ſkill and ingenuity of our artiſans hath taken a wider range; the productions of their labour have been adapted to the wants, not of riſing colonies, but of nations the moſt wealthy and the moſt refined; and our commercial ſyſtem, no longer reſting on the artificial baſis of monopoly, hath been rendered more ſolid as well as more liberal. Before the late war, the chief commodities exported to the colonies were wrought iron, ſteel, copper, pewter, lead, and braſs, cordage, hemp, ſail-cloth, ſhip-chandlery, painter's colours, millenery, hoſiery, haberdaſhery, gloves, hats, broad cloths, ſtuffs, flannels, Colcheſter bays, long ells, ſilks, gold and ſilver lace, Manchester goods, Britiſh, foreign, and Iriſh linens, earthen wares, grind-ſtones, Birmingham and Sheffield wares, toys, ſadlery, cabinet wares, ſeeds, cheeſe, ſtrong beer, ſmoking pipes, ſnuffs, wines, ſpirits, and drugs; Eaſt India goods, books, paper and leather.

The commodities exported from America to Great Britain, and other markets, were tobacco, rice, flour, biſcuit, wheat, beans, peas, oats, Indian corn, and other grain; honey, apples, cyder, and onions; ſalt-beef, pork, hams, bacon, veniſon, tongues, butter, and cheeſe; prodigious quantities of cod, mackarel, and other fiſh, and fiſh oil; furs and ſkins of wild beaſts, ſuch as bear, beaver, otter, fox, deer, and racoon; horſes, and live ſtock; timber planks, maſts, boards, ſtaves, ſhingles, pitch, tar, and turpentine; ſhips built for ſale; flax, flax-ſeed, and cotton; indigo, pot-aſh, bees-wax, tallow, copper ore, and iron in bars and in pigs; beſides many other commodities, peculiar to the climes and ſoil of different provinces. The following is a ſtate of the trade between Great Britain and the colonies, as it exiſted before the differences broke out between them, marking at the ſame time the commercial ſtrength and ſhipping of the colonies.

Colonies.	Ships.	Seamen.	Exports from Great Britain.	Exports from the Colonies.
Hudſon's Bay	4	130	£. 16,000	£. 29,340
Labrador, American veſſels 120				49,050
Newfoundland (3000 boats)	380	20,560	273,400	345,000
Canada	34	408	105,000	105,000
Nova Scotia	6	72	26,500	38,000
New England	46	552	395,000	370,500
Rhode Iſland, Connecticut, and New Hampſhire	3	36	12,000	114,500
New York	30	330	531,000	526,000
Penſylvania	35	390	611,000	705,500
Virginia and Maryland	330	3,960	865,000	1,040,000
North Carolina	34	408	18,000	68,450
South Carolina	140	1,680	365,000	395,666
Georgia	24	240	49,000	74,200
Eaſt Florida	2	24	7,000	
Weſt ditto	10	120	97,000	63,000
	1,078	28,910	3,370,900	3,924,206

The principal iſlands belonging to the Engliſh, in the Weſt Indies, are Jamaica, Barbadoes, St. Chriſtopher's, Grenada, Antigua, St. Vincent, Dominica, Anguilla, Nevis, Montſerrat, the Bermudas, or Summer Iſlands, and the Bahama, or Lucayan Iſlands in the Atlantic ocean.

The Engliſh trade with their Weſt India iſlands conſiſts chiefly in ſugars, rum, cotton, logwood, cocoa, coffee, pimento, ginger, indigo, materials for dyers, mahogany and machineel planks, drugs and preſerves; for theſe the exports from England are oſnaburgs, a coarſe kind of linen, with which the Weſt Indians now clothe their ſlaves; linen of all ſorts, with broad cloth and kerſies, for the planters, their overſeers and families; ſilks and ſtuffs for their ladies and houſhold ſervants; hats; red caps for their ſlaves of both ſexes; ſtockings and ſhoes of all ſorts; gloves and millinery ware, perukes, laces for linen, woollen, and ſilks; ſtrong beer, pale beer, pickles, candles, butter, and cheeſe; iron ware, as ſaws, files, axes, hatchets, chiſels, adzes, hoes, mattocs, gouges, planes, augres, nails; lead, powder, and ſhot; braſs and copper wares; toys, coals, and pantiles; cabinet wares, ſnuffs, and in general whatever is raiſed or manufactured in Great Britain; alſo negroes from Africa, and all ſorts of India goods.

The trade of England to the Eaſt Indies conſtitutes one of the moſt ſtupendous political, as well as commercial machines, that is to be met with in hiſtory. The trade itſelf is excluſive, and lodged in a company, which has a temporary monopoly of it, in conſideration of money advanced to the government. Without entering into the hiſtory of the Eaſt India trade, within theſe twenty years paſt, and the company's concerns in that country, it is ſufficient to ſay, that, beſide their ſettlements on the coaſt of India, which they enjoy under certain reſtrictions by act of parliament; they have, through the various internal revolutions which have happened at Indoſtan, and the ambition or avarice of their ſervants and officers, acquired ſuch territorial poſſeſſions, as renders them the moſt formidable commercial republic (for ſo it may be called in its preſent ſituation) that has been known in the world ſince the demolition of Carthage. Their revenues are only known, and that but imperfectly, to the directors of the company, who are choſen by the proprietors of the ſtock; but it has been publicly affirmed, that they amount annually to above three millions and a half ſterling. The expences of the company in forts, fleets, and armies, for maintaining thoſe acquiſitions, are certainly very great; but after theſe are defrayed, the company not only cleared a vaſt ſum, but was able to pay to the government four hundred thouſand pounds yearly for a certain time, partly by way of indemnification for the expences of the public in protecting the company, and partly as a tacit tribute for thoſe poſſeſſions that are territorial, and not commercial. This republic therefore cannot be ſaid to be independent; and it is hard to ſay what form it may take when the term of the bargain with the government is expired. For many years paſt, the company's ſervants have enriched themſelves more than the public.

This company exports to the Eaſt Indies all kinds of woollen manufacture, all ſorts of hard-ware, lead, bullion, and quickſilver. Their imports conſiſt of gold, diamonds, raw-ſilks, drugs, tea, pepper, arrack, porcelain or China ware, ſalt petre for home conſumption: and of wrought ſilks, muſlins, callicoes, cottons, and all the woven manufactures of India, for exportation to foreign countries. I ſhall now proceed to a conciſe view of the Engliſh trade to other countries, according to the lateſt and moſt authentic accounts.

To Turkey, England ſends in her own bottoms, woollen cloths, tin, lead, and iron, hard-ware, iron utenſils, clocks, watches, verdegris, ſpices, cochineal, and log-wood. She imports from thence raw-ſilks, carpets, ſkins, dying drugs, cotton, fruits, medicinal drugs, coffee, and ſome other articles. Formerly, the balance of this trade was about 500,000l. annually, in favour of England. The Engliſh trade was afterwards diminiſhed through the practices of the French; but the Turkey trade at preſent is at a very low ebb with the French as well as the Engliſh.

England exports to Italy woollen goods of various kinds, peltry, leather, lead,

tin, fiſh, and Eaſt India goods; and brings back raw and thrown ſilk, wines, oil, ſoap, olives, oranges, lemons, pomegranates, dried fruits, colours, anchovies, and other articles of luxury; the balance of this trade in favour of England, is annually about 200,000l.

To Spain England ſends all kinds of woollen goods, leather, tin, lead, fiſh, corn, iron, and braſs manufactures; haberdaſhery wares, aſſortments of linen from Germany, and elſewhere, for the American colonies: and receives in return, wines, oils, dried fruits, oranges, lemons, olives, wool, indigo, cochineal, and other dying drugs, colours, gold and ſilver coin.

Portugal formerly was, upon commercial accounts, the favourite ally of England, whoſe fleets and armies have more than once ſaved her from deſtruction. Of late, her miniſtry have changed their ſyſtem, and have partly fallen in with the views of the houſe of Bourbon. They have eſtabliſhed courts, which are inconſiſtent with the treaties of Portugal and England, and defraud the Engliſh merchants of great part of their capitals, which they find it impoſſible to recover. They have likewiſe erected two Brazil companies; the one for Marenham and Gran Para, the other for Perambuco, greatly to the detriment of the Engliſh rights, but to their own national advantage. Before theſe events took place, the Engliſh trade to Portugal was highly beneficial. England ſent to that country almoſt the ſame kind of merchandizes as to Spain, and they received in return vaſt quantities of wines, with oils, ſalt, dried and moiſt fruits, dying drugs, and gold coins.

To France, England ſends tobacco, lead, tin, flannels, horns, and ſometimes corn; and brings home a much greater value in wines, brandies, brocades, linen, cambrics, lace, velvets, and many other goods. But as there is now a commercial treaty ſubſiſting between England and France, time only can diſcover which country will have the advantage.

England ſends to Flanders, ſerges, flannels, tin, lead, ſugars, and tobacco; and receives in return, laces, linen, cambrics, and other articles of luxury, by which England loſes upon the balance, 250,000l. ſterling yearly. To Germany, England ſends cloths and ſtuffs, tin, pewter, ſugars, tobacco, and Eaſt India merchandize; and brings thence, linen, thread, goat-ſkins, tinned plates, wines, and many other articles. Before the late war, the balance of this trade was thought to be 500,000l. annually to the prejudice of England, but that diſadvantage is now leſſened, as moſt of the German princes find it their intereſt to clothe their armies in Engliſh manufactures. I have already mentioned the trade with Denmark, Norway, Sweden, and Ruſſia, which formerly was againſt England; but the balance was lately diminiſhed by the great improvements of her American colonies, in raiſing hemp, flax, making pot-aſhes, iron-works, and tallow, all which uſed to be furniſhed to her by the northern powers. The goods exported to Poland, chiefly by the way of Dantzic, are many, and the duties upon them low. Many articles are ſent there for which there is no longer any demand in other countries. Poland conſumes large quantities of our woollen goods, hardware, lead, tin, ſalt, ſea-coal, &c. and the export of manufactured tobacco is greater to Poland than to any other country. The balance of trade may be eſtimated much in our favour.

To Holland, England ſends an immenſe quantity of many ſorts of merchandize, ſuch as all kinds of woollen goods, hides, corn, coals, Eaſt India and Turkey merchandize, tobacco, tar, ſugar, rice, ginger, and other American productions: and makes return in fine linen, lace, cambrics, thread, tapes, incle, madder, boards, drugs, whalebone, train-oil, toys, and many other things. The balance is ſuppoſed to be in favour of England.

The acquiſitions which the Engliſh made upon the coaſt of Guinea, particularly their

their ſettlement at Senegal, opened new ſources of commerce with Africa. The French, when in poſſeſſion of Senegal, traded there for gold, ſlaves, hides, oſtrich feathers, bees-wax, millet, ambergris, and above all for that uſeful commodity gum Senegal, which was monopolized by them and the Dutch, and probably will again, as Senegal is now delivered up to them by the late treaty of peace. At preſent, England ſends to the coaſt of Guinea, ſundry ſorts of coarſe woollen and linen, iron, pewter, braſs, and hardware manufactures, lead-ſhot, ſwords, knives, fire-arms, gun-powder, and glaſs manufactures. And, beſides its drawing no money out of the kingdom, it lately ſupplied the American colonies with negro ſlaves, amounting in number to above 100,000 annually. The other returns are in gold-duſt, gum, dying and other drugs, red-wood, Guinea grains, and ivory.

To Arabia, Perſia, China, and other parts of Aſia, England ſends much foreign ſilver coin, and bullion, and ſundry Engliſh manufactures of woollen goods, and of lead, iron, and braſs; and brings home from thoſe remote regions, muſlins and cottons of many various kinds, callicoes, raw and wrought ſilk, chintz; teas, porcelain, gold-duſt, coffee, ſaltpetre, and many other drugs. And ſo great a quantity of thoſe various merchandizes are re-exported to foreign European nations, as more than compenſates fot the ſilver bullion which England carries out.

During the infancy of commerce with foreign parts, it was judged expedient to grant excluſive charters to particular bodies or corporations of men; hence the Eaſt India, South Sea, Hudſon's Bay, Turkey, Ruſſia, and Royal African companies; but the trade to Turkey, Ruſſia, and Africa, is now laid open, though the merchant who propoſes to trade thither muſt become a member of the company, be ſubject to their laws and regulations, and advance a ſmall ſum at admiſſion, for the purpoſes of ſupporting conſuls, forts, &c.

With regard to the general account of England's foreign balance, the exports have been computed at ſeven millions ſterling, and its imports at five, of which above one million is re-exported: ſo that if this calculation be true, England gains, annually, three millions ſterling in trade; but this is a point upon which the moſt experienced merchants, and ableſt calculators, differ. After all that has been ſaid, it muſt be acknowledged, that many exceptions lie to particular eſtimates. The improvements at home, in iron, ſilk, linen, cotton, and other manufactures, and the imports from America, muſt greatly diminiſh the Engliſh imports from abroad. On the other hand, ſome of the other European nations are making vigorous efforts for rivalling the Engliſh manufactures. Yet our foreign trade does not amount to one-ſixth part of the inland; the annual produce of the natural products and manufactures of England amounting to above forty-two millions. The gold and ſilver of England is received from Portugal, Spain, Jamaica, the American colonies, and Africa, but great part of this gold and ſilver we again export to Holland, and the Eaſt Indies; and it is ſuppoſed that two-thirds of the foreign traffic of England is carried on in the port of London.

Cornwall and Devonſhire ſupply tin and lead, and woollen manufactures are common to almoſt all the weſtern counties. Dorſetſhire makes cordage for the navy, feeds an incredible number of ſheep, and has large lace manufactures. Somerſetſhire, beſides furniſhing lead, copper, and lapis calaminaris, has large manufactures of bone-lace, ſtockings, and caps. Briſtol is ſaid by ſome to employ 2000 maritime veſſels of all ſizes, coaſters as well as ſhips employed in foreign voyages: it has many very important manufactures; its glaſs-bottle and drinking-glaſs occupying fifteen large houſes: its braſs-wire manufactures are alſo very conſiderable. Manufactures of all kinds (glaſs, jewellery, clocks, watches, and cutlery, in particular), are carried on in London and its neighbourhood; the gold and ſilver manufactures of London, through the encouragement given by the court and the

nobilily, already equal, if they do not exceed, thoſe of any coûntry in Europe. Colcheſter is famous for its manufactures of bays and ſerges, and alſo Exeter for ſerges and long-ells; and Norwich for its excellent ſtuffs, camelots, druggets, and ſtockings. Birmingham, though no corporation, is one of the largeſt and moſt populous towns in England, and carries on an amazing trade in excellent and ingenious hardware manufactures, particularly ſnuff and tobacco boxes, buttons, ſhoe-buckles, and many other ſorts of ſteel and braſs wares; it is here, and in Sheffield, which is famous for cutlery, that the true genius of Engliſh art and induſtry is to be ſeen; for ſuch are their excellent inventions for fabricating hard wares, that they can afford them for a fourth part of the price at which other nations can furniſh the ſame of an inferior kind: the cheapneſs of coals, all neceſſaries, and the conveniency of ſituation contribute greatly to this.

The northern counties of England carry on a prodigious trade in the coarſer and ſlighter woollen manufactures; witneſs thoſe of Halifax, Leeds, Wakefield, and Richmond, and, above all, Mancheſter; which, by its variety of beautiful cottons, dimities, tickens, checks, and the like ſtuffs, is become a large and populous place, though only a village, and its higheſt magiſtrate a conſtable. I might mention here many other manufacturing towns and places of England, each of which is noted for ſome particular commodity, but the detail would become too bulky. I muſt not however diſmiſs this head, without obſerving the beautiful procelain and earthen ware that have of late years been manufactured in different places of England particularly in Worceſterſhire and Staffordſhire. The Engliſh carpets, eſpecially thoſe of Axminſter, Wilton, and Kidderminſter, though but a late manufacture, greatly excel in beauty any imported from Turkey, and are extremely durable. Paper, which till very lately was imported in vaſt quantities from France and Holland, is now made in every part of the kingdom. The parliament, of late, has given encouragement for reviving the manufacture of ſalt-petre, which was firſt attempted in England by ſir Walter Raleigh, but was dropt afterwards in favour of the Eaſt India Company: the ſucceſs of ſuch an undertaking would be of immenſe benefit, as well as ſecurity to the nation.

After all that has been ſaid, the ſeats of manufactures, and conſequently of trade, in England, are fluctuating; they will always follow thoſe places where living is cheap, and taxes are eaſy: for this reaſon, they have been obſerved of late to remove towards the northern counties, where proviſions are in plenty, and the land-tax very low; and, probably, in a few years, the inland navigations which are completed in many parts of England, will make great alterations in its internal ſtate.

A ſhort View of the STOCKS, *or* PUBLIC FUNDS, *in England; with An Hiſtorical Account of the Eaſt India, the Bank, and the South Sea Companies.*

Theſe ſubjects are intimately connected; and all of them important in the political deſcription of England. Money is the ſtandard of the value of all the neceſſaries and accommodations of life, and paper-money is the repreſentative of that ſtandard to ſuch a degree, as to ſupply its place, and to anſwer all the purpoſes of gold and ſilver coin. Nothing is neceſſary to make this repreſentative of money ſupply the place of ſpecie, but the credit of that office or company who delivers it; which credit conſiſts in the facility afforded by the bank for converting the paper into ſpecie. The notes of the bank of England are of the ſame value as the current coin, as they may be turned into it whenever the poſſeſſor pleaſes. From hence, as notes are a kind of money, the counterfeiting them is puniſhed with death, as well as coining.

The

The method of depoſiting money in the bank, and exchanging it for notes (though they bear no intereſt), is attended with many conveniencies; as they are not only ſafer than money in the hands of the owner himſelf, but as the notes are more portable, and capable of a much more eaſy conveyance: ſince a bank note for a very large ſum may be ſent by the poſt, and to prevent theft, may, without damage, be cut in two, and ſent at two ſeveral times. Or bills, called Bank poſt-bills, may be had by application at the bank, which are particularly calculated to prevent fraud, they being made payable to the order of the perſon who takes them out, at a certain number of days after ſight; which gives an opportunity to ſtop bills at the bank, if they ſhould be loſt, and prevents their being ſo eaſily negociated by ſtrangers as common bank-notes are: and whoever conſiders the hazard, the expence, and trouble, in ſending large ſums of gold and ſilver to and from diſtant places, muſt alſo regard this as a very important advantage. Beſides which, another benefit attends them; for if they are deſtroyed by time, or other accident, the Bank will, on oath being made of ſuch accident, and ſecurity being given, pay the money to the perſon who was in poſſeſſion of them.

Bank notes differ from all kinds of ſtock in theſe three particulars: 1. They are always of the ſame value; 2. They are paid off without being transferred; and, 3. They bear no intereſt; while *ſtocks* are a ſhare in a company's funds, bought without any condition of having the principal returned.

By the word STOCK was originally meant, a particular ſum of money contributed to the eſtabliſhing a fund to enable a company to carry on a certain trade, by means of which the perſon became a partner in that trade, and received a ſhare in the profit made thereby, in proportion to the money advanced. But this term has been extended farther, to ſignify any ſum of money which has been lent to the government, on condition of receiving a certain intereſt till the money is repaid. As the ſecurity both of the government and the public companies is eſteemed preferable to that of any private perſon, as ſtock is negociable and may always be readily transferred, as the intereſt is always punctually paid when due; ſo for theſe reaſons government may commonly borrow money cheaper than individuals, from whom there is often ſome danger of loſing both principal and intereſt.

Every fund being raiſed for a particular purpoſe and limited by parliament to a certain ſum, it follows, that when the fund is completed, no more ſtock can be bought; though ſhares, already purchaſed, may be transferred from one perſon to another. This being the caſe, there is frequently a great diſproportion between the original value of the ſhares, and what is given for them when transferred; for if there are more buyers than ſellers, a perſon who is indifferent about ſelling, will not part with his ſhare without a conſiderable profit to himſelf; and on the contrary, if many are diſpoſed to ſell, and few inclined to buy, the value of ſuch ſhares will naturally fall in proportion to the impatience of thoſe who want to turn their ſtock into ſpecie.

Theſe obſervations were neceſſary to give our readers ſome idea of the nature of that unjuſtifiable and diſhoneſt practice called *Stock-jobbing*, the myſtery of which conſiſts in nothing more than this: the perſons concerned in that practice, who are denominated Stock-jobbers, make contracts to buy or ſell at a certain diſtant time, a certain quantity of ſome particular ſtock; againſt which time they endeavour, according as their contract is, either to raiſe or lower ſuch ſtock, by ſpreading rumours, and fictitious ſtories, in order to induce people either to ſell out in a hurry, and conſequently cheap, if they are to deliver ſtock; or to become unwilling to ſell it, and conſequently to make it dearer, if they are to receive ſtock.

The perſons who make theſe contracts are not in general poſſeſſed of any real ſtock; and when the time comes that they are to receive or deliver the quantity they have contracted for, they only pay ſuch a ſum of money as makes the difference be-

tween

tween the price the ſtock was at when they made the contract, and the price it happens to be at when the contract is fulfilled; and it is no uncommon thing for perſons not worth 100l. to make contracts for the buying or ſelling 100,000l. ſtock. In the language of Exchange-Alley, the buyer in this caſe is called the Bull, and the ſeller the Bear; one is for raiſing or toſſing up, and the other for lowering or trampling upon the Stock.

Beſides theſe, there is another ſet of men, who, though of a higher rank, may properly come under the ſame denomination. Theſe are the great monied men, who are dealers in ſtock, and contractors with the government whenever any new money is to be borrowed. Theſe indeed are not fictitious, but really buyers and ſellers of ſtock; but by raiſing falſe hopes, or creating groundleſs fears, by pretending to buy or ſell large quantities of ſtock on a ſudden, by uſing the forementioned ſet of men as their inſtruments, and other like practices, they are enabled to raiſe or lower the ſtocks one or two per cent. at pleaſure.

However, the real value of one ſtock above onother, on account of its being more profitable to the proprietors, or any thing that will really, or only in imagination, affect the credit of a company, or endanger the government by which that credit is ſecured, muſt naturally have a conſiderable effect on the ſtocks. Thus, with reſpect to the intereſt of the proprietors, a ſhare in the ſtock of a trading company which produces 5l. or 6l. per cent. per ann. muſt be more valuable than an annuity with government ſecurity, that produces no more than 3l. or 4l. per cent. per annum; and conſequently ſuch ſtock muſt ſell at a higher price than ſuch an annuity. Though it muſt be obſerved, that a ſhare in the ſtock of a trading company producing 5l. or 6l. per cent. per annum, will not fetch ſo much money at market as a government annuity producing the ſame ſum, becauſe the ſecurity of the company is not reckoned equal to that of government; and the continuance of their paying ſo much per annum, is more precarious, as their dividend is, or ought to be, always in proportion to the profits of their trade.

As the ſtocks of the Eaſt India, the Bank, and the South Sea companies, are diſtinguiſhed by different denominations, and are of a very different nature, we ſhall give a ſhort hiſtory of each of them, together with an account of the different ſtocks each is poſſeſſed of, beginning with the Eaſt India company, as the firſt eſtabliſhed.

EAST INDIA COMPANY.] Of the above the Eaſt India company is the principal. The firſt idea of it was formed in queen Elizabeth's time, but it has ſince undergone great alterations. Its ſhares, or ſubſcriptions, were originally only 50l. ſterling; and its capital only 369,891l. 5s. but the directors having a conſiderable dividend to make in 1676, it was agreed to join the profits to the capital, by which the ſhares were doubled, and conſequently, each became of 100l. value, and the capital, 739,782l. 10s. to which capital, if 963,639l. the profits of the company to the year 1685, be added, the whole ſtock amounts to 1,703,402l. Though the eſtabliſhment of this company was vindicated in the cleareſt manner by ſir Joſiah Child, and other able advocates, yet the partiality which the duke of York, afterwards James II. had for his favourite African trade, the loſſes it ſuſtained in wars with the Dutch, and the revolutions which had happened in the affairs of Indoſtan, damped the ardour of the public to ſupport it; ſo that at the time of the Revolution, when the war broke out with France, it was in a very indifferent ſituation. This was in a great meaſure owing to its having no parliamentary ſanction, whereby its ſtock often ſold for one half leſs than it was really worth; and it was reſolved that a new company ſhould be erected, under the authority of parliament.

The oppoſition given to all the public-ſpirited meaſures of king William, by faction, rendered this propoſal a matter of difficulty; but at laſt, after many parliamentary enquiries, the new ſubſcription prevailed; and the ſubſcribers, upon ad-

vancing two millions to the public at 8 per cent. obtained an act of parliament in their favour. The old company, however, retained a great intereſt both in the parliament and nation; and the two were united in the year 1702. In 1708, the yearly fund of 8 per cent. for two millions, was reduced to 5 per cent, by a loan of 1,200,000l. to the public, without any additional intereſt; for which conſideration the company obtained a prolongation of its excluſive privileges; and a new charter was grantnd to them, under the title of "The United Company of Merchants trading to the Eaſt-Indies." A farther ſum was lent by the company in 1730, their privileges were extended for thirty-three years, and the intereſt of their capital, which then amounted to 3,190,000l. was reduced to three per cent. and called the India 3 per cent. annuities.

Thoſe annuities are different from the trading ſtock of the company, the proprietors of which, inſtead of receiving a regular annuity, have, according to their different ſhares, a dividend of the profits ariſing from the company's trade; and that dividend riſes or falls according to the circumſtances of the company, either real, or as is too often the caſe, pretended. A proprietor of ſtock to the amount of 1000l. whether man or woman, native or foreigner, has a right to be a manager, and to give a vote in the general council. Two thouſand pounds is the qualification for a director: the directors are twenty-four in number, including the chairman and deputy-chairman, who may be re-elected in turn, ſix a year, for four years ſucceſſively. The chairman has a ſalary of 200l. a year, and each of the directors 150l. The meetings, or court of directors, are to be held at leaſt once a week; but are commonly oftener, being ſummoned as occaſion requires. Out of the body of directors are choſen ſeveral committees, who have the peculiar inſpection of certain branches of the company's buſineſs; as the committee of correſpondence, a committee of buying, a committee of treaſury, a houſe committee, a committee of warehouſe, a committee of ſhipping, a committee of accounts, a committee of lawſuits, and a committee to prevent the growth of private trade.

The amazing territorial acquiſitions of this company, computed to be 282,000 ſquare miles, and containing 30 millions of people, muſt be neceſſarily attended with a proportionable increaſe of trade *: and this, joined to the diſſenſions among its managers both at home and abroad, have of late greatly engaged the attention of the legiſlature. A reſtriction has occaſionally been laid on their dividends for a certain time. From a report of the committee, in 1773, appointed by parliament on India affairs, it appears that the India company, from the year 1708 to 1756, for the ſpace of forty-ſeven years and a half, divided the ſum of 12,000,000l. or above 280,000l. per annum, which, on a capital of 3,190,000l. amounted to above eight and a half per cent. and that at the laſt mentioned period it appeared that, beſides the above dividend, the capital ſtock of the company had been increaſed 180,000l. Conſiderable alterations were made in the affairs and conſtitution of the Eaſt India company by an act paſſed in 1773, intitled, "An act for eſtabliſhing certain rules and orders, for the future management of the affairs of the Eaſt India company, as well in India as in Europe." It was thereby enacted, that the court of directors ſhould, in future, be elected for four years: ſix members annually; but none to hold their ſeats longer than four years. That no perſon ſhould vote at the election of the directors, who had not poſſeſſed their ſtock twelve months. That the ſtock of qualification ſhould, inſtead of 500l. as it had formerly been, be 1000l. That the mayor's court at Calcutta ſhould in future be confined

* According to liſts laid before the houſe of commons, the Company employed 110 ſhips and 8170 men.

to

to ſmall mercantile cauſes, to which only its juriſdiction extended before the territorial acquiſition. That in lieu of this court, thus taken away, a new one be eſtabliſhed, conſiſting of a chief juſtice and three puiſne judges; and that theſe judges be appointed by the crown. That a ſuperiority be given to the preſidency of Bengal, over the other preſidencies in India. That the right of nominating the governor and council of Bengal ſhould be veſted in the crown. The ſalaries of the judges were alſo fixed, at 8000l. to the chief juſtice, and 6000l. a year to each of the other three. The appointments of the governor-general and council were fixed, the firſt at 25,000l. and the four others at 10,000l. each annually. This was certainly a very extraordinary act, and an immenſe power and influence were thereby added to the crown. But no proportional benefit has hitherto reſulted to the company: on the contrary, the new eſtabliſhed court of juſtice has paid ſo little attention to the manners of the inhabitants of India, and to the uſages of that country, as to occaſion the moſt alarming diſcontents among the natives, and great diſſatisfaction even among the company's own ſervants.

In the month of November 1783, Mr. Fox, then ſecretary of ſtate, brought forward a bill for new regulating the company under the ſuppoſition of the incompetency of the directors, and the preſent inſolvent ſtate of the company. The intention of the bill was, to veſt the whole powers of the Eaſt India company in *ſeven directors*, whoſe names were moved by the ſecretary of ſtate, and adopted by the houſe of commons. They were to hold their offices four years, removeable, like the twelve judges, by an addreſs of either houſe of parliament, and not by any other power: and *nine gentlemen*, moved for and adopted in the ſame manner, were to aſſiſt them in managing the commercial affairs of the company.

The effect of this was, to veſt in theſe ſeven directors the whole influence of the offices of every kind both in India and at home, belonging to the company; and the whole influence ariſing from their tranſactions in the purchaſe of goods for exportation, furniſhing ſhiping, ſtores, and recruits; the influence ariſing from the method of ſelling their goods, by bringing forward or keeping back goods at the ſales, or giving indulgencies as to payments, ſo as to accommodate thoſe who were meant to be favoured; the influence ariſing from the favour they may ſhew to thoſe who are now in England, and have left debts or effects in India, as to the mode of bringing home and recovering their fortunes; the influence of contracts of all kinds in India; of promotions, from ſtep to ſtep; of favour in the inland trade; of intimidation with reſpect to every perſon now there; the influence upon foreign companies, or foreign ſtates, who have eſtabliſhments in that country,—who, in return, may have the means of acting upon individuals in Britain; the influence upon the native princes of India, ſome of whom it was ſaid had already found the way of procuring the elections of members of parliament; and many other means of influence, which it is impoſſible to foreſee, or to trace.

This power, was not, indeed, taken from the crown; but it was to be placed in new hands, independent, during four years, equally of the crown and of the people. It was ſuppoſed neceſſarily to follow, that the whole power and patronage of India would be veſted in the members of adminiſtration, not only during four years, but as long as India ſhall belong to this kingdom. The bill paſſed the commons, but an oppoſition was formed againſt it in the houſe of lords, as placing too dangerous a power in the hands of any men. After long debates it was rejected by a majority of 19 peers. The conſequence of this was the downfall of the miniſtry, and a general revolution of the cabinet.

Various attempts for a new bill were afterwards made by Mr. Pitt and the new miniſtry; but without ſucceſs, which occaſioned, with other diſputes, a diſſolution of the houſe of commons.

However,

However, a new bill paſſed at the cloſe of the ſeſſions, 1784, by which three things were intended. Firſt, the eſtabliſhing a power of control in this kingdom, by which the executive government in India is to be connected with that over the reſt of the empire. Secondly, the regulating the conduct of the company's ſervants in India, in order to remedy the evils that have prevailed there. Thirdly, the providing for the puniſhment of thoſe perſons who ſhall continue in the practice of crimes which have brought diſgrace upon the country.

Accordingly ſix perſons are to be nominated by the king as commiſſioners for the affairs of India, of which one of the ſecretaries of ſtate and the chancellor of the exchequer for the time being ſhall be two, and the preſident is to have the caſting vote, if equally divided. New commiſſioners are to be appointed at the pleaſure of the crown. This board is to ſuperintend, direct, and control all acts, operations, and concerns, which in any wiſe relate to the civil or military government or revenues of the Britiſh territorial poſſeſſions in the Eaſt-Indies. They are ſworn to execute the ſeveral powers and truſts repoſed in them without favour or affection, prejudice or malice, to any perſon whatever. The court of directors of the company are to deliver to this board all minutes, orders, and reſolutions of themſelves and of the courts of proprietors, and copies of all letters, orders, and inſtructions propoſed to be ſent abroad, for their approbation or alteration. None to be ſent until after ſuch previous communication on any pretence whatſoever. The directors are ſtill to appoint the ſervants abroad, but the king hath a power by his ſecretary of ſtate to recall the governors and members of the councils, and all inferior magiſtrates. By this bill there is given to the governor and council of Bengal a control over the other preſidencies in all points which relate to any tranſactions with the country powers, to peace and war, or to the application of their forces and revenues; but the council of Bengal are ſubjected to the direction of the company at home, and in all caſes, except thoſe of immediate danger and neceſſity, reſtrained from acting without orders received from hence.

Another object of the bill is the redreſs of the grievances of the natives of India; to provide for the payment of the debts of the nabob of Arcot, which are a burthen on his country, diſcriminating at the ſame time thoſe which have been juſtly incurred from thoſe which have been forced upon him by the injuſtice and extortion of Engliſh oppreſſors; to aſcertain the indeterminate rights and pretenſions on which ſo many differences have ariſen between him and the rajah of Tanjore, fomented by Europeans, for the ſupport of their own intereſted views; and to deliver the zemindars, and other native landholders of India, from oppreſſion, and ſecure to them their poſſeſſions, by permanent rules of moderation and juſtice.

A material part of this bill is directed alſo againſt the abuſes ſaid to have prevailed in the civil and military departments, enjoining a thorough reviſal of their eſtabliſhment; together with a ſuppreſſion of ſuch places as are found to be uſeleſs, and of ſuch expences as may be conveniently avoided. And, in order to prevent any deluſive ſhew of retrenchment in the preſent motion, or any deviation from the wiſe ſyſtem of œconomy at a future period, this reform is directed to be conſtantly ſubmitted, in its whole ſtate and progreſs, to parliament.

Cadets and writers have hitherto been ſent to India in ſuch numbers, as to remain a burthen upon the eſtabliſhments of the company. No more of theſe are now to be ſent out, till their number is reduced within the proper complement, which is not to be exceeded in future.

The recommendations alſo of the directors under which thoſe ſervants of the company who had an intereſt in this country roſe rapidly, to the prejudice of induſtrious and meritorious men, are now rendered ineffectual; and a ſyſtem is eſtabliſhed, of ſucceſſion by ſeniority: leaving, however, to the councils abroad, that power which is indiſpenſable to all executive government, of bringing forward

(for reaſons by them to be aſſigned) any perſons of extraordinary merit or capacity, to thoſe ſituations in which they may effectually ſerve their country. From this regulation neceſſarily flows a limitation of the age of perſons entering upon the line of Eaſt India ſervice from fifteen to twenty-two years; for, if no proviſion was made to prevent children being enrolled on the eſtabliſhment, they might be brought by ſucceſſion to many important employments before they arrived at manhood: or, on the other hand, perſons advanced in years might be appointed to the ſtations of young men, for the ſole purpoſe of repairing diſſipated fortunes; and that without the proſpect of being able to do it in the courſe of years by regular advancement and legal profit. On the ſame ground, and on that of preventing, as far as poſſible, the miſchief of tainting the government of that continent, by introducing into it the parties of Great Britain, all perſons who have reſided five years in Europe, ſince their return from India, are precluded from any farther re-appointment to offices in that country; with the exception, which juſtice requires for a certain time, to ſuch perſons as are now here, or have left India without the knowledge of this proviſion.

The laſt body of regulations for the company's ſervants in India applies to offences committed in that country.

Security has been derived to Indian delinquents, from the circumſtance of their offences being committed within the territories of Indian princes, ſo as not to come within the cognizance of the Britiſh government. This act provides againſt further evaſions of this miſchievous nature, by declaring the offence equally puniſhable in whatever territory of India it is committed. Under the ſpecious name of *Preſents*, the groſſeſt extortion has frequently been practiſed; and all attempts to draw a line having proved nugatory, nothing remained but to put an entire ſtop to the practice. The act, therefore, of receiving preſents, is declared to be in itſelf extortion, and puniſhable by law accordingly. Of the ſame kind with theſe are the regulations againſt diſobedience of orders; for groſs inſtances of which we need not go far back into their hiſtory: and alſo againſt the bargaining for offices; a miſchievous practice in all countries, but moſt ſo in that, where the means of plunder are great. Both of theſe offences are accordingly pronounced miſdemeanours: and proviſion is made, that the guilty perſons ſhall not compound for them with the company, nor ever be reſtored to appointments in their ſervice. Two reſtrictions more remain: one of them binds collectors and receivers, by oath, from accepting any private gratuity, over and above the legal tribute; and the other guards againſt illicit correſpondence with the enemies of the company, and of Great Britain.

To prevent, or more eaſily puniſh, the miſconduct of the ſervants of the company, every perſon returning from India is, within the ſpace of two calendar months after his return, to deliver in upon oath, before the barons of the exchequer, an inventory of all lands, tenements, goods, debts, monies, ſecurities for money, &c. &c. ſpecifying what part thereof was not acquired or purchaſed by property acquired in conſequence of his reſidence in the Eaſt-Indies. A duplicate is to be given to the court of directors, for the inſpection of the proprietors of the company; and in caſe of a complaint within three years after the delivery of the inventory, that it is evaſive, inſufficient, or falſe, then the perſon is to be examined upon oath, in the exchequer, to ſuch interrogatories as the court ſhall think fit, or be impriſoned; and if he hath been guilty of any omiſſion or concealment to the value of 2000 l. all his real and perſonal eſtate ſhall be forfeited, one moiety to the king, and the other to the united company. Perſons arriving from India before the firſt of January, 1787, are exempted from this clauſe to deliver ſuch an inventory. Any perſon who ſhall within the ſpace of three years make diſcovery, on oath, of any part of the eſtate or property, real or perſonal, of any perſon delivering ſuch an inventory,

tory, which ſhall have been concealed, ſhall, upon conviction of the perſon, be allowed ten per cent. of the value of the eſtate or effects ſo diſcovered. It is alſo, by this bill, lawful for the attorney-general, or court of directors, to exhibit an information againſt any perſon guilty of the crime of extortion or other miſdemeanors committed in the Eaſt Indies, after the 1ſt of January, 1785, which information is to be tried by commiſſioners ſelected from both houſes of parliament. The lords are to ballot for twenty-ſix of their houſe, and the commons for forty of their number; their names are again to be put into a box to be drawn out by lot, in preſence of three judges and of the parties, and the perſon againſt whom the information hath been exhibited ſhall have the liberty to challenge as the names are drawn out, or the firſt four names of the peers, and the firſt ſix names of the commons which ſhall be drawn out, without challenging, ſhall be returned by the ſaid judges to the lord chancellor, to inſert their names with thoſe of the three judges in a *ſpecial commiſſion*, for them or any ſeven of them, of whom one of the judges always to be one, to hear and determine every ſuch information, and pronounce judgment thereon; ſuch judgment to be effectual and concluſive to all intents and purpoſes whatſoever.

Various opinions are formed concerning this famous bill; ſome contend that its principle and plan are fair, equitable, and honourable: a proteſt was entered againſt it in the houſe of lords, ſigned by five peers.

Notwithſtanding the regulations of this bill, it has been ſuſpected that they will produce no very material effect, unleſs vigorous meaſures be taken to enforce them. But it may be fairly preſumed, that the proſecutions now carrying on (1790) may be productive of ſalutary conſequences.

BANK OF ENGLAND.] The company of the Bank was incorporated by parliament, in the 5th and 6th years of king William and queen Mary, by the name of the Governors and Company of the Bank of England; in conſideration of the loan of 1,200,000 l. granted to the government; for which the ſubſcribers received almoſt 8 per cent. By this charter, the company are not to borrow under their common ſeal, unleſs by act of parliament; they are not to trade, or ſuffer any perſon in truſt for them to trade, in any goods or merchandize; but they may deal in bills of exchange, in buying or ſelling bullion, and foreign gold and ſilver coin, &c.

By an act of parliament, paſſed in the 8th and 9th year of Will. III. they were impowered to enlarge their capital ſtock to 2,201,171 l. 10s. It was then alſo enacted that the Bank ſtock ſhould be a perſonal, and not a real eſtate; that no contract, either in word or writing, for buying or ſelling Bank ſtock, ſhould be good in law, unleſs regiſtered in the books of the Bank within ſeven days, and the ſtock transferred in fourteen days, and that it ſhould be felony, without benefit of clergy, to counterfeit the common ſeal of the Bank, or any Bank note, or to alter or eraſe ſuch notes.

By another act, paſſed in the 7th of queen Anne, the company were impowered to augment their capital to 4,402,343 l. and they then advanced 400,000 l. more to the government; and in 1714 they advanced another loan of 1,500,000 l.

In the third year of the reign of king George I. the intereſt of their capital ſtock was reduced to 5 per cent. when the Bank agreed to deliver up as many exchequer bills as amounted to 2,000,000 l. and to accept an annuity of 100,000 l. and it was declared lawful for the Bank to call from their members, in proportion to their intereſts in their capital ſtock, ſuch ſums of money as in a general court ſhould be found neceſſary. If any member ſhould neglect to pay his ſhare of the monies ſo called for, at the time appointed, by notice in the London Gazette, and fixed upon the Royal Exchange, it ſhould be lawful for the Bank, not only to ſtop the dividend of ſuch member, and to apply it toward payment of the money in queſtion; but

alſo to ſtop the transfers of the ſhare of ſuch defaulter, and to charge him with the intereſt of five per cent. per annum, for the money ſo omitted to be paid: and if the principal and intereſt ſhould be three months unpaid, the Bank ſhould then have power to ſell ſo much of the ſtock belonging to the defaulter as would ſatisfy the ſame.

After this, the Bank reduced the intereſt of the 2,000,000l. lent to the government, from 5 to 4 per cent, and purchaſed ſeveral other annuities, which were afterwards redeemed by the government, and the national debt due to the Bank reduced to 1,600,000 l. But in 1742, the company engaged to ſupply the government with 1,600,000 l. at 3 per cent, which is now called the 3 per cent. annuities; ſo that the government was now indebted to the company 3,200,000 l. the one half carrying 4, and the other 3 per cent.

In the year 1746, the company agreed that the ſum of 986,800 l. due to them in the Exchequer bills unſatisfied, on the duties for licences to ſell ſpirituous liquors by retail, ſhould be cancelled, and in lieu thereof to accept of an annuity of 39.442 l. the intereſt of that ſum at 4 per cent. The company alſo agreed to advance the farther ſum of 1,000,000 l. at 4 per cent. into the exchequer, for exchequer bills iſſued upon the credit of the duties ariſing from the malt and land-tax; in conſideration of which, the company were enabled to augment their capital with 986,800 l. the intereſt of which, as well as that of the other annuities, was reduced to three and a half per cent. till the 25th of December, 1757, and from that time to carry only 3 per cent.

In order to enable them to circulate the ſaid exchequer bills, they eſtabliſhed what is now called Bank circulation: the nature of which not being well underſtood, we ſhall take the liberty to be a little more particular in its explanation than we have been with regard to the other ſtocks.

The company of the Bank are obliged to keep caſh ſufficient to anſwer not only the common, but alſo any extraordinary demand that may be made upon them; and whatever money they have by them, over and above the ſum ſuppoſed neceſſary for theſe purpoſes, they employ in what may be called the trade of the company; that is to ſay, in diſcounting bills of exchange, in buying gold and ſilver, and in government ſecurities, &c. But when the Bank entered into the above mentioned contract, as they did not keep unemployed a larger ſum of money than what they deemed neceſſary to anſwer their ordinary and extraordinary demands, they could not conveniently take out of their current caſh ſo large a ſum as a million, with which they were obliged to furniſh the government, without either leſſening the ſum employed in diſcounting, buying gold and ſilver, &c. (which would have been very diſadvantageous to them), or inventing ſome method that ſhould anſwer all the purpoſes of keeping the million in caſh. The method which they choſe, and which fully anſwers their end, was as follows:

They opened a ſubſcription, which they renew annually, for a million of money; the ſubſcribers advance 10 per cent. and enter into a contract to pay the remainder, or any part thereof, whenever the Bank ſhall call upon them, under the penalty of forfeiting the 10 per cent. ſo advanced; in conſideration of which, the Bank pays the ſubſcriber 4 per cent. intereſt for the money paid in, and one fourth per cent. for the whole ſum they agree to furniſh; and in caſe a call ſhould be made upon them for the whole, or any part thereof, the Bank farther agrees to pay them at the rate of 5 per cent. per annum for ſuch ſum till they repay it, which they are under an obligation to do at the end of the year. By this means the Bank obtains all the purpoſes of keeping a million of money by them; and though the ſubſcribers, if no call is made upon them (which is in general the caſe), receive ſix and a half per cent. for the money they advance, yet the company gains the ſum of 23,500l. per annum by the contract; as will appear by the following account:

The

The Bank receives from the government, for the advance of a million, — — — —	£. 30,000
The Bank pays to the ſubſcribers who advance, 100,000l. and engage to pay (when called for) 900,000l. more —	6,500
The clear gain to the Bank therefore is — —	23,500

This holds, provided the company ſhould make no call on the ſubſcribers, which they will be very unwilling to do, becauſe it would not only leſſen their profit, but affect the public credit in general.

The company of the Bank are allowed by government very conſiderable ſums annually for the management of the annuities paid at their office. They make dividends of the profits half-yearly, of which notice is publicly given; when thoſe who have occaſion for their money may readily receive it: but private perſons, if they judge convenient, are permitted to continue their funds, and to have their intereſt added to the principal *.

This company is under the direction of a governor, deputy-governor, and twenty-four directors, who are annually elected by the general court, in the ſame manner as in the Eaſt India company. Thirteen, or more, compoſe a court of directors for managing the affairs of the company.

SOUTH SEA COMPANY,.] During the long war with France, in the reign of queen Anne, the payment of the ſailors of the royal navy being neglected, they received tickets inſtead of money, and were frequently obliged, by their neceſſities, to ſell theſe tickets to avaricious men at a diſcount of 40l. and ſometimes 50l. per cent. By this and other means the debts of the nation unprovided for by parliament, and which amounted to 9,471,321l. fell into the hands of theſe uſurers. On which Mr. Harley, at that time chancellor of the Exchequer, and afterwards earl of Oxford, propoſed a ſcheme to allow the proprietors of theſe debts and deficiencies 6l. per cent. per annum, and to incorporate them for the purpoſe of carrying on a trade to the South Sea; and they were accordingly incorporated under the title of "the Governor and Company of Merchants of Great Britain trading to the South Seas, and other parts of America, and for encouraging the Fiſhery, &c."

Though this company ſeem formed for the ſake of commerce, the miniſtry never thought ſeriouſly, during the courſe of the war, about making any ſettlement on the coaſt of South America, which was what flattered the expectations of the people; nor was it indeed ever carried into execution, on any trade ever undertaken by this company, except the Aſſiento, in purſuance of the treaty of Utrecht, for furniſhing the Spaniards with Negroes; of which this company was deprived, upon receiving 100,000l. in lieu of all claims upon Spain, by a convention between the courts of Great Britain and Spain, ſoon after the treaty of Aix la Chapelle, in 1748.

Some other ſums were lent to the government, in the reign of queen Anne, at 6 per cent. In the third of George I. the intereſt of the whole was reduced to 5 per cent. and the company advanced two millions more to the government at the ſame intereſt. By the ſtatute of the 6th of George I. it was declared, that they might redeem all or any of the redeemable national debts; in conſideration of which, the company were empowered to augment their capital according to the ſums they ſhould diſcharge: and for enabling them to raiſe ſuch ſums for purchaſing annuities, exchanging for ready money new Exchequer bills, carrying on their trade, &c. they might, by ſuch means as they ſhould think proper, raiſe ſuch ſums of money as in a general court of the company ſhould be judged neceſſary. The company were alſo empowered to raiſe money on the contracts, bonds, or obligations, under

* The Bank company is ſuppoſed to have twelve millions of circulating paper.

their

their common ſeal, on the credit of their capital ſtock. But if the ſub-governor, deputy-governor, or other members of the company, ſhould purchaſe lands or revenues of the crown upon account of the corporation, or lend money by loan or anticipation on any branch of the revenue, other than ſuch part only on which a credit of loan was granted by parliament, ſuch ſub-governor, or other member of the company, ſhould forfeit treble the value of the money ſo lent.

The fatal South Sea ſcheme, tranſacted in the year 1720, was executed upon the laſt mentioned ſtatute. The company had at firſt ſet out with good ſucceſs, and the value of their ſtock, for the firſt five years, had riſen faſter than that of any other company; and his majeſty, after purchaſing 10,000l. ſtock, had condeſcended to be their governor. Things were in this ſituation, when, taking advantage of the above ſtatute, the South Sea bubble was projected. The pretence was, to raiſe a fund for carrying on a trade to the South Sea, and purchaſing annuities, &c. paid to the other companies: and propoſals were printed and diſtributed, ſhewing the advantages of this deſign. The ſum neceſſary for carrying it on, together with the profits that were to ariſe from it, were divided into a certain number of ſhares, or ſubſcriptions, to be purchaſed by perſons diſpoſed to adventure therein. And the better to carry on the deception, the directors engaged to make very large dividends; and actually declared, that every 100l. original ſtock would yield 50l. per annum: which occaſioned ſo great a riſe of their ſtock, that a ſhare of 100l. was ſold for upwards of 800l. This was in the month of July; but before the end of September it fell to 150l. by which multitudes were ruined, and ſuch a ſcene of diſtreſs occaſioned, as is ſcarcely to be conceived. But the conſequences of this infamous ſcheme are too well known; moſt of the directors were ſeverely fined, to the loſs of nearly all their property; ſome of them had no hand in the deception, nor gained a farthing by it; but it was agreed, they ought to have oppoſed and prevented it.

By a ſtatute of the 6th of George II. it was enacted, that from and after the 24th of June, 1733, the capital ſtock of this company, which amounted to 14,651,103l. 8s. 1d. and the ſhares of the reſpective proprietors, ſhould be divided into four equal parts; three-fourths of which be converted into a joint-ſtock, attended with annuities, after the rate of 4 per cent. until redemption by parliament, and ſhould be called the New South Sea annuities; and the other fourth part ſhould remain in the company as a trading capital ſtock, attended with the reſidue of the annuities or funds payable at the Exchequer to the company for their whole capital, till redemption; and attended with the ſame ſums allowed for the charge of management, with all effects, profits of trade, debts, privileges, and advantages, belonging to the South Sea company. That the accomptant of the company ſhould, twice every year, at Chriſtmas and Midſummer, or within one month after, ſtate an account of the company's affairs, which ſhould be laid before the next general court, in order to their declaring a dividend: and all dividends ſhould be made out of the clear profits, and ſhould not exceed what the company might reaſonbly divide without incurring any farther debt; provided that the company ſhould not at any time divide more than 4 per cent. per annum, until their debts were diſcharged; and the South-Sea company, and their trading ſtock, ſhould, excluſively from the new joint ſtock of annuities, be liable to all the debts and incumbrances of the company; and that the company ſhould cauſe to be kept, within the city of London, an office and books, in which all transfers of the new annuities ſhould be entered, and ſigned by the party making ſuch transfer, or his attorney; and the perſon to whom ſuch transfer ſhould be made, or his attorney, ſhould underwrite his acceptance; and no other method of transferring the annuities ſhould be good in law.

This company is under the direction of a governor, ſub-governor, deputy-governor, and twenty-one directors; but no perſon is qualified to be governor, his majeſty excepted, unleſs ſuch governor has, in his own name and right, 5000l. in

the trading ſtock; the ſub-governor is to have 4000 l. the deputy-governor 3000 l. and a director 2000 l. in the ſame ſtock. In every general court, every member having in his own name and right 500 l. in trading ſtock, has one vote; if 2000 l. two votes; if 3000 l. three votes, and if 5000 l. four votes.

The Eaſt India company, the Bank of England, and the South Sea company, are the only incorporated bodies to which the government is indebted, except the Million Bank, whoſe capital is only one million, conſtituted to purchaſe the reverſion of the long Exchequer orders.

The intereſt of all the debts owing by the government was lately reduced to 3 per cent. excepting only the annuities for the year 1758, the life annuities, and the Exchequer orders: but the South-Sea company ſtill continues to divide 4 per cent. on their preſent capital ſtock; which they are enabled to do from the profits they make on the ſums allowed to them for management of the annuities paid at their office, and from the intereſt of annuities which are not claimed by the proprietors.

As the prices of the different ſtocks are continually fluctuating above and below *par*, ſo when a perſon, who is not acquainted with tranſactions of that nature, reads in the papers the prices of ſtocks, where Bank ſtock is marked perhaps 127, India ditto 134 a 134½, South Sea ditto, 97½, &c. he is to underſtand that 100 l. of thoſe reſpective ſtocks ſell at ſuch a time for thoſe ſeveral ſums.

In comparing the prices of the different ſtocks one with another, it muſt be remembered, that the intereſt due on them from the time of the laſt payment, is taken into the current price, and the ſeller never receives any ſeparate conſideration for it, except in the caſe of India bonds, where the intereſt due is calculated to the day of the ſale, and paid by the purchaſer, over and above the premium agreed for. But as the intereſt on the different ſtocks is paid at different times, this, if not rightly underſtood, would lead a perſon, not well acquainted with them, into conſiderable miſtakes in his computation of their value; ſome always having a quarter's intereſt due in them more than others, which makes an appearance of a conſiderable difference in the price, when in reality there is none at all. Thus, for inſtance, Old South Sea annuities ſell for 84½ l. or 85 l. 10 s. while New South Sea annuities fetch only 84¼ l, or 84 l. 15 s. though each of them produce the ſame annual ſum of 3 per cent.; but the old annuities have a quarter's intereſt more due on them than the new annuities, which amount to 15s. the exact difference. There is, however, one or two cauſes that will always make one ſpecies of annuities ſell ſomewhat lower than another, though of the ſame real value; one of which is, the annuities making but a ſmall capital, and there not being, for that reaſon, ſo many people at all times ready to buy into it, as into others, where the capital is larger; becauſe it is apprehended that whenever the government pays off the national debt, they will begin with that particular ſpecies of annuity the capital of which is the ſmalleſt.

A ſtock may likewiſe be affected by the court of Chancery; for if that court ſhould order the money which is under their direction to be laid out in any particular ſtock, that ſtock, by having more purchaſers, will be raiſed to a higher price than any other of the like value.

By what has been ſaid, the reader will perceive how much the credit and the intereſt of the nation depend on the ſupport of the public funds, of which more particulars will be given under the article REVENUES. While the annuities are regularly paid, and the principal inſured by both prince and people, foreigners will lend us their property, and all Europe be intereſted in our welfare; the paper of the companies will be converted into money and merchandiſe, and Great Britain can never want caſh to carry her ſchemes into execution. In other nations, credit is founded on the word of the prince, if a monarchy; or that of the people, if a republic; but

but here it is eſtabliſhed on the intereſts of both prince and people, which is the ſtrongeſt ſecurity: for however lovely and engaging honeſty may be in other reſpects, intereſt in money-matters will always obtain confidence; becauſe many people pay great regard to their intereſt who have but little veneration for virtue.

CONSTITUTION AND LAWS.] Tacitus, in deſcribing ſuch a conſtitution as that of England, ſeems to think, that however beautiful it may be in theory, it will be found impracticable in the execution. Experience has proved his miſtake; for by contrivances unknown to antiquity, the Engliſh conſtitution has exiſted for above 500 years. It muſt be admitted, that it has received, during that time, many amendments, and ſome interruptions; but its principles are the ſame with thoſe deſcribed by the above mentioned hiſtorian, as belonging to the Germans, and the other northern anceſtors of the Engliſh nation. On the firſt invaſion of England by the Saxons, who came from Germany and the neighbouring countries, their laws and manners were pretty much the ſame as thoſe mentioned by Tacitus. The people had a leader in time of war. The conquered lands, in proportion to the merits of his followers, and their abilities to ſerve him, were diſtributed among them; and the whole was conſidered as the common property which they were to unite in defending againſt all invaders. Freſh adventurers coming over, under ſeparate leaders, the old inhabitants were driven into Wales; and thoſe leaders, at laſt, aſſumed the title of kings over the ſeveral diſtricts they had conquered. This change of appellation made them more reſpectable among the Britons, and their neighbours the Scots and Picts, but did not increaſe their power, which was ſtill confined to military affairs.

All civil matters were propoſed in a general aſſembly of the chief officers and the people, till, by degrees, ſheriffs and other civil officers were appointed. To Alfred we owe that maſter-piece of judicial polity, the ſubdiviſion of England into wapentakes and hundreds, and the ſubdiviſion of hundreds into tythings, names that ſtill ſubſiſt in England; and overſeers were choſen to direct them for the good of the whole. The ſheriff was the judge of all civil and criminal matters within the county, and to him, after the introduction of Chriſtianity, was added the biſhop. In proceſs of time, as buſineſs multiplied, itinerant and other judges were appointed; but by the earlieſt records, it appears that all civil matters were decided by 12 or 16 men, living in the neighbourhood of the place where the diſpute lay; and here we have the original of Engliſh juries. It is certain that they were in uſe among the earlieſt Saxon colonies, their inſtitution being aſcribed by biſhop Nicholſon to Woden himſelf, their great legiſlator and captain. Hence we find traces of juries in the laws of all thoſe countries which adopted the feodal ſyſtem, as in Germany, France, and Italy; which had a tribunal compoſed of 12 good men and true, equals or peers of the party litigant. In England we find mention made of them ſo early as the laws of king Ethelred, and that not as a new invention.

Before the introduction of Chriſtianity, we know not whether the Saxons admitted of juries in criminal matters; but we are certain that there was no action ſo criminal as not to be compenſated for by money *. A mulct was impoſed in proportion to the guilt, even if it was the murder of the king, upon the malefactor, and by paying it he purchaſed his pardon. Thoſe barbarous uſages ſeem to have ceaſed ſoon after the Saxons were converted to Chriſtianity; and caſes of murder and felony were then tried, even in the king's court, by a jury.

Royalty, among the Saxons, was not, ſtrictly ſpeaking, hereditary, though in fact it came to be rendered ſo through the affection which the people bore for the blood of their kings, and for preſerving the regularity of government. Even

* Called by the Saxons GUELT, and thence the word *guilty* in criminal trials.

eſtates

tates and honours were not ſtrictly hereditary, till they were made ſo by William the Norman. That prince, though he made conſiderable innovations in the Engliſh conſtitution, and is generally ſtyled the Conqueror, in conſequence of the victory which he obtained over Harold at the battle of Haſtings, yet before he aſcended the throne he made a compact with his new ſubjects, by his coronation oath, the ſame with that of the Saxon kings. His adminiſtration was, however, tyrannical in a very great degree, and he was guilty of many acts of violence and cruelty; but the conſtitution eſtabliſhed under him in this kingdom was no abſolute monarchy, rather an ingraftment of the feudal tenures and other cuſtoms of Normandy upon the ancient Saxon laws of Edward the Confeſſor. He more than once ſwore to maintain thoſe laws; and in the fourth year of his reign confirmed them in parliament; yet not without great alterations, to which the whole legiſlature agreed, by a more complete introduction of the ſtrict feudal law, as it was practiſed in Normandy; which produced a different political ſyſtem, and changed both power and property in many reſpects; though the firſt principles of that law, and general notions of it, had been in uſe among the Engliſh ſome ages before. It muſt, indeed, be admitted, that William divided many of the Engliſh eſtates among his Norman followers, under pretence that their former owners had fought againſt him at the battle of Haſtings: and he portioned out the lands into knights fees, an indetermined number of which formed a barony, and thoſe baronies were given to the great noblemen who compoſed what is called the King's Court, or Court of Peers, from every baron being a peer, or equal to another. In this court all civil, as well as military matters, and the proportion of knights and men, which each baron was to raiſe for the king's ſervice, were ſettled. Even biſhopricks were converted into lay baronies, and were obliged, as others, to furniſh their quotas. In many reſpects, the firſt princes of the Norman line afterwards did all they could to efface from the minds of the people the remembrance of the Saxon conſtitution; but the attempt was to no purpoſe. The nobility, as well as the people, had their complaints againſt the crown, and after much war and bloodſhed, the famous charter of Engliſh liberties, ſo well known by the name of Magna Charta, was forcibly obtained from king John, and confirmed by his ſon Henry III. who ſucceeded to the crown in 1216. It does not appear, that till this reign, and after much blood had been ſpilt, the commons of England were repreſented in parliament, or the great council of the nation; ſo entirely had the barons engroſſed the diſpoſal of property.

The preciſe year when the houſe of commons was formed is not known; but we are certain there was one in the reign of Henry III. though we ſhall not enter into any diſputes about their ſpecific powers *. We therefore now proceed to deſcribe the CONSTITUTION as it ſtands at preſent.

In all ſtates there is an abſolute ſupreme power, to which the right of legiſlation belongs; and which, by the ſingular conſtitution of theſe kingdoms, is veſted in the king, lords, and commons.

* Judge Blackſtone maintains, that a great or general council of the realm hath been held immemorially under the ſeveral names of *michel-ſynoth*, or great council; *michel-gemote*, or great meeting; and more frequently *wittena gemote*, or the meeting of wiſe men. It was alſo ſtyled in Latin *commune concilium regni*, and ſometimes *communitas regni Angliæ*. We have inſtances of its meeting to order the affairs of the kingdom, to make new laws and amend the old, ſo early as the reign of Ina king of the Weſt Saxons, A.D. 725, Offa, king of the Mercians, and Ethelbert king of Kent, in their ſeveral realms of the heptarchy. The MIRROUR informs us, that king Alfred ordained for a perpetual uſage, that theſe councils ſhould meet twice a year or oftener if need be. Our ſucceeding Saxon and Daniſh monarchs held frequent councils of this ſort, as appears from their reſpective codes of laws. There is alſo no doubt but theſe great councils were held regularly under the firſt princes of the Norman line, for in Edward the Third's time, an act of parliament made in the reign of William the Conqueror, was pleaded in the caſe of the Abbey of St. Edmundſbury, and judicially allowed by the court.

OF THE KING.] The ſupreme executive power of Great Britain and Ireland is veſted by our conſtitution in a ſingle perſon, king or queen; for it is indifferent to which ſex the crown deſcends: the perſon entitled to it is immediately intruſted with all the enſigns, rights, and prerogatives of ſovereign power.

The grand fundamental maxim upon which the right of ſucceſſion to the throne of theſe kingdoms depends, is: "that the crown, by common law and conſtitutional cuſtom, is hereditary; and this in a manner peculiar to itſelf; but that the right of inheritance may from time to time be changed, or limited by act of parliament: under which limitations the crown ſtill continues hereditary."

That the reader may enter more clearly into the deduction of the following royal ſucceſſion, by its being transferred from the houſe of Tudor to that of Stuart it may be proper to inform him, that on the death of queen Elizabeth, without iſſue, it became neceſſary to recur to the other iſſue of her grandfather Henry VII. by Elizabeth of York his queen: whoſe eldeſt daughter Margaret, having married James IV. king of Scotland; king James the Sixth of Scotland, and of England the Firſt, was the lineal deſcendant from that alliance. So that in his perſon, as clearly as in Henry VIII. centered all the claims of the different competitors from the Norman invaſion downward; he being indiſputably the lineal heir of William I. And what is ſtill more remarkable, in his perſon alſo centered the right of the Saxon monarchs, which had been ſuſpended from the Norman invaſion till his ſucceſſion; for Margaret the ſiſter of Edgar Atheling, the daughter of Edward the Outlaw, and grand-daughter of king Edmund Ironſide, was the perſon in whom the hereditary right of the Saxon kings, ſuppoſing it not aboliſhed by the Conqueſt, reſided. She married Malcolm III. king of Scotland; and Henry II. by a deſcent from Matilda their daughter, is generally called the reſtorer of the Saxon line. But it muſt be remembered, that Malcolm, by his Saxon queen, had ſons as well as daughters; and that the royal family of Scotland, from that time downward, were the offſpring of Malcolm and Margaret. Of this royal family king James I. was the lineal deſcendant; and therefore united in his perſon every poſſible claim by hereditary right, to the Engliſh as well as Scottiſh throne, being the heir both of Egbert and William the Norman.

At the Revolution in 1688, the convention of eſtates or repreſentative body of the nation, declared, that the miſconduct of James II. amounted to an abdication of the government, and that the throne was thereby vacant. In conſequence of this vacancy, and from a regard to the ancient line, the convention appointed the next Proteſtant heirs of the blood royal of king Charles I. to fill the vacant throne, in the old order of ſucceſſion; with a temporary exception, or preference to the perſon of king William III.

On the impending failure of the Proteſtant line of king Charles I. (whereby the throne might again have become vacant) the king and parliament extended the ſettlement of the crown to the Proteſtant line of king James I. viz. to the princeſs Sophia of Hanover, and the heirs of her body, being proteſtants; and ſhe is now the common ſtock, from whom the heirs of the crown deſcend *.

The

* A Chronology, of Engliſh KINGS, from the time that this country became united under one monarch, in the perſon of Egbert, who ſubdued the other princes of the Saxon heptarchy, and gave the name of Angle-land to this part of the iſland, the Saxon and Angles having, about four centuries before, ſubdued the ancient Britons, whom they drove into Wales and Cornwall.

The true ground and principle, upon which the Revolution proceeded, was entirely a new caſe in politics, which had never before happened in our hiſtory; the abdication of the reigning monarch, and the vacancy of the throne thereupon. It was not a defeaſance of the right of ſucceſſion, and a new limitation of the crown, by the king and both houſes of parliament: it was the act of the nation alone, upon a conviction that there was no king in being; for, in a full aſſembly of the lords and commons, met in convention upon the ſuppoſition of this vacancy, both houſes came to this reſolution; "that king James II. having endeavoured to ſubvert the conſtitution of the kingdom, by breaking the original contract between king and people; and by the advice of Jeſuits, and other wicked perſons, having violated the

the fundamental laws; and having withdrawn himſelf out of this kingdom, has abdicated the government, and that the throne is thereby vacant." Thus ended at once, by this ſudden and unexpected revolution, the old line of ſucceſſion: which from the Norman invaſion had laſted above 600 years, and from the union of the Saxon heptarchy in king Egbert, almoſt 900.

Though in ſome points the revolution was not ſo perfect as might have been wiſhed, yet from thence a new æra commenced, in which the bounds of prerogative and liberty have been better defined, the principles of government more thoroughly examined and underſtood, and the rights of the ſubject more explicitly guarded by legal proviſions, than in any other period of the Engliſh hiſtory. It is worthy of obſervation, that the convention avoided with great wiſdom the extremes into which the viſionary theories of ſome zealous republicans would have led them. They held that the miſconduct of king James amounted to an endeavour to ſubvert the conſtitution, and not to an actual ſubverſion, or total diſſolution of the government. They, therefore, very prudently voted it to amount to no more than an abdication of the government, and a conſequent vacancy of the throne; whereby the government was allowed to ſubſiſt, though the executive magiſtrate was gone: and the kingly office to remain, though James was no longer king. Thus the conſtitution was kept entire; which, upon every ſound principle of government, muſt otherwiſe have fallen to pieces, had ſo principal and conſtituent a part as the royal authority been aboliſhed, or even ſuſpended.

Hence it is eaſy to collect, that the title to the crown is at preſent hereditary, though not quite ſo abſolutely hereditary as formerly; and the common ſtock or anceſtor, from whom the deſcent muſt be derived, is alſo different. Formerly the common ſtock was king Egbert; then William the Conqueror; afterward, in Jame I's time, the two common ſtocks united, and ſo continued till the vacancy of the throne in 1688: now it is the princeſs Sophia, in whom the inheritance was veſted by the new king and parliament. Formerly the deſcent was abſolute, and the crown went to the next heir without any reſtriction; but now, upon the new ſettlement, the inheritance is conditional; being limited to ſuch heirs only, of the body of the princeſs Sophia, as are Proteſtant members of the church of England, and are married to none but Proteſtants.

In this due medium conſiſts the true conſtitutional notion of right of ſucceſſion to the imperial crown of theſe kingdoms. The extremes, between which it ſteers, have been thought each of them to be deſtructive to thoſe ends for which ſocieties were formed, and are kept on foot. Where the magiſtrate, upon every ſucceſſion, is elected by the people, and may by the expreſs proviſion of the laws be depoſed (if not puniſhed) by his ſubjects, this may ſound like the perfection of liberty, and look well enough when delineated on paper; but in practice will be ever found extremely

difficult.

difficult. On the other hand, divine indefeaſible hereditary right, when joined with the doctrine of unlimited paſſive obedience, is of all conſtitutions the moſt thoroughly ſlaviſh and dreadful. But when ſuch an hereditary right, as our laws have created and veſted in the royal ſtock, is interwoven with thoſe liberties which are equally the inheritance of the ſubject, this union will form a conſtitution, in theory the moſt beautiful of any, in practice the moſt approved, and, in all probability, will prove in duration the moſt permanent. This conſtitution it is the duty of every Briton to underſtand, to revere, and to defend.

The principal duties of the king are expreſſed in his oath at the coronation, which is adminiſtered by one of the archbiſhops, or biſhops of the realm, in the preſence of all the people; who, on their parts, do reciprocally take the oath of allegiance to the crown. This coronation oath is conceived in the following terms:

"*The archbiſhop, or biſhop, ſhall ſay,* Will you ſolemnly promiſe and ſwear, to govern the people of this kingdom of England, and the dominions thereunto belonging, according to the ſtatutes in parliament agreed on, and the laws and cuſtoms of the ſame?—*The king or queen ſhall ſay,* I ſolemnly promiſe ſo to do.

"*Archbiſhop or biſhop.* Will you to your power cauſe law and juſtice, in mercy, to be executed in all your judgments?—*King or Queen.* I will.

"*Archbiſhop or biſhop.* Will you to the utmoſt of your power maintain the laws of God, the true profeſſion of the goſpel, and the Proteſtant reformed religion eſtabliſhed by the law? And will you preſerve unto the biſhops and clergy of this realm, and to the churches committed to their charge, all ſuch rights and privileges as by the law do or ſhall appertain unto them, or any of them?—*King or queen.* All this I promiſe to do.

"*After this the king or queen, laying his or her hand upon the holy goſpels, ſha'l ſay,* The things which I have here before promiſed, I will perform and keep: ſo help me God. *And then kiſs the book.*"

This is the form of the coronation oath, as it is now preſcribed by our laws: and we may obſerve, that in the king's part, in this original contract, are expreſſed all the duties that a monarch can owe to his people; viz. to govern according to law; to execute judgment in mercy; and to maintain the eſtabliſhed religion. With reſpect to the latter of theſe three branches, we may farther remark, that by the act of union, 5 Anne c. 8. two preceding ſtatutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England, which enact, the former, that every king at his ſucceſſion ſhall take and ſubſcribe an oath, to preſerve the Proteſtant religion, and Preſbyterian church-government in Scotland: the latter that, at his coronation, he ſhall take and ſubſcribe a ſimilar oath, to preſerve the ſettlement of the church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

The king of Great Britain, notwithſtanding the limitations of the power of the crown, is the greateſt monarch reigning over a free people. His perſon is ſacred in the eye of the law, which makes it high treaſon to imagine or intend his death; neither can he, in himſelf, be deemed guilty of any crime, the law taking no cognizance of his actions, but only in the perſons of his miniſters, if they infringe the laws of the land. As to his power, it is very great, though he has no right to extend his prerogative beyond the ancient limits, or the boundaries preſcribed by the conſtitution; he can make no new laws, nor raiſe any new taxes, nor act in oppoſition to any of the laws; but he can make war or peace; ſend and receive ambaſſadors; make treaties of league and commerce; levy armies, and fit out fleets, for the defence of his kingdom, the annoyance of his enemies, or the ſuppreſſion of rebellions; grant commiſſions to his officers both by ſea and land, or revoke them at pleaſure; diſpoſe of all magazines, caſtles, &c. ſummon the parliament to meet, and when met, adjourn, prorogue, or diſſolve it at pleaſure; refuſe his aſſent to any bill,

bill, though it had paſſed both houſes; which, conſequently, by ſuch a refuſal, has no more force than if it had never been moved; but this is a prerogative that the kings of England have very ſeldom ventured to exerciſe. He poſſeſſes the right of chuſing his own council; of nominating all the great officers of ſtate, of the houſhold, and the church; and in fine, is the fountain of honour, from whom all degrees of nobility and knighthood are derived.

OF THE PARLIAMENT.] Parliaments, or general councils, in ſome ſhape, are of as high antiquity as the Saxon government in this iſland, and coeval with the kingdom itſelf. Blackſtone, in his valuable Commentaries, ſays, "it is generally agreed, that in the main the conſtitution of parliament, as it now ſtands, was marked out ſo long ago as the 17th of king John, A. D. 1215, in the great charter granted by that prince; wherein he promiſes to ſummon all archbiſhops, biſhops, abbots, lords, and greater barons perſonally; and all other tenants in chief, under the crown by the ſheriff and bailiffs to meet at a certain place, with forty days notice, to aſſeſs aids and ſcutages when neceſſary. And this conſtitution hath ſubſiſted, in fact, at leaſt from the year 1266, 49 Henry III. there being ſtill extant writs of that date to ſummon knights, citizens, and burgeſſes to parliament."

The parliament is aſſembled by the king's writs, and its ſitting muſt not be intermitted above three years. Its conſtituent parts are, the king ſitting there in his royal political capacity, and the three eſtates of the realm; the lords ſpiritual, the lords temporal (who ſit together with the king in one houſe), and the commons, who ſit by themſelves in another. The king and theſe three eſtates, together form the great corporation or body politic of the kingdom, of which the king is ſaid to be *caput, principium, et finis*. For upon their coming together the king meets them, either in perſon, or by repreſentation; without which there can be no beginning of a parliament; and he alſo has alone the power of diſſolving them.

It is highly neceſſary for preſerving the balance of the conſtitution, that the executive power ſhould be a branch, though not the whole, of the legiſlature. The crown cannot begin of itſelf any alterations in the preſent eſtabliſhed law; but it may approve or diſaprove of the alterations ſuggeſted and conſented to by the two houſes. The legiſlature therefore cannot abridge the executive power of any rights which it now has by law, without its own conſent: ſince the law muſt perpetually ſtand as it now does, unleſs all the powers will agree to alter it. And herein conſiſts the true excellence of the Engliſh government, that all the parts of it form a mutual check upon each other. In the legiſlature, the people are a check upon the nobility, and the nobility a check upon the people, by the mutual privilege of rejecting what the other has reſolved: while the king is a check upon both, which preſerves the executive power from encroachments.

The lords ſpiritual conſiſt of two archbiſhops and twenty-four biſhops. The lords temporal conſiſt of all the peers of the realm, the biſhops not being in ſtrictneſs held to be ſuch, but merely lords of parliament. Some of the peers ſit by deſcent, as do all ancient peers; ſome by creation, as do all the new-made ones: others, ſince the union with Scotland, by election, which is the caſe of the ſixteen peers, who repreſent the body of the Scotch nobility. The number of peers is indefinite, and may be increaſed at will by the power of the crown.

A body of nobility is more peculiarly neceſſary in our mixed conſtitution, in order to ſupport the rights of both the crown and the people, by forming a barrier to withſtand the encroachment of both. It creates and preſerves that gradual ſcale of dignity, which proceeds from the peaſant to the prince; riſing like a pyramid from a broad foundation, and diminiſhing to a point as it riſes. The nobility therefore are the pillars, which are reared from among the people, more immediately to ſupport the throne; and if that falls, they muſt alſo be buried under its ruins. Accordingly,

cordingly, when in the laſt century the commons had determined to extirpate monarchy, they alſo voted the houſe of lords to be uſeleſs and dangerous.

The commons conſiſt of all ſuch men of any property in the kingdom as have not ſeats in the houſe of lords; every one of which has a voice in parliament, either perſonally, or by his repreſentatives *. In a free ſtate, every man, who is ſuppoſed a free agent, ought to be, in ſome meaſure, his own governor; and therefore a branch at leaſt of the legiſlative power ſhould reſide in the whole body of the people. In ſo large a ſtate as ours, it is very wiſely contrived, that the people ſhould do that by their repreſentatives, which it is impracticable to perform in perſon: repreſentatives, choſen by a number of minute and ſeparate diſtricts, wherein all the voters are, or eaſily may be, diſtinguiſhed. The counties are therefore repreſented by knights, elected by the proprietors of lands: the cities and boroughs are repreſented by citizens and burgeſſes, choſen by the mercantile part, or ſuppoſed trading intereſt of the nation †. The number of Engliſh repreſentatives is 513, and of Scotch 45; in all 558. And every member, though choſen by one particular diſtrict, when elected and returned ſerves for the whole realm. For the end of his coming thither is not particular, but general; not merely to ſerve his conſtituents, but alſo the commonwealth, and to adviſe his majeſty, as appears from the writ of ſummons.

Theſe are the conſtituent parts of a parliament, the king, the lords ſpiritual and temporal, and the commons. Parts, of which each is ſo neceſſary, that the conſent of all three is required to make any new law that ſhould bind the ſubject. Whatever is enacted for law by one, or by two only, of the three, is no ſtatute; and to it no regard is due, unleſs in what relates to their own privileges.

The power and juriſdiction of parliament, ſays ſir Edward Coke, is ſo tranſcendant and abſolute, that it cannot be confined, either for cauſes or perſons, within any bounds. It hath ſovereign and uncontrollable authority in making, confirming, enlarging, reſtraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all poſſible denominations, eccleſiaſtical or temporal, civil, military, maritime, or criminal: this being the place where that abſolute deſpotic power, which muſt in all governments reſide ſomewhere, is entruſted by the conſtitution of theſe kingdoms. All miſchiefs and grievances, operations and remedies, that tranſcend the ordinary courſe of the laws, are within the reach of this extraordinary tribunal. It can regulate or new-model the ſucceſſion to the crown; as was done in the reign of Henry VIII. and William III. It can alter the eſtabliſhed religion of the land; as was done in a variety of inſtances, in the reign of king Henry VIII. and his three children, Edward VI. Mary, and Elizabeth. It can change and create afreſh even the conſtitution of the kingdom, and of parliaments themſelves; as was done by the act of union, and the ſeveral ſtatutes for triennial and ſeptennial elections. It can do every thing that is not naturally impoſſible; and therefore ſome have not ſcrupled to call its power by a figure

* This muſt be underſtood with ſome limitation. Thoſe who are poſſeſſed of land-eſtates, though to the value of only 40s. per annum, have a right to vote for members of parliament; as have moſt of the members of corporations, boroughs, &c. But there are very large trading towns, and populous places, which ſend no members to parliament; and of thoſe towns which do ſend members, great numbers of the inhabitants have no votes. Many thouſand perſons of great perſonal property, have, therefore, no repreſentatives. Indeed, the inequality and defectiveneſs of the repreſentation, has been juſtly conſidered as one of the greateſt imperfections in the Engliſh conſtitution. The duration of parliaments being extended to ſeven years, has alſo been viewed in the ſame light.

† Copy of the bribery oath, which is adminiſtered to every perſon before they poll; "I do ſwear (or, being one of the people called Quakers, do ſolemnly affirm) I have not received or had by myſelf, or any perſon whatſoever in truſt for me, or for my uſe and benefit, directly or indirectly, any ſum or ſums of money, office, place or employment, gift or reward, or any promiſe or ſecurity for any money, office, or employment, or gift, in order to give my vote at this election: and that I have not before been polled at this election. So help me God."

rather

rather too bold, the *omnipotence of parliament*. But then their power, however great, was given them in truſt, and therefore ought to be employed according to the rules of juſtice, and for the promotion of the general welfare of the people. And it is moſt eſſential to the liberties of the kingdom, that ſuch members be delegated to this important truſt, as are moſt eminent for their probity, their fortitude, and their knowledge; for it was a known apophthegm of the great lord treaſurer Burleigh, "that England could never be ruined but by a parliament:" and, as ſir Matthew Hale obſerves, this being the higheſt and greateſt court, over which none other can have juriſdiction in the kingdom, if by any means a miſgovernment ſhould any way fall upon it, the ſubjects of this kingdom are left without all manner of legal remedy.

In order to prevent the miſchiefs that might ariſe, by placing this extenſive authority in hands that are either incapable, or elſe improper, to manage it, it is provided, that no one ſhall ſit or vote in either houſe of parliament unleſs he be twenty-one years of age. To prevent innovations in religion and government, it is enacted that no member ſhall vote or ſit in either houſe, till he hath, in the preſence of the houſe, taken the oaths of allegiance, ſupremacy, and abjuration; and ſubſcribed and repeated the declaration againſt tranſubſtantiation, the invocation of ſaints, and the ſacrifice of the maſs. To prevent dangers that may ariſe to the kingdom from foreign attachments, connexions, or dependencies, it is enacted, that no alien, born out of the dominions of the crown of Great Britain, even though he be naturalized, ſhall be capable of being a member of either houſe of parliament.

Some of the moſt important privileges of the members of either houſe are, privilege of ſpeech, of perſon, of their domeſtics, and of their lands and goods. As to the firſt, privilege of ſpeech, it is declared by the ſtatute of 1 W. & M. ſt. 2. c. 2. as one of the liberties of the people, "that the freedom of ſpeech, and debates, and proceedings in parliament, ought not to be impeached or queſtioned in any court or place out of parliament." And this freedom of ſpeech is particularly demanded of the king in perſon, by the ſpeaker of the houſe of commons, at the opening of every new parliament. So are the other privileges, of perſon, ſervants, lands, and goods. This includes not only privilege from illegal violence, but alſo from legal arreſts, and ſeizures by proceſs from the courts of law. To aſſault by violence a member of either houſe, or his menial ſervants, is a high contempt of parliament, and as ſuch puniſhed with the utmoſt ſeverity. Neither can any member of either houſe be arreſted and taken into cuſtody, nor ſerved with any proceſs of the courts of law; nor can his menial ſervants be arreſted; nor can any entry be made on his lands; nor can his goods be diſtrained or ſeized, without a breach of the privilege of parliament *.

The houſe of lords are attended by the judges of the court of king's bench and common pleas, and ſuch of the barons of the exchequer as are of the degree of the coif, or have been made ſerjeants at law; as likewiſe by the maſters of the court of chancery; for their advice in point of law, and for the greater dignity of their proceedings.

The ſpeaker of the houſe of lords is generally the lord chancellor, or lord-keeper of the great ſeal, which dignities are commonly veſted in the ſame perſon. Each peer has a right, when a vote paſſes contrary to his ſentiments, to enter his diſſent on the journals of the houſe, with the reaſons for ſuch diſſent; which is uſually ſtyled his proteſt. Upon particular occaſions theſe proteſts have been ſo bold as to

* This exemption from arreſts for lawful debts, was always conſidered by the public as a grievance. The lords and commons therefore generouſly relinquiſhed their privilege by act of parliament in 1770; and members of both houſes may now be ſued like other debtors.

give

give offence to the majority of the houſe, and have therefore been expunged from the journals: but this has been thought a violent meaſure.

The houſe of commons may be properly ſtyled the grand inqueſt of Great Britain, impowered to enquire into all national grievances. The peculiar laws and cuſtoms of the houſe of commons relate principally to the raiſing of taxes, and the elections of members to ſerve in parliament. With regard to taxes: it is the ancient indiſputable privilege and the right of the houſe of commons, that all grants of ſubſidies, or parliamentary aids, do begin in their houſe, and be firſt beſtowed by them; although their grants are not effectual until they have the aſſent of the other two branches of the legiſlature. The general reaſon given for this excluſive privilege of the houſe of commons is, that the ſupplies are raiſed upon the body of the people, and therefore it is proper that they alone ſhould have the right of taxing themſelves. And ſo reaſonably jealous are the commons of this privilege, that herein they will not ſuffer the other houſe to exert any power but that of rejecting; they will not permit the leaſt alteration or amendment to be made by the lords to the mode of taxing the people by a money-bill. Under this appellation are included all bills by which money is directed to be raiſed upon the ſubject, for any purpoſe, or in any ſhape whatſoever; either for the exigencies of government, and collected from the kingdom in general, as the land-tax; or for private benefit, and collected in any particular diſtrict, as by turnpikes, pariſh-rates, and the like.

The method of making laws is much the ſame in both houſes. In each houſe the act of the majority binds the whole: and this majority is declared by votes openly and publicly given; not as at Venice, and many other ſenatorial aſſemblies, privately or by ballot. This latter method may be ſerviceable to prevent intrigues and unconſtitutional combinations, but it is impoſſible to be practiſed in the houſe of commons, where every member's conduct is ſubject to the future cenſure of his conſtituents, and therefore ſhould be openly ſubmitted to their inſpection.

To bring a bill into the houſe of commons, if the relief ſought by it be of a private nature, it is firſt neceſſary to prefer a petition, ſetting forth the grievance deſired to be remedied. This petition muſt be preſented by a member, and, when founded on facts that may be in their nature diſputed, is referred to a committee of members, who examine the matter alleged, and report it to the houſe; and then (or, otherwiſe, upon the mere petition) leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the houſe, without any petition. (In the houſe of lords, if the bill begins there, it is, when of a private nature, referred to two of the judges, to examine and report the ſtate of the facts alleged, to ſee that all neceſſary parties conſent, and to ſettle all points of technical propriety.) This is read a firſt time, and, at a convenient diſtance, a ſecond time; and after each reading, the ſpeaker explains to the houſe the ſubſtance of the bill, and puts the queſtion, whether it ſhall proceed any farther. The introduction of the bill may be oppoſed, as the bill itſelf may at either of the readings; and, if the oppoſition ſucceeds, the bill muſt be dropt for that ſeſſion.

After the ſecond reading, it is committed, that is, referred to a committee; which is either ſelected by the houſe in buſineſs of ſmall importance; or elſe, if the bill is a matter of great or national conſequence, the houſe reſolves itſelf into a committee of the whole houſe. A committee of the whole houſe is compoſed of every member; and, to form it, the ſpeaker quits the chair, (another member being appointed chairman), and may ſit and debate as a private member. In theſe committees, the bill is debated clauſe by clauſe, amendments made, the blanks filled up, and ſometimes the bill entirely new-modelled. After it has gone through the committee, the chairman reports it to the houſe, with ſuch amendments as the

committee have made; and then the houſe reconſider the whole bill again, and the queſtion is repeatedly put upon every clauſe and amendment. When the houſe have agreed or diſagreed to the amendments of the committee, and ſometimes added new amendments of their own, the bill is then ordered to be engroſſed, or written in a ſtrong groſs hand, on one or more long rolls of parchment ſewed together. When this is finiſhed, it is read a third time, and amendments are ſometimes then made to it; and if a new clauſe be added, it is done by tacking a ſeparate piece of parchment on the bill, which is called a rider. The ſpeaker then again explains the contents; and, holding it up in his hands, puts the queſtion, whether the bill ſhall paſs. If this be agreed to, the title to it is then ſettled. After this, one of the members is directed to carry it to the lords, and deſire their concurrence; who, attended by ſeveral more, carries it to the bar of the houſe of peers, and there delivers it to their ſpeaker, who comes down from his woolſack to receive it. It there paſſes through the forms, as in the other houſe (except engroſſing, which is already done), and if rejected, no more notice is taken, but it paſſes *ſub ſilentio*, to prevent unbecoming altercations. But if it be agreed to, the lords ſend a meſſage by two maſters in chancery (or, ſometimes, in matters of high importance, by two of the judges) that they have agreed to the ſame: and the bill remains with the lords, if they have made no amendment. But if any amendments are made, ſuch amendments are ſent down with the bill, to receive the concurrence of the commons. If the commons diſagree to the amendments, a conference uſually follows between members deputed from each houſe; who, for the moſt part, ſettle and adjuſt the difference: but if both houſes remain inflexible, the bill is dropped. If the commons agree to the amendments, the bill is ſent back to the lords by one of the members, with a meſſage to acquaint them therewith. The ſame forms are obſerved, *mutatis mutandis*, when the bill begins in the houſe of lords. But when an act of grace or pardon is paſſed, it is firſt ſigned by his majeſty, and then read once only in each of the houſes, without any new engroſſing or amendment. And when both houſes have done with any bill, it is depoſited in the houſe of peers, to wait the royal aſſent; except in the caſe of a money-bill, which, after receiving the concurrence of the lords, is ſent back to the houſe of commons. No expreſſion can be inſerted, nor the ſlighteſt alteration take place, till the ſpeaker, or the chairman, puts the queſtion; which, in the houſe of commons, is anſwered by *aye* or *no*; and, in the houſe of peers, by *content*, or *not content*.

The giving the royal aſſent to bills is a matter of great form. When the king is to paſs bills in perſon he appears on his throne in the houſe of peers, in his royal robes, with the crown on his head, and attended by his great officers of ſtate and heralds. A ſeat on the right hand of the throne, where the princes of Scotland, when peers of England, formerly ſat, is reſerved for the prince of Wales. The other princes of the blood ſit on the left hand of the king; and the chancellor on a cloſe bench removed a little backwards. The viſcounts and temporal barons, or lords, face the throne, on benches or wool-packs, covered with red cloth or baize. The bench of biſhops runs along the houſe to the bar on the right hand of the throne; as the dukes and earls do on the left. The chancellor and judges, on ordinary days, ſit upon wool-packs between the barons and the throne. The common opinion is, that the houſe ſitting on wool is ſymbolical of wool being formerly the ſtaple commodity of the kingdom. Many of the peers, on ſolemn occaſions, appear in their parliamentary robes. None of the commons have any robes, excepting the ſpeaker, who wears a long black ſilk gown; and when he appears before the king, it is trimmed with gold.

The royal aſſent may be given two ways: 1. In perſon. When the king ſends for the houſe of commons to the houſe of peers, the ſpeaker carries up the money-bill or bills in his hand; and, in delivering them, he addreſſes his majeſty in a ſolemn

ſolemn ſpeech, in which he ſeldom fails to extol the generoſity and loyalty of the commons, and to tell his majeſty how neceſſary it is to be frugal of the public money. It is upon this occaſion, that the commons of Great Britain appear in their higheſt luſtre. The titles of all bills that have paſſed both houſes are read; and the king's anſwer is declared by the clerk of the parliament in Norman-French. If the king conſents to a public bill, the clerk uſually declares, *le roy le veut*, "the king wills it ſo to be;" if to a private bill, *ſoit fait comme il eſt deſiré*, "be it as it is deſired." If the king refuſes his aſſent, it is in the gentle language of *le roy s'aviſera*, "the king will adviſe upon it." When a money-bill is paſſed, it is carried up and preſented to the king by the ſpeaker of the houſe of commons, and the royal aſſent is thus expreſſed, *le roy remercie ſes loyals ſubjects, accepte leur benevolence, et auſſi le veut*, "the king thanks his loyal ſubjects, accepts their benevolence, and wills it ſo to be". In caſe of an act of grace, which originally proceeds from the crown, and has the royal aſſent in the firſt ſtage of it, the clerk of the parliament thus pronounces the gratitude of the ſubject; *les prelats, ſeigneurs, et commons, en ce preſent parliament aſſemblies, au nom de touts vous autres ſubjects, remercient tres humblement votre majeſté, et prient à Dieu vous donner en ſanté bonne vie et longue*; "the prelates, lords, and commons, in this preſent parliament aſſembled, in the name of all your other ſubjects, moſt humbly thank your majeſty, and pray to God to grant you in health and wealth long to live." 2. By the ſtatute 33 Hen. VIII. c. 21. the king may give his aſſent by letters patent under his great ſeal, ſigned with his hand, and notified, in his abſence, to both houſes aſſembled together in the high houſe, by commiſſioners, conſiſting of certain peers, named in the letters. And when the bill has received the royal aſſent in either of theſe ways, it is then, and not before, a ſtatute or act of parliament.

This ſtatute or act is placed among the records of the kingdom; there needing no formal promulgation to give it the force of a law as was neceſſary by the civil law with regard to the emperor's edicts; becauſe every man in England is, in judgment of law, party to the making of an act of parliament, being preſent by his repreſentative. However, copies are uſually printed at the king's preſs, for the information of the whole land.

An act of parliament, thus made, is the exerciſe of the higheſt authority that this kingdom acknowledges upon earth. It hath power to bind every ſubject in the land, and the dominions thereunto belonging; nay, even the king himſelf, if particularly named. And it cannot be altered, amended, diſpenſed with, ſuſpended, or repealed, but in the ſame forms, and by the ſame authority of parliament: for it is a maxim in law, that it requires the ſame ſtrength to diſſolve as to create an obligation.

Such is the parliament of Great Britain; the ſource and guardian of our liberties and properties, the ſtrong cement which binds the foundation and ſuperſtructure of our government, and the wiſely concerted balance maintaining an equal poiſe, that no one part of the three eſtates overpower or diſtreſs either of the other.

From the above general view of the Engliſh conſtitution, it appears, that no ſecurity for its permanency, which man can deviſe, is wanting. If it ſhould be objected, that parliaments may become ſo corrupted as to give up or betray the liberties of the people, the anſwer is, that parliaments, as every other body politic, are ſuppoſed to watch over their political exiſtence as a private perſon does his natural life. If a parliament was to act in that manner, it muſt become *felo de ſe*, an evil that no human proviſions can guard againſt. But there are great reſources of liberty in England; and though the conſtitution has been dangerouſly wounded, and ſometimes overturned, yet its own innate powers have recovered and ſtill preſerve it.

The king of England, beſides his high court of parliament, has ſubordinate officers and miniſters to aſſiſt him, who are reſponſible for their advice and conduct. They are named by the king, without either patent or grant; and on taking the neceſſary oaths, they become privy-counſellors during the life of the king that chuſes them, but ſubject to removal at his pleaſure.

The duty of a privy-counſellor appears from the oath of office, which conſiſts of ſeven articles: 1. To adviſe the king according to the beſt of his cunning and diſcretion. 2. To adviſe for the king's honour and good of the public, without partiality through affection, love, need, doubt, or dread. 3. To keep the king's counſel ſecret. 4. To avoid corruption. 5. To help and ſtrengthen the execution of what ſhall be there reſolved. 6. To withſtand all perſons who would attempt the contrary. And, laſtly, in general, 7. To obſerve, keep, and do all that a good and true counſellor ought to do to his ſovereign lord.

As no government can be ſo complete as to be provided with laws that may anſwer every unforeſeen emergency, the privy-council, in ſuch caſes, muſt ſupply the deficiency. Upon great and urgent occaſions, ſuch as that of a famine, or the dread of one, they can ſuperſede the operation of the law, if the parliament is not ſitting; but this is conſidered as illegal, and an act of parliament muſt paſs for the pardon and indemnification of thoſe concerned.

Among the privy-counſellors, the two ſecretaries of ſtate are more officially ſo than the others, as they are entruſted with the king's ſignet, and are ſuppoſed to adviſe him in acts of government that may not be proper to be communicated even to a privy-counſellor; ſuch as giving orders for ſecret expeditions, correſpondence with foreign agents, ſecuring traitors, and the like. The ſecretaryſhip of ſtate is now held by two noblemen or gentlemen; formerly the king nominated three, but the office was not then of that conſequence which it is now. Since the acceſſion of the family of Hanover, we have likewiſe known three principal ſecretaries of ſtate; but one of them was ſuppoſed to tranſact the affairs of Scotland, which are now committed to other miniſters. Upon the increaſe of the Britiſh colonies, a new board of trade was erected, and the firſt commiſſioner acted as ſecretary for the American affairs, but without that title. A third ſecretary of ſtate was afterwards appointed for carrying on the American war, whoſe office ceaſed with the peace; the board of trade alſo hath been aboliſhed as uſeleſs.

The office of ſecretary of ſtate is at preſent divided into a ſouthern and a northern department. The ſouthern contains France, Spain, Portugal, Italy, the Swiſs Cantons, Conſtantinople, and, in ſhort, all the ſtates in the ſouthern parts. The northern comprehends the different ſtates of Germany, Pruſſia, Poland, Ruſſia, Sweden, Denmark, Holland, Flanders, and the Hanſeatic towns.

With regard to the acts of government formerly committed to the ſecretaries of ſtate, a committee of the privy-council, commonly called a cabinet-council, are chiefly entruſted. This cabinet generally conſiſts of a ſelect number of miniſters and noblemen, according to the king's opinion of their integrity and abilities, or attachment to the views of the court: but though its operations are powerful and extenſive, a cabinet-council is not eſſential to the conſtitution of England.

This obſervation naturally leads me to mention the perſon who is ſo well known by the name of the *firſt miniſter*, a term unknown to the Engliſh conſtitution, though the office, in effect, is perhaps neceſſary. The conſtitution points out the lord high chancellor as miniſter, but the affairs of his own courts give him ſufficient employment. When the office of firſt lord of the treaſury is united with that of chancellor of the exchequer in the ſame perſon, he is conſidered as firſt miniſter. The truth is, his majeſty may make any of his ſervants his firſt miniſter. But though it is no office, yet there is a reſponſibility annexed to the name and common repute, that renders it a poſt of difficulty and danger. I ſhall now take a ſhort review of the

the nine great officers of the crown, who by their poſts take place next to the princes of the royal family and the two primates.

The firſt is the lord high-ſteward of England. This is an office very ancient, and formerly was hereditary, or at leaſt for life; but now, and for centuries paſt, it is exerciſed only occaſionally; that is, at a coronation, or to ſit as judge on a peer or peereſs, when tried for a capital crime. In coronations it is held for that day only, by ſome nobleman of the firſt rank. In caſes of trials, it is exerciſed generally by the lord chancellor, or lord keeper; whoſe commiſſion, as high ſteward, ends with the trial, by breaking his white rod, the badge of office.

The lord high chancellor preſides in the court of chancery, to moderate the ſeverities of the law, in all caſes where the property of the ſubject is concerned, and he is to determine according to the dictates of equity and reaſon. He is an officer of the greateſt weight and power of any now ſubſiſting in the kingdom, and is ſuperior in precedency to every temporal lord. He is a privy-counſellor by his office, and, according to ſome, prolocutor of the houſe of lords by preſcription. To him belongs the appointments of all juſtices of the peace; he is viſitor in right of the king of all hoſpitals and colleges of the king's foundation, and patron of all the king's livings under the value of 20l. per annum in the king's books. He is the general guardian of all infants, idiots, and lunatics; and hath the ſuperintendance of all charitable uſes in the kingdom, over and above the extenſive juriſdiction which he exerciſes in his judicial capacity in the court of chancery.

The poſt of lord high treaſurer has of late been veſted in a commiſſion, conſiſting of five perſons, who are called lords of the treaſury; but the firſt commiſſioner is ſuppoſed to poſſeſs the power of lord high treaſurer. He has the management and charge of all the revenues of the crown kept in the exchequer; as alſo the letting of the leaſes of all crown-lands, and the gift of all places belonging to the cuſtoms in the ſeveral ports of the kingdom. From this ſhort view of his office, its importance may be eaſily underſtood; as he has, in fact, the public finances in his hands, beſides the diſpoſal of ſo great a number of lucrative places, that the bare catalogue of them would exceed the bounds we allot to a long article.

The lord preſident of the council was an officer formerly of great power, and hath precedence next after the lord chancellor and lord treaſurer. His duty is to propoſe all the buſineſs tranſacted at the council-board, and to report to the king, when his majeſty is not preſent, all its debates and proceedings. It is a place of great dignity as well as difficulty, on account of the number of American and Weſt India cauſes, captures, and the like affairs, that come before the board; all which may be abridged, to the great conveniency of the ſubject, by an able preſident.

The office of lord privy ſeal conſiſts in his putting the king's ſeal to all charters, grants, and the like, which are ſigned by the king, in order to their paſſing the great ſeal. The lord privy ſeal has likewiſe under his cognizance ſeveral other affairs, which do not require the great ſeal. He is to take care that the crown is not impoſed upon in any tranſaction paſſing through his hands; and he is reſponſible if he ſhould apply the privy ſeal to any thing againſt the law of the land.

The office of lord great chamberlain of England is hereditary to the duke of Ancaſter's family. He attends the king's perſon, on his coronation, to dreſs him: he has likewiſe charge of the houſe of lords during the ſitting of parliament; and of fitting up Weſtminſter-hall for coronations, or trials of peers.

The office of lord high conſtable has been diſuſed ſince the attainder and execution of Stafford duke of Buckingham, in the year 1521, but is occaſionally revived for a coronation. It was formerly a place of the higheſt truſt, as it commanded all the king's forts and garriſons, and took place of all officers in the field.

The duke of Norfolk is hereditary earl marſhal of England. Before England became ſo commercial a country as it has been for a hundred years paſt, this office required

required great abilities, learning, and knowledge of the Engliſh hiſtory. In time of war he was judge of army-cauſes, and decided according to the principles of the civil law. If the cauſe did not admit of ſuch a deciſion, it was left to a perſonal combat, which was attended with a variety of ceremonies; the arrangement of which fell within the marſhal's province. To this day he, or his deputy, regulates all points of precedency according to the archives kept in the heralds office, which is entirely within his juriſdiction. He directs all ſolemn proceſſions, coronations, proclamations, general mournings, and the like. He is ſuppoſed to be judge of the marſhalſea-court; and in thoſe reigns where proclamations had the force of law, he had a cenſorial power in all caſes of uſurping falſe names, deſignations, armorial bearings, and the like; but this power is now diſputed, and reduced to a conformity with the common law.

The office of lord high admiral of England * is now likewiſe held by commiſſion, and is equal in its importance to any of the preceding, eſpecially ſince the increaſe of the Britiſh naval power. The Engliſh admiralty is a board of direction as well as execution, and is in its proccedings independent of the crown itſelf. All trials upon life and death, in maritime affairs, are appointed and held under a commiſſion immediately iſſuing from that board; and the members muſt ſign even the death warrants for execution; but it may be eaſily conceived, that, as they are removeable at pleaſure, they do nothing that can claſh with the prerogative of the crown, and conform themſelves to the directions they receive from his majeſty. The board of admiralty regulates the naval force of the realm, and names all its officers, or confirms them when named; ſo that its juriſdiction is very extenſive. They appoint vice-admirals under them; but an appeal from them lies to the high court of admiralty, which is of a civil nature: London is the place where it is held; and all its proceſſes and proceedings run in the lord high admiral's name, or thoſe of the commiſſioners, and not in that of the king. The judge of this court is commonly a doctor of the civil law, and its proceedings are according to the method of the civil law; but all criminal matters, relating to piracies, and other capital offences committed at ſea, are tried and determined according to the laws of England, by witneſſes and a jury, ever ſince the reign of Henry VIII. It now remains to treat of the courts of law in England.

COURTS OF LAW.] The court of chancery, which is a court of equity, is next in dignity to the high court of parliament, and is deſigned to relieve the ſubject againſt frauds, breaches of truſt, and other oppreſſions; and to mitigate the rigour of the law. The lord high chancellor ſits as ſole judge, and in his abſence the maſter of the rolls. The form of proceeding is by bills, anſwers, and decrees; the witneſſes being examined in private: however, the decrees of this court are only binding to the perſons of thoſe concerned in them, for they do not affect their lands and goods; and conſequently, if a man refuſed to comply with the terms, they can do nothing more than ſend him to the priſon of the Fleet. This court is always open; and if a man be ſent to priſon, the lord chancellor, in any vacation, can if he ſees reaſon for it, grant a *habeas corpus*. The clerk of the crown likewiſe belongs to this court, he, or his deputy, being obliged always to attend on the lord chancellor as often as he ſits for the diſpatch of buſineſs; through his hands paſs all writs for ſummoning the parliament, or chooſing of members; commiſſions of the peace, pardons &c.

The King's Bench, ſo called either from the kings of England ſometimes ſitting there in perſon, or becauſe all matters determinable by common law between the king and his ſubjects are here tried, except ſuch affairs as properly belong to the court of Exchequer. This court is likewiſe, a kind of checque upon all the inferior

* The laſt lord high admiral was George prince of Denmark, and huſband to queen Anne.

courts,

courts, their judges, and juſtices of the peace. Here preſide four judges, the firſt of whom is ſtyled lord chief juſtice of the king's bench, or, by way of eminence, lord chief juſtice of England, to expreſs the great extent of his juriſdiction over the kingdom; for this court can grant prohibitions in any cauſe depending either in ſpiritual or temporal courts; and the houſe of peers does often direct the lord chief juſtice to iſſue out his warrant for apprehending perſons under ſuſpicion of high crimes. The other three judges are called juſtices or judges of the king's bench.

The court of Common Pleas take cognizance of all pleas debateable, and civil actions depending between ſubject and ſubject; and in it, beſides all real actions, fines and recoveries are tranſacted, and prohibitions are likewiſe iſſued out of it, as well as from the King's Bench. The firſt judge of this court is ſtyled lord chief juſtice of the Common Pleas, or common bench; beſide whom there are likewiſe three other judges or juſtices of this court. None but ſerjeants at law are allowed to plead here.

The court of Exchequer was inſtituted for managing the revenues of the crown, and has a power of judging both according to law and according to equity. In the proceedings according to law, the lord chief baron of the Exchequer and three other barons preſide as judges. They are ſtyled barons, becauſe formerly none but barons of the realm were allowed to be judges in this court. Beſide theſe, there is a fifth, called curſitor baron, who has not a judicial capacity, but is only employed in adminiſtering the oath to ſheriffs and their officers, and alſo to ſeveral of the officers of the cuſtom-houſe. But when this court proceeds according to equity, then the lord treaſurer and the chancellor of the Exchequer preſide, aſſiſted by the other barons. All matters touching the king's treaſury, revenue, cuſtoms, and fines, are here tried and determined. Beſides the officers already mentioned, there belong to the Exchequer the king's remembrancer, who takes and ſtates all accounts of the revenue, cuſtoms, exciſe, parliamentary aids and ſubſidies, &c. except the accounts of the ſheriffs and their officers. The lord treaſurer's remembrancer, whoſe buſineſs is to make out proceſſes againſt ſheriffs, receivers of the revenue, and other officers.

For putting the laws effectually in execution, a high-ſheriff is annually appointed for every county (except Weſtmoreland and Middleſex) by the king *; whoſe office is both miniſterial and judicial. He is to execute the king's mandate, and all writs directed to him out of the king's court of juſtice; to impannel juries, to bring cauſes and malefactors to trial, to ſee ſentences, both in civil and criminal affairs, executed; and at the aſſize to attend the judges, and guard them while they are in his county. He is likewiſe to decide in the firſt inſtance, the elections of knights of the ſhire, or coroners, and of vendurers; to judge, of the qualifications of voters, and to return ſuch as he ſhall determine to be duly elected. It is alſo part of his office to collect all public fines, diſtreſſes and amerciaments into the Exchequer, or where the king ſhall appoint, and to make ſuch payments out of them as his majeſty ſhall think proper.

As his office is judicial, he keeps a court, called the county-court, which is held by the ſheriffs, or his under ſheriffs, to hear and determine all civil cauſes in the county, under forty ſhillings: this, however, is no court of record; but the court formerly called the ſheriff's turn, was one; and the king's leet, through all the county: for in this court inquiry was made into all criminal offences againſt the common law, where by the ſtatute law there was no reſtraint. This court, however, has been long ſince aboliſhed. As the keeper of the king's peace, both by

* Sheriffs were formerly choſen by the inhabitants of the ſeveral counties. In ſome counties the ſheriffs were hereditary, and ſtill continue in the county of Weſtmoreland. The city of London hath alſo the inheritance of the ſhrievalty of Middleſex veſted in their body by charter.

common

common law and ſpecial commiſſion, he is the firſt man in the county, and ſuperior in rank to any nobleman therein, during his office. He may command all the people of his county to attend him, which is called the *poſſe comitatus*, or power of the county.

Under the ſheriff are various officers; as the under-ſheriff, clerks, ſtewards of courts, bailiffs (in London called ſerjeants), conſtables, gaolers, beadles, &c.

The next officer to the ſheriff is the *juſtice of the peace*, ſeveral of whom are commiſſioned for each county: and to them is entruſted the power of putting great part of the ſtatute law in execution, in relation to the highways, the poor, vagrants, treaſons, felonies, riots, the preſervation of the game, &c. &c. They examine and commit to priſon all who break or diſturb the peace, and diſquiet the king's ſubjects. In order to puniſh the offenders, they meet every quarter at the county-town, when a jury of twelve men, called the grant inqueſt of the county, is ſummoned to appear. This jury, upon oath, is to enquire into the caſes of all delinquents, and to preſent them by bill guilty of the indictment, or not guilty: the juſtices commit the former to gaol for their trial at the next aſſizes, and the latter are acquitted. This is called the quarter-ſeſſions for the county. The juſtice of peace ought to be a perſon of great good ſenſe, ſagacity, and integrity, and not without ſome knowledge of the law; for as much power is lodged in his hands, and as nothing is ſo intoxicating, without theſe qualifications he will be apt to make miſtakes, and to ſtep beyond his authority, for which he is indeed liable to be called to an account at the court of king's bench.

Each county contains two *coroners*, who are to enquire by a jury of neighbours, how and by whom any perſon came by a violent death, and to enter it on record as a plea of the crown. Another branch of his office is to enquire concerning ſhipwrecks, and certify whether wreck or not, and who is in poſſeſſion of the goods. In his miniſterial office he is the ſheriff's ſubſtitute.

The civil government of cities is a kind of ſmall independent policy of itſelf; for every city hath, by charter from the king, a juriſdiction within itſelf, to judge in matters civil and criminal: with this reſtraint only, that all civil cauſes may be removed from their courts to the higher courts at Weſtminſter; and all capital offences are committed to the judge of the aſſize. The government of cities differs according to their different charters, immunities, and conſtitutions. They are conſtituted with a mayor, aldermen, and burgeſſes, who together make the corporation of the city, and hold a court of judicature, where the mayor preſides as judge. Some cities are counties, and chuſe their own ſheriffs; and all of them have a power of making bye-laws for their own government. Some have thought the government of cities, by mayor, aldermen, and common-council, is an epitome of the Engliſh government, by king, lords, and commons. The government of incorporated boroughs is nearly ſimilar: in ſome there is a mayor, and in others two bailiffs; who, during their mayoralty or magiſtracy, are juſtices of the peace within their liberties, and conſequently eſquires.

The cinque-ports are five havens, formerly eſteemed moſt important ones, that lie on the eaſt part of England toward France, as Dover, Sandwich, Romney, Haſtings, and Hythe, to which Winchelſea and Rye, have been ſince added, with ſimilar franchiſes in many reſpects. Theſe cinque-ports were endowed with particular privileges by our ancient kings, upon condition that they ſhould provide a certain number of ſhips at their own charge, to ſerve in the wars for forty days, as often as they were wanted.

For the better government of villages, the lords of the ſoil, or manor (who were formerly called barons), have generally a power to hold courts, called courts-leet and courts-baron, where their tenants are obliged to attend and receive juſtice. The buſineſs of courts-leet is chiefly to preſent and puniſh nuiſances; and at courts-baron the

the conveyances and alienations of the copyhold tenants are enrolled, and they are admitted to their eſtates on a deſcent or purchaſe.

A *conſtable* is a very ancient and reſpectable officer of the peace, under the Engliſh conſtitution. Every hundred has a high conſtable, and every pariſh in that hundred a conſtable; and they are to attend the high-conſtable upon proper occaſions. They are aſſiſted by another ancient officer, called the tything-man, who formerly ſuperintended the tenth part of an hundred, or ten free burghs, as they were called in the time of the Saxons, and each free burgh conſiſting of ten families. The buſineſs of conſtable is to keep the peace in all caſes of quarrels and riots. He can impriſon offenders till they are brought before a juſtice of peace; and it is his duty to execute, within his diſtrict, every warrant directed to him from that magiſtrate, or a bench of juſtices. The neglect of the old Saxon courts, both for the preſervation of the peace, and the more eaſy recovery of ſmall debts, has been regretted by many eminent lawyers; and it has of late been found neceſſary to revive ſome of them, and to appoint others of a ſimilar nature.

Beſide theſe, there are courts of conſcience ſettled in many parts of England for the relief of the poor, in the recovery or payment of ſmall debts, not exceeding forty ſhillings.

There neither is, nor ever was, any conſtitution provided with ſo many fences as that of England, for the ſecurity of perſonal liberty. Every man impriſoned has a right to bring a writ befere a judge in Weſtminſter-hall, called his Habeas Corpus. If that judge, after conſidering the cauſe of commitment, ſhall find that the offence is bailable, the party is immediately admitted to bail, till he is condemned or acquitted in a proper court of juſtice.

The rights of individuals are ſo attentively guarded, that the ſubject may, without the leaſt danger, ſue his ſovereign, or thoſe who act in his name, and under his authority: he may do this in open court, where the king may be obliged to pay damages to his ſubject. He cannot take away the liberty of the leaſt individual, unleſs he has, by ſome illegal act, of which he is accuſed or ſuſpected upon oath, forfeited his right to liberty; or except when the ſtate is in danger, and the repreſentatives of the people think the public ſafety makes it neceſſary that he ſhould have the power of confining perſons on ſuch a ſuſpicion of guilt: ſuch as the caſe of a rebellion within the kingdom, when the legiſlature has thought proper to paſs a temporary ſuſpenſion of the Habeas Corpus act: but this has ſeldom been done but with difficulty and caution, and when the national ſafety abſolutely required it. The king has a right to pardon; but neither he nor the judges, to whom he delegates his authority, can condemn a man as a criminal, except he be firſt found guilty by twelve men, who muſt be his equals. That the judges may not be influenced by the king, or his miniſters, to miſrepreſent the caſe to the jury, they have their ſalaries for life, and not during the pleaſure of their ſovereign. Neither can the king take away, nor endanger the life of any ſubject without trial, and the perſons being firſt charged with a capital crime, as treaſon, murder, felony, or ſome other act injurious to ſociety; nor can any ſubject be deprived of his liberty, for the higheſt crime, till ſome proof of his guilt be given upon oath before a magiſtrate; and he has then a right to inſiſt upon his being brought, the firſt opportunity, to a fair trial, or to be reſtored to liberty on giving bail for his apppearance. If a man is charged with a capital offence, he muſt not undergo the ignominy of being tried for his life till the evidences of his guilt are laid before the grand jury of the town or county in which the fact is alledged to be committed, and not unleſs twelve of them agree to a bill of indictment againſt him. If they do this, he is to ſtand a ſecond trial before twelve other men, whoſe opinion is definitive. By the 28 Edward III. it is enacted that where either party is an alien born, the jury ſhall be one half aliens, and the other denizens, if required, for the more impartial trial. A privilege in-

dulged to ſtrangers in no other country, but which is as ancient with us as the time of king Ethelred *. In ſome caſes, the man (who is always ſuppoſed innocent till there be ſufficient proof of his guilt) is allowed a copy of his indictment, in order to help him to make his defence. He is alſo furniſhed with the pannel, or liſt of the jury, who are his true and proper judges, that he may learn their characters, and diſcover whether they want abilities, or whether they are prejudiced againſt him. He may in open court peremptorily object to twenty of the number †, and to as many more as he can give reaſon for their not being admitted as his judges; till at laſt twelve unexceptionable men, the neighbours of the party accuſed, or living near the place where the ſuppoſed fact was committed, are approved of, who take the following oath, that they *ſhall well and truly try, and true deliverance make, between the king and the priſoners whom they ſhall have in charge, according to the evidence.* By challenging the jury, the priſoner prevents all poſſibility of bribery, or the influence of any ſuperior power: by their living near the place where the fact was committed, they are ſuppoſed to be men who knew the priſoner's courſe of life, and the credit of the evidence. Upon their integrity and underſtanding the lives of all that are brought in danger ultimately depend; and from their judgment there lies no appeal: they are to be all of one mind, and after they have fully heard the evidence, are to be confined without meat, drink, or candle, till they are unanimous in acquitting or condemning the priſoner. Every juryman is therefore inveſted with a ſolemn and awful truſt: if he without evidence ſubmits his opinion to that of any other of the jury, or yields in complaiſance to the opinion of the judge; if he neglects to examine with the utmoſt care; if he queſtions the veracity of the witneſſes, who may be of an infamous character; or, after the moſt impartial hearing, has the leaſt doubt upon his mind, and yet joins in condemning the perſon accuſed; he will wound his own conſcience, and bring upon himſelf the complicated guilt of perjury and murder. The freedom of Engliſhmen conſiſts in its being out of the power of the judge on the bench to injure them. Were not this the caſe, juries would be uſeleſs, tyranny might triumph over the lives and liberties of the ſubject, and the judge on the bench be the miniſter of the prince's vengeance.

Trial by jury being ſo great a ſecurity to the liberty of the ſubject, it is much to be regretted, that perſons of education and property are often too ready to evade ſerving the office. By this means juries frequently conſiſt of ignorant and illiterate perſons, who have neither knowledge to underſtand their rights and the privileges of Engliſhmen, nor ſpirit to maintain them. No man ſhould be above ſerving ſo important an office, when regularly called upon: and thoſe who, from indolence or pride, decline diſcharging this duty to their country, ſeem hardly to deſerve that ſecurity and liberty which the inhabitants of England derive from this invaluable inſtitution. Juries have, indeed, always been conſidered as giving the moſt effectual check to tyranny; for in a nation like this, where a king can do nothing againſt law, they afford a ſecurity that he ſhall never make the laws, by a bad adminiſtration, the inſtruments of cruelty and oppreſſion. Were it not for juries, the advice given by father Paul, in his maxims of the republic of Venice, might take effect in its fulleſt latitude. "When the offence is committed by a nobleman againſt a ſubject, ſays he, let all ways be tried to juſtify him; if that be impoſſible, let him be chaſtiſed with greater noiſe than damage. If it be a ſubject that has affronted a nobleman, let him be puniſhed with the utmoſt ſeverity, that the ſubject may not get too great a cuſtom of laying their hands on the Patrician order." In ſhort, was it not for juries, a corrupt nobleman might, whenever he pleaſed, act the tyrant, while the judge would have that power which is now denied to our kings.

* Statute de Monticolis Walliæ. † The party may challenge thirty-five, in caſe of treaſon.

But

But by our happy conſtitution, which breathes nothing but liberty and equity, all imaginary indulgence is allowed to the meaneſt as well as the greateſt. When a priſoner is brought to take his trial, he is freed from all bonds; and though the judges are ſuppoſed to be his counſel, yet, as he may be incapable of vindicating his own cauſe, other counſel are allowed him; he may try the validity and legality of the indictment, and may ſet it aſide, if it be contrary to law. Nothing is wanting to clear up the cauſe of innocence, and to prevent the ſufferer from ſinking under the power of corrupt judges, and the oppreſſion of the great. The racks and tortures that are cruelly employed in other parts of Europe, to make a man accuſe himſelf, are here unknown, and none puniſhed without conviction, but he who refuſes to plead in his own defence.

As the trial of malefactors in England is very different from that of other nations; the following account may be uſeful to foreigners and others, who have not ſeen thoſe proceedings

The court being met, and the priſoner called to the bar, the clerk commands him to hold up his hand, then charges him with the crime of which he is accuſed, and aſks him whether he is *guilty* or *not guilty*. If the priſoner anſwers *guilty*, his trial is at an end: but if he anſwers *not guilty*, the court proceeds on the trial, even though he may before have confeſſed the fact; for the law of England takes no notice of ſuch confeſſion; and unleſs the witneſſes, who are upon oath, prove him guilty of the crime, the jury muſt acquit him: for they are directed to bring in their verdict according to the evidence given in court.

When the witneſſes have given their evidence, and the priſoner has, by himſelf or his counſel, croſs-examined them, the judge recites to the jury the ſubſtance of the evidence given againſt the priſoner, and bids them diſcharge their conſcience; when, if the matter be very clear, they commonly give their verdict without going out of the court; and the foreman for himſelf and the reſt, declares the priſoner *guilty* or *not guilty*. But if any doubt ariſes among the jury, and the matter requires debate, they all withdraw into a room with a copy of the indictment, where they are locked up till they are unanimouſly agreed on the verdict; and if any one of the jury ſhould die during this their confinement, the priſoner will be acquitted. When the jury have agreed on the verdict, they inform the court thereof by an officer who waits without, and the priſoner is again ſet to the bar to hear his verdict. This is unalterable, except in doubtful caſes, when the verdict is brought in *ſpecial*, and is therefore to be determined by the twelve judges of England.

If the priſoner be found guilty, he is then aſked what reaſon he can give why ſentence of death ſhould not be paſſed upon him? There is now properly no benefit of clergy—it is changed to tranſportation, or burning in the hand. Upon a capital conviction the ſentence of death, after a ſummary account of the trial, is pronounced on the priſoner, in theſe words: *The law is, That thou ſhalt return to the place from whence thou cameſt, and from thence be carried to the place of execution, where thou ſhalt be hanged by the neck till thy body be dead, and the Lord have mercy on thy ſoul!* whereupon the ſheriff is charged with the execution.

All the priſoners found *not guilty* by the jury are immediately acquitted and diſcharged; and, in ſome caſes, obtain a copy of their indictment from the court, to proceed at law againſt their proſecutors.

Of PUNISHMENTS.] Though the laws of England are eſteemed more merciful to offenders than thoſe which at preſent ſubſiſt in any other part of the world, yet the puniſhment of ſuch as at their trial refuſe to plead guilty or not guilty was formerly very cruel. In this caſe the priſoner was laid upon his back upon the bare floor, naked, and his arms and legs being ſtretched out with cords, and a conſiderable weight of iron laid upon his breaſt, he was allowed only three morſels of barley bread the firſt day, the next day he was allowed nothing but three

draughts of foul water that ſhall be neareſt to the priſon door; and, in this ſituation, this was to be alternately his daily diet till he expired. This puniſhment, however, there was ſeldom occaſion to inflict, and the cruel proceſs is now aboliſhed; for by a late act of parliament the priſoner's refuſal to plead is to be conſidered as a conviction, and he is to ſuffer the ſame puniſhment as if he had been tried, and found guilty. And formerly, in caſe of high treaſon, though the criminal ſtood mute, judgment was given againſt him, as if he had been convicted, and his eſtate was confiſcated.

The law of England includes all capital crimes under *high treaſon*, *petty treaſon*, and *felony*. The firſt conſiſts in plotting, conſpiring, or riſing up in arms againſt the ſovereign, or in counterfeiting the coin. The traitor is puniſhed by being drawn on a ſledge to the place of execution, when, after being hanged upon a gallows for ſome minutes, the body is cut down alive, the heart taken out and expoſed to public view, and the entrails burnt: the head is then cut off, and the body quartered, after which the head is uſually fixed on ſome conſpicuous place. All the criminal's lands and goods are forfeited, his wife loſes her dowry, and his children both their eſtates and nobility. But though coining of money is adjudged high treaſon, the criminal is only drawn upon a ſledge to the place of execution, and there hanged. Though the ſentence paſſed upon all traitors is the ſame, yet with reſpect to perſons of quality, the puniſhment is generally altered to beheading: a ſcaffold is erected for that purpoſe, on which the criminal placing his head upon a block, it is ſtruck off with an axe *.

The puniſhment for miſpriſion of high treaſon, that is for neglecting or concealing it, is impriſonment for life, the forfeiture of all the offender's goods, and the profits ariſing from his lands.

Petty treaſon is when a child kills his father, a wife her huſband, a clergyman his biſhop, or a ſervant his maſter or miſtreſs. This crime is puniſhed by the offender's being drawn in a ſledge to the place of execution, and there hanged upon a gallows till dead. Women guilty both of this crime and of high-treaſon, are ſentenced to be burnt alive; but this law has been very lately repealed, and they are now hanged, without being burnt.

Felony includes murders, robberies, forging notes, bonds, deeds, &c. Theſe are all puniſhed by hanging, only † murderers are to be executed ſoon after ſentence is paſſed, and then delivered to the ſurgeons in order to be publicly diſſected. Perſons guilty of robbery, when there were ſome alleviating circumſtances, uſed ſometimes to be tranſported for a term of years to his majeſty's plantations; but ſince the American war, they are now generally condemned to hard labour in works of public utility, upon the river, &c. for a certain number of years; lately ſome have been ſent to Africa and Nova Scotia; and it is to be hoped, that the new ſettlement at Botany-Bay will be productive of ſalutary conſequences.

Other crimes puniſhed by the laws are,

Manſlaughter, which is the unlawful killing of a perſon, without premeditated malice, but with a preſent intent to kill; as when two, who formerly meant no harm to each other, quarrel, and the one kills the other; in this caſe the criminal is allowed the benefit of his clergy for the firſt time, and only burnt in the hand.

Chance-medley is the accidental killing of a man without an evil intent, for which

* This is not to be conſidered as a different puniſhment, but as a remiſſion of all the parts of the ſentence mentioned before, excepting the beheading.

† By a late act, murderers are to be executed within twenty-four hours after ſentence is pronounced; but as Sunday is not reckoned a day, they are generally tried on a Saturday; ſo that they obtain a reſpite till Monday.

the

the offender is alſo to be burnt in the hand, unleſs the offender was doing an unlawful act: which laſt circumſtance makes the puniſhment death.

Shoplifting and receiving goods knowing them to be ſtolen, are puniſhed with hard labour for a number of years, or burning in the hand.

Perjury, or keeping diſorderly houſes, are puniſhed with the pillory and impriſonment.

Petty-larceny, or ſmall theft, under the value of twelve pence, is puniſhed by whipping.

Libelling, uſing falſe weights and meaſures, and foreſtalling the market, are commonly puniſhed with ſtanding in the pillory.

For ſtriking, ſo as to draw blood, in the king's court, the criminal is puniſhed with loſing his right hand.

For ſtriking, in Weſtminſter-hall, while the courts of juſtice are ſitting, the puniſhment is impriſonment for life, and forfeiture of all the offender's eſtate.

Drunkards, vagabonds, and looſe, idle, diſorderly perſons, are puniſhed by being ſet in the ſtocks, or by paying a fine.

OF HUSBAND AND WIFE.] The firſt private relation of perſons is that of marriage, which includes the reciprocal rights and duties of huſband and wife; or, as moſt of our elder law-books call them, *baron* and *feme*. The holineſs of the matrimonial ſtate is left entirely to the eccleſiaſtical law; the puniſhment, therefore, or annulling, of inceſtuous, or other unſcriptural marriages, is the province of ſpiritual courts.

The firſt legal diſability is a prior marriage, or having another huſband or wife living; in which caſe, beſides the penalties conſequent upon it as felony, the ſecond marriage is to all intents and purpoſes void: polygamy being condemned both by the law of the New Teſtament, and the policy of all prudent ſtates. The ſecond legal diſability is want of age. This is ſufficient to void all other contracts, on account of the imbecility of judgment in the parties contracting. Therefore if a boy under fourteen, or a girl under twelve years of age, marries, this marriage is imperfect; and, when either of them comes to the age of conſent aforeſaid, they may diſagree, and declare the marriage void, without any divorce or ſentence in the ſpiritual court. This is founded on the civil law. But the canon law pays a greater regard to the conſtitution than the age of the parties: for if they are *habiles ad matrimonium*, it is a good marriage, whatever their age may be. And in our law it is ſo far a marriage, that if at the age of conſent they agree to continue together, they need not be married again. If the huſband be of years of diſcretion, and the wife under twelve, when ſhe comes to years of diſcretion he may diſagree as well as ſhe may; for in contract the obligation muſt be mutual; both muſt be bound, or neither; and ſo it is, *vice verſa*, when the wife is of years of diſcretion, and the huſband under.

Another incapacity ariſes from want of conſent of guardians. By the common law, if the parties themſelves were of age of conſent, there wanted no other concurrence to make the marriage valid; and this was agreeable to the canon law. But by ſeveral ſtatutes, penalties of 100l. are laid on every clergyman, who marries a couple either without publication of banns (which may give notice to parents or guardians), or without a licence; to obtain which, the conſent of parents or guardians muſt be ſworn to. And it has been lately thought proper to enact, that all marriages celebrated by licence (for banns ſuppoſe notice), where either of the parties is under twenty-one (not being a widow, or widower, who are ſuppoſed free) without the conſent of the father, or if he be not living, of the mother or guardians, ſhall be abſolutely void. A proviſion is made, as in the civil law, when the mother or guardian is *non compos*, beyond the ſea, or unreaſonably froward, to diſpenſe with ſuch conſent at the diſcretion of the lord chancellor; but no proviſion is

made, in caſe the father ſhould labour under any mental, or other incapacity. Much may be, and much has been ſaid, both for and againſt this innovation upon our ancient laws and conſtitution. On the one hand, it prevents the clandeſtine marriages of minors, which are often a great inconvenience to thoſe private families wherein they happen. On the other hand, reſtraints upon marriages, eſpecially among the lower claſs, are detrimental to the public, by hindering the increaſe of people; and to religion and morality, by encouraging licentiouſneſs and debauchery among the ſingle of both ſexes, and thereby deſtroying one end of ſociety and government.

A fourth incapacity is want of reaſon: without a competent ſhare of which, as no other, ſo neither can the matrimonial contract be valid.

Laſtly, the parties muſt not only be willing and able to contract, but actually muſt contract themſelves in due form of law, to make it a good civil marriage. Verbal contracts are now of no force, to compel a future marriage. Neither is any marriage at preſent valid, that is not celebrated in ſome pariſh-church, or public chapel, unleſs by diſpenſation from the archbiſhop of Canterbury. It muſt alſo be preceded by publication of banns, or by licence from the ſpiritual judge. It is held tobe alſo eſſential to marriage, that it be performed by a perſon in orders: though in the times of the civil war, all marriages were performed by the juſtices of the peace; and theſe marriages were declared valid in the ſucceeding reign; as the marriages of Quakers are at perſent. As the law now ſtands, we may upon the whole collect, that no marriage by the temporal law is void, that is celebrated by a perſon in orders,—in a pariſh church, or public chapel (or elſewhere, by diſpenſation) —in purſuance of banns or a licence,—between ſingle perſons,—conſenting,—of ſound mind,—and of the age of twenty-one years; or of the age of fourteen in male, and twelve in female, with conſent of parents or guardians, or without it in caſe of widowhood.

There are two kinds of divorce, the one total, the other partial. The total divorce muſt be for ſome of the canonical cauſes of impediment, and thoſe exiſting before the marriage: as conſanguinity, affinity, or corporeal imbecility. The iſſue of ſuch marriage, as it is thus entirely diſſolved, are baſtards.

The other kind of divorce is when the marriage is juſt and lawful, and therefore the law is tender of diſſolving it; but, for ſome ſupervenient cauſe it becomes improper, or impoſſible, for the parties to live together; as in the caſe of intolerable ill temper, or adultery, in either of the parties. In this caſe the law allows alimony to the wife (except when for adultery, the parliament grants a total divorce, as has happened frequently of late years), which is that allowance which is made to a woman, for her ſupport, out of the huſband's eſtate; being ſetttled at the diſcretion of the eccleſiaſtical judge, on the conſideration of all the circumſtances of the caſe, and the rank and quality of the parties.

Having thus ſhewn how marriages may be made, or diſſolved, I come now, laſtly, to ſpeak of the legal conſequences of ſuch making, or diſſolution.

By marriage, the huſband and wife are one perſon in law; that is, the very being, or legal exiſtence of the woman, is ſuſpended during the marriage, or at leaſt is incorporated and conſolidated into that of the huſband: under whoſe wing, protection, and *cover*, ſhe performs every thing, and is therefore called in our Law French, a *feme-covert*, under the protection and influence of her huſband, her *baron* or lord; and her condition, during her marriage, is called her *coverture*. Upon this principle of an union of perſon in huſband and wife depends almoſt all the legal rights, duties, and diſabilities, that either of them acquire by the marriage. I ſpeak not at preſent of the rights of property, but of ſuch as are merely *perſonal*. For this reaſon a man cannot grant any thing to his wife, or enter into a covenant with her; for the grant would be to ſuppoſe her ſeparate exiſtence; and the covenant with her would

would be only to covenant with himſelf; and therefore it is generally true, that all compacts made between huſband and wife, when ſingle, are voided by the intermarriage. A woman indeed may be attorney for her huſband; for that implies no ſeparation from, but is rather a repreſentation of, her lord. And a huſband may alſo bequeath any thing to his wife by will: for that cannot take effect till the coverture is determined by his death. The huſband is bound to provide his wife with neceſſaries by law, as much as himſelf; and if ſhe contracts debts for him, he is obliged to pay them: but for any thing beſides neceſſaries, he is not chargeable. Alſo if the wife elopes, and lives with another man, the huſband is not chargeable even for neceſſaries: at leaſt, if the perſon who furniſhes them is ſufficiently apprized of her elopement. If the wife be indebted before marriage, the huſband is bound afterwards to pay the debt; for he has adopted her and her circumſtances together. If the wife be injured in her perſon or property, ſhe can bring no action for redreſs, without her huſband's concurrence, and in his name, as well as her own; neither can ſhe be ſued, without making the huſband a defendant; except when the huſband has abjured the realm, or is baniſhed; for then he is dead in law. In criminal proſecutions, it is true, the wife may be indicted, and puniſhed ſeparately; for the union is only a civil union. But, in trials of any ſort, they are not allowed to be evidences for, or againſt, each other; partly becauſe it is impoſſible their teſtimony ſhould be impartial; but principally becauſe of the union of perſon. But where the offence is directly againſt the perſon of the wife, this rule has been uſually diſpenſed with; and therefore, in caſe a woman be forcibly taken away, and married, ſhe may be a witneſs againſt ſuch her huſband, in order to convict him of felony.

In the civil law, the huſband and the wife are conſidered as two diſtinct perſons; and may have ſeparate eſtates, contracts, debts, and injuries; and therefore, in our eccleſiaſtical courts, a woman may ſue, and be ſued, without her huſband. Though our law in general conſiders man and wife as one perſon, yet there are ſome inſtances in which ſhe is ſeparately conſidered, as inferior to him, and acting by his compulſion. Therefore all deeds executed, and acts done, by her, during her coverture, are void; except it be a fine, or the like matter of record, in which caſe ſhe muſt be ſolely and ſecretly examined, to learn if her act be voluntary. She cannot by will deviſe land to her huſband, unleſs under ſpecial circumſtances; for, at the time of making it, ſhe is ſuppoſed to be under his coercion. And in ſome felonies, and other inferior crimes committed by her, through conſtraint of her huſband, the law excuſes her; but this extends not to treaſon or murder.

The huſband alſo (by the old, and likewiſe by the civil law) might give his wife moderate correction; for, as he is to anſwer for her miſbehaviour, the law thought it reaſonable to entruſt him with this power of reſtraining her, by domeſtic chaſtiſement, in the ſame moderation that a man is allowed to correct his ſervants or children: for whom the maſter or parent is alſo liable in ſome caſes to anſwer. But in the poliſter reign of Charles II. this power of correction began to be doubted; and a wife may now have ſecurity of the peace againſt her huſband; or, in return, a huſband againſt his wife; yet the lower rank of people claim and exert their ancient privilege; and the courts of law will permit a huſband to reſtrain a wife of her liberty, in caſe of any groſs miſbehaviour.

Theſe are the chief legal effects of marriage during the coverture; upon which we may obſerve, that even the diſabilities, which the wife lies under, are for the moſt part intended for her protection and benefit. So great a favourite is the female ſex with the laws of England!

REVENUES OF THE BRITISH GOVERNMENT. The king's eccleſiaſtical revenues conſiſt in, 1. The cuſtody of the temporalities of vacant biſhopricks; from which he receives little or no advantage. 2. Corodies and penſions, formerly ariſing

ariſing from allowances of meat, drink, and cloathing, due to the king from an abbey or monaſtery, and which he generally beſtowed upon favourite ſervants; and his ſending one of his chaplains to be maintained by the biſhop, or to have a penſion beſtowed upon him till the biſhop promoted him to a benefice. 3. Extra-parochial tithes. 4. The firſt fruits and tenths of benefices. At preſent, ſuch has been the bounty of the crown to the church, that thoſe branches afford little or no revenue.

The king's ordinary temporal revenue conſiſts in, 1. The demeſne lands of the crown, which at preſent lie in a narrow compaſs. 2. The hereditary exciſe; being part of the conſideration for the purchaſe of his feodal profits, and the prerogatives of purveyance and pre-emption. 3. An annual ſum iſſuing from the duty on wine licences; being the reſidue of the ſame conſideration. 4. His foreſts. 5. His courts of juſtice, &c.

The extraordinary grants are uſually called by the ſynonymous names of aids, ſubſidies, and ſupplies; and are granted by the commons of Great Britain, in parliament aſſembled: who, when they have voted a ſupply to his majeſty, and ſettled the *quantum* of that ſupply, uſually reſolve themſelves into what is called a committee of ways and means, to conſider of the ways and means of raiſing the ſupply ſo voted. And in this committee, every member (though it is looked upon as the peculiar province of the chancellor of the exchequer) may propoſe ſuch ſcheme of taxation as he thinks will be leaſt detrimental to the public. The reſolutions of this committee (when approved by a vote of the houſe) are in general deemed final and concluſive; for, though the ſupply cannot be actually raiſed upon the ſubject till directed by an act of the whole parliament, yet no monied man will ſcruple to advance to the government any quantity of ready caſh, if the propoſed terms be advantageous, on the credit of the bare vote of the houſe of commons.

The annual taxes are, 1. The land-tax, or the ancient ſubſidy raiſed upon a new aſſeſſment. 2. The malt-tax, being an annual exciſe on malt, mum, cyder, and perry.

The perpetual taxes are, 1. The cuſtoms, or tonage and poundage of all merchandiſe exported or imported. 2. The exciſe duty, or inland impoſition, on a great variety of commodities. 3. The ſalt duty. 4. The poſt-office *, or duty for the carriage of letters. 5. The ſtamp-duty on paper, parchment, &c. 6. The duty on houſes and windows. 7. The duty on licences for hackney coaches and chairs. 8. The duty on offices and penſions, with a variety of new taxes impoſed in the year 1784.

The neat annual produce of theſe ſeveral branches of the revenue, old and new taxes, after all charges of collecting and management paid, is eſtimated at eleven millions ſterling; with two millions and a quarter raiſed at an average, by the land and malt-tax. How theſe immenſe ſums are appropriated, is next to be conſidered. And this is, firſt and principally, to the payment of the *intereſt* of the national debt.

In order to take a clear and comprehenſive view of the nature of this NATIONAL DEBT, it muſt be firſt premiſed, that after the Revolution, when our new connections with Europe introduced a new ſyſtem of foreign politics, and expences of the nation, not only in ſettling the new eſtabliſhment, but in maintaining long wars, as principals, on the continent, for the ſecurity of the Dutch barrier, reducing the French monarchy, ſettling the Spaniſh ſucceſſion, ſupporting the houſe of Auſtria, maintaining the liberties of the Germanic body, and other purpoſes, increaſed to

* From the year 1644 to 1744, the annual amount of this revenue gradually increaſed from 5000l. to 192,226l. but it ſhould be obſerved, that the groſs amount of both inland and foreign offices was in that year 235,492l. In 1764, the groſs amount of the revenues of the Poſt-office for that year was 432,048l. which, by the act paſſed in the ſeſſions of 1784, increaſing the duty according to the diſtance, and abridging the franking, muſt be conſiderably augmented.

an

an unuſual degree: inſomuch that it was not thought adviſeable to raiſe all the expences of any one year by taxes to be levied within that year, leſt the unaccuſtomed weight of them ſhould create murmurs among the people. It was therefore the policy of the times, to anticipate the revenues of their poſterity, by borrowing immenſe ſums for the current ſervice of the ſtate, and to lay no more taxes upon the ſubject than would ſuffice to pay the annual intereſt of the ſums ſo borrowed: by this means converting the principal debt into a new ſpecies of property, transferrable from one man to another, at any time and in any quantity. A ſyſtem which ſeems to have had its original in the ſtate of Florence, A.D. 1344: which government then owed about 60,000 l. ſterling: and being unable to pay it, formed the principal into an aggregate ſum, called metaphorically a mount or bank: the ſhares whereof were transferrable like our ſtocks. This laid the foundation of what is called the NATIONAL DEBT: for a few long annuities created in the reign of Charles II. hardly deſerve that name. And the example then ſet, has been ſo cloſely followed during the long wars in the reign of queen Anne, and ſince, that the capital of the funded debt at Midſummer 1775 was 129,860,018l. and the annual charge of it amounted to 4,219,254l. 7s. The American war commencing at this time, and the execrable policy continuing of alienating the ſinking fund, with the extravagancies in every department of government, and the manner of borrowing the money for ſupplies, have conſiderably increaſed it *.

The following was the ſtate of the national debt in the year 1783, extracted from the eleventh report of the commiſſioners of public accounts:

£.	s.	d.		£.	s.	d.

			Peace eſtabliſhment reckoned at the average annual expence for eleven years preceding the war - -	3,950,000	0	0
			Income of the civil liſt - - - -	900,000	0	0
			Whole expenditure,	14,350,000	0	0

* In the courſe of the late war from 1776, to 1782, 46,550,000l. was added to the 3 *per cents.* and 26,750,000l. to the 4 *per cents*, making together a capital of 73,400,000l. for which the money advanced was only 48 millions.

ariſing from allowances of meat, drink, and cloathing, due to the king from an abbey or monaſtery, and which he generally beſtowed upon favourite ſervants; and his ſending one of his chaplains to be maintained by the biſhop, or to have a penſion beſtowed upon him till the biſhop promoted him to a benefice. 3. Extra-parochial tithes. 4. The firſt fruits and tenths of benefices. At preſent, ſuch has been the bounty of the crown to the church, that thoſe branches afford little or no revenue.

The king's ordinary temporal revenue conſiſts in, 1. The demeſne lands of the crown, which at preſent lie in a narrow compaſs. 2. The hereditary exciſe; being part of the conſideration for the purchaſe of his feodal profits, and the prerogatives of purveyance and pre-emption. 3. An annual ſum iſſuing from the duty on wine licences; being the reſidue of the ſame conſideration. 4. His foreſts. 5. His courts of juſtice, &c.

The extraordinary grants are uſually called by the ſynonymous names of aids, ſubſidies, and ſupplies; and are granted by the commons of Great Britain, in parliament aſſembled: who, when they have voted a ſupply to his majeſty, and ſettled the *quantum* of that ſupply, uſually reſolve themſelves into what is called a committee of ways and means, to conſider of the ways and means of raiſing the ſupply ſo voted. And in this committee, every member (though it is looked upon as the peculiar province of the chancellor of the exchequer) may propoſe ſuch ſcheme of taxation as he thinks will be leaſt detrimental to the public. The reſolutions of this committee (when approved by a vote of the houſe) are in general deemed final and concluſive; for, though the ſupply cannot be actually raiſed upon the ſubject till directed by an act of the whole parliament, yet no monied man will ſcruple to advance to the government any quantity of ready caſh, if the propoſed terms be advantageous, on the credit of the bare vote of the houſe of commons.

The annual taxes are, 1. The land-tax, or the ancient ſubſidy raiſed upon a new aſſeſſment. 2. The malt-tax, being an annual exciſe on malt, mum, cyder, and perry.

The perpetual taxes are, 1. The cuſtoms, or tonage and poundage of all merchandiſe exported or imported. 2. The exciſe duty, or inland impoſition, on a great variety of commodities. 3. The ſalt duty. 4. The poſt-office *, or duty for the carriage of letters. 5. The ſtamp-duty on paper, parchment, &c. 6. The duty on houſes and windows. 7. The duty on licences for hackney coaches and chairs. 8. The duty on offices and penſions, with a variety of new taxes impoſed in the year 1784.

The neat annual produce of theſe ſeveral branches of the revenue, old and new taxes, after all charges of collecting and management paid, is eſtimated at eleven millions ſterling; with two millions and a quarter raiſed at an average, by the land and malt-tax. How theſe immenſe ſums are appropriated, is next to be conſidered. And this is, firſt and principally, to the payment of the *intereſt* of the national debt.

In order to take a clear and comprehenſive view of the nature of this NATIONAL DEBT, it muſt be firſt premiſed, that after the Revolution, when our new connections with Europe introduced a new ſyſtem of foreign politics, and expences of the nation, not only in ſettling the new eſtabliſhment, but in maintaining long wars, as principals, on the continent, for the ſecurity of the Dutch barrier, reducing the French monarchy, ſettling the Spaniſh ſucceſſion, ſupporting the houſe of Auſtria, maintaining the liberties of the Germanic body, and other purpoſes, increaſed to

* From the year 1644 to 1744, the annual amount of this revenue gradually increaſed from 5000l. to 198,226l. but it ſhould be obſerved, that the groſs amount of both inland and foreign offices was in that year 235,492l. In 1764, the groſs amount of the revenues of the Poſt-office for that year was 432,048l. which, by the act paſſed in the ſeſſions of 1784, increaſing the duty according to the diſtance, and abridging the franking, muſt be conſiderably augmented.

an

an unuſual degree: inſomuch that it was not thought adviſeable to raiſe all the expences of any one year by taxes to be levied within that year, leſt the unaccuſtomed weight of them ſhould create murmurs among the people. It was therefore the policy of the times, to anticipate the revenues of their poſterity, by borrowing immenſe ſums for the current ſervice of the ſtate, and to lay no more taxes upon the ſubject than would ſuffice to pay the annual intereſt of the ſums ſo borrowed: by this means converting the principal debt into a new ſpecies of property, transferrable from one man to another, at any time and in any quantity. A ſyſtem which ſeems to have had its original in the ſtate of Florence, A.D. 1344: which government then owed about 60,000 l. ſterling: and being unable to pay it, formed the principal into an aggregate ſum, called metaphorically a mount or bank: the ſhares whereof were transferrable like our ſtocks. This laid the foundation of what is called the NATIONAL DEBT: for a few long annuities created in the reign of Charles II. hardly deſerve that name. * In the courſe of the late war from 1776, to 1782, 46,550,000l. was added to the 3 *per cents.* and 26,750,000l. to the 4 *per cents.* making together a capital of 73,400,000l. for which the money advanced was only 48 millions.

The produce of the ſeveral taxes were originally ſeparate and diſtinct funds; being ſecurities for the ſums advanced on each ſeveral tax, and for them only. But at laſt it became neceſſary, in order to avoid confuſion, as they multiplied yearly, to reduce the number of theſe ſeparate funds, by uniting them together: ſuperadding the faith of parliament for the general ſecurity of the whole. So that there are now only three capital funds of any account: the *aggregate fund*, the whole produce of which hath been for ſome years about 2,600,000l. *per annum*; the *general fund*, ſo called from ſuch union and addition, which for ſome years have amounted to rather more than a million *per annum*; and the *South Sea fund*, being the produce of the taxes appropriated to pay the intereſt of ſuch part of the national debt as was advanced by that company and its annuitants, the produce of which lately hath been about half a million *per annum*. The ſeparate funds, which were thus united, are become mutual ſecurities for each other; and the whole produce of them, thus aggregated, liable to pay ſuch intereſt or annuities as were formerly charged upon each diſtinct fund; the faith of the legiſlature being moreover engaged to ſupply any caſual deficiencies.

The cuſtoms, exciſes and other taxes, which are to ſupport theſe funds, depending on contingencies, upon exports, imports, and conſumptions, muſt neceſſarily be of a very uncertain amount: but they have always been conſiderably more than ſufficient to anſwer the charge upon them. The ſurpluſſes therefore of the three great national funds, the aggregate, general, and South Sea funds, over and above the intereſt and annuities charged upon them, are directed by ſtatute 3 George I. c. 7. to be carried together, and to attend the diſpoſition of parliament; and are uſually denominated the *ſinking fund*, becauſe originally deſtined to ſink or reduce the national debt. To this have been ſince added many other entire duties, granted in ſubſequent years; and the annnal intereſt of the ſums borrowed on their reſpective credits, is charged on, and payable out of, the produce of the ſinking fund. However, the neat ſurpluſſes and ſavings, after all deductions paid, amount annually to a very conſiderable ſum; for, as the intereſt on the national debt has been at ſeveral times reduced (by the conſent of the proprietors, who had their option either to lower their intereſt, or be paid their principal), the ſavings from the appropriated revenues muſt be extremely large. This ſinking fund is the laſt reſort of the nation; its only domeſtic reſource, on which muſt chiefly depend all the hopes we can entertain of ever diſcharging or moderating our incumbrances.

Between the years 1727 and 1732, ſeveral encroachments were made upon the ſinking fund; and in the year 1733, half a million was taken from it, under pretence of eaſing the landed intereſt. The practice of alienating the ſinking fund hath increaſed; and in 1736, it was anticipated and mortgaged, and ſubſequent adminiſtrations have broken in upon it, thus converting an excellent expedient for ſaving the kingdom, into a ſupply for the worſt purpoſes.

In ſome years, the ſinking fund hath produced from two to three millions; and, if 1,212,000l. of it had been inviolably applied to the redemption of the public debts from the year 1733 to the preſent time, one hundred and ſixty millions would have been paid off, and the nation much relieved. Such regulations are, however, made at preſent, [1790] and actually have, in part, taken place, not only for reducing the national debt, but alſo for collecting the public taxes, as affords the moſt pleaſing proſpect to every perſon anxious for the proſperity of Great Britain *.

Before

* Dr. Price's calculation plainly ſhews that, "A million borrowed annually for twenty years, will pay off, in this time, 55 millions 3 per cent. ſtock, if diſcharged at 60l. in money for every 100l. ſtock, and in forty years more, without any further aid from loans, 333 millions (that is, 388 millions in all) would be paid off.

"The addition of nineteen years to this period would pay off 1000 millions.

"A ſurplus of half a million per annum, made up to a million, by borrowing half a million every year for twenty years, would diſcharge the ſame ſums in the ſame periods.

"In ſhort, ſo neceſſary is it at preſent to expedite

Before any part of the *aggregate fund* (the ſurpluſſes whereof are one of the chief ingredients that form the ſinking fund) can be applied to diminiſh the principal of the public debt, it ſtands mortgaged by parliament to raiſe an annual ſum for the maintenance of the king's houſhold and the civil liſt. For this purpoſe, in the late reigns, the produce of certain branches of the exciſe and cuſtoms, the poſt-office, the duty on wine-licences, the revenues of the remaining crown-lands, the profits ariſing from courts of juſtice (which articles include all the hereditary revenues of the crown), and alſo a clear annuity of 100,000l. in money, were ſettled on the king for life, for the ſupport of his majeſty's houſhold, and the honour and dignity of the crown. And, as the amount of theſe ſeveral branches were uncertain, (though in the laſt reign they were computed to have ſometimes raiſed almoſt a million), if they did not riſe annually to 800,000l. the parliament engaged to make up the deficiency. But his preſent majeſty having, ſoon after his acceſſion, ſpontaneouſly ſignified his conſent, that his own hereditary revenues might be ſo diſpoſed of, as might beſt conduce to the utility and ſatisfaction of the public; and having accepted the limited ſum of 800,000l. *per annum*, for the ſupport of his civil liſt (and that alſo charged with three life annuities, to the princeſs of Wales, the duke of Cumberland, and princeſs Amelia, to the amount of 77,000l.), the ſaid hereditary, and other revenues are now carried into, and made, part of the aggregate fund; and the aggegate fund is charged with the payment of the whole annuity to the crown, beſides annual payments to the dukes of Glouceſter and Cumberland, and the repreſentatives of Arthur Onſlow, eſq. and the earl of Chatham. Hereby the revenues themſelves, being put under the ſame care and management as the other branches of the public patrimony, will produce more, and be better collected than heretofore. The civil liſt, thus liquidated, together with the millions intereſt of the national debt, and the ſums produced from the ſinking fund, beſide the uncertain ſums, ariſing from the annual taxes on land and malt, and others lately impoſed, make the clear produce of the taxes, excluſive of the charge of collecting, which are raiſed yearly on the people of this country, amount to upward of fourteen millions ſterling.

pedite, by every poſſible means, the redemption of our debts, that, let the ſurplus which can be obtained for a ſinking fund be what it will, an addition to it, by annual loans, will be proper, in order to give it greater efficiency and a better chance for ſaving the kingdom.—The increaſe of taxes which ſuch a meaſure muſt occaſion, would be ſo inconſiderable and ſo gradual, as to be ſcarcely perceptible; and, at the ſame time, it would manifeſt ſuch a determined reſolution in our rulers to reduce our debts, as might have the happieſt influence on public credit.

* Redeemable when 25 millions of the 3 or 4 per cents are paid.

† Theſe will fall in January 1860.

‡ Theſe will fall in 1808.

The expences defrayed by the civil liſt, are thoſe that in any ſhape relate to civil government; as the expences of the houſhold, all ſalaries to officers of ſtate, to the judges, and every one of the king's ſervants; the appointments to foreign ambaſſadors, the maintenance of the queen and royal family, the king's private expences, or privy purſe, and other very numerous outgoings; as ſecret ſervice-money, penſions, and other bounties. Theſe ſometimes have ſo far exceeded the revenues appointed for that purpoſe, that application has been made to parliament, to diſcharge the debts contracted on the civil liſt; as particularly in 1724, when one million was granted for that purpoſe by the ſtatute 11 Geo. I. c. 17. Large ſums have alſo been repeatedly granted for the payment of the king's debts in the preſent reign; and the conſiderable augmentation of 100,000l. has likewiſe been made to his annual income. When the bill for ſuppreſſing certain offices, as the board of trade, &c. was debated, by which ſavings were to be made to the amount of 72,368l. per annum, it appeared that the arrears then due on the civil liſt at that time, June 1782, amounted to 95,877l 18s. 4d. notwithſtanding ſo liberal an allowance had been recently made, and the king's debts had been repeatedly liquidated by parliamentary grants; and for the payment of this other debt proviſion was made by the bill.

The civil liſt is indeed properly the whole of the king's revenue in his own diſtinct capacity; the reſt being rather the revenue of the public, or its creditors, though collected and diſtributed again in the name, and by the officers of the crown; it is now ſtanding in the ſame place as the hereditary income did formerly; and as that has gradually diminiſhed, the parliamentary appointments have increaſed.

MILITARY AND MARINE STRENGTH OF GREAT BRITAIN.

The *military ſtate* includes the whole of the ſoldiery; or, ſuch perſons as are peculiarly appointed among the reſt of the people, for the ſafeguard and defence of the realm.

In a land of liberty (ſays judge Blackſtone), it is extremely dangerous to make a diſtinct order of the profeſſion of arms. In ſuch no man ſhould take up arms, but with a view to defend his country and its laws: he puts not off the citizen when he enters the camp; but it is becauſe he is a citizen, and would wiſh to continue ſo, that he makes himſelf for a while a ſoldier. The laws and conſtitution of theſe kingdoms formerly knew no ſuch ſtate, as that of a perpetual ſtanding ſoldier, bred up to no other profeſſion than that of war; and it was not till the reign of Henry VII. that the kings of England had ſo much as a guard about their perſons.

It ſeems univerſally agreed by all hiſtorians, that king Alfred firſt ſettled a national militia in this kingdom, and by his prudent diſcipline made all the ſubjects of his dominions ſoldiers. In the mean time we are not to imagine that the kingdom was left wholly without defence, in caſe of domeſtic inſurrections, or the proſpect of foreign invaſions. Beſides thoſe, who by their military tenures were bound to perform forty days ſervice in the field, the ſtatute of Wincheſter obliged every man, according to his eſtate and degree, to provide a determinate quantity of ſuch arms as were then in uſe, in order to keep the peace; and conſtables were appointed in all hundreds, to ſee that ſuch arms were provided. Theſe weapons were changed by the ſtatute 4 and 5 Ph. and M. c. 2. into others of more modern ſervice. It was uſual from time to time, for our princes to iſſue commiſſioners of array, and ſend into every county officers in whom they could confide, to muſter and array (or ſet in military order) the inhabitants of every diſtrict; and the form of the commiſſion of array was ſettled in parliament in the 5 Henry IV. But at the ſame time it was provided, that no man ſhould be compelled to go out of the kingdom at any rate; nor out of his ſhire, but in caſes of urgent neceſſity; nor ſhould provide ſoldiers unleſs by conſent of parliament. About the reign of king Henry VIII. lord lieu-

tenants

tenants began to be introduced, as ſtanding repreſentatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the ſtatute 4 and 5 Ph. and M. c. 3. though they had not been then long in uſe; for Camden ſpeaks of them in the time of queen Elizabeth as extraordinary magiſtrates, conſtituted only in times of difficulty and danger.

Soon after the Reſtoration of king Charles II. when the military tenures were aboliſhed, it was thought proper to aſcertain the power of the militia, to recogniſe the ſole right of the crown to govern and command them, and to put the whole into a more regular method of military ſubordination: and the order in which the militia now ſtands by law, is principally built upon the ſtatutes which were then enacted. It is true, the two laſt of them are apparently repealed; but many of their proviſions are re-enacted, with the addition of ſome new regulations, by the preſent militia-laws; the general ſcheme of which, is to diſcipline a certain number of the inhabitants of every county, choſen by lot for three years, and officered by the lord-lieutenant, the deputy-lieutenants, and other principal land-holders, under a commiſſion from the crown. They are not compellable to march out of their counties, unleſs in caſe of invaſion, or actual rebellion, nor in any caſe to be ſent out of the kingdom. They are to be exerciſed at ſtated times, and their diſcipline in general is liberal and eaſy; but when drawn out into actual ſervice, they are ſubject to the rigours of martial law, as neceſſary to keep them in order. This is the conſtitutional ſecurity which our laws have provided for the public peace, and for protecting the realm againſt foreign or domeſtic violence, and which the ſtatutes declare, is eſſentially neceſſary to the ſafety and proſperity of the kingdom.

But as the mode of keeping ſtanding armies has prevailed over all Europe for a conſiderable time, it has alſo for many years paſt been annually judged neceſſary by our legiſlature, for the ſafety of the kingdom, the defence of the poſſeſſions of the crown of Great Britain, and the preſervation of the balance of power in Europe, to maintain, even in time of peace, a ſtanding body of troops, under the command of the crown; who are, however, *ipſo facto*, diſbanded at the expiration of every year, unleſs continued by parliament. The land forces * of theſe kingdoms, in time of peace, amount to about 40,000 men, including troops and garriſons in Ireland, Gibraltar, the Eaſt Indies, and America; but in time of war, there have formerly been in Britiſh pay, natives and foreigners, above 150,000; and there have been in the pay of Great Britain, ſince the commencement of the American war, 135,000 men, beſides 42,000 militia. To regulate this body of troops an annual act of parliament paſſes, "to puniſh mutiny and deſertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be diſperſed among the ſeveral inn-keepers and victuallers throughout the kingdom; and eſtabliſhes a law martial for their government. By this, among other things, it is enacted that if any officer and ſoldier ſhall excite, or join any mutiny, or knowing of it, ſhall not give notice to the commanding officer; or ſhall deſert, or liſt in any other regiment, or ſleep upon his poſt, or leave it before he is relieved, or hold correſpondence with a rebel or enemy, or ſtrike or uſe violence to his ſuperior officer, or diſobey his lawful command; ſuch offender

* The land forces conſiſt of

2 Troops of horſe-guards, raiſed in 1660.—2 Troops of horſe-grenadier-guards, raiſed in 693, and 1702.—1 Royal regiment of horſe-guards, ditto, 1661.—4 Regiments of horſe guards, ditto, 1685 and 1688.—3 Regiments of dragoons-guards, ditto, 1685.—18 Regiments of dragoons, incuding light-horſe, raiſed between 1683 and 1759.—3 Regiments of foot-guards raiſed in 1660.—70 Regiments of foot, the firſt or Royal Scots, raiſed in 1633, the others between 1661 and 1762.—20 independent companies of invalids. 4 Battalions of Royal Artillery, a royal regiment of artillery in Ireland, and a corps of engineers: together with 4 diviſions of marine forces.—1 Regiment of light dragoons, and 5 Battalions of foot in Eaſt India. Several regiments raiſed for the ſervice of the crown, from the commencement of the American war, have lately been diſbanded.

ſhall

ſhall ſuffer ſuch puniſhment as a court martial ſhall inflict, though it extend to death itſelf.

Officers and ſoldiers that have been in the king's ſervice are, by ſeveral ſtatutes, at liberty to uſe any trade or occupation they are fit for, in any town of the kingdom (except the two univerſities), notwithſtanding any ſtatute, cuſtom, or charter to the contrary. And ſoldiers, in actual military ſervice, may make verbal wills, and diſpoſe of their goods, wages, and other perſonal chattels, without thoſe forms, ſolemnities, and expences, which the law requires in other caſes.

Daily Pay of each Rank in his Majeſty's Land-Forces on the Britiſh Eſtabliſhment.

The MARITIME ſtate is nearly related to the former; though much more agreeable to the principles of our free conſtitution. The royal navy of England hath ever been its greateſt defence and ornament; it is its ancient and natural ſtrength; the floating bulwark of the iſland; from which, however ſtrong and powerful, no danger can be apprehended to liberty; and accordingly it has been aſſiduouſly cultivated, from the earlieſt ages. To ſuch perfection was our naval reputation arrived in the twelfth century, that the code of maritime laws, which are called the laws of Oleron, and are received by all nations in Europe as the ground of their marine conſtitutions, was confeſſedly compiled by our king Richard I. at the iſle of Oleron, on the coaſt of France, then part of the poſſeſſions of the crown of England. And yet, ſo inferior were our anceſtors in this point to the preſent age, that, even in the maritime reign of queen Elizabeth, ſir Edward Coke thinks it matter of boaſt that the royal navy of England conſiſted of 33 ſhips. The preſent condition of our marine is by many aſcribed to the navigation act framed in 1650, which prohibited all

ſhips of foreign nations from trading with the Engliſh plantations without licence from the council of ſtate. In 1651, the prohibition was extended alſo to the mother-country; and no goods were ſuffered to be imported into England, or any of its dependencies, in any other than Engliſh bottoms, or in the ſhips of that European nation, of which the merchandiſe imported was the genuine growth or manufacture. At the Reſtoration, the former proviſions were continued, by ſtatute 12 Car. II. c. 18. with this very material improvement, that the maſter, and three-fourths of the mariners, ſhall alſo be Engliſh ſubjects.

The complement of ſeamen, in time of peace, hath uſually amounted to 12 or 15,000. In time of war, they have formerly amounted to no leſs than 80,000 men; and after the commencement of the American war, they amounted to above 100,000 men, including marines. The vote of parliament for the ſervice of the year 1784, is for 26,000 ſeamen, including 4495 marines.

This navy is commonly divided into three ſquadrons; namely, the red, white, and blue, which are ſo termed from the differences of their colours, Each ſquadron has its admiral: but the admiral of the red ſquadron has the principal command of the whole, and is ſtyled vice-admiral of Great Britain. Subject to each admiral is alſo a vice and rear-admiral. But the ſupreme command of our naval force is, next to the king, in the lords commiſſioners of the admiralty. Notwithſtanding our favourable ſituation for a maritime power, it was not until the prodigious armament ſent to ſubdue us by Spain, in 1588, that the nation by a vigorous effort, became fully ſenſible of its true intereſt and natural ſtrength, which it has ſince ſo happily cultivated.

Many laws have been made for the ſupply of the royal navy with ſeamen; for their regulation when on board; and to confer privileges and rewards on them during, and after their ſervice.

1. For their ſupply. The power of impreſſing men for the ſea-ſervice by the king's commiſſion, has been a matter of much diſpute, and ſubmitted to with great reluctance; though it hath very learnedly been ſhewn by ſir Michael Foſter, that the practice of impreſſing, and granting powers to the admiralty for that purpoſe, is of very ancient date, and hath been uniformly continued by a regular ſeries of precedents to the preſent time; whence he concludes it to be a part of the common law. The difficulty ariſes from hence, that no ſtatute, or act of parliament, has expreſsly declared this power to be in the crown, though many of them very ſtrongly imply it. It has alſo been ſuppoſed, that a practice ſo unfavourable to the liberty of the ſubject, and to the common principles of juſtice and humanity, could not be ſolidly ſupported without ſome clear, poſitive, and unequivocal law.

Beſides this method of impreſſing (which, even if legal, is only defenſible from public neceſſity; ſuch as an actual rebellion or invaſion of the kingdom, to which all private conſiderations muſt give way), the principal trading cities, and ſometimes the government, offer bounty-money to ſeamen who enter voluntarily into his majeſty's ſervice: and every foreign ſeaman who, during a war, ſhall ſerve two years in any man of war, merchantman, or privateer, is naturalized *ipſo facto*.

But as impreſſing is generally conſidered as a groſs violation of the natural rights of mankind, ſo has the bounty-money, which ſeldom exceeds 40s. proved ineffectual. The wages of ſeamen on board of merchantmen, in time of war, is uſually 50s. to 4l. per month; on board of the royal navy, they only receive 22s. They are flattered indeed with the hopes of prize-money, which, if divided in a more equitable manner, would produce the happieſt effects. There would then be leſs occaſion for bounty-money or preſſing; our fleets would be ſpeedily manned, and regularly ſupplied with experienced and able ſeamen. Since, under Providence, not only the very exiſtence of this nation, its commerce, and foreign ſettlements; but the liberties of Europe, and ſecurity of the Proteſtant religion, ſolely depend on the

ſtrength

ſtrength and ſucceſs of the Britiſh navy, which is the only mode of war we ought ever to engage in; it has been matter of ſurpriſe to every thinking, diſintereſted ſubject of theſe kingdoms, that neither the above mentioned regulations, nor any other ſatisfactory ſcheme has yet taken place; but that to enrich a few ſuperior officers, we ſhould deprive thoſe very men of their rights and liberty, to whoſe valour and intrepidity alone, in the day of public danger, we look for our preſervation.

2. The method of ordering ſeamen in the royal fleet, and keeping up a regular diſcipline there, is directed by certain expreſs rules, firſt enacted by authority of parliament ſoon after the Reſtoration; but new-modelled and altered ſince the peace of Aix-la-Chapelle, to remedy ſome defects, which were ſeverely felt in conducting the preceding war. In theſe articles of the navy almoſt every poſſible offence is ſet down, and the puniſhment thereof annexed, in which reſpect the ſeamen have much the advantage over their brethren in the land ſervice; whoſe articles of war are not enacted by parliament, but framed from time to time at the pleaſure of the crown.

3. With regard to the privileges conferred on ſailors, they are pretty much the ſame with thoſe conferred on ſoldiers; with regard to relief, when maimed or wounded, or ſuperannuated, it is afforded them either by county rates, or from the royal hoſpital at Greenwich; they are alſo allowed the exerciſe of trades in corporations, and the power of making teſtaments; and, farther, no ſeaman aboard his majeſty's ſhips can be arreſted for any debt, unleſs the ſame be ſworn to amount to at leaſt twenty pounds; though by the annual mutiny act, a ſoldier may be arreſted for a debt which extends to half that value *.

I ſhall cloſe this account of the military and maritime ſtrength † of Great Britain, by obſerving, that though ſea-officers and ſailors are ſubject to a perpetual act of parliament,

* The Royal Navy of GREAT BRITAIN as it ſtood at Auguſt 31, 1784.

liament, which anſwers the annual military act, that is paſſed for the government of the army, yet neither of thoſe bodies are exempted from legal juriſdiction in civil or criminal caſes, but in a few inſtances of no great moment. The ſoldiers, particularly may be called upon by a civil magiſtrate, to enable him to preſerve the peace againſt all attempts to break it. The military officer who commands the ſoldiers on thoſe occaſions, is to take his directions from the magiſtrate; and both he and they, if their proceedings are regular, are indemnified againſt all conſequences, be they ever ſo fatal. But thoſe civil magiſtrates who underſtand the principles of the conſtitution, are extremely cautious in calling for the military on theſe occaſions, or indeed upon any commotion whatever, and with good reaſon; for the frequent employment of the military power in a free government is exceedingly dangerous, and cannot be guarded againſt with too much caution.

Coins.] In Great Britain money is computed by pounds, ſhillings, and pence; twelve pence making a ſhilling, and twenty ſhillings one pound, which pound is only an imaginary coin. The gold pieces conſiſt only of guineas, halves, and quarters: the ſilver, of crowns, half-crowns, ſhillings, ſix-pences, groats, and even down to a ſilver penny, and the copper money only of half-pence and farthings.

* *One to every four guns.*

† *Beſides 2d. a month for each man.*

‡ *Beſides 4d. a month from each man.*

In a country like England, where the intrinſic value of ſilver is nearly equal, and in ſome coins, crown pieces particularly, ſuperior to the nominal, the coinage of ſilver money is a matter of great conſequence; and yet the preſent ſtate of the national currency ſeems to demand a new coinage of ſhillings and ſix-pences; the intrinſic value of the latter being, as to many of them, worn down to half their nominal value. This can only be done by an act of parliament, and by the public loſing the difference between the bullion of the new and the old money. Beſides the coins already mentioned, five and two guinea pieces are coined at the Tower of London, but they are not generally current; nor is any ſilver coin that is lower than ſix-pence. The coins of the famous Simon, in the time of Cromwell, and in the beginning of Charles II's reign, are remarkable for their beauty.

ROYAL TITLES, ARMS, AND ORDERS. The title of the king of England, is, By the Grace of God, of Great Britain, France, and Ireland, King Defender of the Faith. The deſignation of the kings of England was formerly, his or her Grace, or Highneſs, till Henry VIII. to put himſelf on a footing with the emperor Charles V. aſſumed that of majeſty; but the old deſignation was not aboliſhed till towards the end of queen Elizabeth's reign. The title of Defender of the Faith above mentioned was given to Henry VIII. by the pope, on account of a book written by the king againſt Luther, and the Reformation. To the titles already given, the king of Great Britain has others from his German dominions, as Elector of Hanover, Duke of Brunſwick, Lunenburg, &c.

Since the acceſſion of the preſent royal family of Great Britain, anno 1714, the royal atchievement is marſhalled as follows: quarterly, in the firſt grand quarter, *Mars, three lions paſſant guardant, in pale, Sol*, the imperial enſigns of England, impaled, with the royal arms of Scotland, which are *Sol, a lion rampant within a double treſſure flowered, and counterflowered, with fleurs-de-lis, Mars.* The ſecond quarter is the royal arms of France, viz. *Jupiter, three fleurs-de-lis, Sol.* The third, the enſigns of Ireland; which is, *Jupiter, an harp, Sol, ſtringed Luna.* And the fourth grand quarter is his preſent majeſty's own coat, viz. *Mars, two lions paſſant, guardant, Sol*, for Brunſwick, impaled with Lunenburgh, which is, *Sol, ſemée of hearts, proper, a lion rampant, Jupiter*; having ancient Saxony, viz. *Mars, an horſe currant Luna, ente* (or grafted) *in baſe*; and *in a ſhield ſurtout, Mars, the diadem, or crown of Charlemagne*; the whole, within a garter, as ſovereign of that moſt noble order of knighthood.

The motto of *Dieu et mon Droit*, that is, *God and my Right*, is as old as the reign of Richard I. who aſſumed it to ſhew his independency upon all earthly powers. It was afterwards revived by Edward III. when he laid claim to the crown of France. Almoſt every king of England had a particular badge or cogniſance: ſometimes a white hart; ſometimes a fetlock with a falcon, by which it is ſaid Edward IV. alluded to the infidelity of one of his miſtreſſes; and ſometimes a portcullis, which was that of the houſe of Lancaſter, many of the princes of which were born in the caſtle of Beaufort. The white roſe was the bearing of the houſe of York; and that of Lancaſter, by way of contradiſtinction, adopted the red. The thiſtle, which is now part of the royal armorial bearings, belonged to Scotland.

The titles of the king's eldeſt ſon, are, prince of Wales, duke of Cornwall and Rothſay, earl of Cheſter, electoral prince of Brunſwick and Lunenburg, earl of Carrick, baron of Renfrew, lord of the Iſles, great ſteward of Scotland, and captain general of the artillery company.

The order of the GARTER, the moſt honourable in England, was inſtituted by Edward III. January 19, 1344. It conſiſts of the ſovereign, who is always the king or queen of England, of 25 companions called Knights of the Garter, who wear a medal of St. George killing the dragon, ſuppoſed to be the titular ſaint of England, commonly enamelled on gold, ſuſpended from a blue ribband, which was for-

merly worn about their necks, but ſince the latter end of James I. croſſes their bodies from the ſhoulder. The garter, which is of blue velvet, bordered with gold, buckled under the left knee, and gives the name to the order, was deſigned as an enſign of unity and combination; on it is embroidered the words, *Honi ſoit qui mal y penſe*, "Evil to him who evil thinks." Authors are divided as to the original of that motto; but it probably alluded to the bad faith of the French king John, Edward's contemporary; the latter thereby declaring the equity of his own intention, and retorting ſhame on any who ſhould think ill of the enterprize he had engaged in to ſupport his right to the crown of France. This order is ſo reſpectable, that ſome of the moſt illuſtrious foreign princes have been companions of it. It has a prelate, who is the biſhop of Wincheſter, and a chancellor, who is the biſhop of Saliſbury for the time being. It has likewiſe a regiſter, who is dean of Windſor, and a principal king at arms, called Garter, whoſe office it is to marſhal and manage the ſolemnities at the inſtallation, and feaſts of the knights. The place of inſtallation is Edward III's chapel at Windſor, on which occaſion the knights appear in magnificent robes, appropriated to their order, and in their collars of SS. The collar and cap and feathers were introduced by Henry VIII. and to the croſs of the order encompaſſed with the garter worn on the left ſide of their coat, Charles II. added a ſilver ſtar of eight points.

Knights of the BATH, ſo called from their bathing at the time of their creation, are ſuppoſed to have been inſtituted by Henry IV. about the year 1399, but the order ſeems to be more ancient. For many reigns they were created at the coronation of a king or queen, or other ſolemn occaſions, and they wear a ſcarlet ribband hanging from the left ſhoulder, with an enamelled medal the badge of the order, a roſe iſſuing from the dexter ſide of a ſceptre, and a thiſtle from the ſiniſter, between three imperial crowns placed within the motto, *Tria juncta in unum*, "Three joined in one." This order being diſcontinued was revived by king George I. on the 18th of May, 1725, and the month following eighteen noblemen and as many commoners were inſtalled knights of the order, with great ceremony, at Weſtminſter, where the place of inſtallment is Henry VIIth's chapel. Their robes are ſplendid and ſhewy, and the number of knights is undetermined. The biſhop of Rocheſter is perpetual dean of the order, which has likewiſe a regiſter and other officers.

The origin of the Engliſh peerage, or nobility, has been already mentioned. Their titles, and order of dignity, are dukes, marquiſes, earls, viſcounts, and lords or barons.

Baronets can ſcarcely be ſaid to belong to an order, having no other badge than a bloody hand in a field, argent, in their arms. They are the only hereditary honour under the peerage, and would take place even of the knights of the Garter, were it not that the latter are always privy counſellors; there being no intermediate honour between them and the parliamentary barons of England. They were inſtituted by James I. about the year 1615. Their number was then two hundred, and each paid about 1000l. on pretence of reducing and planting the province of Ulſter in Ireland: but at preſent their number amounts to 700.

A knight is a term uſed almoſt in every nation in Europe, and in general ſignifies a ſoldier ſerving on horſeback; a rank of no mean eſtimation in ancient armies, and entitling the party himſelf to the appellation of *Sir*. In the common laws they are called milites or ſoldiers; and they are made, by the king laying a ſword upon their ſhoulders, and deſiring them to riſe by the title of *Sir*. It is a mark of perſonal regard from the crown, and therefore the title does not deſcend to poſterity. Other knighthoods formerly took place in England; ſuch as thoſe of *bannerets*, bachelors, knights of the carpet, and the like, but they are now diſuſed. Indeed in the year 1773, at a review of the royal navy at Portſmouth, the king conferred the honour

of Knights Bannerets on two admirals and three captains. They have no particular badge on their garments, but their arms are painted on a banner placed in the frames of the ſupporters.

It is ſomewhat difficult to account for the origin of the word *eſquire*, which formerly ſignified a perſon bearing the arms of a nobleman or knight, and they were therefore called armigeri. This title denoted any perſon, who, by his birth or property, was entitled to bear arms; but is at preſent app ied promiſcuouſly to any man who can afford to live in the character of a gentleman without trade, and even a tradeſman, if he is a juſtice of peace, demands the appellation. This degree, ſo late as in the reign of Henry IV. was an order, and confirmed by the king, by putting about the party's neck a colour of SS. and giving him a pair of ſilver ſpurs. Gower the poet appears from his effigies on his tomb in Southwark, to have been an eſquire by creation. Serjeants-at-law, and other ſerjeants belonging to the king's houſehold, juſtices of the peace, doctors in divinity, law, and phyſic, take place of other eſquires; and it is remarkable, that all the ſons of dukes, marquiſes, earls, viſcounts, and barons, are in the eye of the law no more than eſquires, though commonly deſigned by noble titles. The appellation of gentleman, though now confounded with the mean ranks of people, is the root of all Engliſh honour; for every nobleman is preſumed to be a gentleman, though every gentleman is not a nobleman.

HISTORY.] It is generally agreed, that the firſt inhabitants of Britain were a tribe of the Gauls, or Celtæ, that ſettled on the oppoſite ſhore: a ſuppoſition founded upon their evident conformity in language, manners, government, religion, and complexion.

When Julius Cæſar, about fifty-two years before the birth of Chriſt, meditated the conqueſt of Britain, the natives were much connected with the Gauls, and other people of the continent. Cæſar wrote the hiſtory of his two expeditions, which he pretended were accompanied with vaſt difficulties, and attended by ſuch advantages over the iſlanders that they agreed to pay tribute. It plainly appears, however, from the ſubſequent hiſtory of Britain, that his victories were incomplete and indeciſive; nor did the Romans receive the leaſt advantage from his expeditions but a better knowlege of the iſland than they had before. The Britons at that period were governed in the time of war by a political confederacy of which Caſſibelan, whoſe territories lay in Hertfordſhire, and ſome of the adjacent counties, was the head: and this form of government long continued among them.

In their manner of life, as deſcribed by Cæſar and the beſt authors, they differed little from the rude inhabitants of the northern climates that have been already mentioned; they ſowed corn, but chiefly ſubſiſted upon animal food and milk. Their clothing was ſkins, and their fortifications beams of wood. They were incredibly dexterous in the management of their chariots; and they fought with lances, darts, and ſwords. Women ſometimes led their armies to the field, and were recogniſed as ſovereigns of their particular diſtricts. They favoured a primogeniture or ſeniority, in their ſucceſſion to royalty, but ſet it aſide on the ſmalleſt inconveniency attending it. They painted their bodies with woad, which gave them a bluiſh or greeniſh caſt; and they are ſaid to have had figures of animals, and heavenly bodies on their ſkins. In their marriages they were not very delicate, for they formed themſelves into what we may call matrimonial clubs. Twelve or fourteen men married as many wives, and each wife was in common to them all, but her children belonged to the original huſband.

The Britons lived, during the long reign of Auguſtus Cæſar, rather as the allies than the tributaries of the Romans; but the communications between Rome and Great Britain being then extended, the emperor Claudius Cæſar, about forty-two years after the birth of Chriſt, undertook an expedition in perſon, in which he ſeems

to have been ſucceſsful. His conqueſts, however, were imperfect; Caractacus, and Boadicea, though a woman, made noble ſtands againſt the Romans. The former was taken priſoner after a deſperate battle, and carried to Rome, where his undaunted behaviour before Claudius gained him the admiration of the victors, and is celebrated in the hiſtories of the times. Boadicea being oppreſſed in a manner that diſgraces the Roman name, and defeated, diſdained to ſurvive the liberties of her country; and Agricola, general to Domitian, after ſubduing South Britain, carried his arms northwards, as has been already ſeen in the hiſtory of Scotland, where his ſucceſſors had no reaſon to boaſt of their progreſs, every inch of ground being bravely defended. During the time the Romans remained in this iſland, they erected thoſe walls I have ſo often mentioned, to protect the Britons from the invaſions of the Caledonians, Scots, and Picts: and we are told, that the Roman language, learning, and cuſtoms, became familiar in Britain. There ſeems to be no great foundation for this aſſertion; and it is more probable, that the Romans conſidered Britain chiefly as a nurſery for their armies, on account of the ſuperior ſtrength of body and courage of the inhabitants. That this was the caſe appears plainly enough from the defenceleſs ſtate of the Britons, when the government of Rome recalled her forces from that iſland. I have already taken notice, that during the abode of the Romans in Britain, they introduced into it all the luxuries of Italy; and it is certain, that under them the South Britons were reduced to a ſtate of great vaſſalage, and that the genius of liberty retreated northwards, where the natives made a brave reſiſtance againſt thoſe tyrants of nations. The Roman emperors and generals while in this iſland, aſſiſted by the Britons, were frequently employed in repelling the attacks of the Caledonians and Picts (the latter are thought to have been the ſouthern Britons retired northwards), and they appeared to have had no difficulty in maintaining their authority in the ſouthern provinces.

Upon the mighty inundations of thoſe barbarous nations, which, under the names of Goths and Vandals, invaded the Roman empire with infinite numbers, and with danger to Rome itſelf*, the Roman legions were withdrawn out of Britain, with the flower of the Britiſh youth, for the defence of the capital and centre of the empire. As the Roman forces decreaſed in Britain, the Scots and Picts, who had always oppoſed the progreſs of the Romans in this iſland, advanced the more boldly into the ſouthern parts, carrying terror and deſolation over the whole country. The effeminated Britons were ſo accuſtomed to have recourſe to the Romans for defence, that they again and again implored their return. But the Romans, at length reduced to extremities at home, and fatigued with diſtant expeditions, acquainted the Britons that they muſt no longer look to them for protection, and exhorted them to arm in their own defence; and that they might leave the iſland with a good grace, they aſſiſted the Britons in rebuilding with ſtone the wall of Severus, between Newcaſtle and Carliſle, which they lined with forts and watch-towers; and having done this good office, took their laſt farewell of Britain about the year 448, after having been maſters of the moſt fertile parts of it, if we reckon from the invaſion of Julius Cæſar, near 500 years.

The Scots and Picts finding the iſland finally deſerted by the Roman legions, now regarded the whole as their prize, and attacked Severus's wall with redoubled forces, ravaged all before them with a fury peculiar to northern nations in thoſe ages, and which a remembrance of former injuries could not fail to inſpire. The poor Britons, like a helpleſs family deprived of their parent and protector, already ſubdued by their own fears, had again recourſe to Rome, and ſent over their miſerable epiſtle for relief (ſtill upon record), which was addreſſed in theſe words: *To Aetius, thrice conſul: The groans of the Britons*; and, after other lamentable com-

* See the Introduction.

plaints

plaints, ſaid, *That the barbarians drove them to the ſea, and the ſea back to the barbarians; and they had only the hard choice left of periſhing by the ſword or by the waves.* But having no hopes given them by the Roman general of any ſuccours from that ſide, they began to conſider what other nation they might call over to their relief: Gildas, who was himſelf a Briton, deſcribes the degeneracy of his countrymen at this time in mournful ſtrains, and gives ſome confuſed hints of their officers, and the names of ſome of their kings, particularly one Vortigern, chief of the *Danmonii*, by whoſe advice the Britons ſtruck a bargain with two Saxon chiefs, Hengiſt and Horſa, to protect them from the Scots and Picts. The Saxons were in thoſe days maſters of what is now called the Engliſh Channel, and their native countries comprehending Scandinavia and the northern parts of Germany, being overſtocked with inhabitants, they readily accepted the invitation of the Britons; whom they relieved, by checking the progreſs of the Scots and Picts, and had the iſland of Thanet allowed them for their reſidence. But their own country was ſo barren, and the fertile lands of Britain ſo alluring, that in a very little time Hengiſt and Horſa began to meditate a ſettlement for themſelves: and freſh ſupplies of their countrymen arriving daily, the Saxons ſoon became formidable to the Britons, whom after a violent ſtruggle of near 150 years, they ſubdued, or drove into Wales, where their language and deſcendants ſtill remain.

Literature at this time in England was ſo rude, that we know but little of its hiſtory. The Saxons were ignorant of letters, and public tranſactions among the Britons were recorded only by their bards and poets, a ſpecies of men whom they held in great veneration. Nennius, who ſeems to have been contemporary with Gildas, mentions indeed a few facts, but nothing that can be relied on, or that can form a connected hiſtory. We can therefore only mention the names of Merlin, a reputed prince and prophet; Pendragon, the celebrated Arthur, and Thalieſſin, whoſe works are ſaid to be extant, with others of leſs note. After many repeated bloody wars, in which the Britons were ſometimes the enemies and ſometimes the allies of the Scots and Picts, the Saxons became maſters of all England to the ſouth of Adrian's, or rather Severus's wall; but the Scots and Picts ſeem to have been maſters of all the territory to the north, though they ſuffered the Britons, who had been driven into their territories, to be governed by their own tributary kings; an intermixture that has created much confuſion in hiſtory.

I have already given a ſketch of the conſtitution and government which the Saxons imported into England, and which form by far the moſt valuable part of their ancient hiſtory. We have no account of their converſion to Chriſtianity but from Popiſh writers, who generally endeavour to magnify the merits of their ſuperiors. According to them, Ethelbert king of Kent, who claimed pre-eminence in the heptarchy, as being deſcended from Hengiſt one of the firſt invaders, married the king of France's daughter, and ſhe being a Chriſtian, pope Gregory the Great ſeized that opportunity to enforce the converſion of her huſband to Chriſtianity, or rather to Popery. For that purpoſe, about the year 596, he ſent over to England the famous Auſtin, the monk, who probably found no great difficulty in converting the king and his people, and alſo Sebert, king of the Eaſt Saxons, who was baptized, and founded the cathedral of St. Paul in London. The monk then, by his maſter's orders, attempted to bring the churches of the Britons in Wales to a conformity with that of Rome, particularly as to the celebration of Eaſter; but finding a ſtout reſiſtance on the part of the biſhops and clergy, he perſuaded his Chriſtian converts to maſſacre them, which they did to the number of 1200 prieſts and monks, and reduced the Britons, who were found in the heptarchy, to a ſtate of ſlavery, which ſome think gave riſe to the ancient villenage in England. Auſtin is accounted the firſt archbiſhop of Canterbury, and died in 605, as his convert Ethelbert did ſoon after.

It

It does not fall within my deſign to relate the ſeparate hiſtory of each particular nation that formed the heptarchy. It is ſufficient to ſay, that the pope in Auſtin's time ſupplied England with about 400 monks, and that the popiſh clergy took care to keep their kings and laity under the moſt deplorable ignorance, but always magnifying the power and ſanctity of his holineſs. Hence it was that the Anglo-Saxons, during their heptarchy, were governed by prieſts and monks; and, as they ſaw convenient, perſuaded their kings either to ſhut themſelves up in cloiſters, or to undertake pilgrimages to Rome, where they finiſhed their days: no leſs than thirty Anglo-Saxon kings, during the heptarchy, reſigned their crowns in that manner, and among them was Ina, king of the Weſt Saxons, in other reſpects a wiſe and brave prince. The bounty of thoſe Anglo-Saxon kings to the ſee of Rome was therefore unlimited; and Ethelwald, king of Mercia, impoſed an annual tax of a penny upon every houſe, which was afterwards known by the name of Peter's pence, becauſe paid on the holiday of *St. Peter ad Vincula*, Auguſt 1ſt*.

The Anglo-Saxon kings, during the heptarchy, commonly choſe one who was to be the head of their political confederacy, for regulating their concerns, but without any juriſdiction in the dominion of others. The clergy, we may eaſily ſuppoſe, had great influence on thoſe occaſions; and the hiſtory of the Saxon heptarchy is little more than that of crimes, treaſons, and murders, committed at the inſtigation of prieſts and monks. Even their criminal law, as hath been already obſerved, admitted of a pecuniary compenſation for murder, and regicide itſelf.

Under all thoſe diſadvantages of bigotry and barbarity, the Anglo-Saxons were happier than the nations on the continent; being free from the invaſion of the Saracens, who had erected an empire in the Eaſt upon the ruins of the Roman, and began to extend their ravages over Spain and Italy. London was then a place of very conſiderable trade; and if we are to believe the Saxon chronicles quoted by Tyrrel, Withred, king of Kent, paid at one time to Ina, king of Weſſex, a ſum in ſilver equal to 90,000l. ſterling, in the year 694. England, therefore, we may ſuppoſe to have been about this time a refuge for the people of the continent. The venerable but ſuperſtitious Bede, about the year 740, compoſed his Church Hiſtory of Britain, from the coming in of the Saxons down to the year 731. The Saxon Chronicle is one of the oldeſt and moſt authentic monuments of hiſtory that any nation can produce. Architecture, ſuch as it was, with ſtone and glaſs-working, was introduced into England; and we read, in 709, of a Northumbrian prelate who was ſerved in ſilver-plate. It muſt however be owned, that the Saxon coins, which are generally of copper, are many of them illegible, and all of them mean. Ale and alehouſes are mentioned in the laws of Ina, about the year 728; and in this ſtate was the Saxon heptarchy in England when, about the year 800, moſt of the Anglo-Saxons, tired out with the tyranny of their petty kings, united in calling to the government of the heptarchy Egbert, who was the eldeſt remaining branch of the race of Cerdic, one of the Saxon chiefs who firſt arrived in Britain. On the ſubmiſſion of the Northumbrians, in the year 827, he became king of all England.

Charles the Great, otherwiſe Charlemagne, was then king of France and emperor of Germany; and I have, in a former part of this work, mentioned the commercial treaty between him and Offa, king of Mercia, to whom he ſent in a preſent a Hungarian ſword, a belt, and two ſilken veſts. Egbert had been obliged by

* This tax, was impoſed at firſt for the ſupport of a college at Rome for the education of Engliſh youth, founded by Ina, king of Weſſex, under the name of *Rome-Scat*, but in proceſs of time the popes claimed it as a tribute due to St. Peter and his ſucceſſors.

ſtate jealouſies to fly to the court of Charles for protection from the perſecutions of Eadburga, daughter of Offa, wife to Birthric, king of the Weſt Saxons. At the court of Charles he acquired the arts both of war and government. His proſperity excited the envy of the northern nations, who, under the name of Danes, then infeſted the ſeas, and were no ſtrangers to the coaſts of England; for about the year 833 they made deſcents upon Kent and Dorſetſhire, where they defeated Egbert in perſon, and carried off abundance of booty to their ſhips. About two years after they landed in Cornwall, and, though they were joined by the Corniſh Britons, they were driven out of England by Egbert, who died in the year 838 at Wincheſter, his chief reſidence.

Egbert was ſucceeded by his ſon Ethelwolf, who divided his power with his eldeſt ſon Athelſtan. By this time England had become a ſcene of deſolation, through the renewal of the Daniſh invaſions; and Ethelwolf, after ſome time bravely oppoſing them, retired in a fit of devotion to Rome, to which he carried with him his youngeſt ſon, afterwards the famous Alfred, the father of the Engliſh conſtitution. The gifts which Ethelwolf made to the clergy on this occaſion (copies of which are ſtill remaining) are ſo prodigious, even the tithes of all his dominions, that they ſhew his brain to have been touched by his devotion, or guided by the arts of Swithin, biſhop of Wincheſter. Upon his death, after his return from Rome, he divided his dominions between two of his ſons (Athelſtan being then dead), Ethelbald and Ethelbert, but we know of no patrimony that was left to young Alfred. Ethelbert, who was the ſurviving ſon, left his kingdom, in 866, to his brother Ethelred; in whoſe time, notwithſtanding the courage and conduct of Alfred, the Danes became maſters of the ſea-coaſts, and the fineſt counties in England. Ethelred being killed, his brother Alfred mounted the throne in 871. He was one of the greateſt princes, both in peace and war, mentioned in hiſtory. He fought ſeven battles with the Danes with various ſucceſs, and when defeated he found reſources that rendered him as terrible as before. He was, however, at one time reduced to an uncommon ſtate of diſtreſs, being forced to live in the diſguiſe of a cowherd. He ſtill however kept up a ſecret correſpondence with his brave friends, whom he collected together, and by their aſſiſtance he gave the Danes many ſignal overthrows, till at laſt he recovered the kingdom of England, and obliged the Danes who had been ſettled in it to ſwear obedience to his government.

Among the other glories of Alfred's reign was that of raiſing a maritime power, by which he ſecured his coaſts from future invaſions. He rebuilt the city of London, which had been burnt down by the Danes, and founded the univerſity of Oxford about the year 895: he divided England into counties, hundreds, and tythings; or rather he revived thoſe diviſions, and the uſe of juries, which had fallen into diſuſe ſince the ravages of the Danes. Having been educated at Rome, he was not only a ſcholar but an author: and he tells us, that upon his acceſſion to the throne, he had ſcarcely a lay ſubject who could read Engliſh, or an eccleſiaſtic who underſtood Latin. He introduced ſtone and brick buildings in palaces as well as churches, though it is certain that his ſubjects, for many years after his death, were fond of timber buildings. His encouragement of commerce and navigation may ſeem incredible to modern times, but he had merchants who traded in Eaſt India jewels; and William of Malmſbury ſays, that ſome of their gems were repoſited in the church of Sherborne in his time. He received from one Octher, about the year 890, a full diſcovery of the coaſts of Norway and Lapland, as far as Ruſſia; and he tells the king in his memorial, printed by Hakluyt, "that he ſailed along the Norway coaſt ſo far north as commonly the whale hunters uſe to travel." He invited numbers of learned men into his dominions, and found faithful and uſeful allies, againſt the Danes, in the two Scotch kings his contemporaries, Gregory and Donald. He is ſaid to have fought no leſs than fifty-ſix pitched battles. He

was

was inexorable againſt his corrupt judges, whom he uſed to hang up in the public highways, as a terror to evil doers. He died in the year 901, and his character is ſo completely amiable and heroic, that he is juſtly dignified with the epithet of the Great.

Alfred was ſucceeded by his ſon Edward the Elder, under whom, though a brave prince, the Danes renewed their invaſions. He died in the year 925, and was ſucceeded by his eldeſt ſon Athelſtan. This prince, to encourage commerce, enacted, that every merchant who made three voyages on his own account to the Mediterranean, ſhould be put upon a footing with a *thane*, or *nobleman* of the firſt rank. He cauſed the Scriptures to be tranſlated into the Saxon tongue. He encouraged coinage, and we find by his laws, that archbiſhops, biſhops, and even abbots, had then the privilege of coining money. His dominions were confined towards the north by the Danes, although his vaſſals ſtill kept a footing in thoſe counties. He was ſucceſsful in his wars with the Scots, and died in 941. The reigns of his ſucceſſors, Edmund, Edred, and Edwy, were weak and inglorious, they being either engaged in wars with the Danes, or diſgraced by the influence of prieſts. Edgar, who mounted the throne about the year 959, revived the naval glory of England, and is ſaid to have been rowed down the river Dee by eight kings his vaſſals, he ſitting at the helm; but, like his predeceſſors, he was the ſlave of prieſts, particularly St. Dunſtan. His reign however was pacific and happy, though he was obliged to cede to the Scots all the territory to the north of the Tine. He was ſucceeded, in 975, by his eldeſt ſon Edward, who was barbarouſly murdered by his ſtep-mother, whoſe ſon Ethelred mounted the throne in 978. The nation was at that time haraſſed by the Danes. To get rid of them Ethelred agreed to pay them 30,000l. which was levied by way of tax, and called *Danegeld*, and was the firſt land-tax in England. In the year 1002 they had made ſuch ſettlements in England, that Ethelred conſented to a general maſſacre of them by the Engliſh. But this atrocious deſign ſerved only to enrage the Daniſh king Swein, who, in 1013, drove Ethelred, his queen, and two ſons out of England into Normandy, a province of France, facing the ſouth eaſt coaſt of England, at that time governed by its own princes, ſtyled the dukes of Normandy. Swein being killed, was ſucceeded by his ſon Canute the Great; but Ethelred returning to England, forced Canute to retire to Denmark, from whence he invaded England with a vaſt army, and obliged Edmund Ironſide (ſo called for his great bodily ſtrength), Ethelred's ſon, to divide with him the kingdom. Upon Edmund's being aſſaſſinated, Canute ſucceeded to the undivided kingdom; and dying in 1035, his ſon Harold Harefoot did nothing memorable, and his ſucceſſor Hardicanute was ſo degenerate a prince, that the Daniſh royalty ended with him in England.

The family of Ethelred was now called to the throne; and Edward, commonly called the Confeſſor, mounted it, though Edgar Atheling, a weak youth, being deſcended from an elder branch, had the lineal right. Edward the Confeſſor was a ſoft, good natured prince, a great benefactor to the church, and exceſſively fond of the Normans, with whom he had reſided. He was governed by his miniſter earl Goodwin, and his ſons, the eldeſt of whom was Harold. He durſt not reſent, though he felt, their ignominious treatment of him. It is ſaid, that he deviſed the ſucceſſion of his crown to William duke of Normandy. Be that as it will, it is certain that, upon the death of the Confeſſor, in the year 1056, Harold, ſon to Goodwin, earl of Kent, mounted the throne.

William duke of Normandy, though a baſtard, poſſeſſed that great duchy, and reſolved to aſſert his right to the crown of England. For that purpoſe, he invited the neighbouring princes, as well as his own vaſſals, to join him, and made liberal promiſes to his followers, of lands and honours in England, to induce them to aſſiſt him effectually. By theſe means he collected 40,000 of the braveſt and moſt

regular troops in Europe, and while Harold was embarraſſed with freſh invaſions of the Danes, William landed in England without oppoſition. Harold returning from the North, encountered William in the place where the town of Haſtings now ſtands, in Suſſex, and a moſt bloody battle was fought between the two armies; but Harold being killed, the crown of England devolved upon William, in the year 1066.

Few improvements, either in arts or arms, were made by the Saxons in England ſince the firſt invaſion of the Danes. Theſe barbarians ſeem to have carried off with them almoſt all the bullion and ready money of the Anglo-Saxons; for I perceive that Alfred the Great left no more to his two daughters for their portions than 100l. each. The return of the Danes to England, and the victories which had been gained over them, had undoubtedly brought back great part of the money and bullion they had carried off: for we are told, that Harold in his laſt victory over the Danes, regained as much treaſure as twelve luſty men could carry off. We have indeed very particular accounts of the value of proviſions and manufactures in thoſe days; a palfrey coſt 1s. an acre of land (according to biſhop Fleetwood, in his Chronicon Pretioſum) 1s. a hide of land containing 120 acres 100s. but there is great difficulty in forming the proportion of value which thoſe ſhillings bore to the preſent ſtandard of money, though many ingenious treatiſes have been written on that head. A ſheep was eſtimated at 1s. an ox was computed at 6s. a cow at 4s. a man at 3l. The board wages of a child the firſt year was 8s. The tenants of Shireburne were obliged at their choice to pay either 6d. or four hens. Silk and cotton were quite unknown. Linen was not much uſed. In the Saxon times, land was divided among all the male children of the deceaſed. Entails were ſometimes practiſed in thoſe times.

With regard to the manners of the Anglo-Saxons, we can ſay little, but that they were in general a rude uncultivated people, ignorant of letters, unſkilful in the mechanical atts, untamed to ſubmiſſion under law and government, addicted to intemperance, riot, and diſorder. Even ſo low as the reign of Canute, they ſold their children and kindred into foreign parts. Their beſt quality was their military courage, which yet was not ſupported by diſcipline or conduct. Even the Norman hiſtorians, notwithſtanding the low ſtate of the arts in their own country, ſpeak of them as barbarians, when they mention the invaſion made upon them by the duke of Normandy. Conqueſt put the people in a ſituation of receiving ſlowly from abroad the rudiments of ſcience and cultivation, and of correcting their rough and licentious manners.

The loſs which both ſides ſuffered at the battle of Haſtings is uncertain. Anglo-Saxon authors ſay, that Harold was ſo impatient to fight, he attacked William with half of his army, ſo that the advantage of numbers was on the ſide of the Norman; and, indeed, the death of Harold ſeems to have decided the day; and William with very little farther difficulty, took poſſeſſion of the throne, and made a conſiderable alteration in the conſtitution of England, by converting lands into knight's fees *, which are ſaid to have amounted to 62,000, and were held of the Norman and other great perſons who had aſſiſted him in his conqueſt, and who were bound to attend him with their knights and their followers in his wars. To one of his favourites he gave the whole county of Cheſter, which he erected into a palatinate, and rendered by his grant almoſt independent of the crown. William found it no eaſy matter to keep poſſeſſion of his crown. Edgar Atheling, and his ſiſter, the next Anglo-Saxon heirs, were affectionately received in Scotland, and many of the Saxon lords took arms, and formed conſpiracies in England. William got

* Four hides of land made one knight's fee; a barony was twelve times greater than that of a knight's-fee: and when Doomſday-book was framed, the number of great barons amounted to 700.

the better of all difficulties, eſpecially after he had made a peace with Malcolm king of Scotland, who married Atheling's ſiſter; but not without exerciſing horrible cruelties upon the Anglo-Saxons. He introduced the Norman laws and language. He built the ſtone ſquare tower at London, commonly called the White Tower; bridled the country with forts, and diſarmed the old inhabitants; in ſhort, he attempted every thing poſſible to obliterate every trace of the Anglo-Saxon conſtitution; though, at his coronation, he took the ſame oath that uſed to be taken by the ancient Saxon kings.

He cauſed a general ſurvey of all the lands of England to be made, or rather to be completed (for it was begun in Edward the Confeſſor's time), and an account to be taken of the villains, ſlaves, and live ſtock upon each eſtate; all which were recorded in a book called Doomſday-book, which is now kept in the Exchequer. But the repoſe of this fortunate and victorious king, was diſturbed in his old age, by the rebellion of his eldeſt ſon Robert, who had been appointed governor of Normandy, but now aſſumed the government as ſovereign of that province, in which he was favoured by the king of France. In this tranſaction we have the riſe of the wars between England and France; which have continued longer, drawn more noble blood, and been attended with more memorable atchievements, than any other national quarrel we read of in ancient or modern hiſtory. William ſeeing a war inevitable, entered upon it with his uſual vigour, and with incredible celerity, tranſporting a brave Engliſh army, invaded France, where he was every where victorious, but died before he had finiſhed the war, in the year 1087, the ſixty-firſt of his age, and twenty-firſt of his reign in England, and was buried in his own abbey at Caen in Normandy.

By the Norman conqueſt, England not only loſt the true line of her ancient Saxon kings, but alſo her principal nobility; who either fell in battle in defence of their country and liberties, or fled to foreign countries, particularly Scotland, where, being kindly received by king Malcolm, they eſtabliſhed themſelves; and, what is very remarkable, introduced the Saxon or Engliſh, which has been the prevailing language in the Lowlands of Scotland to this day.

On the other hand, England by virtue of the conqueſt, became much greater, both in dominion and power, by the acceſſion of ſo much territory upon the continent. For though the Normans gained much of the Engliſh land and riches, yet England gained the large and fertile dukedom of Normandy, which became a province to this crown. England likewiſe gained much by the great increaſe of naval power, and multitude of ſhips, wherein Normandy then abounded. This, with the perpetual intercourſe between England and the continent, gave us an increaſe of trade and commerce, and of treaſure to the crown and kingdom, beſides a natural right to the dominion of the Channel, which had been before acquired only by the greater naval power of Edgar, and other Saxon kings. For the dominion of the narrow ſeas ſeems naturally to belong, like that of rivers, to thoſe who poſſeſs the banks or coaſts on both ſides; and thus the former title was confirmed, by ſo long a coaſt as that of Normandy on one ſide, and of England on the other ſide of the Channel.

The ſucceſſion of the crown of England was diſputed between the Conqueror's ſons, Robert and William (commonly called Rufus, from his being red-haired), and was carried in favour of the latter. He was a brave and intrepid prince, but no friend to the clergy, who have therefore been unfavourable to his memory. He was likewiſe hated by the Normans, who loved his elder brother, and conſequently he was engaged in perpetual wars with his brothers and rebellious ſubjects. About this time the cruſades to the Holy Land began, and Robert, who was among the firſt to engage, accommodated matters with William for a ſum of money, which he levied from the clergy. William behaved with great generoſity towards Edgar Atheling

and the court of Scotland, notwithſtanding all the provocations he had received from that quarter, but was accidentally killed as he was hunting in New Foreſt in Hampſhire, in the year 1100, and the forty-fourth year of his age. He is chiefly accuſed of rapacity and oppreſſion; but the circumſtances of his reign required money, which he had no other means of raiſing but from a luxurious, over-grown clergy, who had engroſſed all the riches of the kingdom.

This prince built Weſtminſter-hall as it now ſtands, and added ſeveral works to the Tower, which he ſurrounded with a wall and ditch. In the year 1100 happened that inundation of the ſea which overflowed great part of earl Goodwin's eſtate in Kent, and formed thoſe ſhallows in the Downs, now called the Goodwin Sands.

William Rufus was ſucceeded by his brother Henry I. ſurnamed Beauclerc, on account of his learning, though his brother Robert was then returning from the Holy Land. Henry may be ſaid to have purchaſed the throne; firſt by his brother's treaſures, which he ſeized at Wincheſter; ſecondly, by a charter, in which he reſtored his ſubjects to the rights and privileges they had enjoyed under the Anglo-Saxon kings; and thirdly, by his marriage with Matilda, daughter of Malcolm III. king of Scotland, and niece to Edgar Atheling, of the ancient Saxon line. His reign reſtored the clergy to their influence in the ſtate, and they formed a ſeparate body dependent upon the pope, which afterwards created great convulſions in England. Henry, partly by force and partly by ſtratagem, made himſelf maſter of his brother Robert's perſon, and duchy of Normandy; and, with a moſt ungenerous meanneſs, detained him a priſoner for twenty-eight years, till the time of his death; meanwhile quieting his conſcience by founding an abbey. He was afterwards engaged in a bloody but ſucceſsful war with France; and before his death he ſettled the ſucceſſion upon his daughter the empreſs Matilda, widow to Henry IV. emperor of Germany, and her ſon Henry, by her ſecond huſband Geoffrey Plantagenet, earl of Anjou. Henry died of a ſurfeit, in the ſeventy-eighth year of his age, in 1135.

Notwithſtanding the late ſettlement of ſucceſſion, the crown of England was claimed, and ſeized by Stephen earl of Blois, the ſon of Adela, fourth daughter to William the Conqueror. Matilda and her ſon were then abroad; and Stephen was aſſiſted in his uſurpation by his brother the biſhop of Wincheſter, and the other great prelates, that he might hold the crown dependent upon them. Matilda, however, found a generous protector in her uncle, David, king of Scotland; and a worthy ſubject in her natural brother Robert, earl of Glouceſter, who headed her party until her ſon grew up. A long and bloody war enſued, the clergy having abſolved Stephen and all his friends from their guilt of breaking the act of ſucceſſion; but at length, the barons, who dreaded the power of the clergy, inclined towards Matilda; and Stephen, having been abandoned by his partizans, was defeated and taken priſoner in 1141. Being carried before Matilda, ſhe impotently upbraided him, and ordered him to be put in chains.

Matilda was proud and weak, the clergy were bold and ambitious; and when joined with the nobility, who were factious and turbulent, they were an overmatch for the crown. They demanded to be governed by the Saxon laws, according to the charter that had been granted by Henry I. upon his acceſſion; and finding Matilda refractory, they drove her out of England in 1142. Stephen having been exchanged for the earl of Glouceſter, who had been likewiſe taken priſoner, upon obtaining his liberty, found that his clergy and nobility had in fact excluded him from the government, by building 1100 caſtles, where each owner lived as an independent prince. Stephen attempted to force them to declare his ſon Euſtace heir apparent to the kingdom; and exaſperated the clergy ſo much, that they invited over young Henry of Anjou, who accordingly landed in England with an army of foreigners.

This

This meaſure divided the clergy from the barons, who were apprehenſive of a ſecond conqueſt; and the earl of Arundel, with the heads of the lay ariſtocracy, propoſed an accommodation, to which both parties agreed. Stephen, who about that time loſt his ſon Euſtace, was to retain the name and office of king; but Henry, who was in fact inveſted with the chief executive power, was acknowledged his ſucceſſor. Though this accommodation was only precarious and imperfect, yet it was received with joy by the Engliſh, who had bled at every pore during the late civil wars; and Stephen dying very opportunely, Henry mounted the throne, without a rival, in 1154.

Henry II. ſurnamed Plantagenet, was by far the greateſt prince of his time. He ſoon diſcovered amazing abilities for government, and had performed, in the ſixteenth year of his age, actions that would have dignified the moſt experienced warriors. At his acceſſion to the throne, he found the condition of the Engliſh boroughs greatly bettered, by the privileges granted them in the ſtruggles between their late kings and the nobility. Henry perceived the good policy of this, and brought the boroughs to ſuch a height, that if a bondman or ſervant remained in a borough a year and a day, he was by ſuch reſidence made free. He erected Wallingford, Wincheſter, and Oxford, into free boroughs, for the ſervices the inhabitants had done to his mother and himſelf.

Without being very ſcrupulous in adhering to his former engagements, he reſumed the exceſſive grants of crown lands made by Stephen, which were repreſented as illegal. He demoliſhed many of the caſtles that had been built by the barons; but when he came to touch the clergy, he found their uſurpations not to be ſhaken. He perceived that the root of all their enormous diſorders lay in Rome, where the popes had exempted churchmen, not only from lay courts, but civil taxes. The bloody cruelties and diſorders occaſioned by thoſe exemptions, all over the kingdom, would be incredible, were they not atteſted by the moſt unexceptionable evidences. Unfortunately for Henry, the head of the Engliſh church, and chancellor of the kingdom, was the celebrated Thomas Becket. This man, powerful from his offices, and ſtill more by his popularity, ariſing from a pretended ſanctity, was violent, intrepid, and a determined enemy to temporal power of every kind, but withal cool and politic. The king aſſembled his nobility at Clarendon, the name of which place is ſtill famous for the conſtitutions there enacted; which, in fact, aboliſhed the authority of the Romiſh ſee over the Engliſh clergy. Becket finding it in vain to reſiſt the ſtream, ſigned thoſe conſtitutions, till they could be ratified by the pope, who, as he foreſaw, rejected them. Henry, though a prince of the moſt determined ſpirit of any of his time, was then embroiled with all his neighbours; and the ſee of Rome was in its meridian grandeur. Becket having been arraigned and convicted of robbing the public, while he was chancellor, fled to France, where the pope and the French king eſpouſed his quarrel. The effect was, that all the Engliſh clergy who were on the king's ſide were excommunicated, and the ſubjects abſolved from their allegiance. This diſconcerted Henry ſo much, that he ſubmitted to treat, and even to be inſulted by his rebel prelate, who returned triumphantly through the ſtreets of London in 1170. His return ſwelled his pride, and increaſed his inſolence, till both became inſupportable to Henry, who was then in Normandy. Finding that he was in fact only the firſt ſubject of his own dominions, he was heard to ſay in the anguiſh of his heart, "Is there none who will revenge his monarch's cauſe upon this audacious prieſt?" Theſe words reached the ears of four knights, Reginald Fitzurſe, William de Tracy, Hugh de Moreville, and Richard Brito; who, without acquainting Henry of their intentions, went over to England, where they beat out Becket's brains before the altar of his own church at Canterbury, in the year 1171. Henry was in no condi-

condition to ſecond the blind obedience of his knights, and the public reſentment roſe ſo high, on the ſuppoſition that he was privy to the murder, that he ſubmitted to be ſcourged by monks at the tomb of the pretended martyr.

Henry, in conſequence of his well known maxim, endeavoured to cancel all the grants which had been made by Stephen to the royal family of Scotland, and actually reſumed their moſt valuable poſſeſſions in the north of England. This occaſioned a war between the two kingdoms, in which William king of Scotland was taken priſoner; and, to deliver himſelf from captivity, was obliged to pay liege homage to king Henry for his kingdom of Scotland, and for all his other dominions. It was alſo agreed, that liege homage ſhould be done, and fealty ſworn to Henry, without reſerve or exception, by all the earls and barons of the territories of the king of Scotland, from whom Henry ſhould deſire it, in the ſame manner as by his other vaſſals. The heirs of the king of Scotland, and the heirs of his earls, barons, and tenants in chief, were likewiſe obliged to render the liege homage to the heirs of the king of England.

Henry likewiſe diſtinguiſhed his reign by the conqueſt of Ireland; and by marrying Eleanor the divorced queen of France, heireſs of Guienne and Poictou, he became almoſt as powerful in France as the French king himſelf and the greateſt prince in Chriſtendom. In his old age he was unhappy, having embarraſſed himſelf in intrigues with women, particularly the fair Roſamond. His infidelity was reſented by his queen Eleanor, even to the ſeducing her ſons, Henry (whom his father had unadviſedly cauſed to be crowned in his own life-time), Richard, and John, in repeated rebellions, which affected their father ſo much as to throw him into a fever, and he died at Chinon in France, in the year 1189, and 57th of his age. The ſum he left in ready money at his death has perhaps been exaggerated, but the moſt moderate accounts make it amount to 200,000l. of our money.

During the reign of Henry corporation charters were eſtabliſhed all over England, by which, as I have already hinted, the power of the barons was greatly reduced. Thoſe corporations encouraged trade; but manufactures, eſpecially thoſe of ſilk, ſeem ſtill to have been confined to Spain and Italy; for the ſilk coronation robes, made uſe of by young Henry and his queen, coſt 87 l. 10s. 4d. in the ſheriff of London's account, printed by Mr. Maddox; a vaſt ſum in thoſe days. Henry introduced the uſe of glaſs windows into England, and ſtone arches in building. Malmſbury, Henry archdeacon of Huntingdon, and other hiſtorians who lived under him, are remarkable for their Latin ſtyle, which is often pure and elegant.

In this reign, and in thoſe barbarous ages, it was a cuſtom in London for great numbers, to the amount of a hundred or more, of the ſons and relations of eminent citizens, to form themſelves into a licentious confederacy, to break into rich houſes and plunder them, to rob and murder paſſengers, and to commit with impunity all ſorts of diſorders. Henry, about the year 1176, divided England into ſix parts, called *circuits*, appointing judges to go at certain times of the year and hold *aſſizes*, to adminiſter juſtice to the people, as is practiſed to this day

Henry ſo far aboliſhed the barbarous and abſurd practice of forfeiting ſhips which had been wrecked on the coaſt, that if one man or animal were alive in the ſhip, the veſſel and goods were reſtored to the owners. This prince was alſo the firſt who levied a tax on the moveable or perſonal eſtates of his ſubjects, nobles as well as people. Their zeal for the holy war made them ſubmit to this innovation; and a precedent being once obtained, this taxation became in following reigns an uſual method of ſupplying the neceſſities of the crown. It was the practice of ſome kings of England to repeat the ceremony of their coronation thrice a year, on aſſembling the ſtates at the three great feſtivals. Henry, after the firſt years of his reign,

reign, never renewed this ceremony, which was found to be very expenſive and very uſeleſs. None of his ſucceſſors ever revived it. Since we are here collecting ſome detached inſtances, which ſhow the genius of thoſe ages, it may not be improper to mention the quarrel between Roger archbiſhop of York and Richard archbiſhop of Canterbury. We may judge of the violence of military men and laymen, when eccleſiaſtics would proceed to ſuch extremities. The pope's legate having ſummoned an aſſembly of the clergy at London, and as both the archbiſhops pretended to ſit on his right hand, this queſtion of precedency begot a controverſy between them. The monks and retainers of archbiſhop Richard fell upon Roger in the preſence of the cardinal and of the ſynod, threw him on the ground, trampled him under foot, and ſo bruiſed him with blows, that he was taken up half dead, and his life was with difficulty ſaved from their violence.

Richard I. ſurnamed Cœur de Lion, from his great courage, was the third, but eldeſt ſurviving ſon of Henry II. The clergy had found means to gain him over, and for their own ends they perſuaded him to make a moſt magnificent, but ruinous cruſade to the Holy Land, where he took Aſcalon, and performed actions of valour that gave countenance even to the fables of antiquity. After ſeveral glorious, but fruitleſs campaigns, he made a truce of three years with Saladin emperor of the Saracens; and in his return to England he was treacherouſly ſurpriſed by the duke of Auſtria, who, in 1193, ſent him a priſoner to the emperor Henry VI. His ranſom was fixed by the ſordid emperor at 150,000 marks; about 300,000l. of our preſent money. According to contemporary authors, the raiſing of this ranſom proved to be a matter of ſo much difficulty, that all the church plate was melted down, and a tax was laid on all perſons, both eccleſiaſtical and ſecular, of one-fourth part of their income for one year; and twenty ſhillings on every knight's fee; alſo one year's wool borrowed of the Ciſtercians; beſides money raiſed upon the clergy of the king's French dominions; ard 2000 marks which were furniſhed by William king of Scotland, in gratitude for Richard's generous behaviour to him before his departure. Though all thoſe ſums are well authenticated, yet it is not eaſy to reconcile them with certain other money tranſactions of this reign, but by ſuppoſing that Richard carried off with him, and expended abroad, all the viſible ſpecie in the kingdom; and that the people had reſerved vaſt hoards, which they afterwards produced, when commerce took a briſker turn.

Upon Richard's return from captivity, he held a parliament at Nottingham; whither William king of Scotland came, and demanded the counties of Northumberland, Cumberland, Weſtmoreland, and Lancaſter, as his predeceſſors had enjoyed them. Richard put him off for the preſent with fair words: by advice of his council he granted William by charter the following honours and benefits for him and his ſucceſſors, viz: "That whenever a king of Scotland was ſummoned to the court of England, to do homage for the lands he held in England, he ſhould be met at the river Tweed, by the biſhop of Durham and the ſheriff of Northumberland, and they ſhould conduct him to the river Tees, where the archbiſhop and ſheriff of York ſhould receive him; and ſo in like ſort the biſhop and ſheriffs of the other ſhires, till they arrived at court. On his journey he had 100 ſhillings (15l. of our money) per day allowed him for charges. At court thirty ſhillings per day; twelve waſtels, and twelve ſimnels of the king's (two ſorts of fine bread in uſe then); four quarts of the king's beſt wine; ſix quarts of ordinary wine; two pound weight of pepper; and four pound weight of cinnamon; four wax lights; forty great long perches of the king's beſt candles; and twenty-four of the ordinary ones. And on his return he was to be conducted as before, with the ſame allowances."

Whilſt

Whilſt the Scottiſh kings enjoyed their lands in England, they found it their intereſt, once generally in every king's reign, to perform the ſame homage; but when they were deprived of their ſaid lands, they paid no more homage*.

Woollen broad cloths were made in England at this time. An ox ſold for three ſhillings, which anſwers to nine ſhillings of our money, and a ſheep at four pence, or one ſhilling. Weights and meaſures were now ordered to be the ſame all over the kingdom. Richard upon his return, found his dominions in great diſorder, through the practices of his brother John, whom he however pardoned; and by the invaſions of the French, whom he repelled; but was ſlain in beſieging the caſtle of Chalons, in the year 1199, the 42d of his age, and 10th of his reign.

The reign of his brother John, who ſucceeded him, is infamous in the Engliſh hiſtory. He is ſaid to have put to death Arthur, the eldeſt ſon of his brother Geoffrey, who had the hereditary right to the crown. The young prince's mother, Conſtance, complained to Philip the king of France; who, upon John's non-appearance at his court as a vaſſal, deprived him of Normandy. John notwithſtanding, in his wars with the French, Scotch, and Iriſh, gave many proofs of perſonal valour; but became at laſt ſo apprehenſive of a French invaſion, that he rendered himſelf a tributary to the pope, and laid his crown and regalia at the foot of the legate Pandulph, who kept them for five days. The great barons reſented his meanneſs, by taking arms; but he repeated his ſhameful ſubmiſſions to the pope, and, after experiencing various fortunes of war, was at laſt brought ſo low, that the barons obliged him, in 1216, to ſign the great deed ſo well known by the name of *Magna Charta*. Though this charter is deemed the foundation of Engliſh liberty, yet it is in fact no other than a renewal of thoſe immunities which the barons and their followers had poſſeſſed under the Saxon princes, and which they claimed by the charters of Henry I. and Henry II. As the principles of liberty came to be more enlarged, and property to be better ſecured, this charter, by various ſubſequent acts and explanations, came to be applicable to every Engliſh ſubject, as well as to the barons, knights, and burgeſſes. John had ſcarcely ſigned it, when he retracted, and called upon the pope for protection, when the barons withdrew their allegiance from him, and transferred it to Lewis, the eldeſt ſon of Philip Auguſtus, king of France. This gave umbrage to the pope; and the barons being apprehenſive leſt their country ſhould become a province to France, they returned to John's allegiance; but he was unable to protect them, till the pope refuſed to confirm the title of Lewis. John died in 1216, in the 18th year of his reign, and the 49th of his age, juſt as he had a glimpſe of reſuming his authority. Without diſputing what hiſtorians have ſaid of his arbitrary, inconſtant, and cruel diſpoſition, it is evident, from the ſame relations, that he had great provocations from the clergy and the barons, who in their turns attempted to annihilate the regal prerogative. It is undeniable at the ſame time that, under John, the commons of England laid the foundation of all the wealth and privileges they now enjoy; and the commerce of England received a moſt ſurpriſing increaſe. He may be called the father of the privileges of free boroughs, which he eſtabliſhed and endowed all over his kingdom; and it was under him that the ſtone bridge, as it ſtood ſome years ago, was finiſhed acroſs the Thames at London. The city of London owes ſome of her privileges to him. The office of

* It appears however, that William I. king of Scotland, and his ſubjects, conſented to acknowledge the king of England and his heirs, to all perpetuity, to be their ſovereigns and liege lords, and that they did homage for the kingdom of Scotland accordingly: but this advantage was given up by Richard I. *Vide* Lord Lyttelton's Hiſtory of Henry II. vol. v. p. 220, 223, 225: 8vo. edit.

mayor, before his reign, was for life; but he gave them a charter to chuſe a mayor out of their own body annually, and to elect their ſheriffs and common council annually, as at preſent.

England was in a deplorable ſituation when her crown devolved upon Henry III. the late king's ſon, who was but nine years old. The earl of Pembroke was choſen his guardian; the pope taking part with the young prince, the French were defeated and driven out of the kingdom, and their king obliged to renounce all claims upon the crown of England. The regent, earl of Pembroke, who had thus retrieved the independency of his country, died in 1219, and the regency devolved upon the biſhop of Wincheſter. The French king all this time kept poſſeſſion of Normandy; but at home the power of the pope became exorbitant; and he ſent no fewer than 300 of his rapacious clergy, in the year 1240, to take poſſeſſion of the beſt Engliſh benefices, and to load the people with taxes. This evil was increaſed by the marriage of Henry with the daughter of the earl of Provence, a needy prince, whoſe poor relations engroſſed the beſt eſtates and places in the kingdom. The king was of a ſoft, pliable diſpoſition, and had been perſuaded to violate the Great Charter. Indeed he ſeemed always endeavouring to evade the privilege which he had been compelled to grant and confirm. An aſſociation of the barons was formed againſt him and his government, and a civil war breaking out, Henry ſeemed to be abandoned by all but his Gaſcons and foreign mercenaries. His profuſion brought him into inexpreſſible difficulties; and the famous Stephen Montfort, who had married his ſiſter, and was made earl of Leiceſter, being choſen general of the aſſociation, the king and his two ſons were defeated, and taken priſoners at the battle of Lewes. A difference happening between Montfort and the earl of Glouceſter, a nobleman of great authority, prince Edward, Henry's eldeſt ſon, obtained his liberty, and aſſembling as many as he could of his father's ſubjects, who were jealous of Montfort, and weary of the tyranny of the barons, he gave battle to the rebels, whom he defeated at Eveſham, Auguſt 4, 1265, and killed Montfort. The repreſentatives of the commons of England, both knights and burgeſſes, now formed part of the Engliſh legiſlature, in a ſeparate houſe; and before this reign hiſtorians are not agreed as to the office or powers of this branch of the parliament. Prince Edward being engaged in a cruſade, Henry, during his abſence, died in 1272, the 64th year of his age, and 56th of his reign, which was uncomfortable and inglorious; and yet to the ſtruggles at that time the people in great meaſure owe the liberties of the preſent day. During his reign, the principal cuſtoms aroſe from the importation of French and Rheniſh wines, the Engliſh being as yet ſtrangers to thoſe of Spain, Portugal, and Italy. Intereſt had in that age amounted to an enormous height: there are inſtances of 50l. per cent. being paid for money, which tempted the Jews to remain in England, notwithſtanding the grievous oppreſſions they laboured under, from the bigotry of the age and Henry's extortions. In 1255 Henry made a freſh demand of 8000 marks from the Jews, and threatened to hang them if they refuſed compliance. They now loſt all patience, and deſired leave to remove with their effects from the kingdom. But the king replied, "How can I remedy the oppreſſion you complain of? I am myſelf a beggar; I am deſpoiled; I am ſtripped of all my revenues; I owe above 200,000 marks; and if I had ſaid 300,000, I ſhould not exceed the truth; I am obliged to pay my ſon, prince Edward, 15,000 marks a year; I have not a farthing, and I muſt have money from any hand, from any quarter, or by any means." King John his father, once demanded 10,000 marks from a Jew at Briſtol; and, on his refuſal, ordered one of his teeth to be drawn every day till he ſhould conſent: the Jew loſt ſeven teeth, and then paid the ſum required. Trial by *ordeal* was now entirely diſuſed,

and that by *duel* diſcouraged. Bracton's famous law treatiſe was publiſhed in this reign.

Edward returning to England, on the news of his father's death, invited all who held of his crown *in capite* to his coronation dinner, which conſiſted (that the reader may have ſome idea of the luxury of the times) of 278 bacon hogs, 450 hogs, 440 oxen, 430 ſheep, 22,600 hens and capons, and 13 fat goats (ſee Rymer's Fœdera). Alexander III. king of Scotland was at the ſolemnity, and on the occaſion 500 horſes were let looſe, for all that could catch them to keep them.

Edward was a brave and politic prince, and being perfectly well acquainted with the laws, intereſts, and conſtitution of his kingdom, his regulations and reformations of his laws, have juſtly given him the title of the Engliſh Juſtinian. He paſſed the famous mortmain act, whereby all perſons "were reſtrained from giving by will or *otherwiſe*, their eſtates to (thoſe *ſo called*) religious purpoſes, and the ſocieties that never die, without a licence from the crown." He granted certain privileges to the cinque-ports, which, though now very inconſiderable, were then obliged to attend the king, when he went beyond ſea, with fifty-ſeven ſhips, each having twenty armed ſoldiers on board, and to maintain them at their own coſts for the ſpace of fifteen days. He reduced the Welch to pay him tribute, and annexed its principality to his crown, and was the firſt who gave the title of prince of Wales to his eldeſt ſon. Though he encouraged foreigners to trade with England, yet the aggregate body of every particular nation reſiding here became anſwerable for the miſdemeanors of every individual perſon of their number. He regulated the forms of parliament as they now ſtand, with very little variation. Perceiving that the indolence of his ſubjects rendered them a prey to the Jews, who were the great uſurers and money-dealers of the times, he expelled them out of England, and ſeized all their immoveable eſtates. I have, in the article of Scotland, mentioned the unjuſtifiable manner in which he aboliſhed the independency of that kingdom; but, on the other hand, it muſt be acknowledged that he held the balance of power in Europe, and employed the vaſt ſums he raiſed from his ſubjects for the aggrandizement of his crown and people. He had frequent wars abroad, eſpecially with France, in which he was not very ſucceſsful; and would willingly have abridged the power of the barons and great nobility, had the deſign been practicable.

His vaſt connections with the continent were productive of many benefits to his ſubjects, particularly by the introduction of reading glaſſes and ſpectacles; though they are ſaid to have been invented, in the former reign, by the famous friar Bacon. Windmills were erected in England about the ſame time, and the regulation of gold and ſilver workmanſhip was aſcertained by an aſſay and mark of the goldſmiths' company. Edward was often embroiled with the pope, eſpecially upon the affairs of Scotland; and he died in 1307, the 69th year of his age and 35th of his reign, while he was upon a freſh expedition to exterminate that people. He ordered his heart to be ſent to the Holy Land, with 32,000l. for the maintenance of what was called the *Holy Sepulchre*.

His ſon and ſucceſſor Edward II. ſhewed early diſpoſitions for encouraging favourites; but Gaveſton his chief minion, a Gaſcon, being baniſhed by his father, he mounted the throne with vaſt advantages, both political and perſonal, all which he ſoon forfeited by his own imprudence. He recalled Gaveſton, and loaded him with honours, and married Iſabella, daughter to the French king, who reſtored to him part of the territories which Edward I. had loſt in France. The barons, however, obliged him once more to baniſh his favourite, and to confirm the great charter, while king Robert Bruce recovered all Scotland, excepting the caſtle of Stirling; near to which, at Bannockburn, Edward in perſon received the greateſt defeat that

England ever ſuffered, in 1314. Gaveſton being beheaded by the barons, they fixed upon young Hugh Spencer as a ſpy upon the king, but he ſoon become his favourite. Through his pride, avarice, and ambition, he was baniſhed, together with his father, who had been created earl of Wincheſter. The queen, an ambitious and worthleſs woman, perſuaded her huſband to recall the Spencers, while the common people, from their hatred to the barons, joined the king's ſtandard, and after defeating them, reſtored him to the exerciſe of all his prerogatives. A cruel uſe was made of thoſe ſucceſſes, and many noble patriots, with their eſtates, fell victims to the queen's revenge; but at laſt ſhe became enamoured with Roger Mortimer, who was her priſoner, and had been one of the moſt active of the anti-royaliſt lords. A breach between her and the Spencers ſoon followed, and, going over to France with her lover, ſhe found means to form ſuch a party in England, that, returning with ſome French troops, ſhe put the eldeſt Spencer to an ignominious death, made her huſband priſoner, and forced him to abdicate his crown in favour of his ſon Edward III. then fifteen years of age. Nothing now but the death of Edward II. was wanting to complete her guilt; and he was moſt barbarouſly murdered in Berkeley-caſtle by ruffians, ſuppoſed to be employed by her and her paramour Mortimer, in the year 1327.

It muſt, however, be admitted, that the misfortunes of Edward II. were in a great degree brought upon himſelf by his imprudence and miſconduct. His government was ſometimes extremely arbitrary, and he was too much engroſſed by favourites, who led him into ſanguinary meaſures. It was alſo a misfortune to him, that he was not a match for Robert Bruce, king of Scotland; in conſequence of whoſe military and political abilities, and their own civil contentions, the Engliſh loſt that kingdom. But it has been alledged in his favour, that none of his predeceſſors equalled him in his encouragement of commerce, and that he protected his trading ſubjects with great ſpirit againſt the Hanſeatic league and rhe neighbouring powers. Upon an average, the difference of living then and now, ſeems to be nearly as 5 or 6 is to 1, always remembering that their money contained thrice as much ſilver as our money or coin of the ſame denomination does. Thus, for example, if a gooſe then coſt $2\frac{1}{2}d.$ that is $7\frac{1}{2}d.$ of our money, according to the proportion of 6 to 1, it would now coſt 3*s.* 9*d.* The Knights Templars were ſuppreſſed in this reign, owing to their enormous vices.

Edward III. mounted the throne in 1327. He was then under the tuition of his mother, who cohabited with Mortimer; and they endeavoured to keep poſſeſſion of their power, by executing many popular meaſures, and putting an end to all national differences with Scotland, for which Mortimer was created earl of March. Edward, young as he was, was ſoon ſenſible of their deſigns. He ſurpriſed them in perſon at the head of a few choſen friends in the caſtle of Nottingham. Mortimer was put to a public death, hanged as a traitor on the common gallows at Tyburn, and the queen herſelf was ſhut up in confinement twenty-eight years, to her death. It was not long before Edward found means to quarrel with David king of Scotland, though he had married his ſiſter. David was driven to France by Edward Baliol, who did homage to Edward for Scotland. Upon the death of Charles the Fair, king of France (without iſſue), who had ſucceeded by virtue of the Salic law, which the French pretended cut off all female ſucceſſion to that crown, Philip of Valois claimed it, as being the next heir male by ſucceſſion; but he was oppoſed by Edward, as being the ſon of Iſabella, who was ſiſter to the three laſt mentioned kings of France, and firſt in the female ſucceſſion. The former was preferred; but, the caſe being doubtful, Edward purſued his claim, and invaded France with a powerful army.

On this occaſion the vaſt difference between the feudal conſtitutions of France, which were then in full force, and the government of England, more favourable

to public liberty, appeared. The French officers knew no ſubordination. They and their men were equally undiſciplined and diſobedient, though far more numerous than their enemies in the field. The Engliſh freemen, on the other hand, having now vaſt property to fight for, which they could call their own, knew its value, and had learned to defend it by providing themſelves with proper armour, and ſubmitting to military exerciſe and proper ſubordination in the field. The war, on the part of Edward, was therefore a continued ſcene of ſucceſs and victory. In 1340 he took the title of king of France, uſing it in all public acts, and quartered the arms of France with his own, adding this motto, *Dieu et mon droit*, "God and my right." At Creſſy, Auguſt 26th, 1346, above 100,000 French were defeated by 30,000 Engliſh, chiefly by the valour of the prince of Wales, who was but ſixteen years of age (his father being no more than thirty-four). The loſs of the French far exceeded the number of the Engliſh army, whoſe loſs conſiſted of no more than three knights, one eſquire, and about fifty private men. The battle of Poictiers was fought in 1356, between the prince of Wales and the French king John, but with greatly ſuperior advantages of numbers on the part of the French, who were totally defeated, and their king and his favourite ſon Philip taken priſoners. It is thought that the number of French killed in this battle was double that of all the Engliſh army; but the modeſty and politeneſs with which the prince treated his royal priſoners, formed the brighteſt wreath in his garland.

Edward's glories were not confined to France. Having left his queen Philippa, daughter to the earl of Hainault, regent of England, ſhe had the good fortune to take priſoner David king of Scotland, who had ventured to invade England about ſix weeks after the battle of Creſſy. Thus Edward had the glory to ſee two crowned heads his captives at London. Both kings were afterwards ranſomed; David for 100,000 marks, after being eleven years in captivity, and John for three millions of gold crowns; but John returned to England, and died at the palace of the Savoy. After the treaty of Bretigni, into which Edward III. is ſaid to have been frightened by a dreadful ſtorm, his fortunes declined. He had reſigned his French dominions entirely to the prince of Wales, and he ſunk in the eſteem of his ſubjects at home, on account of his miſtreſs, one Alice Pierce. The prince of Wales, commonly called the Black Prince *, from his wearing that coloured armour, while he was making a glorious campaign in Spain, where he reinſtated Peter the Cruel on that throne, was ſeized with a conſumptive diſorder, which carried him off in the year 1372. His father did not long ſurvive him; for he died, diſpirited and obſcure, at Shene in Surry, in the year 1377, the 65th of his age, and 51ſt of his reign.

No prince ever underſtood the intereſt of Europe better than Edward did, and he was one of the moſt illuſtrious kings that ſat on the Engliſh throne. Bent on the conqueſt of France, he gratified the more readily his people in their demands for ſecurity to their liberties and properties; but his ambition exhauſted his regal dominions; and his ſucceſſor, when he mounted the throne, was leſs powerful than Edward in the beginning of his reign. He has the glory of inviting over and protecting fullers, dyers, weavers, and other artificers from Flanders, and of eſtabliſhing the the woollen manufacture among the Engliſh, who, till this time, generally exported the unwrought commodity. The rate of living in his reign ſeems to have been much the ſame as in the preceding; and few of the Engliſh ſhips, even of war, exceeded forty or fifty tons. But, notwithſtanding the vaſt increaſe of property in

* He was alſo the firſt in England that had the title of *Duke*, being created by his father duke of Cornwall; and ever ſince, the eldeſt ſon of the king of England is by birth duke of Cornwall.

England, villenage ſtill continued in the royal, epiſcopal, and baronial manors. Hiſtorians are not agreed whether Edward made uſe of artillery in his firſt invaſion of France, but it certainly was well known before his death. The magnificent caſtle of Windſor was built by Edward III. and his method of conducting that work may ſerve as a ſpecimen of the condition of the people in that age. Inſtead of alluring workmen by contract and wages, he aſſeſſed every county in England to ſend him ſo many maſons, tilers, and carpenters, as if he had been levying an army. Soldiers were enliſted only for a ſhort time; they lived idle all the reſt of the year, and commonly all the reſt of their lives; one ſucceſsful campaign, by pay and plunder, and the ranſom of priſoners, was ſuppoſed to be a ſmall fortune; which was a great allurement to enter into the ſervice. The wages of a maſter carpenter was limited through the whole year to three pence a day, a common carpenter to two pence, money of that age.

Dr. John Wickliffe, a ſecular prieſt, educated at Oxford, began, in the latter end of this reign, to ſpread the doctrines of reformation by his diſcourſes, ſermons, and writings; and he made many diſciples of all ranks. He was a man of parts, learning, and piety; and has the honour of being the firſt perſon in Europe who publicly called in queſtion thoſe doctrines which had paſſed for certain during ſo many ages. The doctrines of Wickliffe being derived from his ſearch into the ſcriptures, and into eccleſiaſtical antiquity, were nearly the ſame with thoſe propagated by the reformers in the ſixteenth century. But, though many ſeemed ſtrongly diſpoſed to receive them, affairs were not yet fully ripe for this great revolution, which was reſerved for a more free and enquiring age, that aboliſhed Romiſh ſuperſtition in this and many other kingdoms of Europe. He had many friends in the univerſity of Oxford and at court, and was powerfully protected againſt the evil deſigns of the pope and biſhops, by John of Gaunt duke of Lancaſter, one of the king's ſons, and other great men. His diſciples were diſtinguiſhed by the name of Wickliffites or Lollards.

Richard II. ſon of the Black Prince, was only eleven years of age when he mounted the throne. The Engliſh arms were then unſucceſsful both in France and Scotland; but the doctrines of Wickliffe took root under the influence of the duke of Lancaſter, the king's uncle and one of his guardians, and gave enlarged notions of liberty to the villains, the lower ranks of people. The truth is, that agriculture was then in ſo flouriſhing a ſtate, that corn, and other victuals, were ſuffered to be tranſported, and the Engliſh had fallen upon a way of manufacturing, for exportation, their leather, horns, and other native commodities; and with regard to the woollen manufactures, they ſeem from records to have been exceeded by none in Europe. John of Gaunt's foreign connections with the crowns of Portugal and Spain were of prejudice to England; and ſo many men were employed in unſucceſsful wars, that the commons of England, like powder, receiving a ſpark of fire, all at once flamed out into rebellion, under the conduct of Ball, a prieſt, Wat Tyler, Jack Straw, and others, the loweſt of the people. The conduct of theſe inſurgents was very violent, and in many reſpects extremely unjuſtifiable; but it cannot be denied, that the common people of England then laboured under many oppreſſions, particularly a *poll tax*, and had abundant reaſon to be diſcontented with the government.

Richard was not then above ſixteen, but he acted with great ſpirit and wiſdom. He faced the ſtorm of the inſurgents, at the head of the Londoners, while Walworth, the mayor, and Philpot, an alderman, had the courage to put Tyler, the leader of the malcontents, to death, in the midſt of his adherents. This, with the ſeaſonable behaviour of Richard, quelled the inſurrection for that time; but it broke out with the moſt bloody effects in other parts of England: and, though it was ſuppreſſed by making many examples of ſeverity among the inſurgents, yet the

the common people never afterwards loſt ſight of their own importance, till by degrees they obtained thoſe privileges which they now enjoy. Had Richard been a prince of real abilities, he might, after the ſuppreſſion of thoſe inſurgents, have eſtabliſhed the tranquillity of his dominions on a ſure foundation; but he delivered himſelf up to worthleſs favourites, particularly Michael de la Pole, ſon to a merchant of London, whom he created earl of Suffolk and lord chancellor, judge Treſilian, and, above all, Robert de Vere, earl of Oxford, whom he created marquis * of Dublin and duke of Ireland. They were obnoxious both to the parliament and people, and Richard ſtooped in vain to the moſt ignoble meaſures to ſave them. They were attainted, and condemned to ſuffer as traitors. The chief juſtice Treſilian was hanged at Tyburn, but de la Pole and the duke of Ireland eſcaped abroad, where they died in obſcurity. Richard then aſſociated to himſelf a new ſet of favourites. His people and great lords again took up arms, and being headed by the duke of Glouceſter the king's uncle, they forced Richard once more into terms; but being inſincere in all his compliances, he was upon the point of becoming more deſpotic than any king of England had ever been when he loſt his crown and life by a ſudden cataſtrophe.

A quarrel happened between the duke of Hereford, ſon to the duke of Lancaſter, and the duke of Norfolk; and Richard baniſhed them both, with particular marks of injuſtice to the former, who now became duke of Lancaſter by his father's death. Richard carrying over a great army to quell a rebellion in Ireland, a ſtrong party was formed in England, the natural reſult of Richard's tyranny, who offered the duke of Lancaſter the crown. He landed from France at Ravenſpur in Yorkſhire, and was ſoon at the head of 60,000 men, all of them Engliſh. Richard hurried back to England, where his troops refuſing to fight, and his ſubjects, whom he had affected to deſpiſe, generally deſerting him, he was made priſoner with no more than twenty attendants; and being carried to London, he was depoſed in full parliament, upon a formal charge of tyranny and miſconduct; and ſoon after he is ſuppoſed to have been ſtarved to death in priſon, in the year 1399, the 34th of his age, and the 23d of his reign. He had no iſſue by either of his marriages.

Though the nobility of England were poſſeſſed of great power at the time of this revolution, yet we do not find that it abated the influence of the commons. They had the courage to remonſtrate boldly in parliament againſt the uſury, which was but too much practiſed in England, and other abuſes of both clergy and laity; and the deſtruction of the feudal powers ſoon followed.

Henry the Fourth †, ſon of John of Gaunt, duke of Lancaſter, fourth ſon of Edward III. being ſettled on the throne of England, in prejudice to the elder branches of Edward III.'s family, the great nobility were in hopes that this glaring defect of his title would render him dependent upon them. At firſt ſome conſpiracies were formed againſt him by the dukes of Surry and Exeter, the earls of Glouceſter and Saliſbury, and the archbiſhop of York; but he cruſhed them by his activity and ſteadineſs, and laid a plan for reducing their overgrown power. This was underſtood by the Percy family, the greateſt in the north of England, who complained of Henry having deprived them of ſome Scotch priſoners, whom they had taken in battle, and a dangerous rebellion broke out under the old earl of Northumber-

* The firſt who bore the title of marquis in England.

† The throne being now vacant, the duke of Lancaſter ſtepped forth, and having croſſed himſelf on his forehead and on his breaſt, and called upon the name of Chriſt, he pronounced theſe words, which I ſhall give in the original language, becauſe of their ſingularity.

In the name of Fadher, Son, and Holy Ghoſt, I Henry of Lancaſter, challenge this rewme of Yinglande, and the croun, with all the membris, and the appurtenances; als I that am deſcendit by right line of the blode (meaning a claim in right of his mother) *coming from the gude king Henry therde and throge that right that God of his grace hath ſent me, with helpe of kyn, and of my friendes, to recover it; the which rewme was in point to be endone by default of governance, and ondoying of the gude lawes.*

land,

land, and his ſon the famous Henry Percy, ſurnamed Hotſpur, but it ended in the defeat of the rebels, chiefly by the valour of the prince of Wales. With equal good fortune, Henry ſuppreſſed the inſurrections of the Welch, under Owen Glendower; and by his prudent conceſſions to his parliament, to the commons particularly, he at laſt conquered all oppoſition, while, to remedy the defect of his title, the parliament entailed the crown upon him and the heirs male of his body lawfully begotten, thereby ſhutting out all female ſucceſſion. The young duke of Rothſay, heir to the crown of Scotland (afterwards James I. of that kingdom), falling a priſoner into Henry's hands about this time, was of infinite ſervice to his government; and before his death, which happened in 1413, in the 46th year of his age, and 13th of his reign, he had the ſatisfaction to ſee his ſon and ſucceſſor, the prince of Wales, diſengage himſelf from many youthful follies, which had till then diſgraced his conduct.

The Engliſh marine was now ſo greatly increaſed, that we find an Engliſh veſſel of 200 tons in the Baltic, and many other ſhips of equal burden, carrying on trade in various parts, particularly with the Hanſe towns. With regard to public liberty, Henry IV. as I have already hinted, was the firſt prince who gave the different orders in parliament, eſpecially that of the commons, their due weight. It is, however, a little ſurpriſing, that learning was at this time at a much lower paſs in England, and all over Europe, than it had been 200 years before. Biſhops, when teſtifying ſynodal acts, were often forced to do it by proxy in the following terms, viz. "As I cannot read myſelf, N. N. hath ſubſcribed for me;" or, "As my lord biſhop cannot write himſelf, at his requeſt I have ſubſcribed." By the influence of the court and the intrigues of the clergy, an act was obtained in the ſeſſions of parliament 1401 for the burning of heretics, occaſioned by the great increaſe of the Wickliffites or Lollards; and immediately after, one Sawtree, pariſh-prieſt of St. Oſithe, in London, was burnt alive by the king's writ, directed to the mayor and ſheriffs of London.

The balance of trade with foreign parts was againſt England at the acceſſion of Henry V. in 1413, ſo greatly had luxury increaſed. The Lollards, or the followers of Wickliffe, were exceſſively numerous, and ſir John Oldcaſtle, lord Cobham, having joined them, it was pretended that he had agreed to put himſelf at their head, with a deſign to overturn the government; but this appears to have been a groundleſs accuſation, from the bloody zeal of the clergy, though he was put to death in conſequence of it. His only real crime ſeems to have been the ſpirit with which he oppoſed the ſuperſtition of the age, and he was the firſt of the nobility who ſuffered on account of religion. Henry was about this time engaged in a conteſt with France, which he had many incitements for invading. He demanded a reſtitution of Normandy, and other provinces, that had been ravaged from England in the preceding reigns; alſo the payment of certain arrears due for king John's ranſom ſince the reign of Edward III. and availing himſelf of the diſtracted ſtate of that kingdom by the Orleans and Burgundy factions, he invaded it, took Harfleur, and then defeated the French in the battle of Agincourt, which equalled the glory of Creſſy and Poictiers, but exceeded them in its conſequences, on account of the vaſt number of French princes of the blood, and other great noblemen, who were ſlain. Henry, who was as great a politician as a warrior, made ſuch alliances, and divided the French among themſelves ſo effectually, that he forced the queen of France, whoſe huſband Charles VI. was a lunatic, to agree to his marrying her daughter, the princeſs Catherine, to diſinherit the dauphin, and to declare Henry regent of France during her huſband's life, and him and his iſſue ſucceſſors to the French monarchy, which muſt at this time have been exterminated, had not the Scots (though their king ſtill continued Henry's captive) furniſhed the dauphin with effectual ſupplies, and preſerved the French crown for his head.

Henry,

Henry, however, made a triumphal entry into Paris, where the dauphin was proſcribed; and after receiving the fealty of the French nobility, he returned to England to levy a force that might cruſh the dauphin and his Scotch auxiliaries. He probably would have been ſucceſsful, had he not died of a pleuritic diſorder, 1422, the 34th year of his age, and the 10th of his reign.

By an authentic and exact account of the ordinary revenues of the crown during this reign, it appears that they amounted only to 55,7141. a year, which is nearly the ſame with the revenues in Henry III.'s time, and the kings of England had neither become much richer nor poorer in the courſe of 200 years. The ordinary expences of the government amounted to 52,507 l. ſo that the king had of ſurplus only 3207l. for the ſupport of his houſehold, for his wardrobe, for the expence of embaſſies, and other articles. This ſum, though money of the ſame denomination then contained thrice as much ſilver as it does at preſent, was not nearly ſufficient even in time of peace; and to carry on his wars, this great conqueror was reduced to many miſerable ſhifts: he borrowed from all quarters; he pawned his jewels and ſometimes the crown itſelf; he ran in arrears to his army; and he was often obliged to ſtop in the midſt of his career of victory, and to grant a truce to the enemy. I mention theſe particulars, that the reader may judge of the ſimplicity and temperance of our predeceſſors three centuries ago, when the expences of the greateſt king in Europe were ſcarcely equal to the penſion of a ſuperannuated courtier of the preſent age.

It required a prince equally able with Henry IV. and V. to confirm the title of the Lancaſter houſe to the throne of England. Henry VI. ſurnamed of Windſor, was no more than nine months old, when, in conſequence of the treaty of Troyes, concluded by his father with the French court, he was proclaimed king of France as well as England. He was under the tuition of his two uncles the dukes of Bedford and Glouceſter, both of them princes of great accompliſhments, virtues, and courage, but unable to preſerve their brother's conqueſts. Upon the death of Charles VI. the affections of the French for his family revived in the perſon of his ſon and ſucceſſor Charles VII. The duke of Bedford, who was regent of France, performed many glorious actions, and at laſt laid ſiege to Orleans, which, if taken, would have completed the conqueſt of France. The ſiege was raiſed by the valour and good conduct of the Maid of Orleans, a phenomenon hardly to be paralleled in hiſtory, ſhe being born of the loweſt extraction, and bred a cow-keeper, and ſometimes a helper in ſtables at public inns. She muſt, notwithſtanding, have poſſeſſed an amazing fund of ſagacity as well as valour. After an unparalleled train of heroic actions, and placing the crown upon her ſovereign's head, ſhe was taken priſoner by the Engliſh in making a ſally during the ſiege of Compiegne, and burnt alive for a witch at Roan, May 30, 1431.

The death of the duke of Bedford, and the agreement of the duke of Burgundy, the great ally of the Engliſh, with Charles VII. contributed to the entire ruin of the Engliſh intereſt in France, and the loſs of all their fine provinces in that kingdom, notwithſtanding the amazing courage of Talbot, the firſt earl of Shrewſbury, and their other officers. The capital misfortune of England, at this time, was its diſunion at home. The duke of Glouceſter loſt his authority in the government, and the king married Margaret of Anjou, daughter to the needy king of Sicily; a woman of a high ſpirit, but an implacable diſpoſition; while the cardinal of Wincheſter, who was the richeſt ſubject in England, if not in Europe, preſided at the head of the treaſury, and by his avarice ruined the intereſt of his country, both at home and abroad. Next to the cardinal, the duke of York, who was lord lieutenant of Ireland, was the moſt powerful ſubject in England. He was deſcended by the mother's ſide from Lionel, an elder ſon of Edward III. and prior in claim to the reigning king, who was deſcended from John of Gaunt, Edward's youngeſt ſon;

and

and he affected to keep up the diſtinction of a white roſe, that of the houſe of Lancaſter being red. It is certain that he paid no regard to the parliamentary entail of the crown upon the reigning family, and he loſt no opportunity of forming a party to aſſert his right, but acted at firſt with profound diſſimulation. The duke of Suffolk was a favourite of the queen, and a profeſſed enemy to the duke of York; but, being impeached in parliament, he was baniſhed for five years, and had his head ſtruck off on board a ſhip, by a common ſailor. This was followed by an inſurrection of 20,000 Kentiſh men, headed by one Jack Cade, a man of low condition, who ſent to the court a liſt of grievances; but he was defeated by the valour of the citizens of London. The inglorious management of the Engliſh affairs in France proved advantageous to the duke of York, and, upon his arrival in England from Ireland, he found a ſtrong party of the nobility his friends; but being conſidered as the fomenter of Cade's rebellion, he profeſſed the moſt profound reverence to Henry.

The perſons in high power and reputation in England, next to the duke of York, were the earl of Saliſbury, and his ſon the earl of Warwick. The latter had the greateſt land eſtate of any ſubject in England, and his vaſt abilities, joined to ſome virtues, rendered him equally popular. Both father and ſon were ſecretly on the ſide of York; and during a fit of illneſs of the king that duke was made protector of the realm. Both ſides now prepared for arms, and the king recovering, the queen, with wonderful activity, aſſembled an army; but the royaliſts were defeated in the firſt battle of St. Alban's, and the king himſelf was taken priſoner. The duke of York was once more declared protector of the kingdom; but it was not long before the queen reſumed all her influence in the government, and the king, though his weakneſs became every day more and more viſible, recovered all his authority.

The duke of York upon this threw off the maſk, and, in 1459, openly claimed the crown, and the queen was again defeated by the earl of Warwick, who was now called the King-maker. A parliament being aſſembled, it was enacted, that Henry ſhould poſſeſs the throne for life, but that the duke of York ſhould ſucceed him, to the excluſion of all Henry's iſſue. The queen alone rejected this compromiſe. She retreated northwards, and the king being ſtill a priſoner, ſhe pleaded his cauſe ſo well, that aſſembling a freſh army, ſhe fought the battle of Wakefield, where the duke of York was defeated and ſlain in 1460.

It is remarkable, that though the duke of York and his party openly aſſerted his claim to the crown, they ſtill profeſſed allegiance to Henry; but the duke of York's ſon, afterwards Edward IV. prepared to revenge his father's death, and obtained ſeveral victories over the royaliſts. The queen, however, advanced towards London, and, defeating the earl of Warwick in the ſecond battle of St. Alban's, delivered her huſband; but the diſorders committed by her northern troops diſguſted the Londoners ſo much, that ſhe durſt not enter London, where the duke of York was received on the 28th of February, 1461, while the queen and her huſband were obliged to retreat northward. She ſoon raiſed another army, and fought the battle of Towton, the moſt bloody perhaps that ever happened in any civil war. After prodigies of valour had been performed on both ſides, the victory remained with young king Edward, and near 40,000 men lay dead on the field of battle. Margaret and her huſband were once more obliged to fly to Scotland, where they met with a generous protection.

This civil war was carried on with uncommon animoſity. Margaret was as blood-thirſty as her opponents, and when priſoners of either ſide were made, their deaths, eſpecially if they were perſons of rank, were deferred only for a few hours.

Margaret, by the conceſſions ſhe made to the Scots, ſoon raiſed a freſh army there, and in the north of England, but met with defeat upon defeat, till at laſt her huſband, the unfortunate Henry, was carried priſoner to London.

The duke of York, now Edward IV. being crowned on the 29th of June, fell in love with, and privately married Elizabeth, the widow of ſir John Gray, though he had ſome time before ſent the earl of Warwick to demand the king of France's ſiſter in marriage, in which embaſſy he was ſucceſsful, and nothing remained but the bringing over the princeſs into England. When the ſecret of Edward's marriage broke out, the haughty earl, deeming himſelf affronted, returned to England inflamed with rage and indignation; and from being Edward's beſt friend became his moſt formidable enemy, and gaining over the duke of Clarence, Edward was made priſoner, but eſcaping from his confinement, the earl of Warwick, and the French king, Lewis XI. declared for the reſtoration of Henry, who was replaced on the throne, and Edward narrowly eſcaped to Holland. Returning from thence, he advanced to London, under pretence of claiming his dukedom of York; but being received into the capital, he reſumed the exerciſe of royal authority, made king Henry once more his priſoner, and defeated and killed Warwick, in the battle of Barnet. A few days after, he defeated a freſh army of Lancaſtrians, and made queen Margaret priſoner, together with her ſon prince Edward, whom Edward's brother, the duke of Glouceſter, murdered in cold blood, as he is ſaid (but with no great ſhew of probability) to have done his father Henry VI. then a priſoner in the Tower of London, a few days after, in the year 1471. Edward being now ſettled on the throne, was guilty of the utmoſt cruelty to all the Lancaſtrian party, whom he put to death, wherever he could find them.

The great object of his vengeance was Henry, earl of Richmond. He was deſcended from John Beaufort the eldeſt ſon of the earl of Somerſet, who was the eldeſt ſon of John of Gaunt, by his laſt wife Catherine Swineford, but born in adultery, during her huſband's life-time. This diſability, however, was afterwards removed both by the pope and by the parliament, and the deſcendants of John of Gaunt, by that lady, as far as could be done, were declared legitimate. The laſt lord, John, duke of Somerſet, left a daughter, Margaret, who was married to Edmund Tudor, earl of Richmond, ſon of the widow of Henry V. by Owen Tudor, a Welſh gentleman whom ſhe had condeſcended to marry; and their ſon was Henry, earl of Richmond (afterwards Henry VII.), who then lived in France, to ſecure himſelf from the cruelty of Edward. The reader may ſee, from the detail of this important genealogy, that the young earl of Richmond had not the ſmalleſt claim in blood (even ſuppoſing the illegitimacy of his anceſtors had been removed) to the crown of England.

In 1474, the kingdom was in a deplorable ſituation. The king was immerſed in expenſive and criminal luxuries, in which he was imitated by his great men; who, to ſupport their extravagancies, became penſioners to France. The parliament ſeemed to act only as the executioners of Edward's bloody mandates. The beſt blood in England was ſhed on ſcaffolds; and even the duke of Clarence fell a victim to his brother's jealouſy. Edward, partly to amuſe the public, and partly to ſupply the vaſt expences of his court, pretended ſometimes to quarrel, and ſometimes to treat with France; but his irregularities occaſioned his death (1483), in the twenty-third year of his reign, and forty-ſecond of his age.

Notwithſtanding the turbulence of the times, the trade and manufactures of England, particularly the woollen, increaſed during the reigns of Henry VI. and Edward IV. So early as 1440, a navigation act was contrived by the Engliſh, as the only means to preſerve the benefit of being the ſole carriers of their own merchandiſe; but foreign influence prevented Henry's paſſing the bill for that purpoſe.

poſe. The invention of printing, which is generally ſuppoſed to have been imported into England by William Caxton, and which received ſome countenance from Edward, is the chief glory of his reign; but learning in general was then in a poor ſtate. The lord Tiptoft was its chief patron, and ſeems to have been the firſt Engliſh nobleman who cultivated what are now called the belles lettres. The books printed by Caxton are moſtly re-tranſlations, or compilations from the French or Monkiſh Latin; but it muſt be acknowledged, at the ſame time, that literature, after this period, made a more rapid and general progreſs among the Engliſh than it did in any other European nation. The famous Littleton, judge of the common pleas, and Forteſcue, chancellor of England, flouriſhed at this period.

Edward IV. left two ſons by his queen, who had exerciſed her power with little prudence, and nobilitated many of her obſcure relations. Her eldeſt ſon, Edward V. was about thirteen; and his uncle the duke of Glouceſter, taking advantage of the queen's want of popularity among the great men, found means to baſtardize her iſſue, by act of parliament, under the ſcandalous pretext of a precontract between their father and another lady. The duke, at the ſame time, was declared guardian of the kingdom, and at laſt accepted the crown, which was offered him by the Londoners; having firſt put to death all the great men whom he thought well affected to the late king's family. Whether the king and his brother were murdered in the Tower by his direction, is doubtful. The moſt probable opinion is, that they were clandeſtinely ſent abroad by his orders, and that the elder died, but that the younger ſurvived, and was the ſame who was well known by the name of Perkin Warbeck. Be this as it will, the Engliſh were prepoſſeſſed ſo ſtrongly againſt Richard, as the murderer of his nephews, that the earl of Richmond who ſtill remained in France, carried on a ſecret correſpondence with the remains of Edward IV.'s friends, and by offering to marry his eldeſt daughter, he was encouraged to invade England at the head of about 2000 foreign troops: but they were ſoon joined by 7000 Engliſh and Welch. A battle between him and Richard, who was at the head of 15,000 men, enſued at Boſworth-field, in which Richard after diſplaying the moſt aſtoniſhing acts of perſonal valour, was killed, having been firſt abandoned by a main diviſion of his army, under lord Stanley and his brother, in the year 1485.

There can ſcarcely be a doubt but that the crimes of Richard have been exaggerated by hiſtorians. He was exemplary in his diſtributive juſtice. He kept a watchful eye over the great barons, whoſe oppreſſion he aboliſhed, and was a father to the common people. He founded the ſociety of heralds; an inſtitution, which, in his time, was found neceſſary to prevent diſputes among great families. During his reign, ſhort as it was, we have repeated inſtances of his relieving cities and corporations that had gone into decay. He was remarkable for the encouragement of the hardware manufactures, and for preventing their importation into England, no fewer than ſeventy-two different kinds being prohibited by one act. He was the firſt Engliſh king who appointed a conſul for the ſuperintendency of Engliſh commerce abroad; one Strozzi being nominated for Piſa, with an income of the fourth part of one per cent. on all goods of Engliſhmen imported to or exported from thence.

Though the act of baſtardy obtained by Richard affected the daughters as well as the ſons of his brother, yet no diſputes were raiſed upon the legitimacy of the princeſs Elizabeth, eldeſt daughter to Edward IV. and who, as had been before concerted, married Henry of Lancaſter earl of Richmond, thereby uniting both houſes, which happily put an end to the long and bloody wars between the contending families of York and Lancaſter. Henry, however, reſted his right upon conqueſt, and ſeemed to pay little regard to the advantages of his marriage. He

was the moſt ſagacious monarch that had ever reigned in England; but, at the ſame time, the moſt jealous of his power; for he ſhut up the earl of Warwick, ſon to the duke of Clarence, brother to Edward IV. a cloſe priſoner in the Tower, though he was but a boy, and though nothing was alledged againſt him but his propinquity to the houſe of York. He was the firſt who inſtituted that guard called *Yeomen*, which ſtill ſubſiſts, and in imitation of his predeceſſor, he gave an irrecoverable blow to the dangerous privileges aſſumed by the barons, in aboliſhing liveries and retainers, by which every malefactor could ſhelter himſelf from the law, on aſſuming a nobleman's livery, and attending his perſon. Some rebellions happened in the beginning of his reign, but they were eaſily ſuppreſſed; as was the impoſture of Lambert Simnel, who pretended to be the impriſoned earl of Warwick: Simnel was taken priſoner, and after being employed in the king's kitchen, was made one of his falconers. The deſpotic court of ſtar-chamber owed its original to Henry; but, at the ſame time, it muſt be acknowledged, that he paſſed many acts, eſpecially for trade and navigation, that were highly for the benefit of his ſubjects. They expreſſed their gratitude by the great ſupplies and benevolence they afforded him, and, as a finiſhing ſtroke to the feudal tenures, an act paſſed by which the barons and gentlemen of landed intereſt were at liberty to ſell and mortgage their lands, without fines or licences for the alienation.

This, if we regard its conſequences, is perhaps the moſt important act that ever paſſed in an Engliſh parliament, though its tendency ſeems only to have been known to the politic king. Luxury, by the increaſe of trade, and the diſcovery of America, had broken with irreſiſtible force into England, and monied property being chiefly in the hands of the commons, the eſtates of the barons became theirs, but without any of their dangerous privileges; and thus the baronial powers were ſoon extinguiſhed.

Henry, after encountering and ſurmounting many difficulties both in France and Ireland, was attacked in the poſſeſſion of his throne by a young man, one Perkin Warbeck, who pretended to be the duke of York, ſecond ſon to Edward IV. and was acknowledged as ſuch by the ducheſs of Burgundy, Edward's ſiſter. We ſhall not follow the adventures of this young man, which were various and uncommon; but it is certain that many of the Engliſh, with the courts of France and Scotland, believed him to be what he pretended. Henry endeavoured to prove the death of Edward V. and his brother, but never did it to the public ſatisfaction; and though James IV. of Scotland baniſhed Perkin his dominions, being engaged in a treaty of marriage with Henry's eldeſt daughter, yet, by the kind manner in which he entertained and diſmiſſed him, it is plain that he believed him to be the real duke of York, eſpecially as he refuſed to deliver up his perſon, which he might have done with honour, had he thought him an impoſtor. Perkin, after various unfortunate adventures, fell into Henry's hands, and was ſhut up in the Tower of London, from whence he endeavoured to eſcape along with the innocent earl of Warwick, for which Perkin was hanged, and the earl beheaded. It is ſaid, that Perkin made a confeſſion of his impoſtures before his death; but if he did, it might have been extorted from him, either upon the hope of pardon, or the fear of torture. In 1499, Henry's eldeſt ſon, Arthur prince of Wales, was married to the princeſs Catharine of Arragon, daughter to the king and queen of Spain, and he dying ſoon after, ſuch was Henry's reluctance to refund her great dowry, 200,000 crowns of gold, that he conſented to her being married again to his ſecond ſon, then prince of Wales, on pretence that the firſt match had not been conſummated. Soon after, Henry's eldeſt daughter, the princeſs Margaret, was ſent with a magnificent train to Scotland, where ſhe was married to James IV. Henry, at the time of his death, which happened in 1509, the 52d year of his age, and 24th of his reign, was poſſeſſed of 1,800,000l. ſterling, which is equivalent to five millions

lions at preſent; ſo that he may be ſuppoſed to have been maſter of more ready money than all the kings in Europe beſides poſſeſſed, the mines of Peru and Mexico being then only beginning to be worked. He was immoderately fond of repleniſhing his coffers, and often tricked his parliament into ſubſidies for foreign alliances, which he intended not to purſue.

I have already mentioned the vaſt alteration which happened in the conſtitution of England during Henry VII's reign. His exceſſive love of money and avarice was the probable reaſon why he did not become maſter of the Weſt Indies, he having the firſt offer of the diſcovery from Columbus, whoſe propoſals being rejected by Henry, that great man applied to the court of Spain. Henry, however, made ſome amends by encouraging Cabot a Venetian, who diſcovered the main land of North-America, in 1498; and we may obſerve, to the praiſe of this king, that ſometimes in order to promote commerce, he lent to merchants ſums of money without intereſt, when he knew that their ſtock was not ſufficient for thoſe enterprizes which they had in view. From the proportional prices of living, produced by Maddox, Fleetwood, and other writers, agriculture and breeding of cattle muſt have been prodigiouſly advanced before Henry's death; an inſtance of this is given in the caſe of lady Anne, ſiſter to Henry's queen, who had an allowance of 20s. per week, for her exhibition, ſuſtentation, and convenient diet of meat and drink; alſo for two gentlewomen, one woman child, one gentleman, one yeoman, and three grooms, (in all eight perſons) 51l. 11s. 8d. per annum, for their wages, diet and clothing: and for the maintenance of ſeven horſes yearly, 16l. 9s. 4d. *i. e.* for each horſe 2l. 17s. 0d. $\frac{1}{2}$ yearly, money being then 1 $\frac{1}{2}$ times as weighty as our modern ſilver coin. Wheat ſold that year at 3s. 4d. a quarter, which anſwers to 5s. of our money, conſequently it was about ſeven times as cheap as at preſent.

The fine arts were as far advanced in England at the acceſſion of Henry VIII. 1509, as in any European country, if we except Italy; and perhaps no prince ever entered with greater advantages than he did on the exerciſe of royalty. Young, vigorous, and rich, unrivalled maſter of the throne, he might have held the balance of power in Europe, had he been careful to improve his advantages. Imagining he ſtood not in need of a ſupply, he improved not Cabot's diſcoveries, but ſuffered the Eaſt and Weſt Indies to be engroſſed by Portugal and Spain. His vanity engaged him too much in the affairs of the continent, and his flatterers encouraged him to make preparations for the conqueſt of France. Theſe projects, and his eſtabliſhing what is properly called a *navy royal*, for the permanent defence of the nation (a moſt excellent meaſure), led him into incredible expences. He was on all occaſions the dupe of the emperor Maximilian, the pooreſt prince in Europe; and early in his reign he gave himſelf alſo entirely up to the guidance of the celebrated cardinal Wolſey, the ſon of a butcher at Ipſwich, but educated at Oxford, and made dean of Lincoln by Henry VII. While involved in a war with France, his lieutenant, the earl of Surrey, conquered and killed James IV. of Scotland, who had invaded England; and Henry became a candidate for the German empire, during its vacancy, but ſoon reſigned his pretenſions to Francis I. of France, and Charles of Auſtria, king of Spain, who was elected in 1519. Henry's conduct, in the long and bloody wars between thoſe princes, was directed by Wolſey's views upon the popedom, which he hoped to gain by the intereſt of Charles; but finding himſelf twice deceived, he perſuaded his maſter to declare himſelf for Francis, who had been taken priſoner at the battle of Pavia. Henry, however, continued to be the dupe of both parties, and to pay great part of their expences till at laſt he was forced to lay vaſt burthens upon his ſubjects.

Henry continued all this time the great enemy of the Reformation, and the champion of the popes and the Romiſh church. He wrote a book againſt Luther, "of the *Seven Sacraments*," about the year 1521, for which the pope gave him the title of *Defender of the Faith*, which his ſucceſſors retain to this day; but about

the year 1527, he began to have ſome ſcruples with regard to the validity of his marriage with his brother's widow. I ſhall not ſay, how far on this occaſion he might be influenced by ſcruples of conſcience, or averſion to the queen, or the charms of the famous Anne Boleyn, maid of honour to the queen, whom he married, before he had obtained a divorce from Rome. The difficulties he met with in this proceſs ruined Wolſey, who died heart-broken at being ſtript of his immenſe power and poſſeſſions.

A perplexing, though nice conjunction of affairs, it is well known, induced Henry at laſt to throw off all relation to, or dependence upon, the church of Rome, and to bring about a Reformation; in which, however, many of the Romiſh errors and ſuperſtitions were retained. Henry never could have effected this mighty meaſure, had it not been for his deſpotic diſpoſition, which broke out on every occaſion. Upon a ſlight ſuſpicion of his queen's inconſtancy, and after a ſham trial, he cut off her head in the Tower, and put to death ſome of her neareſt relations; and in many reſpects he acted in the moſt arbitrary manner, his wiſhes, however unreaſonable, being too rapidly complied with, in conſequence of the ſhameful ſervility of his parliaments. The diſſolution of the religious houſes, and immenſe wealth that came to Henry, by ſeizing all the eccleſiaſtical property in the kingdom, enabled him to give full ſcope to his ſanguinary diſpoſition; ſo that the beſt and moſt innocent blood of England was ſhed on ſcaffolds. Among others, was the aged counteſs of Saliſbury, deſcended immediately from Edward IV. and mother to cardinal Pole; the marquis of Exeter, the lord Montague, and others of the blood royal, for holding a correſpondence with that cardinal.

His third wife was Jane Seymour, daughter to a gentleman of fortune and family; but ſhe died in bringing Edward VI. into the world. His fourth wife was Anne, ſiſter to the duke of Cleves: he diſliked her ſo much, that he ſcarcely bedded with her, and obtaining a divorce, ſuffered her to reſide in England on a penſion of 3000l. a year. His fifth wife was Catharine Howard, niece to the duke of Norfolk, whoſe head he cut off for ante-nuptial incontinency. His laſt wife was Catharine Par, in whoſe poſſeſſion he died, after ſhe had narrowly eſcaped being brought to the ſtake for her religious opinions, which favoured the Reformation. Henry's cruelty increaſed with his years, and was now exerciſed promiſcuouſly on Proteſtants and Catholics. He put the brave earl of Surry to death without a crime being proved againſt him; and his father, the duke of Norfolk, muſt have ſuffered the next day, had he not been ſaved by Henry's own death, in the year 1547, in the 56th year of his age, and the 38th year of his reign.

By the help of printing, the reign of Henry VIII. is better known than that of his predeceſſors. His attention to the naval ſecurity of England is highly commendable; and he ſometimes employed his unjuſt and arbitrary power for the glory and intereſt of his ſubjects. Without enquiring into his religious motives, it muſt be candidly confeſſed, that had the Reformation gone through all the forms preſcribed by the laws, and the courts of juſtice, it probably could never have taken place, or at leaſt not for many years; and whatever Henry's perſonal crimes or failings might have been, the partition he made of the church's property among his courtiers and favourites, and thereby reſcuing it from dead hands, undoubtedly promoted the preſent greatneſs of England. With regard to learning and the arts, Henry was a generous encourager of both. He gave a penſion to Eraſmus, the greateſt ſcholar of his age. He brought to England, encouraged, and protected Hans Holbein, that excellent painter and architect; and in his reign noblemen's houſes began to have the air of Italian magnificence and regularity. He was a conſtant and generous friend to Cranmer: and though, upon the whole, rather whimſical than ſettled in his own principles of religion, he advanced and encouraged many who became afterwards the inſtruments of a more pure reformation.

In

In his reign the Bible was ordered to be printed in Engliſh. Wales was united and incorporated with England. Ireland was erected into a kingdom, and Henry took the title of king inſtead of lord of Ireland.

Edward VI. was but nine years old at the time of his father's death; and after ſome diſputes were over, the regency was ſettled in the perſon of his uncle the earl of Hertford, afterwards the protector and duke of Somerſet, a declared friend of the Reformation, and a bitter enemy to the ſee of Rome. Much of the popiſh leaven, however, ſtill remained in the council, which was embroiled at once with France and Scotland. The protector marched with an army into Scotland, to force that people to give their young queen Mary, only child of James V. in marriage to Edward, with a view to unite the two kingdoms; a meaſure which the late king had recommended with his dying breath to his executors. The protector defeated the Scots at Pinkey, but the match never took place; and the factions now forming againſt the protector, obliged him to return with his army to England. His own brother, who married the queen dowager, was at the head of his enemies; and, ſhe dying, he made his addreſſes to the princeſs Elizabeth, afterwards queen. This gave a handle to the protector to bring his brother, who was lord admiral, to the block.

The reader is to obſerve in general, that the Reformation was not effected without many public diſturbances. The common people, during the reigns of Henry and Edward, being deprived of the vaſt relief they had from abbeys and religious houſes, and being ejected from their ſmall corn-growing farms, had often taken arms, but had been as often ſuppreſſed by the government; and ſeveral of theſe inſurrections were cruſhed in his reign. A war, which was not very happily managed, broke out with Scotland; and the protector, who was upon the whole a weak, but conſcientious man, was firſt driven from the helm of ſtate, and then loſt his head upon a ſcaffold. Dudley, who was created duke of Northumberland, then took the lead in the government, and drove Edward, who, though young, meant extremely well, and was a ſincere Proteſtant, into many impolitic acts; ſo that England made but an inconſiderable figure in this reign, compared with what it had done at other periods.

The Reformation, however, went on rapidly, through the zeal of Cranmer, and others, ſome of them foreign divines. In ſome caſes, particularly with regard to the princeſs Mary, they loſt ſight of that moderation which the reformers had before ſo ſtrongly recommended; and ſome ſanguinary executions, on account of religion, took place. Edward's youth excuſes him from blame, and his charitable endowments, as Bridewell and St. Thomas's hoſpitals, and alſo ſeveral ſchools which ſtill exiſt and flouriſh, ſhew the goodneſs of his heart. He died of a conſumption in 1553, in the 16th year of his age, and the 7th of his reign.

Edward, on his death-bed, from his zeal for religion, had made a very unconſtitutional will, for he ſet aſide his ſiſter Mary from the ſucceſſion, which was claimed by lady Jane Grey, daughter to the ducheſs of Suffolk, younger ſiſter to Henry VIII. This lady, though ſhe had ſcarcely reached her 17th year, was a prodigy of learning and virtue; but the bulk of the Engliſh nation recognized the claim of the princeſs Mary who cut off lady Jane's head. Her huſband Lord Guildford Dudley and his father, the duke of Northumberland, ſuffered in the ſame manner.

Mary being thus ſettled on the throne, ſuppreſſed an inſurrection under Wyat, and proceeded, like a female fury, to re-eſtabliſh popery, which ſhe did all over England. She recalled cardinal Pole from baniſhment, made him inſtrumental in her cruelties, and lighted up the flames of perſecution, in which archbiſhop Cranmer, the biſhops Ridley, Cooper, and Latimer, and many other illuſtrious confeſſors of the Engliſh reformed church, were conſumed; not to mention a vaſt number of other ſacrifices of both ſexes and all ranks. Bonner, biſhop of London, and Gar-

diner, biſhop of Wincheſter, were the chief executioners of her bloody mandates; and had ſhe lived, ſhe would have endeavoured to exterminate all her Proteſtant ſubjects.

Mary was married to Philip II. king of Spain, who, like herſelf was an unfeeling bigot; and the chief praiſe of her reign is, that, by the marriage articles, proviſion was made for the independency of the Engliſh crown. By the aſſiſtance of troops, which ſhe furniſhed to her huſband, he gained the important battle of St. Quintin; but that victory was ſo ill improved, that the French, under the duke of Guiſe, ſoon after took Calais, the only place then remaining to the Engliſh in France, and which had been held ever ſince the reign of Edward III. This loſs, which was chiefly owing to cardinal Pole's ſecret connections with the French court, is ſaid to have broken Mary's heart, who died in 1558, in the 42d year of her life, and 6th of her reign. "In the heat of her perſecuting flames (ſays a contemporary writer of credit), were burnt to aſhes, one archbiſhop, 4 biſhops, 21 divines, 8 gentlemen, 84 artificers, and 100 huſbandmen, ſervants, and labourers, 26 wives, 20 widows, 9 virgins, 2 boys, and 2 infants; one of them whipped to death by Bonner, and the other, ſpringing out of the mother's womb from the ſtake as ſhe burned, thrown again into the fire." Several alſo died in priſon, and many were otherwiſe cruelly treated.

Elizabeth, daughter to Henry VIII. by Anne Boleyn, mounted the throne under the moſt diſcouraging circumſtances, both at home and abroad. Popery was the eſtabliſhed religion of England; her title to the crown, on account of the circumſtances attending her mother's marriage and death, was diſputed by Mary queen of Scots, grandchild to Henry VII.'s eldeſt daughter, and wife to the dauphin of France; and the only ally ſhe had on the continent was Philip king of Spain, who was the main ſupport of the popiſh cauſe, both abroad and in England. Elizabeth was no more than twenty-five years of age at the time of her inauguration; but her ſufferings under her bigoted ſiſter, joined to the ſuperiority of her genius, had taught her caution and policy. To mention every glorious action of her reign, would far exceed my bounds; I ſhall therefore only touch on the great lines of her government.

In matters of religion ſhe ſucceeded with ſurpriſing facility; for in her firſt parliament, in 1559, the laws eſtabliſhing Popery were repealed, her ſupremacy was reſtored, and an act of uniformity paſſed ſoon after. And it is obſerved, that of 9400 beneficed clergymen in England, only about 120 refuſed to comply with the Reformation. With regard to her title, ſhe took advantage of the divided ſtate of Scotland, and formed a party there, by which Mary, now become the widow of Francis II. of France, was obliged to renounce, or rather to ſuſpend her claim. Elizabeth, not contented with this, ſent troops and money, which ſupported the Scotch malcontents, till Mary's unhappy marriage with lord Darnley, and then with Bothwell, the ſuppoſed murderer of the former, and her other misfortunes, drove her to take refuge in Elizabeth's dominions, where ſhe had been often promiſed a ſafe and an honourable aſylum. It is well known how unfaithful Elizabeth was to this profeſſion of friendſhip, and that ſhe detained the unhappy priſoner eighteen years in England, then brought her to a ſham trial, pretending that Mary aimed at the crown, and, without ſufficient proof of her guilt, cut off her head; an action which greatly tarniſhed the glories of her reign.

As to Elizabeth's affairs with Spain, which formed in fact the main buſineſs of her government, they exhibit different ſcenes of wonderful events, partly ariſing from her own maſterly conduct, partly from the ſagacity of her ſtateſmen, and partly from the intrepidity of her forces by ſea and land.

The ſame Philip, who had been the huſband of her late ſiſter, upon Elizabeth's acceſſion to the throne, offered to marry her, but ſhe dexterouſly avoided his addreſſes; and

and by a train of ſkilful negociations between her court and that of France, ſhe kept the balance of Europe ſo undetermined, that ſhe had leiſure to unite her people at home, and to eſtabliſh an excellent internal policy. She ſometimes ſupported the proteſtants of France againſt their perſecuting princes; and ſometimes gave the dukes of Anjou and Alençon, brothers of the French king, the ſtrongeſt aſſurances that one or other of them ſhould be her huſband; by which ſhe kept that court, who dreaded Spain, in ſuch good humour with her government, that it ſhewed no reſentment when ſhe cut off queen Mary's head.

When Philip was no longer to be impoſed upon by Elizabeth's arts, which had ſo long amuſed and baffled him, it is well known that he made uſe of the immenſe ſums he drew from Peru and Mexico, in equipping the moſt formidable armament that perhaps had ever been put to ſea, and a numerous army of veterans, under the prince of Parma, the beſt captain of that age; and that he procured a papal bull for abſolving Elizabeth's ſubjects from their allegiance. No reader can be ſo uninformed as to be ignorant of the conſequences, that the largeneſs of the Spaniſh ſhips proved diſadvantageous to them on the ſeas where they engaged; that the lord admiral Howard and the brave ſea officers under him engaged, beat, and chaſed the Spaniſh fleet for ſeveral days; and that the ſeas and tempeſts finiſhed the deſtruction which the Engliſh arms had begun, and that few of the enemy recovered their ports. Next to the admiral lord Howard of Effingham, ſir Francis Drake, captain Hawkins, and captain Frobiſher, diſtinguiſhed themſelves againſt this formidable invaſion, in which the Spaniards are ſaid to have loſt 81 ſhips of war, large and ſmall, and 13,500 men.

Elizabeth had for ſome time ſupported the revolt of the Hollanders from Philip, and had ſent them her favourite, the earl of Leiceſter, who acted as her viceroy and general in the Low Countries. Though Leiceſter behaved ill, yet her meaſures were ſo wiſe, that the Dutch eſtabliſhed their independency; and then ſhe ſent forth her fleets under Drake, Raleigh, the earl of Cumberland, and other gallant naval officers, into the Eaſt and Weſt Indies, from whence they brought prodigious treaſures, taken from the Spaniards.

After the death of the earl of Leiceſter, the young earl of Eſſex became Elizabeth's chief favourite, and commanded the land-forces in a joint expedition with the lord admiral Howard, in which they took and plundered the city of Cadiz, deſtroyed the ſhips in the harbour, and did other damage to the Spaniards, to the amount of twenty millions of ducats.

Elizabeth in her old age grew diſtruſtful, peeviſh, and jealous. Though ſhe undoubtedly loved the earl of Eſſex, ſhe teaſed him by her capriciouſneſs into the madneſs of taking arms, and then cut off his head. She complained that ſhe had been betrayed into this ſanguinary meaſure, and this occaſioned a ſinking of her ſpirits, which brought her to her grave in 1603, the 70th year of her age, and 45th of her reign, having previouſly named her kinſman James VI. king of Scotland, and ſon to Mary, for her ſucceſſor.

Elizabeth ſupported the proteſtants in Germany againſt the houſe of Auſtria, of which Philip, king of Spain, was the head. She cruſhed the papiſts in her own dominions, and made a farther reformation in the church of England, in which ſtate it has remained ever ſince. In 1600 the Engliſh Eaſt India company received its firſt formation, that trade being till then in the hands of the Portugueſe (in conſequence of their having firſt diſcovered the paſſage to India by the Cape of Good Hope, by Vaſco de Gama in the reign of Henry VII.) who at this time were ſubjects to Spain; and factories were eſtabliſhed in China, Japan, India, Amboyna, Java, and Sumatra.

Before queen Elizabeth's reign, the kings of England had uſual recourſe to the city of Antwerp for voluntary loans; and their credit was ſo low, that, beſides the exorbitant intereſt of 10 or 12 per cent. they were obliged to make the city of London

don join in the ſecurity. The trade to Turkey was begun about 1583; and that commerce was immediately confined to a company by queen Elizabeth. Before that time, the Grand Signior had always conceived England to be a dependent province of France. About 1590 there were in London four perſons only rated in the ſubſidy book ſo high as 400 l. In 1567 there were found, on enquiry, to be 4851 ſtrangers of all nations in London, of whom 3838 were Flemings, and only 58 Scots.

As to Elizabeth's internal government, the ſucceſſes of her reign have diſguiſed it; for ſhe was far from being a friend to perſonal liberty, and ſhe was guilty of many ſtretches of power againſt the moſt ſacred rights of Engliſhmen. The ſevere ſtatutes againſt the puritans, debarring them of liberty of conſcience, and by which many ſuffered death, muſt be condemned. Before I cloſe this ſhort account of her reign, I am to obſerve, that through the practices of the Spaniards with the Iriſh Roman catholics, ſhe found great difficulty to keep that iſland in ſubjection, and at the time of her death her government there had fallen into great diſorder.

We can ſcarcely require a ſtronger proof that the Engliſh began to be tired of Elizabeth than the joy teſtified by all ranks at the acceſſion of her ſucceſſor, notwithſtanding the inveterate animoſities between the two kingdoms. James was far from being deſtitute of natural abilities for government; but he had received wrong impreſſions of the regal office, and too high an opinion of his own dignity, learning, and political talents. It was his misfortune that he mounted the Engliſh throne under a full conviction that he was entitled to all the unconſtitutional powers that had been occaſionally exerciſed by Elizabeth and the houſe of Tudor; and which various cauſes had prevented the people from oppoſing with proper vigour. The nation had been wearied and exhauſted by the long and deſtructive wars between the houſes of Lancaſter and York, in the courſe of which the ancient nobility were in a great part cut off; and the people were inclined to endure much rather than again involve themſelves in the miſeries of civil war. Neither did James make any allowance for the glories of Elizabeth; which, as I have obſerved, diſguiſed her moſt arbitrary acts; and none for the free, liberal ſentiments, which the improvement of knowledge and learning had diffuſed through England. It is needleſs, perhaps, to point out the vaſt increaſe of property, through trade and navigation, which enabled the Engliſh at the ſame time to defend their liberties. James's firſt important meaſure was an attempt to effect an union between England and Scotland; but though he failed in this, he ſhewed no violent reſentment at the diſappointment. It was an advantage to him at the beginning of his reign, that the courts of Rome and Spain were thought to be his enemies; and this opinion was increaſed by the diſcovery and defeat of the gunpowder treaſon *.

I have

* This was a ſcheme of the Roman catholics to cut off at one blow the king, lords, and commons, at the meeting of parliament, when it was alſo expected that the queen and prince of Wales would be preſent. The manner of enliſting any new conſpirator was by oath, and adminiſtering the ſacrament; and this dreadful ſecret, after being religiouſly kept near 18 months, was happily diſcovered in the following manner: about ten days before the long wiſhed-for meeting of parliament, a Roman catholic peer received a letter, which had been delivered to his ſervant by an unknown hand, earneſtly adviſing him to ſhift off his attendance on parliament at that time; but which contained no kind of explanation. The nobleman, though he conſidered the letter as a fooliſh attempt to frighten and ridicule him, thought proper to lay it before the king, who ſtudying the contents with more attention, began to ſuſpect ſome dangerous contrivance by gun-powder; and it was judged adviſeable to inſpect all the vaults below the houſes of parliament; but the ſearch was purpoſely delayed till the night immediately preceding the meeting, when a juſtice of peace was ſent with proper attendants, and before the door of the vault under the upper houſe, finding one Fawkes, whc had juſt finiſhed all his preparations, he immediately ſeized him, and at the ſame time diſcovered in the vault 36 barrels of powder, which had been carefully concealed under faggots and piles of wood. The match, with every thing proper for ſetting fire to the train, were found in Fawkes's pocket, whoſe

counte-

I have already taken notice, in former parts of this work, of the obligations which commerce and colonization owed to this prince; and, in fact, he laid the foundations of great national advantages. That his pedantry was ridiculous cannot be denied; and it is certain that he had no juſt ideas of the Engliſh conſtitution and liberties, which led him into many abſurd diſputes with his parliament: and he and his miniſters were continually inventing new ways to raiſe money; as by monopolies, benevolences, loans, and other illegal methods. Among other expedients, he ſold the titles of baron, viſcount, and earl, at a certain price; made a number of knights of Nova Scotia, each to pay ſuch a ſum; and inſtituted a new order of knights baronets, which was to be hereditary, for which each perſon paid 1095 l.

His pacific reign was a ſeries of theological conteſts, in which he ſhowed himſelf more the theologian than the prince, and in 1617 he attempted to eſtabliſh epiſcopacy in Scotland, but the zeal of the people baffled his deſign. Without enquiring from what motive his love of peace proceeded, it was eventually productive of many bleſſings to England; and though his perpetual negociations have given riſe to much ſatire againſt his perſon and government, yet they were leſs expenſive and deſtructive to his people than any wars he could have entered into. He reſtored to the Dutch their cautionary towns, upon their diſcharging part of the mortgage that was upon them; but he procured from Spain at the ſame time an acknowledgement of their independency.

James gave his daughter, the princeſs Elizabeth, in marriage to the elector palatine, the moſt powerful proteſtant prince in Germany, who ſoon after aſſumed the crown of Bohemia. The memory of James has been much abuſed for his tame behaviour, after that prince had loſt his kingdom and electorate by the imperial arms; but it is to be obſerved, that he ſtrongly oppoſed his ſon-in-law's aſſuming the crown of Bohemia; that had he kindled a war to reinſtate him in that and his electorate, he probably would have ſtood ſingle in the conteſt, except the feeble and uncertain aſſiſtance he might have received from the elector's dependents and friends in Germany. Nothing, however, is more certain, than that James furniſhed the elector with large ſums of money; and that he actually raiſed a regiment of 2200 men, under ſir Horace Vere, who carried them over to Germany, where the Germans, under the marquis of Anſpach, refuſed to ſecond them againſt Spinola the Spaniſh general, and that the elector hurt his own cauſe by not giving the brave count Mansfield the command of his troops inſtead of Anſpach.

James has been greatly and juſtly blamed for his partiality to favourites. His firſt was Robert Carr, a private Scotch gentleman, who was created earl of Somerſet. He married the counteſs of Eſſex, who had obtained a divorce from her huſband, and was with her found guilty of poiſoning ſir Thomas Overbury in the Tower; but James, contrary, as is ſaid, to a ſolemn oath he made, pardoned them both. His next favourite was George Villiers, a private Engliſh gentleman, who, upon Somerſet's diſgrace, was admitted to an unuſual ſhare of favour and familiarity with his ſovereign. James had at that time formed a ſyſtem of policy for attaching himſelf intimately to the court of Spain, that it might aſſiſt him in recovering the palatinate; and to this ſyſtem he had ſacrificed the brave ſir Walter Raleigh, on a charge of having committed hoſtilities againſt the Spaniſh ſettlements in the Weſt Indies. James having loſt his eldeſt ſon Henry prince of Wales, who

countenance beſpoke his ſavage diſpoſition, and who, after regretting that he had loſt the opportunity of deſtroying ſo many heretics, made a full diſcovery; and the conſpirators, who never exceeded 80 in number, being ſeized by the country people, confeſſed their guilt, and were executed in different parts of England. Notwithſtanding this horrid crime, the bigoted catholics were ſo devoted to Garnet, a Jeſuit, one of the conſpirators, that they fancied miracles to be wrought by his blood, and in Spain he was conſidered as a martyr.

had an invincible antipathy to a popiſh match, threw his eyes upon the infanta of Spain, as a proper wife for his ſon Charles, who had ſucceeded to that principality. Buckingham, who was equally a favourite with the ſon as with the father, fell in with the prince's romantic humour, and againſt the king's will they travelled in diſguiſe to Spain, where a moſt ſolemn farce of courtſhip was played; but the prince returned without his bride, and had it not been for the royal partiality in his favour, the earl of Briſtol, who was then ambaſſador in Spain, would probably have brought the duke of Buckingham to the block.

James was all this while perpetually jarring with his parliament, whom he could not perſuade to furniſh money equal to his demands: and at laſt he agreed to his ſon's marrying the princeſs Henrietta Maria, ſiſter to Lewis XIII. and daughter to Henry the Great of France. James died before the completion of this match; and it is thought that had he lived, he would have diſcarded Buckingham. His death happened in 1625, in the fifty-ninth year of his age, after a reign over England of twenty-two years. James encouraged and employed that excellent painter ſir Peter Paul Rubens, as well as Inigo Jones, who reſtored the pure taſte of architecture, and in his reign the poetical genius of England diſplayed its greateſt luſtre, though not much encouraged at court. Mr. Middleton at this time projected the conveying water into the city from Hertfordſhire, by means of pipes, which is now called the *New River*.

Charles I. was unfortunate in his marriage with the princeſs Henrietta Maria. He ſeems at firſt to have been but a cold lover; and he quarrelled with, and ſent back her favourite attendants a few days after her arrival in England. But ſhe ſoon acquired a great aſcendancy over him; for ſhe was high-ſpirited and artful. She diſdained and diſliked every thing that was incompatible in government with her Italian and arbitrary education, and was a diſagreeable wife, notwithſtanding her huſband's condeſcenſion and tenderneſs. The ſpirit of the people had forced the late king into a breach with Spain, and Charles early gave ſuch indications of his partiality for Buckingham, and his own deſpotic temper, that the parliament was remiſs in furniſhing him with money for carrying on the war. In a ſhort time Buckingham perſuaded Charles to take the part of the French Hugonots. They were ſo ill ſupported, that Rochelle was reduced to extremity, by which the proteſtant intereſt received an irrecoverable blow in France. The blame of all the public miſcarriages and diſgraces was thrown, by the almoſt unanimous voice of the parliament and people, upon the favourite; but he ſheltered himſelf from their vengeance under the royal protection, till he was aſſaſſinated by one Felton, a ſubaltern officer, as he was ready to embark for the relief of Rochelle, which ſoon after ſurrendered to cardinal Richlieu.

The death of the duke of Buckingham, which happened in 1628, did not deter Charles from his arbitrary proceedings, which the Engliſh patriots in that enlightened age, juſtly conſidered as ſo many acts of tyranny. He, without authority of parliament, laid arbitrary impoſitions upon trade, which were refuſed to be paid by many of the merchants and members of the houſe of commons. Some of them were impriſoned, and the judges were checked for admitting them to bail. The houſe of commons reſented thoſe proceedings by drawing up a proteſt, and denying admittance to the gentleman-uſher of the black rod, who came to adjourn them, till it was finiſhed. This ſerved only to widen the breach, and the king diſſolved the parliament; after which he exhibited informations againſt nine of the moſt eminent members, among whom was the great Mr. Selden, who was as much diſtinguiſhed by his love of liberty as by his uncommon erudition. They objected to the juriſdiction of the court, but their plea was over-ruled, and they were ſent to priſon during the king's pleaſure.

Every

Every thing now operated towards the deſtruction of Charles. The commons would vote no ſupplies without ſome redreſs of the national grievances; upon which Charles, preſuming on what had been practiſed in reigns when the principles of liberty were imperfectly, or not at all underſtood, levied money upon monopolies of ſalt, ſoap, and ſuch neceſſaries, and other obſolete claims, particularly for knighthood, and raiſed various taxes without authority of parliament. His government becoming every day more and more unpopular, Burton, a divine, Prynne a lawyer, and Baſtwick, a phyſician, men of no great eminence or abilities, but warm and reſolute, publiſhed ſeveral pieces which gave offence to the court, and which contained ſome ſevere ſtrictures againſt the ruling clergy. They were proſecuted for theſe pieces in the ſtar-chamber in a very arbitrary and cruel manner; and puniſhed with ſo much rigour, as excited an almoſt univerſal indignation againſt the authors of their ſufferings. Thus was the government rendered ſtill more odious; and unfortunately for Charles, he put his conſcience into the hands of Laud, archbiſhop of Canterbury, who was as great a bigot as himſelf, both in church and ſtate. Laud adviſed him to perſecute the puritans, and in the year 1637 to introduce epiſcopacy into Scotland. The Scots upon this formed ſecret connections with the diſcontented Engliſh, and invaded England, in Auguſt 1640, where Charles was ſo ill-ſerved by his officers and his army, that he was forced to agree to an inglorious peace with the Scots; but neither party being ſincere in obſerving the terms, and Charles diſcovering that ſome of their great men had offered to throw themſelves under the protection of the French king, he raiſed a freſh army by virtue of his prerogative. All his preparations, however, were baffled by the Scots, who made themſelves maſters of Newcaſtle and Durham; and being now openly befriended by the houſe of commons, they obliged the king to comply with their demands.

Charles did this with ſo bad a grace, though he took a journey to Scotland for that purpoſe, that it did him no ſervice; on the contrary, it encouraged the commons to riſe in their demands. He had made Wentworth, earl of Strafford, a man of great abilities, preſident of the council of the North, and lord lieutenant of Ireland; and he was generally believed to be the firſt miniſter of ſtate. Strafford had been a leading member of the oppoſition to the court, but he afterwards, in conjunction with Laud, exerted himſelf ſo vigorouſly in carrying the king's deſpotic ſchemes into execution, that he became an object of public deteſtation. As lord preſident of the North, as lord lieutenant of Ireland, and as a miniſter and privy-counſellor in England, he behaved in a very arbitrary manner, and was guilty of many actions of great injuſtice and oppreſſion. He was, in conſequence, at length on the 22d of May, 1641, brought to the block, though much againſt the inclinations of the king, who was in a manner forced by the parliament and people to ſign the warrant for his execution. Archbiſhop Laud was alſo beheaded; but his execution did not take place till a conſiderable time after that of Strafford, the 10th of January, 1645.

In the fourth year of his reign, Charles had paſſed the *petition of right* into a law, which was intended by the parliament for the future ſecurity of the ſubject. It is enacted, "That no man hereafter be compelled to make or yield any gift, loan, benevolence, tax, or ſuch like charge without common conſent by act of parliament;" but he afterwards violated it in numerous inſtances, ſo that an almoſt univerſal diſcontent at his adminiſtration prevailed throughout the nation. A rebellion alſo broke out in Ireland, on October 23, 1641, where the proteſtants, without diſtinction of age, ſex, or condition, to the amount of many thouſands, were maſſacred by the papiſts; and great pains were taken to perſuade the public that Charles ſecretly favoured them, out of hatred to his Engliſh ſubjects. The biſhops were expelled the houſe of peers, on account of their conſtantly oppoſing the deſigns and bills of the other houſe; and the leaders of the Engliſh houſe of commons ſtill

kept up a correſpondence with the diſcontented Scots. Charles went in perſon to the houſe of commons, January 4, 1642, and demanded that lord Kimbolton, Mr. Pym, Mr. Hampden, Mr. Hollis, ſir Arthur Haſelrig, and Mr. Stroud, ſhould be apprehended; but they had previouſly made their eſcape. This act of Charles was reſented as high treaſon againſt his people, and the commons rejected all the offers of ſatisfaction he could make them. The city of London took the accuſed members into its protection. The train-bands were raiſed, and the mobs were ſo unruly, that Charles removed from Whitehall to Hampton-court, and from thence into Yorkſhire, where he raiſed an army to face that which the parliament, or rather the houſe of commons, might raiſe in and about London.

Notwithſtanding the many acts of tyranny and oppreſſion, of which the king and his miniſters had been guilty, yet, when the civil war broke out, there were great numbers who repaired to the regal ſtandard. Many of the nobility and gentry and the greateſt part of the landed intereſt were much attached to the crown. The parliament, however, took upon themſelves the executive power, and were favoured by moſt of the trading towns and corporations; but their great reſource lay in London. The king's general was the earl of Lindſey, a brave, but not an enterpriſing commander; but he had great dependence on his nephews, the princes Rupert and Maurice, ſons to the elector Palatine, by his ſiſter the princeſs Elizabeth. In the beginning of the war, the royal army had the aſcendancy, but in the progreſs of it affairs took a different turn. The earl of Eſſex was made general under the parliament, and the firſt battle was fought at Edge-hill, in Warwickſhire, the 23d of October, 1642; both parties claimed the victory, but the parliament was ſo much diſtreſſed, that they invited the Scots to come to their aſſiſtance, and they accordingly entered England anew with about 20,000 horſe and foot. Charles attempted to remove the parliament to Oxford, where many members of both houſes met; but his enemies were ſtill ſitting at Weſtminſter, and continued to carry on the war againſt him with great animoſity. The independent party which had ſcarcely before been thought of, began now to increaſe and to figure at Weſtminſter. They were averſe to the preſbyterians, who till then had conducted the war againſt the king, nearly as much as to the royaliſts; and ſuch was their management, under the direction of the famous Oliver Cromwell, that a plan was formed for diſmiſſing the earls of Eſſex and Mancheſter, and the heads of the preſbyterians, from the parliament's ſervice, on a ſuppoſition that they were not for bringing the war to a ſpeedy end, nor for reducing the king too low; and for promoting Fairfax, who was an excellent officer, but more manageable, though a preſbyterian, and ſome independent officers. In the mean while, the war went on with reſentment and loſs on both ſides. Two battles were fought at Newbury; one on September 20, 1643, and the other October 27, 1644, in which the advantage inclined to the king. He had likewiſe many other ſucceſſes; and having defeated ſir William Waller, he purſued the earl of Eſſex, who remained ſtill in command, into Cornwall, from whence he was obliged to eſcape by ſea; but his infantry ſurrendered priſoners to the royaliſts, though his cavalry delivered themſelves by their valour.

The firſt fatal blow the king's army received, was at Marſton-moor, July 2d, 1644, where, through the imprudence of prince Rupert, the earl of Mancheſter defeated the royal army, of which 4000 were killed, and 1500 taken priſoners. This victory was owing chiefly to the courage and conduct of Cromwell; and though it might have been balanced by the ſucceſſes of Charles in the Weſt, yet his whole conduct was a ſtring of miſtakes, till at laſt his affairs became irretrievable. It is true, many treaties of peace, particularly one at Uxbridge, were ſet on foot, and the heads of the preſbyterian party would have agreed to terms that would have little bounded the king's prerogative. They were outwitted and over-ruled by the independents, who were aſſiſted by the ſtiffneſs, inſincerity, and

unamiable

unamiable behaviour of Charles himſelf. In ſhort, the independents at laſt ſucceeded, in perſuading the members at Weſtminſter, that Charles was not to be truſted, whatever his conceſſions might be. From that moment the affairs of the royaliſts became deſperate. Sir Thomas Fairfax, whoſe father, lord Fairfax, remained in the North, was at the head of the army, which was now new modelled; ſo that Charles ſucceſſively loſt all his towns and forts, and was defeated by Fairfax and Cromwell, at the deciſive battle of Naſeby, June 14, 1645, owing partly, as uſual, to the miſconduct of prince Rupert. This battle was followed by freſh misfortunes to Charles, who retired to Oxford, the only place where he thought himſelf ſafe.

The Scots were then beſieging Newark; and no good underſtanding ſubſiſted between them and the Engliſh parliamentarians. In this ſituation of his affairs, Charles eſcaped in diſguiſe from Oxford and came to the Scotch army before Newark, on May 6, 1640, upon a promiſe of protection. The Scots, however, were ſo intimidated, by the reſolutions of the parliament at Weſtminſter, that in conſideration of receiving 400,000l. of their arrears, they put the perſon of Charles into the hands of the parliament's commiſſioners, not ſuſpecting the conſequences.

The preſbyterians were more inclined than ever to make peace with the king, but they were no longer maſters, being forced to receive laws from the army, and the independents. The army now avowed their intentions. They firſt by force took Charles out of the hands of the commiſſioners, June 4, 1647, and then dreading that a treaty might ſtill take place with the king, they impriſoned 41 of the preſbyterian members, voted the houſe of peers to be uſeleſs, and that of the commons was reduced to 150, moſt of them officers of the army. In the mean while Charles, who unhappily promiſed himſelf relief from thoſe diſſenſions, was carried from priſon to priſon, and ſometimes cajoled by the independents with hopes of deliverance, but always narrowly watched. Several treaties were ſet on foot, but all miſcarried; and he had been imprudent enough, after his effecting an eſcape, to put himſelf into colonel Hammond's hands, the parliament's governor of the Iſle of Wight. A freſh negociation was begun, and almoſt finiſhed, when the independents, dreading the general diſpoſition of the people for peace, and ſtrongly perſuaded of the inſincerity of the king, once more ſeized upon his perſon, brought him a priſoner to London, carried him before a court of juſtice of their own erecting, and, after an extraordinary trial, his head was cut off, before his own palace at Whitehall, on the 30th of January, 1648-9, being the 49th year of his age, and 24th of his reign.

Charles is allowed to have had many virtues, and ſome have ſuppoſed that affliction had taught him ſo much wiſdom and moderation, that had he been reſtored to his throne he would have become an excellent prince; but there is abundant reaſon to conclude, from his private letters, that he retained his arbitrary principles to the laſt, and that he would again have regulated his conduct by them, if he had been reinſtated in power. It is however certain that, notwithſtanding the tyrannical nature of his government, his death was exceedingly lamented by great numbers; and many, in the courſe of the civil war who had been his great opponents in parliament, became converts to his cauſe, in which they loſt their lives and fortunes. We cannot reflect upon the great loſs of lives, to the amount of at leaſt 100,000 fighting men, during the ſix years of the civil war, without admiring the populouſneſs of England at that period. Though the hiſtory has been minutely related, by writers of all parties, who had the beſt opportunities to know the truth, yet we do not find that the loſs of men had any influence upon agriculture or commerce, or the exerciſe of the common arts of life, and proviſions rather ſunk than roſe in their value. The ſurviving children of Charles, were Charles and James, who were ſucceſſively kings of England; Henry, duke of Glouceſter, who died ſoon after his brother's

ther's reſtoration; the princeſs Mary, married to the prince of Orange, and mother to William prince of Orange, who was afterwards king of England; and the princeſs Henrietta Maria, who was married to the duke of Orleans, and whoſe daughter was married to Victor Amadeus, duke of Savoy and king of Sardinia.

They who brought Charles to the block were men of different perſuaſions and principles, but many of them poſſeſſed great abilities for government. They omitted no meaſure that could give a perpetual excluſion to kingly power in England; and it cannot be denied, that, after they erected themſelves into a commonwealth, they did prodigious things for retrieving the glory of England by ſea. They were joined by many of the preſbyterians, and both parties hated Cromwell and Ireton, though they were forced to employ them in the reduction of Ireland, and afterwards againſt the Scots, who had received Charles II. as their king. By cutting down the timber upon the royal domains, they produced a fleet ſuperior to any that had ever been ſeen in Europe. Their general, Cromwell, invaded Scotland, and though he was there reduced to great difficulties, he totally defeated the Scots at the battles of Dunbar and Worceſter. The ſame commonwealth paſſed an act of navigation; and declaring war againſt the Dutch, who were thought till then invincible at ſea, they effectually humbled thoſe republicans.

By this time Cromwell, who hated ſubordination to a parliament, had the addreſs to get himſelf declared commander in chief of the Engliſh army. Admiral Blake, and the other Engliſh admirals, carried the terror of the Engliſh name by ſea to all quarters of the globe; and Cromwell having now but little employment, began to be afraid that his ſervices would be forgotten, for which reaſon he went, April 20, 1653, without any ceremony, with about 300 muſqueeters, and diſſolved the parliament, opprobrioufly driving the members from the houſe. He next annihilated the council of ſtate, with whom the executive power was lodged, and tranſferred the adminiſtration of government to about 140 perſons whom he ſummoned to Whitehall, on the 4th of July, 1653.

The war with Holland, in which the Engliſh were again victorious, ſtill continued. Seven bloody engagements by ſea were fought in little more than the compaſs of one year; and in the laſt, which was deciſive in favour of England, the Dutch loſt their brave admiral Van Tromp. Cromwell all this while wanted to be declared king, but he perceived that he muſt encounter unſurmountable difficulties from Fleetwood, and his other friends, if he ſhould perſiſt in that reſolution. He was, however, declared *lord protector* of the commonwealth of England; a title under which he exerciſed greater power than had ever been annexed to the regal dignity. He next proceeded to new-model the government, and various were the ſchemes that were propoſed, eſtabliſhed, and proved abortive.

A deſire to fill his coffers made him take part with France againſt Spain. He lent the former 6000 men, who took Dunkirk, of which he kept poſſeſſion. Finding that his uſurpation gave as much diſcontent to his own party, as terror to the royaliſts, he had thoughts of renewing the model of the conſtitution, and actually erected a houſe of lords out of his own creatures. No king ever acted, either in England or Scotland more deſpotically in ſome reſpects than he did, yet no tyrant ever had fewer real friends, and even thoſe few threatened to oppoſe him, if he ſhould take upon him the title of king. Hiſtorians, in drawing the character of Cromwell, have been impoſed upon by his amazing ſucceſs, and dazzled by the luſtre of his fortune; but when we conſult his ſecretary Thurloe's, and other ſtate papers, the impoſition in a great meaſure vaniſhes. After a moſt uncomfortable uſurpation of four years, eight months, and thirteen days, he died on the 3d of September, 1658, in the 60th year of his age.

It is not to be denied that England acquired much more reſpect from foreign powers, between the death of Charles I. and that of Cromwell, that ſhe had been

treated

treated with ſince the death of Elizabeth. This was owing to the great men who formed the republic, which Cromwell aboliſhed, and who, as it were, inſtantaneouſly called forth the naval ſtrength of the kingdom. Neither they nor Cromwell had formed any plan of legiſlation, and his ſafety was owing to the different ſentiments of government, that prevailed among the heads of the republic. In the year 1656, the charge of the public amounted to one million three hundred thouſand pounds; of which a million went to the ſupport of the navy and army, and the remainder to that of the civil government. In the ſame year, Cromwell aboliſhed all tenures *in capite*, by knight's ſervice, and ſoccage in chief, and likewiſe the courts of wards and liveries. Several other grievances, that had been complained of, during the late reigns, were likewiſe removed. Next year the total charge, or public expence of England, amounted to two millions three hundred twenty-ſix thouſand nine hundred and eighty-nine pounds. The collections by aſſeſſments, exciſe, and cuſtoms, paid into the Exchequer, amounted to two millions three hundred and ſixty-two thouſand pounds, four ſhillings.

Upon the whole it appears, that England, from the year 1648, to the year 1658, increaſed greatly in riches and in power. The legal intereſt of money was reduced from 8 to 6 per cent. The famous navigation act was now planned and eſtabliſhed, and afterwards confirmed under Charles II. Monopolies of all kinds were aboliſhed, and liberty of conſcience to all ſects was granted, to the vaſt advantage of population and manufactures, which had ſuffered greatly by Laud's intolerant meaſures. To the above national meliorations, we may add the modeſty and frugality introduced among the common people, and the citizens in particular, by which they were enabled to augment their capitals. It appears, however, that Cromwell, had he lived, and been firmly ſettled in the government, would have broken through the ſober maxims of the republicans; for, ſome time before his death, he affected great magnificence in his perſon, court, and attendants. He maintained the honour of the nation much, and in many inſtances interpoſed effectually in favour of the Proteſtants abroad. Arts and ſciences were not much patronized, and yet he had the good fortune to find in Cooper an excellent miniature painter, and his coins done by Simon exceed in beauty and workmanſhip any of that age. He certainly did many things worthy of praiſe, and as his genius and capacity led him to the choice of fit perſons for the ſeveral parts of adminiſtration; ſo he paid ſome regard to men of learning, and particularly to thoſe entruſted with the care of youth at the univerſities.

No friend to the Britiſh conſtitution, conſiſting in the proper equilibrium of the three eſtates of the kingdom, can ever ſpeak of Cromwell or his uſurpation with reſpect. Under the name of a republic, there was all the tyrannical ſpirit of deſpotiſm. The people had no ſhare in legiſlation. Cromwell, with the title of Protector, exerciſed all the powers of an arbitrary monarch. His parliaments were but a name. He made what laws he pleaſed; and, by the help of his army, which ſupported them, he carried them into execution, and forced all to ſubmit to his will. In compariſon of Cromwell, Henry the VIII.th revered the Engliſh conſtitution.

Richard Cromwell, a weak unambitious man, ſucceeded his father in the protectorſhip. He was placed in his dignity by thoſe who wanted to make him the tool of their own government; and he was ſoon after driven, without the leaſt ſtruggle or oppoſition, into obſcurity. It is in vain for hiſtorians of any party to aſcribe the reſtoration of Charles II. (who, with his mother and brothers, during the uſurpation, had lived abroad on a very precarious ſubſiſtence) to the merits of any particular perſons. The preſbyterians were very zealous in promoting it, but it was effected by a general concurrence of the people, who ſeem to have thought that neither peace nor protection were to be obtained, but by reſtoring the ancient

conſtitution of monarchy. General Monk, a man of military abilities, but devoid of probity, had the ſagacity to obſerve this; and after temporizing in various ſhapes, being at the head of the army, he had the principal ſhare in reſtoring Charles II. for this he was created duke of Albemarle, confirmed in the command of the army, and loaded with honours and riches.

Charles II. being reſtored in 1660, in the firſt year of his reign ſeemed to have a real deſire to promote his people's happineſs. Upon his confirming the abolition of all the feudal tenures, he received from the parliament a gift of the exciſe for life; and in this act coffee and tea are firſt mentioned. By his long reſidence, and that of his friends, abroad, he imported into England the culture of many uſeful vegetables; ſuch as that of aſparagus, artichokes, cauliflowers, and ſeveral kinds of beans, peas, and ſallads. Under him, Jamaica, which had been conquered by the Engliſh under the auſpices of Cromwell, was greatly improved, and made a ſugar colony. The Royal Society was inſtituted, and many popular acts reſpecting trade and colonization were paſſed. In ſhort, Charles knew and cultivated the true intereſts of his kingdom, till he was warped by pleaſure, and ſunk in indolence; failings that had the ſame conſequences as deſpotiſm itſelf. He appeared to intereſt himſelf in the ſufferings of his ſubjects when London was burnt down in 1666; and its being rebuilt with greater luſtre and conveniences is a proof of the increaſe of trade; but there was no bounds to Charles's love of pleaſure, which led him into the moſt extravagant expences. He has been ſeverely cenſured for ſelling Dunkirk to the French king to ſupply his neceſſities, after he had ſquandered the immenſe ſums granted him by parliament. The price was about 250,000l. ſterling. But even in this his conduct was more defenſible than in his ſecret connections with France, which were of the moſt ſcandalous nature, utterly repugnant to the welfare of the kingdom, and ſuch as muſt for ever reflect infamy on his memory.

Among the evidences of his degeneracy as a king may be mentioned his giving way to the popular clamour againſt the lord Clarendon, as the chief adviſer of the ſale of Dunkirk; a man of extenſive knowledge and great abilities, and more honeſt in his intentions than moſt of his other miniſters, but whom he ſacrificed to the ſycophants of his pleaſurable hours. The firſt Dutch war, which began in 1665, was carried on with great reſolution and ſpirit under the duke of York; but through Charles's miſapplication of the public money, which had been granted for the war, the Dutch, while a treaty of peace was depending at Breda, found means to inſult the royal navy of England, by ſailing up the Medway as far as Chatham, and deſtroyed ſeveral ſhips of the line. Soon after this, a peace was concluded at Breda between Great Britain and the States General, for the preſervation of the Spaniſh Netherlands; and Sweden having acceded to the treaty, in 1668, it was called the *triple alliance*.

In 1671, Charles was ſo ill adviſed as to ſeize upon the money of the bankers, which had been lent him at 8 per cent. and to ſhut up the Exchequer. This was an indefenſible ſtep; but Charles pretended to juſtify it by the neceſſity of his affairs, being then on the eve of a freſh war with Holland. This was declared in 1672, and had almoſt proved fatal to that republic, for the Engliſh fleet and army acted in conjunction with thoſe of France. The duke of York commanded the Engliſh fleet, and diſplayed great gallantry in that ſtation. The duke of Monmouth, the eldeſt and favourite natural ſon of Charles, commanded 6000 Engliſh forces, who joined the French in the Low Countries; and all Holland muſt have fallen into the hands of the French, had it not been for the vanity of their monarch Lewis XIV. who was in a hurry to enjoy his triumph in his capital, and ſome very unforeſeen circumſtances. All confidence was now loſt between Charles and his parliament, notwithſtanding the glory which the Engliſh fleet obtained by

ſea

ſea againſt the Dutch. The popular clamour at laſt obliged Charles to give peace to that republic, in conſideration of 200,000l. which was paid him.

In ſome things Charles acted very deſpotically. He complained of the freedom taken with his prerogative in coffee-houſes, and ordered them to be ſhut up, but in a few days after they were opened again. Great rigour and ſeverity were exerciſed againſt the preſbyterians, and all other nonconformiſts to epiſcopacy, which was again eſtabliſhed with a high hand in Scotland as well as in England. His parliament addreſſed him, but in vain, to make war with France in the year 1677, for he was entirely devoted to that crown, and regularly received its money as a penſioner, and hoped through its influence and power to be abſolute. It is not, however, to be denied, that the trade of England was now incredibly increaſed, and Charles entered into many vigorous meaſures for its protection and ſupport.

Charles's connections in France gave him no merit in the eyes of his parliament, which grew every day more and more exaſperated againſt the French and the papiſts; at the head of whom was the king's eldeſt brother, and preſumptive heir of the crown, the duke of York. Charles dreaded the proſpect of a civil war, and offered any conceſſions to avoid it. But many of the members of parliament were bent upon ſuch a reſolution as afterwards took place, and were ſecretly determined that the duke of York ſhould never reign. In 1678, the famous Titus Oates, and ſome others, opened a plot, charging the papiſts with a deſign to murder the king, and to introduce popery by means of Jeſuits in England, and from St. Omer's. Though nothing could be more ridiculous, and more ſelf-contradictory, than ſome parts of their narrative, yet it was ſupported with the utmoſt zeal on the part of the parliament. The aged lord Strafford, Coleman, ſecretary to the duke of York, with many Jeſuits, and other Papiſts, were publickly executed on evidences, ſuppoſed now to have been perjured by thoſe who will have the whole plot to be a fiction. The queen herſelf eſcaped with difficulty; the duke of York was obliged to retire into foreign parts, and Charles, though convinced, it is ſaid, that the whole was an impoſture, yielded to the torrent. At laſt it ſpent its force. The earl of Shafteſbury, who was at the head of the oppoſition, puſhed on the total excluſion of the duke of York from the throne. He was ſeconded by the ill-adviſed duke of Monmouth, and the bill, after paſſing the commons, miſcarried in the houſe of peers. All England was again in a flame; but the king by a well-timed adjournment of the parliament to Oxford, ſeemed to recover the affections of his people.

The duke of York and his party made a ſcandalous uſe of their victory. They trumped up on their ſide a plot of the proteſtants for killing or ſeizing the king, and altering the government. This plot was as falſe as that which had been laid againſt the papiſts. Lord Ruſſel, who had been remarkable in his oppoſition to the popiſh ſucceſſion, Algernon Sidney, and ſeveral other diſtinguiſhed proteſtants were tried, condemned, and ſuffered death, and the king ſet his foot upon the neck of oppoſition. Even the city of London was intimidated into the meaſures of the court, as were almoſt all the corporations in the kingdom. The duke of Monmouth and the earl of Shafteſbury were obliged to fly, and the duke of York returned in triumph to Whitehall. It was thought, however, that Charles repented of ſome of his arbitrary ſteps, and intended to have recalled the duke of Monmouth, and have executed ſome meaſures for the future quiet of his reign; when he died February 6th, 1684-5, in the 55th year of his age, and 25th of his reign. He had married Catharine, infanta of Portugal, by whom he had received a large fortune in ready money, beſides the town and fortreſs of Tangier in Africa; but he left behind him no lawful iſſue. The deſcendants of his natural ſons and daughters are now amongſt the moſt diſtinguiſhed of the Britiſh nobility.

In recounting the principal events of this reign, I have been ſufficiently explicit as to the principles, both of the king and the oppoſition to his government. The heads of the latter were preſbyterians and moderate churchmen, who had been greatly inſtrumental in the civil war againſt the late king, and the uſurpations that followed. They had been raiſed and preferred by Charles, in hopes of their being uſeful in bringing their party into his meaſures; and he would probably have ſucceeded, had not the remains of the old royaliſts, and the diſſipated part of the court, fallen in with the king's foible for pleaſure. The preſbyterians, however, availed themſelves of their credit, in the early part of his reign, when the fervor of loyalty was abated, to bring into parliament ſuch a number of their friends as rendered the reign of Charles very uneaſy, and it was owing, perhaps, to them, that civil liberty and proteſtantiſm now exiſt in the Engliſh government. On the other hand, they ſeem to have carried their jealouſy of a popiſh ſucceſſor too far; and many of the people without doors certainly thought that the parliament ought to have been ſatisfied with the legal reſtraints and diſabilities which Charles offered to impoſe upon his ſucceſſor. This gave ſuch a turn to the affections of the people as left Charles, and his brother, at the time of his death, almoſt maſters of the laws and liberties of England; and they governed in an abſolute and arbitrary manner, ſupported by the clergy's preaching up the old doctrines of paſſive obedience and non-reſiſtance, and the flattering addreſſes preſented from many perſons advancing the prerogative of the crown to the moſt extravagant height.

The reign of Charles has been celebrated for wit and gallantry, but both were coarſe and indelicate. The court was the nurſery of vice, and the ſtage exhibited ſcenes of impurity. Some readers were found, who could admire Milton as well as Dryden, and never perhaps were the pulpits of England ſo well ſupplied with preachers as in this reign, which was equally diſtinguiſhed for mathematics and natural philoſophy. Charles loved, patronized, and underſtood the arts, more than he encouraged or rewarded them, eſpecially thoſe of Engliſh growth; but this neglect proceeded not from narrow-mindedneſs, but indolence and want of reflection. If the memory of Charles II. has been traduced for being the firſt Engliſh prince who formed a body of ſtanding forces, as guards to his perſon; it ought to be remembered, at the ſame time, that he carried the art of ſhip-building to the higheſt perfection; and that the royal navy of England, at this day, owes its fineſt improvements to his and his brother's attention to naval affairs. As to his religion, James, ſoon after his death, publiſhed to the world, that his brother, notwithſtanding his repeated profeſſions of regard to the proteſtant faith, was a papiſt and died ſuch, of which there are now inconteſtible proofs.

The oppoſition which, during the late reign, had ſhaken the throne, ſeems to have vaniſhed at the acceſſion of James II. The popular affection towards him was increaſed by the early declaration he made in favour of the church of England, which, during the late reign, had formally pronounced all reſiſtance to the reigning king to be unlawful. This doctrine proved fatal to James, and almoſt ruined proteſtaniſm. The army and people ſupported him in cruſhing an ill-concerted rebellion of the duke of Monmouth, who pretended to be the lawful ſon of Charles II. and, as ſuch, had aſſumed the title of king. The duke's head being cut off, July 15, 1685, and ſome hundreds of his followers hanged, drawn, and quartered, in the weſt of England, exhibiting a ſcene of barbarity ſcarcely ever known in this country, by the inſtrumentality of Jefferies and colonel Kirke, James deſperately reſolved to try how far the practice of the church of England would agree with her doctrine of non-reſiſtance. The experiment failed him. He employed the moſt offenſive meaſures for rendering popery the eſtabliſhed religion of his dominions. He pretended to a power of diſpenſing with the known laws; he inſtituted an illegal eccleſiaſtical court, openly received and admitted into his privy-council the

pope's emiſſaries, and treated them with uncommon reſpect. His impriſoning ſeven biſhops for preſenting a petition againſt reading his declaration for liberty of conſcience, greatly alarmed his proteſtant friends; and his encroachments upon the civil and religious rights of his ſubjects were diſapproved, it is ſaid, by the pope himſelf.

In this extremity, many great men in England and Scotland, though they wiſhed well to James, applied for relief to William prince of Orange, a prince of great abilities, and the inveterate enemy of Lewis XIV. who then threatened Europe with chains. The prince of Orange was the nephew and ſon-in-law of James, having married the princeſs Mary; he embarked with a fleet of 500 ſail for England, avowing it to be his deſign to reſtore the church and ſtate to their due rights. Upon his arrival, he was joined not only by the Whigs, but by many whom James had conſidered as his beſt friends; and even his daughter the princeſs Anne, and her huſband, George prince of Denmark, left him and joined the prince of Orange. James might ſtill have reigned; but he was ſurrounded with French emiſſaries, and ignorant Jeſuits, who wiſhed him not to reign rather than not reſtore popery. They ſecretly perſuaded him to ſend his queen and ſon, real or pretended, then but ſix months old, to France, and to follow them in perſon, which he did; and thus, in 1688, ended his reign in England, which event in Engliſh hiſtory is termed *the Revolution*.

This ſhort reign afforded little room for the national progreſs in its true intereſts. James is allowed, on all hands, to have underſtood them, and that, had it not been for his popiſh bigotry and arbitrary principles, he would have made a moſt excellent king. The writings of the Engliſh divines againſt popery, in this reign, are eſteemed to be the moſt maſterly pieces of controverſy that ever were publiſhed on that ſubject.

The conduct of James gave advantages to his rival, which he could not otherwiſe have hoped for. Few were in the prince's ſecret; and when a convention of the ſtates was called, there ſeemed reaſon to believe, that had not James abdicated his throne, it would not have been filled by the prince and princeſs of Orange. Even then it was not done without long debates. It is well known that king William's chief object was to humble the power of France, and his reign was ſpent in an almoſt uninterrupted courſe of hoſtilities with that power, which were ſupported by England, at an expence never before known. The nation had grown cautious, through the experience of the two laſt reigns, and he gave his conſent to the *bill of rights*, by which the liberties of the people were confirmed and ſecured; though the friends of liberty in general complained that the bill of rights was very inadequate to what ought to have been inſiſted on, in a period ſo favourable to the enlargement and ſecurity of liberty, as a crown beſtowed by the free voice of the people. The two laſt kings had made a very bad uſe of the national revenue, which was put into their hands, and which was found ſufficient to raiſe and maintain a ſtanding army. The revenue was therefore now divided, part was allotted for the current national ſervice of the year, and was to be accounted for to parliament; and part, which is ſtill called the civil liſt money, was given to the king, for the ſupport of his houſe and dignity.

It was the juſt ſenſe the people of England had of their civil and religious rights alone, that could provoke them to agree to the late revolution; for they never in other reſpects had been at ſo high a pitch of wealth and proſperity, as in the year 1688. The tonnage of their merchant ſhips, according to Dr. Davenant, was that year near double to what it had been in 1666; and the tonnage of the royal navy, which in 1660, was only 62,594 tons, was in 1688 increaſed to 101,032 tons. The increaſe of the cuſtoms, and the annual rental of England, grew in the ſame proportion. It was therefore no wonder, that a ſtrong party both

both in the parliament and nation, ſhould be formed againſt the government, which was hourly increaſed by the king's predilection for the Dutch. The war with France, which, on the king's part, was far from being ſucceſsful, required an enormous expence, and the Iriſh continued, in general, faithful to king James. But many Engliſh, who wiſhed well to the Stuart family, dreaded their being reſtored by conqueſt; and the parliament enabled the king to reduce Ireland, and to gain the battle of the Boyne againſt James, who there loſt all the military honour he had acquired before. The marine of France proved ſuperior to that of England, in the beginning of the war; but in the year 1692, that of France received an irrecoverable blow in the defeat at La Hogue.

Invaſions were threatened, and conſpiracies diſcovered every day againſt the government, and the ſupply of the continental war forced the parliament to open new reſources for money. A land-tax was impoſed, and every ſubject's lands were taxed, according to their valuations given in by the ſeveral counties. Thoſe who were the moſt loyal gave the higheſt valuations, and were the heavieſt taxed, and this prepoſterous burthen ſtill continues; but the greateſt and boldeſt operation in finances, that ever took place, was eſtabliſhed in this reign, which was the carrying on the war by borrowing money upon parliamentary ſecurities, which form what are now called the *public funds*. The chief projector of this ſcheme is ſaid to have been Charles Montague, afterwards lord Haliſax. His chief argument for ſuch a project was, that it would oblige the monied part of the nation to befriend the Revolution intereſt; becauſe, after lending their money, they could have no hopes of being repaid but by ſupporting that intereſt, and the weight of taxes would oblige the commercial people to be more induſtrious.

William, notwithſtanding the vaſt ſervice he had done to the nation, and the public benefits which took place under his auſpices, particularly in the eſtabliſhment of the bank of England, and the recoining the ſilver money, met with ſo many mortifications from his parliament, that he actually reſolved upon an abdication, and had drawn up a ſpeech for that purpoſe, which he was prevailed upon to ſuppreſs. He long bore the affronts he met with in hopes of being ſupported in his war with France, but at laſt, in 1697, he was forced to conclude the peace of Ryſwick with the French king, who acknowledged his title to the crown of England. By this time William had loſt his queen *, but the government was continued in his perſon. After peace was reſtored, the commons obliged him to diſband his army, all but an inconſiderable number, and to diſmiſs his favourite Dutch guards. Towards the end of his reign, his fears of ſeeing the whole Spaniſh monarchy in poſſeſſion of France at the death of the catholic king Charles II. which was every day expected, led him into a very impolitic meaſure, which was the partition treaty with France, by which that monarchy was to be divided between the houſes of Bourbon and Auſtria. This treaty was highly reſented by the parliament, and ſome of his miniſtry were impeached for adviſing it. It is thought that William ſaw his error when it was too late. His miniſters were acquitted from their impeachment, and the death of king James diſcovered the inſincerity of the French court, which immediately proclaimed his ſon king of Great Britain.

This perfidy rendered William again popular in England. The two houſes paſſed the bill of abjuration, and an addreſs for a war with France. The laſt and moſt glorious act of William's reign was his paſſing the bill for ſettling the ſucceſſion to the crown in the houſe of Hanover, on the 12th of June, 1701. His death was haſtened by a fall he had from his horſe, ſoon after he had renewed the grand alliance againſt France, on the eighth of March, 1702, the 52d year of his age,

* She died of the ſmall-pox, Dec. 28, 1694, in the thirty-third year of her age.

and

and the 14th of his reign in England. This prince was not made by nature for popularity. His manners were cold and forbidding; he ſeemed alſo ſometimes almoſt to loſe ſight of thoſe principles of liberty, for the ſupport of which he had been raiſed to the throne; and though he owed his royalty to the whigs, yet he often favoured the tories. The former had the mortification of ſeeing thoſe who had acted the moſt inimical to their party, and the free principles of the conſtitution, as the marquis of Halifax, the earl of Danby, and lord Nottingham, taken into favour, and reſume their places in the cabinet; and the whole influence of government extended to ſilence all enquiries into the guilt of thoſe who had been the chief inſtruments in the cruel perſecutions of the paſt reign. The reſcue and preſervation of religion and public liberty were glorious to William; but England under him ſuffered ſeverely both by ſea and land, and the public debt, at the time of his death, amounted to 14,000,000.

Anne, princeſs of Denmark, by virtue of the act of ſettlement, and being the next proteſtant heir to her father James II. ſucceeded to the throne. As ſhe had been ill treated by the late king, it was thought ſhe would have deviated from his meaſures; but the behaviour of the French in acknowledging the title of her brother, who has ſince been well known by the name of the Pretender, left her no choice, and ſhe reſolved to fulfil all William's engagements with his allies, and to employ the earl of Marlborough, who had been impriſoned in the late reign on a ſuſpicion of Jacobitiſm, and whoſe wife was her favourite, as her general. She could not have made a better choice of a general and a ſtateſman, for that earl excelled in both capacities. No ſooner was he placed at the head of the Engliſh army abroad, than his genius and activity gave a new turn to the war, and he became as much the favourite of the Dutch as his wife was of the queen.

Charles II of Spain, in conſequence of the intrigues of France, and at the ſame time reſenting the partition treaty, to which his conſent had not been aſked, left his whole dominions by will to Philip, duke of Anjou, grandſon of Lewis XIV. and Philip was immediately proclaimed king of Spain, which laid the foundation of the family alliance that ſtill ſubſiſts between France and that nation. Philip's ſucceſſion was diſputed by the ſecond ſon of the emperor of Germany, who took upon himſelf the title of Charles III. and his cauſe was favoured by the Empire, England, Holland, and other powers, who joined in a confederacy againſt the houſe of Bourbon, now become more dangerous than ever by the acquiſition of the whole Spaniſh dominions.

The capital meaſure of continuing the war againſt France being fixed, the queen found no great difficulty in forming her miniſtry, who were for the moſt part tories; and the earl of Godolphin, who (though afterwards a leading whig) was thought all his life to have a predilection for the late king James and his queen, was placed at the head of the treaſury. His ſon had married the earl of Marlborough's eldeſt daughter, and the earl could truſt no other with that important department.

In the courſe of the war, ſeveral glorious victories were obtained by the earl, who was ſoon made duke of Marlborough. Thoſe of Blenheim and Ramilies gave the firſt effectual checks to the French power. By that of Blenheim in 1704, the empire of Germany was ſaved from immediate deſtruction. Though prince Eugene was that day joined in command with the duke, yet the glory of the day was confeſſedly owing to the latter. The French general Tallard was taken priſoner, and ſent to England; and 20,000 French and Bavarians were killed, wounded, or drowned in the Danube, beſides about 13,000 who were taken, and a proportionable number of cannon, artillery, and trophies of war. About the ſame time, the Engliſh admiral, ſir George Rook, reduced Gibraltar, which ſtill remains in our poſſeſſion. The battle of Ramillies in 1706, was fought and gained under the duke

of Marlborough alone. The loſs of the enemy there has been variouſly reported it is generally ſuppoſed to have been 8000 killed or wounded, and 6000 taken priſoners; but the conſequences ſhewed its importance.

After the battle of Ramillies, the ſtates of Flanders aſſembled at Ghent, and recognized Charles for their ſovereign, while the confederates took poſſeſſion of Louvain, Bruſſels, Mechlin, Ghent, Oudenarde, Bruges, and Antwerp; and ſeveral other conſiderable places in Flanders and Brabant acknowledged the title of king Charles. The next great battle gained over the French was at Oudenarde, 1708, where they loſt 3000 on the field, and about 7000 were taken priſoners; and the year after, September 11, 1709, the allies forced the French lines at Malplaquet, near Mons, after a very bloody action, in which the French loſt 15,000 men. Thus far I have recounted the flattering ſucceſſes of the Engliſh, but they were balanced by great misfortunes.

The queen had ſent a very fine army to aſſiſt Charles III. in Spain, under the command of lord Galway; but in 1707, after he had been joined by the Portugueſe, the Engliſh were defeated in the plains of Almanza, chiefly through the cowardice of their allies. Though ſome advantages were obtained at ſea, yet that war in general was carried on to the detriment, if not the diſgrace of England. Prince George of Denmark, huſband to the queen, was then lord high admiral; but he entruſted the affairs of that board to underlings, who were either corrupted or ignorant, and complaints coming from every quarter, with regard to that department, the houſe of commons were put into very bad humour, nor did things ſeem to be much better managed after the prince's death. The immenſe ſums raiſed for the current ſervice of the year being ſeverely felt, and but indifferently accounted for, it appeared that England had borne the chief burden of the war; that neither the Auſtrians, Germans, nor Dutch, had furniſhed their ſtipulated quotas, and that they truſted to the Engliſh parliament for making them good. A deſign for taking Toulon miſcarried through the ſelfiſhneſs of the court of Vienna, whoſe chief object of attention was their own war in Naples. At the ſame time, England felt ſeverely the ſcarcity of hands in carrying on her trade and manufactures.

Theſe and many other internal diſputes about the prerogative, the ſucceſſion, religion, and other public matters, had created great ferments in the nation and parliament. The queen at firſt ſtuck cloſe to the duke of Marlborough and his friends, who finding that the tories inclined to treat with France, put themſelves at the head of the whigs, who were for continuing the war, from which the duke and his dependents, according to their ſtations, received immenſe emoluments. The failures of the Germans and Dutch could not, however, be longer diſſembled, and the perſonal intereſt of the ducheſs of Marlborough with the queen began to be ſhaken by her own haughtineſs.

As Lewis XIV. profeſſed a readineſs for peace, and ſued earneſtly for it, the whigs at laſt gave way to a treaty, and the conferences were held at Gertruydenburg, 1710. They were managed, on the part of England, by the duke of Marlborough and the lord Townſhend, and by the marquis de Torcy for the French. The French king was gradually brought to comply with all the demands of the allies, except that of employing his own troops againſt the duke of Anjou, in Spain, where the fortune of war continued ſtill doubtful. But all his offers were rejected by the duke and his aſſociate, as only deſigned to amuſe and divide the allies, and the war was continued.

The unreaſonable haughtineſs of the Engliſh plenipotentiaries at Gertruydenburg, (as ſome term it) and the then expected change of the miniſtry in England, ſaved France, and affairs from that day took a turn in its favour. Means were found to convince

convince the queen, who was faithfully attached to the church of England, that the war in the end, if continued, muſt prove ruinous to her and her people, and that the whigs were no friends to the national religion. The general cry of the deluded people was, that "the church was in danger," which, though groundleſs, had great effects. One Sacheverel, an ignorant, worthleſs preacher, had eſpouſed this clamour in one of his ſermons, with the ſlaviſh doctrines of paſſive obedience, and non-reſiſtance. It was agreed by both parties to try their ſtrength in this man's cauſe. He was impeached by the commons, and found guilty by the lords, who ventured to paſs upon him only a very ſmall cenſure. After this trial the queen's affections was entirely alienated from the ducheſs of Marlborough and the whig adminiſtration. Her friends loſt their places, which were ſupplied by tories, and even the command of the army was taken from the duke of Marlborough in 1712, and given to the duke of Ormond, who produced orders for a ceſſation of arms; but they were diſregarded by the queen's allies in the Britiſh pay. And, indeed, the removal of the duke of Marlborough from the command of the army, while the war continued, was an act of the greateſt imprudence, and excited the aſtoniſhment of all Europe. So numerous had been his ſucceſſes, and ſo great his reputation, that his very name was almoſt equivalent to an army. But the honour and intereſt of the nation was ſacrificed to court intrigues, managed by Mrs. Maſham, a relation of the ducheſs of Marlborough, who had ſupplanted her benefactreſs, and by Mr. Harley.

Conferences were opened for peace at Utrecht, in January 1712, to which the queen and the French king ſent plenipotentiaries; and the allies being defeated at Denain, they grew ſenſible that they were no match for the French, now that they were abandoned by the Engliſh. In ſhort, the terms were agreed upon between France and England. The reader need not be informed of the particular ceſſions made by the French, eſpecially that of Dunkirk; but, after all, the peace would have been ſtill more indefenſible and ſhameful than it was, had it not been for the death of the emperor Joſeph, by which his brother Charles III. for whom the war was chiefly undertaken, became emperor of Germany, as well as king of Spain; and the dilatorineſs, if not bad faith of the allies, in not fulfilling their engagements, and throwing upon the Britiſh parliament almoſt the whole weight of the war, not to mention the exhauſted ſtate of the kingdom. Mr. Harley, who was created earl of Oxford, and lord high treaſurer of England, was then conſidered as the queen's firſt miniſter; but the negociations for the peace went alſo through the hands of Mr. Prior and lord Bolingbroke, one of the principal ſecretaries of ſtate. The miniſtry endeavoured to ſtifle the complaints of the whigs and the remonſtances of prince Eugene, who arrived in England on the part of the allies, by falling upon the contractors, foragers, and other agents of the fleet and army, whom they accuſed of corrupt practices.

The queen was at this time in a critical ſituation. The whigs condemned the peace as injurious to the honour and intereſt of the nation. The majority of the houſe of lords was of that party, but the houſe of commons favoured the court. The queen was afraid that the peers would reject the peace, and by an unprecedented exerciſe of her prerogative, ſhe created twelve peers at one time, which ſecured the approbation of her meaſures. The reſt of the queen's life was rendered uneaſy by the jarring of parties, and the contentions among her miniſters. The whigs demanded a writ for the electoral prince of Hanover, as duke of Cambridge, to come to England, and ſhe was obliged haſtily to diſmiſs her lord-treaſurer; when ſhe fell into a lethargic diſorder, which carried her off the firſt of Au-

guſt, 1714, in the fiftieth year of her age, and the thirteenth of her reign *. I have nothing to add to what I have already ſaid of her character, but that though ſhe was a favourite with neither party in her parliament till towards the end of her reign, when the tories affected to idolize her, yet her people dignified her with the name of the good queen Anne. Notwithſtanding all I have ſaid of the exhauſted ſtate of England before the peace of Utrecht was concluded, yet the public credit was little or nothing affected by her death, though the national debt then amounted to about fifty millions; ſo firm was the dependence of the people upon the ſecurity of parliament.

Anne had no ſtrength of mind, by herſelf, to carry an important reſolve into execution; and ſhe left public meaſures in ſo indeciſive a ſtate, that, upon her death, the ſucceſſion took place in terms of the act of ſettlement, and George I. elector of Hanover, ſon of the princeſs Sophia, grand-daughter of James I. was proclaimed king of Great Britain; his mother, who would have been next in ſucceſſion, having died but a few days before. He came over to England with ſtrong prepoſſeſſions againſt the tory miniſtry, moſt of whom he diſplaced; but this did not make any great alteration to his prejudice in England. Many of the Scots, by the influence of the earl of Mar, and other chiefs, were driven into rebellion in 1715, which was happily ſuppreſſed the beginning of the next year. Some deluded noblemen and gentlemen in the north of England joined a party of the Scotch rebels, but they were ſurrounded at Preſton, where they delivered up their arms, and their leaders were ſent priſoners to London, where ſome of them ſuffered. The tories and jacobites, however, raiſed mobs and commotions at London, Oxford, and other parts of England; but they were ſoon ſuppreſſed, by making their ring-leaders examples of juſtice. Lord Oxford was impriſoned for three years; but the capital proſecution of him by the whigs, for the hand he had in the peace of Utrecht, was ſecretly diſſapproved of by the king, and dropped.

After all, the nation was in ſuch a diſpoſition that the miniſtry durſt not venture to call a new parliament, and the members of that which was ſitting voted a continuance of their duration from three to ſeven years, which is thought to have been the greateſt ſtretch of parliamentary power ever known. Several other extraordinary meaſures took place about the ſame time. Mr. Shippen, an excellent ſpeaker, and member of parliament, was ſent to the Tower for ſaying that the king's ſpeech was calculated for the meridian of Hanover rather than of London; and one Matthews, a young journeyman printer, was hanged for compoſing a ſilly pamphlet, that in later times would not have been thought worthy of animadverſion. The truth is, the whig miniſtry were exceſſively jealous of every thing that ſeemed to affect their maſter's title; and George I. though a ſagacious, moderate prince, undoubtedly rendered England too ſubſervient to his continental connections, which were various and complicated. He quarrelled with the czar of Muſcovy about their German concerns, and had not Charles XII. king of Sweden been killed ſo criti-

* And with her ended the line of the Stuarts, which, from the acceſſion of James I. anno 1603, had ſwayed the ſceptre of England 111 years, and that of Scotland 343 years, from the acceſſion of Robert II. anno 1371. James, the late pretender, ſon of James II. and brother to queen Anne, upon his father's deceaſe, anno 1701, was proclaimed king of England, by Lewis XIV. at St. Germains, and for ſome time treated as ſuch by the courts of Rome, France, Spain, and Turin. He reſided at Rome, where he kept up the appearance of a court, and continued firm in the Romiſh faith till his death, which happened in 1765. He left two ſons, viz. Charles Edward, born in 1720, who was defeated at Culloden in 1746, and upon his father's death, repaired to Rome, where he continued for ſome time, and afterwards reſided at Florence, under the title of count Albany, but died lately. Henry, his ſecond ſon, who enjoys a dignified place in the church of Rome, and is known by the name of cardinal York. March 28th, 1772, Charles, married Louiſa Maximillienne, born Sept. 21ſt, 175 , daughter of a prince of the family of Stolberg Grudern, in the circle of Upper Saxony, and grand-daughter, by the mother, of Thomas Bruce, late earl of Ayleſbury.

cally as he was, Great Britain probably would have been invaded by that northen conqueror, great preparations being made for that purpoſe, he being incenſed at George as elector of Hanover, for purchaſing Bremen and Verden of the Danes, which had been a part of his dominions.

In 1718, George quarrelled with Spain on account of the quadruple alliance that had been formed by Great Britain, France, Germany, and the States-general; and his admiral, ſir George Byng, by his orders, deſtroyed the Spaniſh fleet near Syracuſe. A trifling war with Spain then commenced, but it was ſoon ended by the Spaniards delivering up Sardinia and Sicily; the former to the duke of Savoy, and the latter to the emperor.

A national puniſhment, different from plague, peſtilence, and famine, overtook England in the year 1720, by the ſudden riſe of the South-ſea ſtock, one of the trading companies. The plan of this company had been formed in 1711, for the purpoſe of carrying on an excluſive trade, and making ſettlements in South America. In 1720, the company obtained an act to increaſe their capital ſtock, by redeeming the public debts; and was then inveſted with the aſſiento of negroes, which had been ſtipulated between Great Britain and Spain. Men's hopes were ſo ſanguine, that the ſtock roſe to 310l. for a 100l. before the bill had the royal aſſent in April; before the end of May to 500; and by the twentieth of June, their ſtock roſe to 890 per cent. and afterwards to 1000; but, before the end of September, it fell to 150, by which thouſands were involved in ruin. Though this might be owing to the inconſiderable avarice of the ſubſcribers, yet the public imagined that the miniſtry had contributed to the calamity; ſome of the directors inſinuated as if the miniſters and their friends had been the chief gainers. The latter, however, had the addreſs to eſcape without cenſure, but the parliament paſſed a bill which confiſcated the eſtates of the directors, with an allowance for their maintenance; a poor reparation for the public injuries.

The Jacobites thought to avail themſelves of the national diſcontent at the South-Sea ſcheme and England's connections with the continent, which every day increaſed. One Layer, a lawyer, was tried and executed for high treaſon. Several perſons of great quality and diſtinction were apprehended on ſuſpicion, but the ſtorm fell chiefly on Francis Atterbury, lord biſhop of Rocheſter, who was deprived of his ſee and ſeat in parliament, and baniſhed for life. There was ſome irregularity in the proceedings againſt him, and therefore the juſtice of the biſhop's ſentence has been queſtioned, though there is little reaſon to doubt of his guilt. After the ferment of this plot had ſubſided, the miniſtry, who were all in the intereſt of Hanover, ventured upon ſeveral bold meaſures, in ſome of which the national intereſt, if not honour, was evidently ſacrificed to that electorate. The crown of Great Britain was engaged in every continental diſpute, however remote from her intereſt; and a difference ſtill ſubſiſting between the courts of Madrid and Vienna, it was agreed that it ſhould be determined by a congreſs to be held at Cambray, under the auſpices of France. This congreſs proved abortive, and England was involved in freſh difficulties on account of Hanover. So fluctuating was the ſtate of Europe at this time, that in September, 1725, a freſh treaty was concluded at Hanover between the kings of Great Britain, France, and Pruſſia, to counterbalance an alliance that had been formed between the courts of Vienna and Madrid. A ſquadron was ſent to the Baltic, to hinder the Ruſſians from attacking Sweden, another to the Mediterranean, and a third, under admiral Hoſier, to the Weſt Indies, to watch the Spaniſh plate fleet. This laſt was a fatal as well as an inglorious expedition. The admiral and moſt of his men periſhed by epidemical diſeaſes, and the hulks of his ſhips rotted ſo as to render them unfit for ſervice. The management of the Spaniards was little better. They loſt near 10,000 men in the ſiege of Gibraltar, which they were obliged to raiſe. The king, in his ſpeech to the parliament, pub-

licly accuſed the emperor of a deſign to place the Pretender upon the throne of Great Britain; but this was ſtrenuouſly denied by baron Palme, the imperial ambaſſador at London, who was therefore ordered to leave the kingdom.

A quarrel with the emperor was the moſt dangerous to Hanover of any that could happen; but though an oppoſition in the houſe of commons was formed by ſir William Wyndham and Mr. Pulteney, the parliament grew more laviſh in granting money and enormous ſubſidies for the protection of Hanover, to the kings of Denmark and Sweden, and the landgrave of Heſſe Caſſel. Such was the ſtate of affairs in Europe, when George I. ſuddenly died on the 11th of June 1727, at Oſnaburgh, in the ſixty-eighth year of his age, and the 13th of his reign. The reign of George I. is remarkable for an incredible number of bubbles and cheating projects, by which it was reckoned that almoſt a million and a half was won and loſt; and for the great alteration of the ſyſtem of Europe, by the concern which the Engliſh took in the affairs of the continent. The inſtitution of the ſinking fund, for diminiſhing the national debt, is likewiſe owing to this period. The value of the northern parts of the kingdom began now to be better underſtood than formerly, and the ſtate of manufactures began to ſhift. This was chiefly owing to the unequal diſtribution of the land-tax, which rendered it difficult for the poor to ſubſiſt in certain counties, which had been forward in giving in the true value of their eſtates when that tax took place.

Sir Robert Walpole was conſidered as firſt miniſter of England when George I. died, and ſome differences having happened between him and the prince of Wales, it was generally thought, upon the acceſſion of the latter to the crown, that ſir Robert would be diſplaced. That might have been the caſe, could another perſon have been found equally capable, as he was to manage the houſe of commons, and to gratify that predilection for Hanover which George II. inherited from his father. No miniſter ever underſtood better the temper of the people of England, and none, perhaps, ever tried it more. He filled all places of power, truſt, and profit, and almoſt the houſe of commons itſelf, with his own creatures; but peace was his darling object, becauſe he thought that war muſt be fatal to his power. During his long adminiſtration he never loſt a queſtion that he was in earneſt to carry. The exciſe ſcheme was the firſt meaſure that gave a ſhock to his power, and even that he could have carried, had he not been afraid of the ſpirit of the people without doors, which might have either produced an inſurrection, or endangered his intereſt at the next general election. Having compromiſed all differences with Spain, he filled all the courts of Europe with embaſſies and negociations, and the new parliament gratified him with the means of performing his engagements. He continued and enlarged the ſubſidies paid to the German princes for the ſecurity of Hanover, and had even the addreſs to obtain, from time to time, votes of credit for fulfilling his immediate engagements; and in the mean while, to amuſe the public, he permitted enquiries into the ſtate of the jails, and other matters that did not affect his own power.

His pacific ſyſtem brought him into inconveniences both at home and abroad. It encouraged the Spaniards to continue their depredations upon the Britiſh ſhipping in the American ſeas, and the French to treat the Engliſh court with inſolence and neglect. At home, many of the great peers thought themſelves ſlighted, and they intereſted themſelves more than ever they had done in elections. This, together with the diſguſt of the people at the propoſed exciſe ſcheme, and paſſing the *Gin Act*, in the year 1736, increaſed the minority in the houſe of commons to 130, ſome of whom were as able men and as good ſpeakers as ever had ſat in parliament; and taking advantage of the increaſing complaints againſt the Spaniards, they attacked the miniſter with great ſtrength of argument, and with great eloquence. In juſtice to Walpole, it ſhould be obſerved, that he filled the courts of

of juſtice with able and upright judges, nor was he ever known to attempt any perverſion of the known laws of the kingdom. He was ſo far from checking the freedom of debate, that he bore with equanimity the moſt ſcurrilous abuſe that was thrown out to his face. He gave way to one or two proſecutions for libels, in compliance to his friends, who thought themſelves affected by them; but it is certain, that the preſs of England never was more open or free than during his adminiſtration. And as to his pacific ſyſtem, it undoubtedly more than repaid to the nation all that was required to ſupport it, by the increaſe of her trade and the improvement of her manufactures.

With regard to the king's own perſonal concern in public matters, Walpole was rather his miniſter than his favourite; and his majeſty often hinted to him, as Walpole himſelf has been heard to acknowledge, that he was reſponſible for all meaſures of government. The debates concerning the Spaniſh depredations in the Weſt Indies, and the proofs that were brought to ſupport the complaints of the merchants, made at laſt an impreſſion even upon many of Walpole's friends. The heads of the oppoſition, in both houſes of parliament, accuſed the miniſter of having by the treaty of Seville, and other negociations, introduced a branch of the houſe of Bourbon into Italy, and depreſſed the houſe of Auſtria, the ancient and natural ally of England. They expoſed, with invincible force of eloquence and reaſoning, the injuſtice and diſgrace, as well as loſs ariſing from the Spaniſh depredations, and the neceſſity of repelling force by force. Sir Robert ſtill adhered to his pacific ſyſtem, and concluded a ſhameful and indefenſible compromiſe under the title of a convention with the court of Spain, which produced a war with that nation.

Queen Caroline, conſort to George II. had been always a firm friend to the miniſter; but ſhe died November 20th, 1737, when a variance ſubſiſted between the king and his ſon, the prince of Wales. The latter complained, that through Walpole's influence he was deprived not only of the power but the proviſion to which his birth entitled him; and he put himſelf at the head of the oppoſition with ſo much firmneſs, that it was generally foreſeen that Walpole's power was drawing to a cloſe. Admiral Vernon, who hated the miniſter, was ſent, in 1739, with a ſquadron of ſix ſhips to the Weſt-Indies, where he took and demoliſhed Porto-Bello; but being a hot, impracticable man, he miſcarried in his other attempts, eſpecially that upon Carthagena, in which ſome thouſands of Britiſh lives were wantonly thrown away. The oppoſition exulted in Vernon's ſucceſs, and afterwards imputed his miſcarriages to the miniſter's ſtarving the war, by with-holding the means for carrying it on. The general election approaching, ſo prevalent was the intereſt of the prince of Wales in England, and that of the duke of Argyle in Scotland, that a majority was returned to parliament who were no friends to the miniſter, and after a few trying diviſions, he retired from the houſe, on the 9th of February, 1742, was created earl of Orford, and the 11th reſigned all his employments.

George II. bore the loſs of his miniſter with the greateſt equanimity, and even conferred titles of honour, and poſts of diſtinction, upon the heads of the oppoſition. By this time, the death of the emperor Charles VI. the danger of the pragmatic ſanction (which meant the ſucceſſion of his daughter to all the Auſtrian dominions) through the ambition of France, and many other concurrent cauſes, induced George to take the leading part in a continental war. He was encouraged to this by lord Carteret, afterwards earl of Granville, an able, but a headſtrong miniſter, whom George had made his ſecretary of ſtate, and indeed by the voice of the nation in general. George accordingly put himſelf at the head of his army, fought and gained the battle of Dettingen, June 16, 1743, and his not ſuffering his general, the earl of Stair, to improve the blow, was thought to proceed from tender-

tenderneſs for his electoral dominions. This partiality created an univerſal flame in England; and a clamour raiſed againſt his lordſhip's meaſures was increaſed by the duke of Newcaſtle and his brother, lord chancellor Hardwicke, the lord Harrington, and other miniſters, who reſigned, or offered to reſign their places, if lord Carteret ſhould retain his influence in the cabinet. His majeſty was obliged to give way to what he thought the voice of his people, and he indulged them with accepting the ſervices of ſome gentlemen who never had been conſidered as zealous friends to the houſe of Hanover. After various removals, Mr. Pelham was placed at the head of the treaſury, and appointed chancellor of the exchequer, and conſequently was conſidered as firſt miniſter; or rather the power of the premierſhip was divided between him and his brother the duke of Newcaſtle.

Great Britain was then engaged in a very expenſive war both againſt the French and Spaniards, and her enemies ſought to avail themſelves of the general diſcontent that prevailed in England on account of the king's predilection for Hanover. This naturally ſuggeſted to them the idea of applying to the Pretender, who reſided at Rome; and he agreed that his ſon Charles, who was a ſprightly young man, ſhould repair to France, from whence he ſet ſail, and narrowly eſcaped, with a few followers, in a frigate to the weſtern coaſts of Scotland, between the iſlands of Mull and Sky, where he diſcovered himſelf, aſſembled his followers, and publiſhed a manifeſto exciting the nation to rebellion. It is neceſſary, before we relate the true cauſe of this enterprize, to make a ſhort retroſpect to foreign parts.

The war of 1741 proved unfortunate in the Weſt Indies, through the fatal diviſions between admiral Vernon and general Wentworth, who commanded the land troops; and it was thought that above 20,000 Britiſh ſoldiers and ſeamen periſhed in the impracticable attempt on Carthagena, and the inclemency of the air and climate during other idle expeditions. The year 1742, had been ſpent in negociations with the courts of Peterſburgh and Berlin, which, though expenſive, proved of little or no ſervice to Great Britain; ſo that the victory of Dettingen left the French troops in much the ſame ſituation as before. A difference between the admirals Matthews and Leſtock had ſuffered the Spaniſh and French fleets to eſcape out of Toulon with but little loſs; and ſoon after, the French, who had before acted only as allies to the Spaniards, declared war againſt Great Britain, who, in her turn, declared war againſt the French. The Dutch, the natural allies of England, during this war, carried on a moſt lucrative trade; nor could they be brought to act againſt the French, till the people entered into aſſociations and inſurrections againſt the government. Their marine was in a miſerable condition, and when they at laſt ſent a body of troops to join the Britiſh and Auſtrian armies, which had been wretchedly commanded for one or two campaigns, they did it with ſo bad a grace, that it was plain they intended not to act in earneſt. When the duke of Cumberland took upon himſelf the command of the army, the French, to the great reproach of the allies, were almoſt maſters of the barrier in the Netherlands, and were beſieging Tournay. The duke attempted to raiſe the ſiege, but by the coldneſs of the Auſtrians, and the cowardice of the Dutch, whoſe government all along held a ſecret correſpondence with France, he loſt the battle of Fontenoy, and 7000 of his beſt men; though it is generally allowed that his diſpoſitions were excellent, and both he and his troops behaved with unexampled intrepidity. To counterbalance ſuch a train of misfortunes, admiral Anſon returned this year to England, with an immenſe treaſure (about a million ſterling) which he had taken from the Spaniards in his voyage round the world; and commodore Warren, with colonel Pepperel, took from the French the important town and fortreſs of Louiſbourg, in the iſland of Cape Breton.

Such was the ſtate of affairs abroad in Auguſt 1745, when the Pretender's eldeſt ſon, at the head of ſome Highland followers, ſurpriſed and diſarmed a party of the kings

king's troops in the weſtern Highlands, and advanced with great rapidity to Perth. The government never ſo thoroughly experienced, as it did at that time, the benefit of the public debt for the ſupport of the Revolution. The French and the Jacobite party, (for ſuch there was at that time in England) had laid a ſcheme for diſtreſſing the Bank; but common danger aboliſhed all diſtinctions, and united them in the defence of one intereſt, which was private property. The merchants undertook, in their addreſs to the king, to ſupport it, by receiving bank-notes in payment. This ſeaſonable meaſure ſaved the public credit; but the defeat of the rebels by the duke of Cumberland at Culloden, in the year 1746, did not reſtore tranquillity to Europe. Though the prince of Orange, ſon-in-law to his majeſty George II. was, by the credit of his majeſty, and the ſpirit of the people of the United Provinces, raiſed to be their ſtadtholder, the Dutch could never be brought to act heartily in the war. The allies were defeated at Val, near Maeſtricht, and the duke of Cumberland was in danger of being made priſoner. Bergen-op zoom was taken in a manner that has never yet been explained. The allies ſuffered other diſgraces on the continent; and it now became the general opinion in England, that peace was neceſſary to ſave the duke and his army from total deſtruction. By this time, however, the French marine and commerce were in danger of being annihilated by the Engliſh fleet, under the command of the admirals Anſon, Warren, Hawke, and other gallant officers; but the Engliſh arms were not ſo ſucceſsful as could have been wiſhed, under rear-admiral Boſcawen in the Eaſt Indies. In this ſtate of affairs, the ſucceſſes of the French and Engliſh, during the war, may be ſaid to have been balanced, and both miniſtries turned their thoughts to peace. The queſtion is not yet decided which party had greateſt reaſon to deſire it, the French and Spaniards for the immenſe loſſes they had ſuſtained by ſea, or the allies for the diſgraces they had ſuffered by land.

The preliminaries for peace were ſigned in April 1748, a definitive treaty was concluded at Aix la-Chapelle in October, the baſis of which was the reſtitution on both ſides of all places taken during the war. The number of prizes taken by the Engliſh in this war, from its commencement to the ſigning the preliminaries was 3434; namely, 1249 from the Spaniards, and 2185 from the French: they loſt during the ſame time, 3238; 1360 being taken by the Spaniards, and 1878 by the French. Several of the ſhips taken from the Spaniards were immenſely rich; ſo that the balance, upon the whole, amounted to almoſt two millions in favour of England. Such is the groſs calculation on both ſides; but the conſequences plainly proved that the loſſes of the French and Spaniards muſt have been much greater. The vaſt fortunes made by private perſons in England all of a ſudden, ſufficiently ſhewed that immenſe ſums had not been brought to the public account; but the greateſt proof was, the next year the intereſt of the national debt was reduced from four to three and a half per cent. for ſeven years, after which the whole was to ſtand reduced to three per cent.

This was the boldeſt ſtroke of financing ever attempted perhaps in any country, conſiſtently with public faith; for the creditors of the government, after an ineffectual oppoſition, continued their money in the funds, and a few who ſold out even made intereſt to have it replaced on the ſame ſecurity, or were paid off their principal ſums out of the ſinking fund. This was an æra of improvements: Mr. Pelham's candour and rectitude of adminiſtration leaving him few or no enemies in parliament, he omitted no opportunity of carrying into execution every ſcheme for the improvement of commerce, manufactures, and the fiſheries; the benefits of which were felt during the ſucceeding war, and are to this day. Every intelligent perſon, however, conſidered the peace of Aix-la-Chapelle as no better than an armed ceſſation of hoſtilities. The French employed themſelves in recruiting and repairing their marine, and had formed the deſign of ſeizing the Britiſh back ſettlements in America,

rica, and for cutting off all communication between the Engliſh and the native Indians; in which caſe our colonies muſt have been reduced to a narrow ſlip on the coaſts, without the means of getting ſubſiſtence but from the mother country. Fortunately for Great Britain, they diſcloſed their intention, by entering upon hoſtilities before they had power to ſupport them.

In the mean while, a new treaty of commerce was ſigned at Madrid, between Great Britain and Spain, by which, in conſideration of 100,000l. the South-Sea company gave up all their future claims to the aſſiento contract, by virtue of which, that company had ſupplied the Spaniſh Weſt-Indies with negroes. In March, 1750, died univerſally lamented, his royal highneſs Frederic prince of Wales. In May, 1751, an act paſſed for regulating the commencement of the year, by which the old ſtyle was aboliſhed, and the new ſtyle eſtabliſhed. This was done by ſinking eleven days in September 1752, and from that time beginning the year on the firſt of January. In 1753 the famous act paſſed for preventing clandeſtine marriages; but whether it is for the benefit of the ſubject, is a point that is ſtill very queſtionable. The people of England about this time ſuſtained an immenſe loſs by the death of Mr. Pelham, who was one of the honeſteſt, wiſeſt, and beſt miniſters England had ever ſeen.

The barefaced encroachments of the French, who had built forts on our back ſettlements in America, and the diſpoſitions they made for ſending over vaſt bodies of veteran troops to ſupport thoſe encroachments, produced a wonderful ſpirit in England, eſpecially after admiral Boſcawen was ordered with eleven ſhips of the line to ſail to the banks of Newfoundland, where he took two French men of war, the reſt of their fleet eſcaping up the river St. Lawrence, by the ſtraights of Belleiſle. No ſooner was it known that hoſtilities were begun, than the people of England poured their money into the government's loan, and orders were iſſued for making general repriſals in Europe as well as in America; and that all the French ſhips, whether outward or homeward bound, ſhould be ſtopped and brought into Britiſh ports. Theſe orders were ſo effectual, that before the end of the year 1755, above 500 of the richeſt French merchant ſhips, and above 8,000 of their beſt ſailors were brought into the kingdom. This vigorous meaſure was followed by farther ſucceſs, for about two years after, near 30,000 French ſeamen were found to be priſoners in England.

In July, 1755, general Braddock, who had been ſent from England to attack the French, and reduce the forts on the Ohio, was defeated and killed, by falling into an ambuſcade of the French and Indians near Fort du Queſne; but major-general Johnſon defeated a body of French near Crown Point, of whom he killed about 1000.

The Engliſh navy in 1755 conſiſted of one ſhip of 110 guns, five of 100 guns each, thirteen of 90, eight of 80, five of 74, twenty-nine of 70, four of 66, one of 64, thirty-three of 60, three of 54, twenty-eight of 50, four of 44, thirty-five of 40, and forty-two of 20; four ſloops of war of 18 guns each, two of 16, eleven of 14, thirteen of 12, and one of 10; beſides a great number of bomb-ketches, fire-ſhips, and tenders; a force ſufficient to oppoſe the maritime ſtrength of all the powers of Europe. Whilſt that of the French, even at the end of this year, and including the ſhips then upon the ſtocks, amounted to no more than ſix ſhips of 80 guns, twenty-one of 74, one of 72, four of 70, thirty-one of 64, two of 60, ſix of 50, and thirty-two frigates.

In proportion as the ſpirits of the public were elevated by thoſe invincible armaments, they were ſunk with an account that the French had landed 11,000 men in Minorca, to attack Fort St. Philip there; that admiral Byng, who had been ſent out with a ſquadron at leaſt equal to that of the French, had been baffled, if not defeated, by their admiral Galiſſionere, and that at laſt Minorca was ſurrendered by general

general Blakeney. The Engliſh were far more alarmed than they ought to have been at thoſe events. The loſs of Minorca was more ſhameful than detrimental to the kingdom, but the public outcry was ſuch, that the king gave up Byng to public juſtice, and he was ſhot to death at Portſmouth for not doing all that was in his power againſt the enemy.

It was about this time that Mr. Pitt was placed, as ſecretary of ſtate, at the head of the adminiſtration. He had been long known as a bold, eloquent, and energetic ſpeaker, and he ſoon proved himſelf to be a ſpirited miniſter. The miſcarriages in the Mediterranean had no conſequence but the loſs of fort St. Philip, which was more than repaired by the vaſt ſucceſs of the Engliſh privateers, both in Europe and America. The ſucceſſes of the Engliſh in the Eaſt Indies, under colonel Clive, were extraordinary. He defeated Suraja Dowla, nabob of Bengal, Bahar and Orixa, and placed Jaffier Ally Cawn in the ancient ſeat of the nabobs of thoſe provinces. Suraja Dowla, who was in the French intereſt, a few days after his being defeated, was taken by the new nabob Jaffier Ally Cawn's ſon, and put to death. This event laid the foundation of the great extent of riches and territory which the Engliſh now poſſeſs in the Eaſt Indies.

Mr. Pitt introduced into the cabinet a new ſyſtem of operations againſt France, than which nothing could be better calculated to reſtore the ſpirits of his countrymen, and to alarm their enemies. Far from dreading an invaſion, he planned an expedition for carrying the arms of England into France itſelf; and the deſcent was to be made at Rochefort, under general ſir John Mordaunt, who was to command the land troops. Nothing could be more promiſing than the diſpoſitions for this expedition. It ſailed on the 8th of September, 1757; but admiral Hawke brought back the ſea and land forces on the 6th of October to St. Helen's, the general having made no attempt to land on the coaſt of France. He was tried and acquitted without public murmur, ſo great an opinion had the people of the miniſter; who, to do him juſtice, did not ſuffer a man or a ſhip belonging to the Engliſh army or navy to lie idle.

The French having attacked the electorate of Hanover with a powerful army, the Engliſh parliament voted large ſupplies of men and money to defend the electoral dominions. The duke of Cumberland had been ſent thither to command an army of obſervation, but was ſo powerfully preſſed by a ſuperior army, that he found himſelf obliged to lay down his arms; and the French under the duke of Richlieu, took poſſeſſion of that electorate and its capital. At this time, a ſcarcity bordering on famine, raged in England; and the Heſſian troops, who, with the Hanoverians, had been ſent to defend the kingdom from an invaſion intended by the French, ſtill remained in England. So many difficulties concurring, in 1758, a treaty of mutual defence was agreed to between his majeſty and the king of Pruſſia: in conſequence of which, the parliament voted 670,000l. to his Pruſſian majeſty; and alſo voted large ſums, amounting in the whole to near two millions a year, for the payment of 50,000 of the troops of Hanover, Heſſe-Caſſel, Saxe-Gotha, Wolfenbuttel, and Buckeburg. This treaty, which proved afterwards ſo burdenſome to England, was intended to unite the Proteſtant intereſt in Germany.

George II. with the conſent of his Pruſſian majeſty, declaring that the French had violated the convention concluded between them and the duke of Cumberland at Cloſterſeven, ordered his Hanoverian ſubjects to reſume their arms under prince Ferdinand of Brunſwick, a Pruſſian general, who inſtantly drove the French out of Hanover; and the duke of Marlborough, after the Engliſh had repeatedly inſulted the French coaſts, by deſtroying their ſtores and ſhipping at St. Maloes and Cherbourg, marched into Germany, and joined Prince Ferdinand with 12,000

Britiſh troops, which were afterwards increaſed to 25,000. A war enſued, in the courſe of which the Engliſh gained great victories, which produced no deciſive effects. Even the battle of Minden, the moſt glorious perhaps in the Engliſh annals, in which about 7000 Engliſh defeated 80,000 of the French regular troops, contributed nothing to the concluſion of the war, or towards weakening the French in Germany.

The Engliſh bore the expences of the war with cheerfulneſs, and applauded the activity and ſpirit of Mr. Pitt's adminiſtration. Admiral Boſcawen and general Amherſt, in Auguſt, 1758, reduced and demoliſhed Louiſbourg, in North America, which had been reſtored to the French by the treaty of Aix-la-Chapelle, and was become the ſcourge of the Britiſh trade, and took five or ſix French ſhips of the line; Frontenac and Fort du Queſne, in the ſame quarter, fell alſo into the hands of the Engliſh; acquiſitions that far over-balanced a check which the Engliſh received at Ticonderago, and the loſs of above 300 of the Engliſh guards, as they were returning under general Bligh from the coaſt of France.

The Engliſh affairs in the Eaſt Indies this year proved equally fortunate; and the lords of the admiralty received letters from thence, with an account that admiral Pococke had engaged the French fleet near Fort St. David's on the 29th of March, in which engagement a French man of war, called the Bien Amié, of 74 guns, was ſo much damaged that they run her on ſhore. The French had 600 men killed and wounded on this occaſion, and the Engliſh only 29 killed, and 89 wounded. That on the third of Auguſt following, he engaged the French fleet a ſecond time near Pondicherry; when, after a briſk firing of ten minutes, the French bore away with all the ſail they could make, and got ſafe into the road of Pondicherry. The loſs of the French in this engagement was 540 killed and wounded; and that of the Engliſh only 147 killed and wounded. And that on the 14th of December following, general Lally, commander of the French army in thoſe parts, marched to beſiege Madras, which was defended by the Engliſh colonels Laurence and Draper; and after a briſk cannonade, which laſted till the 16th of February following, the Engliſh having received a reinforcment of 600 men, generally Lally thought proper to raiſe the ſiege and retire with precipitation, leaving behind him forty pieces of cannon.

The year 1759 was introduced by the taking of the iſland of Goree on the coaſt of Africa, by commodore Keppel. Three capital expeditions were undertaken this year in America, and all of them proved ſucceſsful. One of them was againſt the French iſlands in the Weſt Indies, where Guadaloupe was reduced. The ſecond expedition was againſt Quebec, the capital of French Canada. The command was given, by the miniſter's advice, to general Wolfe, a young officer of a truly military genius. Wolfe was oppoſed with far ſuperior force by Montcalm, the beſt and moſt ſucceſsful general the French had. Though the ſituation of the country which Wolfe was to attack, and the works the French threw up to prevent a deſcent of the Engliſh, were deemed impregnable, yet Montcalm never relaxed in his vigilance. Wolfe's courage and perſeverance, however, ſurmounted incredible difficulties; he gained the heights of Abraham, near Quebec, where he fought and defeated the French army, but was killed himſelf, as was Montcalm; general Monkton, who was next in command, being wounded, the completion of the French defeat, and the glory of reducing Quebec, was reſerved for brigadier-general (now lord viſcount) Townſhend.

General Amherſt, who was the firſt Engliſh general on command in America, conducted the third expedition. His orders were to reduce all Canada, and to join the army under general Wolfe on the banks of the river St. Laurence. It is to the honour of the miniſter, Mr. Amherſt in this expedition was ſo well provided

with every thing that could make it ſucceſsful, that there ſcarcely appeared any chance for its miſcarriage; and thus the French empire in North America became ſubject to Great Britain.

The affairs of the French being now deſperate, and their credit ruined, they reſolved upon an attempt to retrieve all by an invaſion of Great Britain: but, on the 18th of Auguſt, 1759, admiral Boſcawen attacked the Toulon ſquadron, commanded by M. de la Clue, near the ſtraits of Gibraltar, took Le Centaur, of 74, Le Temeraire of 74, and Le Modeſte of 74 guns; and burnt L'Ocean of 80, and Le Redoubtable of 74 guns. The reſt of the fleet, conſiſting of ſeven ſhips of the line, and three frigates, made their eſcape in the night; and on November 20, ſir Edward Hawke defeated the Breſt fleet, commanded by admiral Conflans, off the iſland of Dumet, in the bay of Biſcay. The Formidable, a French man of war of 80 guns, was taken; the Theſée of 74, and the Superbe of 70 guns, were ſunk; and the Soliel Royal of 80, and the Heros, of 74 guns, were burnt, and afterwards the Juſte of 70 periſhed in the mouth of the Loire. Seven or eight French men of war of the line got up the river Villaine, by throwing their guns over board; and the reſt of the fleet, conſiſting of five ſhips of the line, and three frigates, eſcaped in the night. The Engliſh loſt on this occaſion, the Eſſex of 64, and the Reſolution of 74 guns, which ran on ſhore in the chace. After this engagement, the French gave over all thoughts of their intended invaſion of Great Britain.

In February 1760, captain Thurot, a French marine adventurer, who had with three ſloops of war alarmed the coaſts of Scotland, and actually made a deſcent at Carrickfergus in Ireland, was, on his return from thence, met, defeated, and killed by captain Elliot, the commodore of three ſhips, inferior in force to the Frenchman's ſquadron. Every day's gazette added to the accounts of the ſucceſſes of the Engliſh, and the utter ruin of the French finances, which that government did not bluſh publicly to avow. In ſhort, Great Britain now reigned as ſole miſtreſs of the main, and ſucceeded in every meaſure that had been projected for her own ſafety and advantage.

The war in Germany, however, continued ſtill as undeciſive as it was expenſive, and many in England began to conſider it now as foreign to the internal intereſts of Great Britain. The French again and again ſhewed diſpoſitions for treating, and the charges of the war, which began now to amount to little leſs than eighteen millions ſterling yearly, inclined the Britiſh miniſtry to liſten to their propoſals. A negociation was accordingly entered upon, which proved abortive, as did many other projects for accommodation; but on the 25th of October 1760. George II. died ſuddenly (from a rupture in the right ventricle of the heart), full of years and glory, in the 77th year of his age, and 34th of his reign, and was ſucceeded by his grandſon, now George III. eldeſt ſon to the late prince of Wales.

The memory of George II. is reprehenſible on no head but his predilection for his electoral dominions. He never could ſeparate an idea that there was any difference between them and his regal dominions; and he was ſometimes ill enough adviſed to declare ſo much in his ſpeeches to parliament. We are, however, to remember, that his people gratified him in this partiality, and that he never acted by power or prerogative. He was juſt rather than generous; and in matters of œconomy, either in his ſtate or his houſehold, he was willing to connive at abuſes, if they had the ſanction of law and cuſtom. He was not very acceſſible in converſation, and therefore it is no wonder that having left Germany after he had attained to man's eſtate, he ſtill retained foreign notions both of men and things. In government he had no favourite, for he parted with ſir Robert Walpole with great indifference, and ſhewed very little concern at the ſubſequent revolutions among his ſervants. This quality may be deemed a virtue, as it contributed greatly to the inter-

nal quiet of his reign, and prevented the people from loading the king with the faults of his miniſters. In his perſonal diſpoſition he was paſſionate, but placable, fearleſs of danger, fond of military parade, and enjoyed the memory of the campaigns in which he ſerved when young. His affections, either public or private, were never known to interfere with the ordinary courſe of juſtice; and though his reign was diſtracted by party, the courts of juſtice were never better filled than under him: this was a point in which all factions were agreed.

King George III. (grandſon to his late majeſty, his father having died while he was only prince of Wales) aſcended the throne with great advantages. His being a native of England prejudiced the people in his favour: he was in the bloom of youth, in his perſon tall and comely, at the time of his acceſſion Great Britain was in the higheſt degree of reputation and proſperity, and the moſt ſalutary unanimity and harmony prevailed among the people. The firſt acts of his reign ſeemed alſo calculated to convince the public that the death of his predeceſſor ſhould not relax the operations of the war. Accordingly, in 1761, the iſland of Belleiſle, on the coaſt of France, ſurrendered to his majeſty's ſhips and forces under commodore Keppel and general Hodgſon; as did the important fortreſs of Pondicherry, in the Eaſt Indies, to colonel Coote and admiral Stevens. The operations againſt the French Weſt Indies ſtill continued under general Monkton, lord Rollo, and ſir James Douglas; and in 1762, the iſland of Martinico, hitherto deemed impregnable, with the iſlands of Grenada, St. Lucia, Grenadillas, St. Vincent, and others of leſs note, were ſubdued by the Britiſh arms with inconceivable rapidity.

As his majeſty could not eſpouſe a Roman catholic, he was precluded from intermarrying into any of the great families of Europe; he therefore choſe a wife from the houſe of Mecklenburg Strelitz, the head of a ſmall but ſovereign ſtate in the north-weſt of Germany; and the conduct of his excellent conſort has hitherto been ſuch as moſt highly to juſtify his choice. She was conveyed to England in great pomp, and the nuptials were celebrated on the very night of her arrival, viz. Sept. 8, 1761: and on the 22d of the ſame month, the ceremony of the coronation was performed with great magnificence in Weſtminſter-abbey.

In the mean time, Mr. Pitt, who had conducted the war againſt France with ſuch eminent ability, and who had received the beſt information of the hoſtile intentions and private intrigues of the court of Spain, propoſed in council an immediate declaration of war againſt that kingdom. He urged his reaſons for this meaſure with his uſual energy; aſſerting that "this was the time for humbling the whole houſe of Bourbon, that Spain was in daily expectation of a rich fleet from the Weſt Indies, that if we could intercept that, it would give a diſheartening blow to their power and pride, and that were this opportunity let ſlip, it might never be recovered." But he was over-ruled in the council, all the members of which declared themſelves of a contrary opinion, excepting his brother-in-law earl Temple. Mr. Pitt now found the decline of his influence; and it was ſuppoſed that the earl of Bute, who had a conſiderable ſhare in directing the education of the king, had acquired an aſcendency in the royal favour*. Mr. Pitt, however, ſaid, that "as he was called to the miniſtry by the voice of the people, to whom he conſidered himſelf as accountable for his conduct, he would no longer remain in a ſituation which made him reſponſible for meaſures that he was not allowed to guide." He, therefore, reſigned the ſeals, and lord Temple alſo gave up the poſt which he held in the adminiſtration. But the next day, the king ſettled a penſion of three thouſand pounds a year upon Mr. Pitt, and at the ſame time a title was conferred upon his lady and her iſſue; and the penſion was to be continued for three lives. Theſe advantages

* It was on the 25th of March 1761, that the earl of Bute was appointed one of the principal ſecretaries of ſtate; and on the 5th of October following, Mr. Pitt reſigned the ſeals.

and

and honours had unqueſtionably been well deſerved by his public ſervices; but his acceptance of them greatly leſſened his popularity. A very conſiderable degree of diſcontent notwithſtanding prevailed in the nation, on account of his removal from power; and it was extremely natural, that the people ſhould behold, with the utmoſt regret, the removal of a miniſter, of whoſe abilities and integrity they had the higheſt opinion, and in the midſt of a war, which he had conducted with ſo much honour to himſelf and to his country. This great man had not reſigned the ſeals many weeks, when the Spaniſh fleet arrived ſafe in their ports, richly laden; an event which added the merit of truth and ſagacity to his laſt addreſs. After this, the court of Spain ſoon threw off the maſk, and gave the moſt unequivocal marks of their hoſtile intentions.

The war ſtill continued to be carried on with vigour after the reſignation of Mr. Pitt, and the plans were purſued that he had previouſly concerted. Lord Egremont was appointed to ſucceed him, as ſecretary for the ſouthern department. It was at length alſo found indiſpenſably neceſſary to engage in a war with Spain, the famous family compact among all the different branches of the Bourbon family being now generally known; and accordingly war was declared againſt that kingdom, on the 4th of January 1762. A reſpectable armament was fitted out under admiral Pococke, having the earl of Albemarle on board to command the land forces; and the vitals of the Spaniſh monarchy were ſtruck at, by the reduction of the Havannah, the ſtrongeſt and moſt important fort which his catholic majeſty held in the Weſt Indies, after a ſiege of two months and eight days. The capture of the Hermione, a large Spaniſh regiſter ſhip, bound from Lima to Cadiz, the cargo of which was valued at a million ſterling, preceded the birth of the prince of Wales, and the treaſure paſſed in triumph through Weſtminſter to the Bank, the very hour he was born. The loſs of the Havannah, with the ſhips and treaſures there taken from the Spaniards, was ſucceeded by the reduction of Manilla and the Philippine iſlands in the Eaſt Indies, under general Draper and admiral Corniſh, with the capture of the Trinidad, reckoned worth three millions of dollars. To counteract thoſe dreadful blows given to the family compact, the French and Spaniards employed their laſt reſource, which was to quarrel with and invade Portugal, the faithful but feeble ally of Great Britain. Whether this quarrel was real or pretended, is not for me to decide. It certainly embarraſſed his Britannic majeſty, who was obliged to ſend thither armaments both by ſea and land.

The negociations for peace were now reſumed; and the enemy at laſt offered ſuch terms as the Britiſh miniſtry thought admiſſible. The defection of the Ruſſians from the confederacy againſt the king of Pruſſia, and his conſequent ſucceſſes, produced a ceſſation of arms in Germany, and in all other quarters; and on the 10th of February 1763, the definitive treaty of peace between his Britannic majeſty, the king of France, and the king of Spain, was concluded at Paris, and acceded to by the king of Portugal; March 10, the ratifications were exchanged at Paris. The 22d, the peace was ſolemnly proclaimed at Weſtminſter and London; and the treaty having on the eighteenth been laid before the parliament, it met the approbation of a majority of both houſes.

By this treaty, the extenſive province of Canada, with the iſlands of Newfoundland, Cape Breton, and St. John, were confirmed to Great Britain; alſo the two Floridas, containing the whole of the continent of North America, on this ſide the Miſſiſſippi, (except the town of New Orleans, with a ſmall diſtrict round it,) was ſurrendered to us by France and Spain, in conſideration of reſtoring to Spain the iſland of Cuba; and to the French the iſlands of Martinico, Guadaloupe, Mariegalante, and Deſirade; and in conſideration of our granting to the French the two ſmall iſlands of St. Pierre and Miquelon, on the coaſt of Newfoundland, and quitting our pretenſions to the neutral iſland of St. Lucia, they yielded to us the iſlands of

Grenada.

Grenada and the Grenadilles, and quitted their pretenſions to the neutral iſlands of St. Vincent, Dominica, and Tobago. In Africa we retained the ſettlement of Senegal, by which we nearly engroſſed the whole gum trade of that country; but we reſtored Goree, a ſmall iſland of little value. The article that relates to the Eaſt Indies, was dictated by the directors of the Engliſh company; which reſtores to the French all the places they had at the beginning of the war, on condition that they ſhall maintain neither fort nor forces in the province of Bengal. And the city of Manilla was reſtored to the Spaniards; but they confirmed to us the liberty of cutting logwood in the bay of Honduras in America. In Europe, likewiſe, the French reſtored to us the iſland of Minorca, and we reſtored to them the iſland of Belleiſle. In Germany, after ſix years ſpent in marches and countermarches, numerous ſkirmiſhes and bloody battles, Great Britain acquired much military fame, but at the expence of 30 millions ſterling! As to the objects of that war, it was agreed that a mutual reſtitution and oblivion ſhould take place, and each party ſit down at the end of the war, in the ſame ſituation in which they began it. And peace was reſtored between Portugal and Spain, both ſides to be upon the ſame footing as before the war.

The war, to which a period was now put, was the moſt brilliant in the Britiſh annals. No national prejudices nor party diſputes then exiſted. The ſame truly Britiſh ſpirit by which the miniſter was animated, fired the breaſt of the ſoldier and ſeaman. The nation had then arrived at a pitch of wealth unknown to former ages; and the monied man, pleaſed with the aſpect of the times, confiding in the abilities of the miniſter, and courage of the people, cheerfully opened his purſe. The incredible ſums of 18, 19, and 22 millions, raiſed by a few citizens of London, upon a ſhort notice, for the ſervice of the years 1759, 1760, and 1761, was no leſs aſtoniſhing to Europe, than the ſucceſs which attended the Britiſh fleets and armies in every quarter of the globe.

But the peace, though it received the ſanction of a majority of both houſes of parliament, was far from giving univerſal ſatisfaction to the people. The manner in which it was begun, and the precipitation with which it was concluded, were condemned. The terms alſo were cenſured by many, as extremely inadequate to what might juſtly have been expected from the numerous victories and advantages which had been obtained againſt the enemy. And from this period various cauſes concurred to excite a ſpirit of diſcontent in the nation.

On the 30th of April, 1763, three of the king's meſſengers entered the houſe of John Wilkes, eſq. member of parliament for Ayleſbury, and ſeized his perſon, by virtue of a general warrant from the ſecretary of ſtate, which directed them to ſeize 'the authors, printers, and publiſhers, of a ſeditious and treaſonable paper, intitled the North Briton, No. 45.' The papers publiſhed under this title, ſeverely arraigned the conduct of the adminiſtration, and repreſented the earl of Bute as the favourite of the king, and the perſon from whom meaſures of government of a very pernicious tendency originated. The 45th number contained ſtrictures on the king's ſpeech. Mr. Wilkes was ſuſpected to be the author, but his name was not mentioned in the warrant by which he was apprehended. He objected to being taken into cuſtody by ſuch a warrant, alleging that it was illegal. However he was forcibly carried before the ſecretaries of ſtate for examination, and they committed him cloſe priſoner to the Tower, his moſt ſecret and confidential papers being alſo ſeized. He was likewiſe deprived of his commiſſion as colonel of the Buckinghamſhire militia. Not to mention the privilege of parliament which was flagrantly violated, the warrants were totally illegal, and directed as much againſt the whole Engliſh nation as againſt Mr. Wilkes and the other perſons taken into cuſtody. They were indeed conformable to precedent, but no precedent is ſufficient to juſtify what is in the nature of things wrong; or to ſubſtitute diſcretion in the place of law, which knows

knows no diſcretion, nor leaves the conſtruction to be put on warrants to thoſe low creatures, who muſt be entruſted with their execution. A writ of habeas corpus being procured by his friends, he was brought up to the court of Common Pleas, and the matter being there argued, he was ordered to be diſcharged. This affair made a great noiſe; people of all ranks intereſted themſelves in it, and Weſtminſter-hall reſounded with acclamations when he was ſet at liberty. An information, however, was filed againſt him in the court of King's Bench, at his majeſty's ſuit, as author of the North Briton, No. 45. On the firſt day of the meeting of parliament, after theſe tranſactions, Mr. Wilkes ſtood up in his place, and made a ſpeech, in which he complained to the houſe, that in his perſon the rights of all the commons of England, and the privileges of parliament, had been violated by his impriſonment, the plundering of his houſe, and the ſeizure of his papers. The ſame day, a meſſage was ſent to acquaint the houſe of commons, with the information his majeſty had received, that John Wilkes, eſq. a member of that houſe, was the author of a moſt ſeditious and dangerous libel, and the meaſures that had been taken thereupon. The next day a duel was fought in Hyde-park between Mr. Wilkes and Mr. Martin, another member of parliament, and ſecretary of the treaſury, in which Mr. Wilkes received a dangerous wound in the belly with a piſtol-bullet. Both houſes of parliament ſoon concurred in voting the North-Briton, No. 45, to be a falſe, ſcandalous, and ſeditious libel, and ordered it to be burnt by the common hangman. This order was accordingly executed, though not without great oppoſition from the populace; and Mr. Harley, one of the ſheriffs who attended, was wounded, and obliged to take ſhelter in the Manſion-Houſe. Another proſecution was commenced againſt Mr. Wilkes, for having cauſed an obſcene and profane poem to be printed, intitled, "An Eſſay on Woman." Of this, only twelve copies had been privately printed; and it did not appear to have been intended for publication. Finding, however, that he ſhould continue to be proſecuted with the utmoſt rigour, when his wound was in ſome degree healed, he thought proper to quit the kingdom. He was ſoon after expelled the houſe of commons; verdicts were alſo given againſt him, both on account of the North Briton and the Eſſay on Woman, and towards the end of the year 1764 he was outlawed. Sundry other perſons had been taken up for being concerned in printing and publiſhing the North Briton; but ſome of them obtained verdicts againſt the king's meſſengers for falſe impriſonment.

In the mean while, the earl of Bute, who had been made firſt lord of the treaſury, reſigned that office, and was ſucceeded by Mr. George Grenville. And under this gentleman's adminiſtration, an act was paſſed, ſaid to have been framed by him, entitled, "An Act for laying a *ſtamp-duty* in the Britiſh Colonies of North-America," which received the royal aſſent on the 22d of March 1765. Some other regulations were previouſly made, under pretence of preventing ſmuggling in America; but which in effect ſo cramped the trade of the colonies, as to be prejudicial both to them and to the mother-country. As ſoon as it was known in North America that the *ſtamp-act* was paſſed, the whole continent was kindled into a flame. As the Americans had hitherto been taxed by their own repreſentatives in their provincial aſſemblies, they loudly aſſerted, that the Britiſh parliament, in which they were not repreſented, had no right to tax them. Indeed, the ſame doctrine had been maintained in the Britiſh parliament, when the ſtamp-act was under conſideration. On the other hand, it was contended, that the colonies, who had been protected by Great Britain, ought, in reaſon and juſtice, to contribute towards the expence of the mother-country. 'Theſe children of our own planting,' ſaid Mr. George Grenville, ſpeaking of the Americans, 'nouriſhed by our indulgence, until they are grown to a good degree of ſtrength and opulence, and protected by our arms,

arms, will they grudge to contribute their mite to relieve us from the heavy load of national expence which we lie under?'

When the ſtamp-act, as printed by royal authority, reached the colonies, it was treated with every mark of indignation and contempt. It was publicly burnt in ſeveral places, together with the effigies of thoſe who were ſuppoſed to be the moſt active in bringing it about. The aſſembly of Virginia reſolved, 'That the general aſſembly of that colony, together with his majeſty or his ſubſtitute, have, in their repreſentative capacity, the only excluſive right and power to lay taxes and impoſitions upon the inhabitants of that colony; and that every attempt to inveſt ſuch a power in any perſon or perſons whatſoever, other than the general aſſembly aforeſaid, is illegal, unconſtitutional, and unjuſt, and has a manifeſt tendency to deſtroy Britiſh as well as American freedom.' Similar reſolves were alſo made in other colonies.

The general diſcontent which prevailed in America being known in England, ſeveral maſters of ſhips refuſed to take any ſtamps on board for the colonies; and it ſoon appeared, that their precaution was well founded; for ſuch as ventured to take them, had abundant reaſon to repent it, on their arrival at their deſtined ports; where, to ſave their veſſels from fire, they were forced to deliver their cargoes of ſtamped paper into the hands of the enraged multitude, to be treated in the ſame ignominious manner in which the act had been treated; and other veſſels were obliged to take ſhelter under ſuch of the king's ſhips as happened to be at hand to protect them. Many perſons who came from England, with commiſſions to act as diſtributors of the ſtamps, were alſo compelled publicly to renounce having any concern in them. Several other acts of violence were likewiſe committed, with a view of preventing the operations of the ſtamp-act, and aſſociations were alſo formed in the different colonies, whereby the people bound themſelves not to import or purchaſe any Britiſh manufactures, till that act ſhould be repealed. The inhabitants of the different colonies alſo eſtabliſhed committees to correſpond with each other, concerning the general affairs of the whole, and even appointed deputies from thoſe committees to meet IN CONGRESS at New-York. They aſſembled in that city, in October 1765, and this was the firſt congreſs held on the American continent.

Theſe commotions in America occaſioned ſo great an alarm in England, that the king thought proper to diſmiſs his miniſters. The marquis of Rockingham was appointed firſt lord of the treaſury; and ſome of his lordſhip's friends ſucceeded to the vacant places. In March 1766, an act was paſſed for repealing the American ſtamp-act. This was countenanced and ſupported by the new miniſtry; and Mr. Pitt, though not connected with them, yet ſpoke with great force in favour of the repeal. He ſaid of the late miniſtry, that 'every capital meaſure they had taken was entirely wrong.' He contended that the parliament of Great Britain had no right to tax the colonies. 'For the commons of America, repreſented in their ſeveral aſſemblies, have ever been in poſſeſſion of the exerciſe of their conſtitutional right, of giving and granting their own money. They would have been ſlaves if they had not enjoyed it. At the ſame time, this kingdom, as the ſupreme governing and legiſlative power, has always bound the colonies by her laws, by her regulations, and reſtrictions in trade, in navigation, in manufactures,—in every thing except that of taking their money out of their pockets without their conſent.'

At the time that the ſtamp-act was repealed, an act was alſo paſſed for ſecuring the dependence of the American colonies on Great Britain. But this does not appear then to have given much umbrage to the coloniſts; and the repeal of the ſtamp-act occaſioned great rejoicings both in America and Great Britain.

The marquis of Rockingham and his friends continued in adminiſtration but a ſhort

ſhort time: though, during their continuance in power, ſeveral public meaſures were adopted, tending to relieve the burthens of the people, and to the ſecurity of their liberties. But on the 30th of July, 1766, the duke of Grafton was appointed firſt lord of the treaſury, in the room of the marquis of Rockingham; the earl of Shelburne, ſecretary of ſtate, in the room of the duke of Richmond; Charles Townſhend, chancellor of the exchequer; and Mr. Pitt, now created earl of Chatham, was appointed lord-privy-ſeal; but that eminent ſtateſman's acceptance of a peerage, as it removed him from the houſe of commons, greatly leſſened his weight and influence. Indeed, this political arrangement was not of any long continuance, and ſundry changes followed. Mr. Charles Townſhend, who was a gentleman of great abilities and eloquence, made for ſome time a conſiderable figure both in the cabinet and in parliament; but, on his death, the place of chancellor of the exchequer was ſupplied by lord North, who afterwards became firſt lord of the treaſury, and obtained a great aſcendancy in the adminiſtration, which began the American war without neceſſity, conducted it without ſpirit or prudence, and at laſt concluded it without honour or advantage, nay with infinite diſhonour and diſadvantage, as they cut off from the empire the immenſe continent of North America, which our colonies poſſeſſed, the brighteſt jewel in the crown.

In the year 1768, Mr. Wilkes, who had for a conſiderable time reſided in France, came over to England, and again became an object of public attention. The parliament had juſt before been diſſolved; and on his arrival in London, though he ſtill lay under the ſentence of outlawry, he offered himſelf a candidate to repreſent that city in the enſuing parliament. He was received with loud acclamations, and the generality appeared greatly intereſted in his favour, but he loſt his election; only 1247 liverymen voted for him. His want of ſucceſs did not diſcourage him, for he immediately offered himſelf a candidate for the county of Middleſex. He was attended by an amazing number of people to Brentford, the place of election. The two other candidates had large fortunes, and great connections in the country; they had repreſented it for ſeveral years, and were ſupported by the whole intereſt of the court. Mr. Wilkes, however, being conſidered as a man who had been unjuſtly and unconſtitutionally perſecuted by the government, was elected by a great majority, on the 28th of March. The extreme joy of the populace at this event, occaſioned them to commit ſome irregularities in the city of London, on the evening of the day of election: and ſo great were the apprehenſions of the court upon this occaſion, that on the following day orders were given to the guards on duty at St. James's to be in readineſs at the beat of drum, to march to ſuppreſs any riot that might happen. In May following, Mr. Wilkes having voluntarily ſurrendered himſelf to the court of King's-bench, was committed to the King's-bench priſon. Soon after this, a number of perſons having aſſembled in St. George's fields, near that priſon, in hopes of ſeeing Mr. Wilkes, ſome diſorder enſued, and the ſoldiers were raſhly ordered to fire among the mob. Several perſons were killed, and in particular one William Allen, who was ſingled out, purſued by one of the ſoldiers, and ſhot near his father's houſe, in a manner which the occaſion could in no reſpect juſtify. This affair made a great noiſe; and the pains taken by the miniſter to ſupport and vindicate the military, increaſed the odium of the tranſaction. On the 8th of June Mr. Wilkes's outlawry was reverſed, and on the 18th of the ſame month ſentence was paſſed on him, that, for the republication of the North Briton, No. 45, he ſhould pay a fine of five hundred pounds, and be impriſoned ten months; and for publiſhing the Eſſay on Woman, that he ſhould pay the ſame fine, and be impriſoned twelve months, to be computed from the expiration of the term of the former impriſonment. He afterwards petitioned the houſe of commons, complaining of the injuſtice and illegality of the proceedings againſt him; but the houſe voted, that his complaints were frivolous

volous and groundleſs. He was alſo again expelled, for being the author of ſome prefatory remarks on a letter which he publiſhed, written by one of the ſecretaries of ſtate to the chairman of the quarter-ſeſſions at Lambeth, in which the ſecretary had recommended to the magiſtrates, previous to the unhappy affair of St. George's Fields, calling in the aſſiſtance of the military, and employing them *effectually*, if there ſhould be occaſion. In the vote for his expulſion, his former offences, for which he was now ſuffering impriſonment, were complicated with this charge; and a new writ was ordered to be iſſued for the election of a member for the county of Middleſex.

The rigor with which Mr. Wilkes was proſecuted only increaſed his popularity. Before his expulſion he had been choſen an alderman of London: and on the 16th of February, 1769, he was re-elected at Brentford member for the county of Middleſex. The return having been made to the houſe, it was reſolved, that Mr. Wilkes, having been expelled that ſeſſion, was incapable of being elected a member of that parliament. The late election, therefore, was declared void, and a new writ iſſued for another. He was once more unanimouſly re-elected by the freeholders, and the election was again declared void by the houſe of commons. After this a new election being ordered, colonel Luttrel, in order to recommend himſelf to the court, vacated the ſeat which he already had in parliament, by the acceptance of a nominal place, and declared himſelf a candidate for the county of Middleſex. Though the whole weight of court intereſt was thrown into the ſcale in this gentleman's favour, yet a majority of near four to one appeared againſt him on the day of election; the numbers for Wilkes being 1143, and for Luttrel only 296. Notwithſtanding this, two days after the election, it was reſolved in the houſe of commons, that Mr. Luttrel ought to have been returned a knight of the ſhire for the county of Middleſex; and the deputy-clerk of the crown was ordered to amend the return, by eraſing the name of Mr. Wilkes, and inſerting that of colonel Luttrel. The latter accordingly took his ſeat in parliament: but this was thought ſo groſs a violation of the rights of the electors that it excited a very general diſcontent.

Petitions, couched in very ſtrong terms, were preſented to the throne from different places, complaining of this and other national grievances. The county of Middleſex, as the moſt immediately affected, took the lead on this occaſion, and preſented a petition, in which they complained, 'that their legal and free choice of a repreſentative had been repeatedly rejected, and the right of election finally taken from them, by the unprecedented ſeating of a candidate who was never choſen by the county.' They alſo ſaid, that 'inſtead of the ancient and legal civil police, the military were introduced at every opportunity, unneceſſarily and unlawfully; that the civil magiſtracy was rendered contemptible, by the appointment of improper and incapable perſons; and that the civil magiſtrates, being tampered with by adminiſtration, neglected and refuſed to diſcharge their duty.' Theſe petitioners likewiſe addreſſed his majeſty in the following terms: 'With great grief and ſorrow we have long beheld the endeavours of certain evil-minded perſons to infuſe into your royal mind notions and opinions of the moſt pernicious tendency, and who promote and counſel ſuch meaſures as cannot fail to deſtroy that harmony and confidence which ſhould ever ſubſiſt between a juſt and virtuous prince, and a free and loyal people.' Petitions of a ſimilar nature were preſented from the livery of London, the electors of Weſtminſter, from ſeveral other cities and boroughs, and about ſeventeen counties. Theſe petitions were ſaid to be ſigned by upwards of 60,000 electors. Some of them were principally confined to the violated right of election, but others were more diffuſe; and Yorkſhire, Weſtminſter, and ſome others, prayed, in expreſs terms, for a diſſolution of parliament, under the idea of its being venal and corrupt. Addreſſes were, however, procured from ſundry other places

places, of a very different tendency, and breathing nothing but loyalty and attachment to the government; notwithſtanding which it was extremely manifeſt that a great ſpirit of diſcontent prevailed throughout the nation.

In the courſe of this year a very important act was paſſed for regulating the conduct of the houſe of commons in controverted elections. Theſe uſed formerly to be determined by the houſe at large, and by a majority of votes, ſo that they were conſidered merely as party-matters, and the ſtrongeſt party, which was always that of the miniſtry, was ſure to carry the point, without paying the leaſt regard to the merits of the queſtion on either ſide. But by the bill, which was now paſſed, commonly called the Grenville-act, as it was drawn up and brought in by Mr. Grenville, they were ordered for the future to be decided by a committee of thirteen members, choſen by lot, and under the ſacred obligation of an oath; and ſince the enaction of this law, no well-grounded complaint has been made againſt the impartiality of their deciſions.

After the term of Mr. Wilkes's impriſonment was expired, in the year 1771, he was choſen one of the ſheriffs for London and Middleſex; and the ſame year a remarkable conteſt happened between the city of London and the houſe of commons. Several printers had been ordered to attend that houſe, being charged with having inſerted in their news-papers accounts of the ſpeeches of members of parliament, contrary to a ſtanding order of the houſe. One of theſe printers, who had refuſed to attend the ſummons of the houſe, was apprehended by a meſſenger of the houſe of commons in his own houſe; whereupon he immediately ſent for a conſtable, and the meſſenger was carried before the lord-mayor at the manſion-houſe, where the aldermen Wilkes and Oliver alſo then were. The deputy ſerjeant at arms alſo attended, and demanded, in the name of the ſpeaker, that both the meſſenger and the printer ſhould be delivered up to him. This was refuſed by the lord-mayor, who aſked, for what crime, and upon what authority, the meſſenger had arreſted the printer? The meſſenger anſwered, he had done it by warrant from the ſpeaker. It was then aſked, if the warrant had been backed by a city magiſtrate? Which being anſwered in the negative, the warrant was demanded, and, after much altercation, produced; and its invalidity being argued by the printer's counſel, the three magiſtrates preſent diſcharged him from confinement. His complaint for an aſſault and falſe impriſonment being then heard, and the facts proved and admitted, the meſſenger was aſked for bail, which the ſerjeant having refuſed to give, a warrant for his commitment to priſon was made out, and ſigned by the lord-mayor and the two aldermen; but the ſerjeant then offered bail, which was accepted. The conſequence of this tranſaction was, that a few days after, the lord-mayor Croſby, and alderman Oliver, members of the houſe of commons, were committed priſoners to the Tower for their ſhare in this buſineſs, by the authority of the houſe; but they avoided, as much as poſſible, any new conteſt with Mr. Wilkes. That gentleman was choſen member for Middleſex in the ſubſequent parliament, and in the year 1783, after the change of lord North's adminiſtration, all the declarations, orders, and reſolutions, of the houſe of commons reſpecting his election for the county of Middleſex, were ordered to be expunged from the journals of that houſe, "as being ſubverſive of the rights of the whole body of electors of this kingdom." And it ſhould be remembered, that in conſequence of his manly and ſpirited conteſts with the government, general warrants were declared to be illegal, and an end was put to ſuch warrants, and to the unlawful ſeizure of an Engliſhman's papers by ſtate meſſengers.

Elective kingdoms are ſubject to ſuch violent ſhocks and convulſions upon every vacancy of the throne, that it has been thought proper in moſt of the modern ſtates of Europe, to eſtabliſh hereditary monarchies; and even in theſe laſt a diſputed title is always attended with ſuch civil wars and bloodſhed, that it has

been found expedient to keep the line of ſucceſſion as clear and diſtinct as poſſible. This is the reaſon why ſo much attention is given in this kingdom to the marriages of the royal family. The king's two brothers, the dukes of Glouceſter and Cumberland, having married privately, the former the counteſs dowager of Waldegrave, the latter a widow lady of the name of Horton, daughter to lord Irnham; a bill was now paſſed, in the year 1772, enacting, that all the deſcendants of his late majeſty (other than the iſſue of princeſſes, who have married, or may hereafter marry into foreign families) ſhall be incapable of contracting marriage without the conſent of the king, or his ſucceſſors on the throne, ſignified under the great ſeal, and declared in council; that every ſuch marriage, without ſuch conſent, ſhall be void; that, nevertheleſs, ſuch deſcendants being above the age of twenty-five years, upon their giving the privy-council twelve months notice of their deſign, may, after the expiration of that term, enter into marriage without the royal conſent, unleſs both houſes of parliament ſhall within that time expreſly declare their diſapprobation of it.

After the repeal of the ſtamp-act, which was received with great joy in America, all things became quiet there: but unhappily new attempts were made to tax them in the Britiſh parliament, though beſides the experience of the ill ſucceſs of the ſtamp-act, governor Pownall, a gentleman well acquainted with the diſpoſition of the coloniſts, ſaid in the houſe of commons in 1767, "It is a fact which this houſe ought to be appriſed of in all its extent, that the people of America, univerſally, unitedly, and unalterably, are reſolved not to ſubmit to any internal tax impoſed upon them by any legiſlature, in which they have not a ſhare by repreſentatives of their own election." He added, "this claim muſt not be underſtood, as though it were only the pretences of party-leaders and demagogues; as though it were only the viſions of ſpeculative enthuſiaſts; as though it were the mere ebullition of a faction which muſt ſubſide; as though it were only temporary, and partial—it is the cool, deliberate, principled maxim of every man of buſineſs in the country." The event verified the juſtice of theſe obſervations; yet the ſame year an act was paſſed, laying certain duties on paper, glaſs, tea, &c. imported into America, to be paid by the colonies for the purpoſe of raiſing a revenue to the government. About two years after, it was thought proper to repeal theſe duties, except that on tea; but as it was not the *amount* of the duties, but the *right* of the parliament of Great Britain to impoſe taxes in America, which was the ſubject of diſpute, the repealing the other duties anſwered no purpoſe, while that on tea remained, which accordingly became a freſh ſubject of conteſt between the mother-country and the colonies. Other laws had alſo been paſſed in England, particularly one relating to quartering troops in the colonies, and another for ſuſpending the legiſlative powers of the aſſembly of New York, which gave great umbrage in America. Another ſcheme which was alſo adopted, of appointing the governors and judges in the colonies to be paid by the crown, and not by the provincial aſſemblies, as heretofore, occaſioned likewiſe much diſcontent in America, as it was ſuppoſed that this new regulation would render the governors and judges wholly dependent on the crown.

In order to induce the Eaſt India company to become inſtrumental in enforcing the tea-duty in America, an act was paſſed, by which they were enabled to export their teas, duty-free, to all places whatſoever. Several ſhips were accordingly freighted with teas for the different colonies by the company, who alſo appointed agents there for the diſpoſal of that commodity. This was conſidered by the Americans as a ſcheme calculated merely to circumvent them into a compliance with the revenue law, and thereby pave the way to an unlimited taxation. For it was eaſily comprehended, that if the tea was once landed, and in the cuſtody of the conſignees, no aſſociations nor other meaſures would be ſufficient to prevent its

ſale

ſale and conſumption: and it was not to be ſuppoſed, that when taxation was eſtabliſhed in one inſtance, it would be reſtrained in others. Theſe ideas being generally prevalent in America, it was reſolved by the coloniſts to prevent the landing of the tea-cargoes amongſt them, at whatever hazard. Accordingly, three ſhips laden with tea having arrived in the port of Boſton in December, 1773, a number of armed men, under the diſguiſe of Mohawk Indians, boarded theſe ſhips, and in a few hours diſcharged their whole cargoes into the ſea, without doing any other damage, or offering any injury to the captains or crews. Some ſmaller quantities of tea met afterwards with a ſimilar fate at Boſton, and a few other places; but in general, the commiſſioners for the ſale of that commodity were obliged to relinquiſh their employments, and the maſters of the tea-veſſels, from an apprehenſion of danger, returned again to England with their cargoes. At New York, indeed, the tea was landed under the cannon of a man of war. But the perſons in the ſervice of government there were obliged to conſent to its being locked up from uſe. And in South Carolina ſome was thrown into the river, as at Boſton, and the reſt put into damp warehouſes, where it periſhed.

Theſe proceedings in America excited ſo much indignation in the government of England, that on the 31ſt of March, 1774, an act was paſſed for removing the cuſtom-houſe officers from the town of Boſton, and ſhutting up the port. Another act was ſoon after paſſed 'for better regulating the government in the province of Maſſachuſet's Bay.' The deſign of this act was to alter the conſtitution of that province as it ſtood upon the charter of king William; to take the whole executive power out of the hands of the people, and to veſt the nomination of the counſellors, judges, and magiſtrates of all kinds, including ſheriffs, in the crown, and in ſome caſes in the king's governor, and all to be removeable at the pleaſure of the crown. Another act was alſo paſſed, which was conſidered as highly injurious and unconſtitutional, empowering the governor of Maſſachuſet's Bay to ſend perſons accuſed of crimes there to be tried in England for ſuch offences. Some time after an act was likewiſe paſſed 'for making more effectual proviſion for the government of the province of Quebec,' which excited a great alarm both in England and America. By this act, a legiſlative council was to be eſtabliſhed for all the affairs of the province of Quebec, except taxation, which council was to be appointed by the crown, the office to be held during pleaſure; and his majeſty's Canadian Roman catholic ſubjects were entitled to a place in it. The French laws, and a trial without jury, were alſo eſtabliſhed in civil caſes, and the Engliſh laws, with a trial by jury, in criminal; and the popiſh clergy were inveſted with a legal right to their tithes from all who were of their own religion. No aſſembly of the people, as in other Britiſh colonies, was appointed, it being ſaid in the act, that it was then inexpedient: but the king was to erect ſuch courts of criminal, civil, and eccleſiaſtical juriſdiction, as he ſhould think proper. The boundaries of the province of Quebec were likewiſe extended by the act thouſands of miles at the back of the other colonies, whereby, it was ſaid, a government little better than deſpotic was eſtabliſhed throughout an extenſive country. As to the clauſes reſpecting the Popiſh clergy in Canada, it was admitted, that it would have been unjuſt to have perſecuted them, or to have deprived them of the exerciſe of their religion; but it was maintained, that it could not be neceſſary that popery ſhould have ſuch a legal eſtabliſhment given it by a Britiſh government, as that their prieſts ſhould have the ſame right to claim their eccleſiaſtical revenues, as the clergy of the eſtabliſhed church in England. It was alſo thought extremely injurious to the Britiſh ſettlers in Canada, that, when that province had been conquered by Britiſh arms, they ſhould be compelled to ſubmit to French laws, and be deprived of thoſe privileges which they would have enjoyed in other parts of his majeſty's dominions.

The

The meaſures of government reſpecting America had ſo univerſally exaſperated the coloniſts, that provincial or town-meetings were held in every part of the continent, wherein they avowed their intentions of oppoſing, in the moſt vigorous manner, the meaſures of adminiſtration. One cauſe, one injury, and one ſentiment, rouſed and pervaded all. Agreements were entered into in the different colonies, whereby the ſubſcribers bound themſelves in the moſt ſolemn manner, and in the preſence of God, to ſuſpend all commercial intercourſe with Great Britain, from the laſt day of the month of Auguſt, 1774, until the Boſton-port-bill, and the other late obnoxious laws, were repealed, and the colony of Maſſachuſet's Bay fully reſtored to its chartered rights. Other tranſactions ſucceeded; and the flame continued to increaſe and extend in America, till at length twelve of the colonies, including that whole extent of country which reaches from Nova Scotia to Georgia, had appointed deputies to attend a General Congreſs, which was opened at Philadelphia, the 5th of September, 1774. They met accordingly, and the number of delegates amounted to fifty-one; who repreſented the ſeveral Engliſh colonies of New Hampſhire (2), Maſſachuſet's Bay (4), Rhode Iſland and Providence Plantations (2), Connecticut (3), New York (7), New Jerſey (4), Pennſylvania (7), the lower counties on Delaware (3), Maryland (4), Virginia (7), North Carolina (3), and South Carolina (5 delegates); Georgia afterwards acceded to the confederacy, and ſent deputies to the Congreſs. They entered into an aſſociation, in which they bound themſelves and their conſtituents, not to import into Britiſh America, from Great Britain or Ireland, any goods, wares, or merchandiſe whatſoever, from the firſt day of December following; nor to import any Eaſt India tea from any part of the world; nor to export any merchandiſe or commodity whatſoever to Great Britain, Ireland, or the Weſt Indies, from the 10th of September, 1775, unleſs the act for ſtopping the port and blocking up the harbour of Boſton, that for altering the charter and government of the province of Maſſachuſet's Bay, the Quebec act, the acts by which duties were impoſed on any commodities imported into America, and ſome other acts, which they enumerated, were repealed. They avowed their allegiance to his Majeſty, and their affection and regard for their fellow ſubjects in Great Britain, but aſſerted the neceſſity of their adopting ſuch meaſures as were calculated to obtain a redreſs of thoſe grievances which they laboured under; and which, they ſaid, "threatened deſtruction to the lives, liberty, and property of the inhabitants of the colonies."

They alſo drew up a petition to the king, in which they enumerated their ſeveral grievances, and ſolicited his Majeſty to grant them peace, liberty, and ſafety. They likewiſe publiſhed an addreſs to the people of Great Britain, another to the colonies in general, and another to the inhabitants of the provinces of Quebec. The congreſs broke up on the 26th of October, having reſolved, that another congreſs ſhould be held in the ſame place, on the 10th of May following, unleſs the grievances of which they complained ſhould be redreſſed before that time: and they recommended to all the colonies to chooſe deputies, as ſoon as poſſible, for that purpoſe.

Shortly after theſe events, ſome meaſures were propoſed in the parliament of Great Britain, for putting a ſtop to the commotions which unhappily ſubſiſted in America. The earl of Chatham, who had been long in an infirm ſtate of health, appeared in the houſe of lords, and expreſſed in the ſtrongeſt terms his diſapprobation of the whole ſyſtem of American politics. He alſo made a motion for immediately recalling the troops from Boſton. He repreſented this as a matter which ſhould be inſtantly adopted; urging, that an hour then loſt, in allaying the ferment in America, might produce years of calamity. He alledged, that the preſent ſituation of the troops rendered them and the Americans continually liable to events, which would cut off the poſſibility of a reconciliation; but that this conciliatory

ciliatory meaſure would be well-timed; and as a mark of affection and good-will on our ſide, would remove all jealouſy and apprehenſion on the other, and inſtantaneouſly produce the happieſt effects to both. His lordſhip's motion was rejected by a large majority, 68 againſt 18; as was alſo a bill which he brought in ſoon after for ſettling the American troubles, by 61 to 32. The methods propoſed in the houſe of commons for promoting an accommodation, met alſo with a ſimilar fate. The number of his majeſty's troops was ordered to be augmented; and an act was paſſed for reſtraining the commerce of the New England colonies, and to prohibit their fiſhery on the banks of Newfoundland. A motion was, indeed, afterwards made in the houſe of commons, by lord North, firſt lord of the treaſury, for ſuſpending the exerciſe of the right of taxation in America, claimed by the Britiſh parliament, in ſuch of the colonies as ſhould, in their general aſſemblies, raiſe ſuch contributions as were approved of by the king in parliament. This motion was carried, and afterwards communicated to ſome of the provincial aſſemblies: but it was rejected by them as deluſive and unſatisfactory, and only calculated to diſunite them. The petition from the congreſs to the king was ordered by his majeſty to be laid before the parliament: whereupon Dr. Franklin, and two other American agents, ſolicited to be heard at the bar of the houſe of commons, on behalf of the colonies, in ſupport of that petition: but their application was rejected; it being ſaid, that the American congreſs was no legal aſſembly, and that therefore no petition could be received from it by the parliament with propriety.

In the mean time, the inhabitants of the American colonies began to prepare for war; they trained and exerciſed their militia with great induſtry; and when advice was received of a proclamation which was iſſued in England, to prevent the exportation of arms and ammunition to America, meaſures were immediately adopted to remedy the defect. And to render themſelves as independent as poſſible of foreigners, for the ſupply of thoſe articles, mills were erected, and manufactories formed, both in Philadelphia and Virginia, for the making of gun-powder; and encouragement was given in all the colonies, for the fabrication of arms of every kind.

It was on the 19th of April, 1775, that the firſt blood was drawn, in this unhappy civil war. The Americans having collected ſome military ſtores at the town of Concord in New-England, general Gage, governor of the colony, ſent the grenadiers and light infantry of the army to deſtroy them. The detachment, conſiſting of about 900 men, embarked in boats at Boſton, and having landed at a place called Phipps's farm, proceeded with expedition towards Concord. When they arrived at Lexington, they found a company of militia, of about 100 men, muſtered near a meeting-houſe. It was juſt before ſun-riſe when the Britiſh troops came in ſight of them; whereupon an officer in the van called out, "Diſperſe, you rebels, throw down your arms, and diſperſe," the ſoldiers at the ſame time running up with loud huzzas. Some ſcattering ſhots were firſt fired, and immediately ſucceeded by a general diſcharge, by which eight of the American militia were killed, and ſeveral wounded: it was ſaid by ſome of the regulars, that the provincials firſt fired, the contrary was teſtified upon oath by a number of the Americans. After this the detachment advanced to Concord, and proceeded to execute their commiſſion, by rendering three pieces of cannon unſerviceable, burning ſome new gun carriages, a number of carriage wheels, and throwing into the river a conſiderable quantity of flour, gunpowder, muſket-balls, and other articles. In the mean time a ſmall body of the militia returned towards the bridge which they had lately paſſed; and upon this movement, the light infantry retired on the Concord ſide of the river, and began to pull up the bridge; but, upon the near approach of the militia, the ſoldiers immediately fired, and killed two men. The Americans returned the fire, and a ſkirmiſh enſued at the bridge, in which the

Engliſh troops were forced to retreat, having ſeveral men killed and wounded, and a lieutenant and ſome others taken. About this time the country people began to riſe more generally againſt the king's troops, and to attack them on all quarters; ſkirmiſh ſucceeded upon ſkirmiſh; and a continued, though irregular fire, was ſupported through the whole of a long and hot day. In the march back to Lexington, a diſtance of ſix miles, the troops were extremely annoyed, and it is probable, that their whole body would have been cut off, had not general Gage ſent lord Percy in the morning to ſupport them with ſixteen companies of foot, and a body of marines, with two pieces of cannon. This powerful reinforcement obliged the provincials for ſome time to keep their diſtance: but as ſoon as the king's troops reſumed their march, the attacks, as the country people became more numerous, grew in proportion more violent, and the danger was continually augmenting, until they arrived, about ſun-ſet, at Charles-Town, from whence they paſſed over directly to Boſton, extremely haraſſed and fatigued. The loſs of the king's troops amounted to 65 killed, 170 wounded, and about 20 priſoners. The Americans were computed not to have loſt more than 60, including killed and wounded.

Soon after this action, numerous bodies of the American militia inveſted the town of Boſton, in which general Gage and his troops were. In all the colonies they prepared for war with the utmoſt diſpatch; and a ſtop was almoſt every where put to the exportation of proviſions. The continental congreſs met at Philadelphia on the 10th of May 1775, as propoſed, and ſoon adopted ſuch meaſures as confirmed the people in their reſolutions to oppoſe the Britiſh government to the utmoſt. Among their firſt acts, were reſolutions for the raiſing of an army, and the eſtabliſhment of a large paper currency for its payment. They aſſumed the appellation of "The United Colonies of America," who were ſecurities for realizing the nominal value of this currency. They alſo ſtrictly prohibited the ſupplying of the Britiſh fiſheries with any kind of proviſions, and to render this order the more effectual, ſtopt all exportation to thoſe colonies, iſlands, and places, which ſtill retained their obedience.

In the mean time, a body of provincial adventurers, amounting to about 240 men, ſurpriſed the garriſons of Ticonderago and Crown Point. Theſe fortreſſes were taken without the loſs of a man on either ſide: and the provincials found in the forts a conſiderable number of pieces of cannon, beſides mortars, and ſundry kinds of military ſtores. However, the force of Great Britain in America was now augmented, by the arrival at Boſton from England, of the generals Howe, Burgoyne, and Clinton, with conſiderable reinforcements. But the continental congreſs were ſo little intimidated by this, that they voted, a few days after, that the compact between the crown and the people of Maſſachuſet's Bay was diſſolved, by the violation of the charter of William and Mary; and therefore recommended to the people of that province, to proceed to the eſtabliſhment of a new government, by electing a governor, aſſiſtants, and houſe of aſſembly, according to the powers contained in their original charter.

The town of Boſton had now been for ſome time blocked up by the provincials: but the poſt of Charles-Town, which is ſeparated from Boſton only by a river, had hitherto been neglected by both parties. The Americans at laſt thought this poſt neceſſary for them, whether they ſhould chuſe to act on the offenſive or defenſive. They accordingly made preparations, and ſent a body of men at night to throw up works upon Bunker's hill, a high ground that lies juſt within the iſthmus, or neck of land that joins the peninſula to the continent. The party carried on their works with ſuch order and ſilence, that though the peninſula was ſurrounded with ſhips of war, they were not heard during the night, and uſed ſuch incredible diſpatch in the execution, that they had a ſmall but ſtrong redoubt, conſiderable entrenchments, and a breaſt-work, which was in ſome parts cannon-proof, far advanced towards

completion, by the break of day. The fight of the works was the firſt notice that alarmed the Lively man of war early in the morning; and her guns called the town, camp, and fleet, to behold a fight which ſeemed little leſs than a prodigy. Upon this diſcovery, a heavy and continual fire of cannon, howitzers, and mortars, was carried on upon the works of the provincials, from the ſhips, from floating batteries, and from the top of Cop's Hill in Boſton: but the Americans bore this ſevere fire with great firmneſs, and appeared to purſue their buſineſs as if no enemy had been near. About noon general Gage cauſed a conſiderable body of troops to be embarked under the command of major-general Howe, and brigadier-general Pigot, to drive the provincials from their works. This detachment, together with a reinforcement which it afterwards received, amounted in the whole to more than 2000 men. The attack was begun by a moſt ſevere fire of cannon and howitzers, under which the troops advanced very ſlowly towards the enemy, and halted ſeveral times, to afford an opportunity to the artillery to ruin the works, and to put the Americans into confuſion. The Americans, on their part, ſuſtained a ſevere and continual fire of ſmall arms and artillery with remarkable firmneſs and reſolution. They did not return a ſhot, until the king's forces had approached almoſt to the works, when a moſt dreadful fire took place, by which numbers of the Britiſh troops fell, and many of their officers. They were thereupon thrown into diſorder; but being rallied, and again brought to the charge, they attacked the works of the Americans with fixed bayonets, and forced them in every quarter. Many of the provincials were deſtitute of bayonets, and their ammunition is ſaid to have been expended; however, a number of them fought deſperately within the works, from which they were not driven without great difficulty, and they at length retreated ſlowly over Charles Town Neck. Charles Town itſelf, during the action, was ſet on fire in ſeveral places, and burnt to the ground. This was the firſt ſettlement made in the colony, and was conſidered as the mother of Boſton, that town owing its birth and nurture to emigrants from the former: it contained about 400 houſes, and had a great trade. The loſs of the king's troops in the action at Bunker's Hill amounted to 226 killed, and more than 800 wounded, including many officers.

After this action the Americans immediately threw up works upon another hill, oppoſite to it, on their ſide of Charles Town Neck; ſo that the troops were as cloſely inveſted in that peninſula as they had been in Boſton. About this time the congreſs appointed George Waſhington, eſq. a gentleman of large fortune in Virginia, of great military talents, and who had acquired conſiderable experience in the command of different bodies of provincials during the laſt war, to be general and commander in chief of all the American forces. They alſo publiſhed a declaration, in which they ſtyled themſelves "the Repreſentatives of the United Colonies of North America," and aſſigned their reaſons for taking up arms. It was written in a very animated ſtrain, and contained the following paſſage: "In our own native land, in defence of the freedom that is our birth-right, and which we ever enjoyed till the late violation of it; for the protection of our property, acquired ſolely by the honeſt induſtry of our forefathers and ourſelves; againſt violence actually offered, we have taken up arms. We ſhall lay them down when hoſtilities ſhall ceaſe on the part of the aggreſſors, and all danger of their being renewed ſhall be removed, and not before." A ſecond petition to the king was alſo voted by the congreſs, in which they earneſtly ſolicited his majeſty to adopt ſome method of putting a ſtop to the unhappy conteſt between Great Britain and the colonies. This petition was preſented by Mr. Penn, late governor, and one of the proprietors of Pennſylvania, through the hands of lord Dartmouth, ſecretary of ſtate for the American department; but Mr. Penn was ſoon after informed, that no anſwer would be given to it. The refuſal of the king to give an anſwer to this petition, from near three millions of people by their repreſentatives, contributed exceedingly

towards farther exaſperating the minds of the Americans. An addreſs was now publiſhed by the congreſs to the inhabitants of Great Britain, and to the people of Ireland.

But as no conciliatory meaſures were adopted, hoſtilities ſtill continued; and an expedition was ſet on foot by the Americans againſt Canada, to which they were induced by an extraordinary commiſſion given to general Carleton, the governor of Canada; by which he was empowered to embody and arm the Canadians, to march out of the country for the ſubjugation of the other colonies, and to proceed even to capital puniſhments againſt all thoſe whom he ſhould deem rebels and oppoſers of the laws. The American expedition againſt Canada was chiefly conducted by Richard Montgomery, an Iriſhman, on whom the congreſs conferred the rank of brigadier-general. He firſt made himſelf maſter of Chamblée, a ſmall fort, in which he found 120 barrels of gunpowder, and other military ſtores. He afterwards took the fort of St. John's, in which was a garriſon of about 500 regulars, together with ſome Canadian volunteers; and the town of Montreal alſo ſurrendered to him on the 13th of November, 1775. In the mean time colonel Benedict Arnold undertook to march with a body of Americans from Boſton to Quebec, by a rout which had hitherto been untried, and conſidered as impracticable. They had thick woods, deep ſwamps, difficult mountains and precipices alternately to encounter; and were at times obliged to cut their way for miles together through the thickets. After overcoming innumerable difficulties, they arrived in Canada, where Arnold publiſhed an addreſs to the people of that province, ſigned by general Waſhington, in which they were invited to join with the other colonies in an indiſſoluble union, and to range themſelves under the ſtandard of general liberty. A ſimilar publication had before been iſſued by Montgomery. Arnold appeared before Quebec on the 9th of November, and ſoon after joined Montgomery, on whom the chief command of courſe devolved. General Carleton, the governor, employed every effort to repel the aſſailants. On the 31ſt of December Montgomery attemped to gain poſſeſſion of the place by ſtorm, but was killed in the firſt fire from a battery, as advancing in the front of his men: Arnold was alſo dangerouſly wounded, about 60 of their men were likewiſe killed and wounded, and 300 taken priſoners. The beſiegers immediately quitted their camp, and retired about three miles from the city, and the ſiege was for ſome months converted into a blockade. On general Carleton's receiving conſiderable reinforcements and ſupplies of proviſions from England, May 1776, Arnold was obliged to make a precipitate retreat; Montreal, Chamblée, and St. John's were re-taken, and all Canada recovered by the king's troops.

During theſe tranſactions the royal army at Boſton was reduced to great diſtreſs for want of proviſions; the town was bombarded by the Americans, and general Howe, who now commanded the king's troops, which amounted to upwards of ſeven thouſand men, was obliged to quit Boſton, and embark for Halifax, leaving a conſiderable quantity of artillery and ſome ſtores behind. The town was evacuated on the 17th of March, 1776, and general Waſhington immediately took poſſeſſion of it. On the 4th of July following, the congreſs publiſhed a ſolemn declaration, in which they aſſigned their reaſons for withdrawing their allegiance from the king of Great Britain. In the name, and by the authority of the inhabitants of the united colonies, they declared that they then were, and of right ought to be, "Free and independent States;" that they were abſolved from all allegiance to the Britiſh crown, and that all political connection between them and the kingdom of Great Britain was totally diſſolved; and alſo that, as free and independent ſtates, they had full power to levy war, conclude peace, contract alliances, eſtabliſh commerce, and do all other acts and things, which independent ſtates may

of

of right do. They likewiſe publiſhed articles of confederation and perpetual union between the united colonies, in which they aſſumed the title of "the United States of America," and by which each of the colonies contracted a reciprocal treaty of alliance and friendſhip for their common defence, for the maintenance of their liberties, and for their general and mutual advantage; obliging themſelves to aſſiſt each other againſt all violence that might threaten all or any one of them, and to repel in common all the attacks that might be levelled againſt all, or any one of them, on account of religion, ſovereignty, commerce, or under any other pretext whatſoever. Each of the colonies reſerved to themſelves alone the excluſive right of regulating their internal government, and of framing laws in all matters not included in the articles of confederation.

Several attempts were made in the Britiſh parliament by the duke of Richmond, Mr. Burke, Mr. Hartley, Mr. Wilkes, and others, to promote conciliatory meaſures: but no ſchemes for that purpoſe obtained the countenance of the government. Nogociations were ſet on foot for taking large bodies of foreign troops into the pay of Great Britain, and the war continued to be carried on againſt the Americans with great ardour. In July 1776, an attempt was made by commodore ſir Peter Parker, and lieutenant-general Clinton, upon Charles-town in South Carolina. But this place was ſo ably defended by the Americans under general Lee, that the Britiſh commodore and general were obliged to retire, the king's ſhips having ſuſtained conſiderable loſs, and a twenty-eight gun ſhip, which run a-ground, was obliged to be burnt by the officers and ſeamen. However, a much more important and ſucceſsful attack againſt the Americans was ſoon after made under the command of general Howe, then joined with a large body of Heſſians, and a conſiderable number of Highlanders, ſo that his whole force was now extremely formidable. The fleet was commanded by his brother vice-admiral lord Howe; and both the general and admiral were inveſted with a power, under the title of "Commiſſioners for granting Peace to the Colonies," of granting pardons to thoſe who would lay down their arms. But their offers of this kind were treated by the Americans with contempt. An attack upon the town of New-York ſeems to have been expected by the provincials, and therefore they had fortified it in the beſt manner they were able. On Long Iſland, near New York, the Americans had alſo a large body of troops encamped, and ſeveral works thrown up. General Howe firſt landed on Staten Iſland, where he met with no oppoſition; but early in the morning of the 22d of Auguſt, a deſcent was made by the Britiſh troops upon Long Iſland, and towards noon about fifteen thouſand were landed. They had greatly the advantage of the Americans, by their ſuperior ſkill and diſcipline, and being better provided with artillery and every kind of military accommodation; and the American paſſes were far from being properly ſecured. Some ſkirmiſhes happened during ſeveral ſucceſſive days; in which the Britiſh troops engaged their enemies with great ardour, and the Americans ſuffered exceedingly. Finding themſelves ſo much overpowered, they at length reſolved to quit the iſland, and general Waſhington came over from New York to conduct their retreat, in which he diſplayed great ability. In the night of the 29th of July, the American troops were withdrawn from the camp and their different works, and with their baggage, ſtores, and part of their artillery, were conveyed to the water-ſide, embarked, and paſſed over a long ferry to New York, with ſuch extraordinary ſilence and order, that the Britiſh army did not perceive the leaſt motion, and were ſurpriſed in the morning at finding the American lines abandoned, and ſeing the laſt of their rear-guard in their boats, and out of danger. The provincials had been ſo ſurrounded by the Britiſh troops, and the latter had diſplayed ſuch ſuperior military ſkill, it was a ſubject of wonder that the greateſt part of the American army ſhould be able to effectuate their retreat. In the different actions

previous to their retreat, the loſs of the Americans had been very conſiderable. Upwards of a thouſand of them were taken priſoners, including three generals, three colonels, and many inferior officers; their number of killed and wounded was computed to be ſtill greater; they loſt alſo five field-pieces, and a quantity of ordnance was found in the different redoubts and forts on the iſland; whilſt the whole loſs of the Britiſh troops did not amount to more than three hundred killed and wounded.

But this great ſucceſs of the royal army was far from bringing the Americans to ſubmiſſion. When ſome overtures, tending towards a reconciliation, were a few days after made by lord Howe, he was anſwered by a committee from the congreſs, "that the colonies now conſidered themſelves as independent ſtates, and were ſettling, or had ſettled, their government accordingly; and that, therefore, a return to the domination of Great Britain was not now to be expected; but they were willing to enter into any treaty with Great Britain which might be beneficial to both countries." Soon after this, the Americans abandoned the city of New York to the king's troops, who took poſſeſſion of it with little oppoſition, and found therein a large quantity of ordnance and military ſtores. Some of the provincials afterwards found means to ſet fire to the city in ſeveral places, and a third part of it was burnt down.

After the ſurrender of New York, the royal army obtained other conſiderable advantages over the Americans: as at the White Plains, taking Fort-Waſhington, with a garriſon of 2500 men, and Fort Lee with a great quantity of ſtores, which loſſes obliged the American general to retreat through the Jerſies to the river Delaware, a diſtance of ninety miles. Alſo on the 8th of December, general Clinton, and ſir Peter Parker obtained poſſeſſion of Rhode-iſland; and the Britiſh troops covered the Jerſies. This was the criſis of American danger. Their forts were taken, the time of military ſervice of the greateſt part was expired, and the few that remained with their officers were in a deſtitute ſtate, with a well clothed and diſciplined army purſuing. Had general Howe haſtened at that time to Philadelphia, after Waſhington, it hath been maintained, there would have been an end of the conteſt. His delay gave time for volunteer reinforcements of gentleman, merchant, farmer, tradeſman, and labourer, to join general Waſhington, who, in the night of the 25th of December, amidſt ſnow, ſtorms, and ice, with a ſmall detachment, croſſed the Delaware, and ſurpriſed a brigade of the Heſſian troops at Trenton. He took upwards of 900 of them priſoners, with whom he repaſſed the river; having alſo taken three ſtandards, ſix pieces of braſs cannon, and near one thouſand ſtand of arms. Immediately after this ſurpriſe of the Heſſians, and depoſiting them in ſafety, Waſhington recroſſed the river to reſume his former poſt at Trenton. The Britiſh troops collected in force to attack him, and only waited for the morning; but the Americans defeated his plan. Waſhington, to diſguiſe his retreat, in the night, ordered a line of fires in front of his camp. Then moving from the ground with his baggage and artillery, he, by a circuitous march of eighteen miles, reached Prince-town early in the morning, carried the Britiſh poſt at that place, and ſet off with near 300 priſoners on his return to the Delaware, juſt as the Britiſh troops at Trenton were under arms and proceeding to attack him, ſuppoſing him in his former poſition. By theſe two events, accompliſhed with but a ſmall force, the Americans deranged all the meaſures of the Britiſh general; made him draw in his troops to a cloſer compaſs, to protect his magazines at Brunſwick; and by the efforts of their general, they cloſed the campaign with advantage, which but a few days before had threatened the country with deſtruction. The Americans had alſo fitted out a great number of privateers, which took many prizes; and, on the other hand, not a few of the American veſſels fell into the hands of the Engliſh, but they were generally of little value.

In

In the month of September 1777, two actions of ſome importance happened between the armies of general Howe and general Waſhington, in both of which the former had the advantage; and ſoon after, the city of Philadelphia ſurrendered to the king's troops. But an expedition, that had for ſome time been concerted, of invading the northern colonies by the way of Canada, proved extremely unſucceſsful. The command of this expedition had been given to lieutenant-general Burgoyne. He ſet out from Quebec with an army of near 10,000 men, and a fine train of artillery, and was joined by a conſiderable body of the Indians. For ſome time he drove the Americans before him, and made himſelf maſter of Ticonderago; but at length he encountered ſuch difficulties, and was ſo vigouroufly oppoſed by the Americans under Gates and Arnold, that after two ſevere actions, in which great numbers fell, general Burgoyne and his army of 5,600 men were obliged to lay down their arms October 17, 1777: they were, however, permitted to march out of their camp with all the honours of war, and were to be allowed to return to Europe, upon condition of their not ſerving again during the preſent war. In one of the actions previous to this convention, brigadier-general Frazer, a very gallant officer, was killed; and at the time of their ſurrender, the Britiſh army was exceedingly reduced in numbers; and their ſtock of proviſions was not more than ſufficient for three days ſubſiſtence: whilſt on the other hand, the American army had been joined by numerous bodies of the militia, who were exaſperated at ſome late cruelties committed by the Indians in the ſervice of Great Britain.

About the ſame time, ſir Henry Clinton and general Vaughan made a ſucceſsful expedition againſt the Americans up the North River; but the Americans complained that the Britiſh troops had wantonly ſet fire to houſes and towns, particularly Eſopus, and carried on the war in a manner not uſual among civilized nations. Theſe devaſtations greatly increaſed their averſion to the Britiſh governent, which had already taken a deep root. General Howe ſoon after returned to England, and the command of the Britiſh army in America devolved upon general Clinton: but it was now found neceſſary to evacuate Philadelphia; and accordingly Clinton reteated with the army to New York, in June, 1778. The Britiſh troops were attacked on their march by the Americans, but the retreat was ſo ably conducted, or the American general Lee behaved ſo ill, that their loſs did not amount to 300, killed and wounded.

This war with the colonies, the French court ſeems to have thought a favourable opportunity for leſſening the power of Great Britain. They ſupplied the Americans with arms and ammunition; ſome French officers alſo entered into the American ſervice; and on the 6th of February, 1778, a treaty of alliance was concluded at Paris, between the king and the Thirteen United Colonies; and of this treaty it was declared, that the eſſential and direct end was "to maintain effectually the liberty, ſovereignty, and independence, abſolute and unlimited, of the United States of North America, as well in matters of government as of commerce."

The parliament and people of Great Britain now began to be alarmed; and in June, 1778, the earl of Carliſle, William Eden, and George Johnſtone, eſqrs. arrived at Philadelphia, as commiſſioners from his majeſty, to ſettle the diſputes between the mother-country and the colonies. They were inveſted with certain powers for this purpoſe by act of parliament. But it was now too late: the terms, which, at an earlier period of the conteſt, would have been accepted with gratitude, were now rejected with diſdain. The congreſs refuſed to enter into any treaty with the Britiſh commiſſioners, unleſs the independency of the United States of America was previouſly acknowledged, or the Britiſh fleets and armies withdrawn from America. Neither of theſe requiſitions being complied with, the war continued to be carried on with mutual animoſity. At the cloſe of the year, Georgia was invaded

vaded by the king's troops, the town of Savannah taken, and the whole province at length reduced.

The conduct of France towards Great Britain, in taking part with the revolted coloniſts, occaſioned the commencement of hoſtilities between the two nations, though without any formal declaration of war on either ſide. On the 17th of June, 1778, the Licorne and La Belle Poule, two French frigates, were taken by admiral Keppel. Orders were immediately iſſued by the French court for making repriſals on the ſhips of Great Britain; and on the 27th of July a battle was fought off Breſt between the Engliſh fleet, under the command of admiral Keppel, and the French fleet, under the command of the count d'Orvilliers. The Engliſh fleet conſiſted of 30 ſhips of the line, and the French of 32, beſides frigates: they engaged for about three hours; but the action was not deciſive, no ſhip being taken on either ſide, and the French fleet at length retreated into the harbour of Breſt. Of the Engliſh 133 were killed in the action, and 373 wounded; and the loſs of the French is ſuppoſed to have been very great. After the engagement, there was much murmuring throughout the Engliſh fleet, becauſe a deciſive victory had not been obtained over the French; at laſt the blame was thrown upon ſir Hugh Palliſer, vice-admiral of the blue, who was charged in a newſpaper with miſconduct and diſobedience of orders. Though no regular accuſation was brought againſt him, he required of admiral Keppel publicly to vindicate his conduct from the unfavourable reports that were propagated againſt him. This the admiral declined, which gave riſe to ſome altercation between them; and ſir Hugh Palliſer afterwards thought proper to exhibit to the board of admiralty (of which he himſelf was a member) articles of accuſation againſt admiral Keppel, though, for many months after the action, he had continued to act under him. A mode of conduct ſo extraordinary was very generally and ſeverely cenſured; but the lords of the admiralty ordered a court-martial to be held for the trial of admiral Keppel. Soon after a memorial was preſented to the king by the duke of Bolton, ſigned by twelve admirals, among whom was lord Hawke, remonſtrating againſt the injuſtice of holding a court-martial on admiral Keppel, upon the accuſation of an inferior officer, "after forty years of meritorious ſervice, and a variety of actions in "which he had exerted eminent courage and conduct, by which the honour and "power of this nation, and the glory of the Britiſh flag, had been maintained and "increaſed in various parts of the world." When the court-martial was held, admiral Keppel was acquitted in the moſt honourable manner; and ſir Hugh Palliſer's charge againſt him was declared by the court to be "malicious and ill-"founded." Sir Hugh Palliſer being afterwards tried by another court-martial, partly compoſed from ſome of the captains of his own diviſion, he likewiſe was acquitted; and his diſobedience to the admiral's orders was aſcribed to the diſabled ſtate of his ſhip.

In the Eaſt Indies an engagement happened between ſome Engliſh ſhips of war under the command of ſir Edward Vernon, and ſome French ſhips under the command of Monſ. de Tronjolly, on the 10th of Auguſt, in which the former obliged the latter to retire; and on the 17th of October following, Pondicherry ſurrendered to the arms of Great Britain. In the courſe of the ſame year the iſland of St. Lucia, in the Weſt Indies, was taken from the French; who in return made themſelves maſters of Dominica, and the following year they obtained poſſeſſion of St. Vincent's and Grenada. In September, 1779, the count D'Eſtaing arrived at the mouth of the river Savannah, with a large fleet, and a conſiderable body of French troops, to the aſſiſtance of the Americans. After dallying a month, the French and Americans made an united attack upon the Britiſh troops at Savannah, under the command of general Prevoſt. But the latter defended themſelves ſo well, that the French and Americans were driven off with great loſs, and D'Eſtaing ſoon

ſoon after totally abandoned the coaſt of America. And at the cloſe of the year 1779, ſeveral French ſhips of war and merchant-ſhips were taken in the Weſt Indies, by a fleet under the command of ſir Hyde Parker.

By the intrigues of the French court, Spain was at length brought to engage in the war againſt England, and to aſſemble forces to beſiege Gibraltar, which was defended by the garriſon with great vigour. The naval force of Spain was alſo added to that of France, now become extremely formidable, and their combined fleets ſeemed for a time to ride triumphant in the Britiſh Channel. So great were their armaments, that the nation was under no inconſiderable apprehenſions of an invaſion; but they did not venture to make an experiment of that kind, and after parading for ſome time in the Channel, thought proper to retire to their own ports. On the 8th of January, 1780, ſir George Brydges Rodney, who had a large fleet under his command, captured ſeven Spaniſh ſhips and veſſels of war belonging to the royal company of Carraccas, with a number of trading veſſels under their convoy; and in a few days after the ſame admiral engaged near Cape St. Vincent a Spaniſh fleet, conſiſting of eleven ſhips of the line and two frigates, under Don Juan de Langara. Four of the largeſt Spaniſh ſhips were taken, and carried into Gibraltar, and two others driven on ſhore, one of which was afterwards recovered by the Engliſh. A Spaniſh 70 gun ſhip, with 600 men, was alſo blown up in the action. In April and May three actions likewiſe happened in the Weſt Indies, between the Engliſh fleet under admiral Rodney, who was now arrived in that part of the world, (having previouſly thrown ſupplies into Gibraltar), and the French fleet under the count de Guichen; but no ſhip was taken on either ſide. In July following admiral Geary took twelve valuable French merchant ſhips from Port au Prince; but on the 8th of Auguſt, the combined fleets of France and Spain took five Engliſh Eaſt Indiamen, and fifty Engliſh merchant ſhips, bound for the Weſt Indies, which was one of the moſt complete naval captures ever made, and a very ſevere ſtroke to the commerce of Great Britain.

On the 4th of May, 1780, ſir Henry Clinton made himſelf maſter of Charlestown, South Carolina; and on the 16th of Auguſt earl Cornwallis obtained a very ſignal victory over general Gates in that province, in which about a thouſand American priſoners were taken, beſides ſeven pieces of braſs cannon, a number of colours, and their ammunition-waggons. But on the 10th of July, Monſ. Ternay, with a fleet conſiſting of ſeven ſhips of the line, beſides frigates, and a large body of French troops, commanded by the count de Rochambeau, arrived at Rhode Iſland, and landed 6000 men there. The American inhabitants congratulated the French general upon his arrival, and he aſſured them, that the king, his maſter, had ſent him to the aſſiſtance of his good and faithful allies, the United States of America; and that the French troops were to act under the orders of general Waſhington, and would live with the Americans as their brethren.

Soon after, major-general Arnold deſerted the ſervice of the congreſs, made his eſcape to New York, and was appointed a brigadier-general in the royal ſervice. His behaviour in the government of Philadelphia had incurred the diſpleaſure of the Americans. He was reprimanded by a court-martial, but afterwards taken into ſervice in the principal army, with conſiderable rank and truſt. His affections however were totally eſtranged from the American cauſe. Accordingly when the ſtrong and important poſt of Weſt Point, with its dependencies, and a wing or conſiderable diviſion of the army were entruſted to him, a negociation was diſcovered between him and general Clinton for the purpoſe of delivering up the poſt which he commanded. This would have enabled Clinton to ſurpriſe the other poſts and batteries, and final ruin to the Americans muſt have been the reſult. Major Andrè, adjutant-general of the Britiſh army, was employed in this clandeſtine negociation. After an interview with Arnold, and ſtaying in his tent

a whole

a whole night and day; on his return to New York he was taken, diſguiſed, within the American lines, and in his boot were found, in Arnold's hand-writing, exact returns of the ſtate of the forces, ordnance, and defences at Weſt Point and its dependencies, the artillery orders, critical remarks on the works, eſtimates of the number of men on duty to man them, and a copy of very intereſting matters which had been laid before a council of war by the commander in chief. Theſe papers that were found upon him ſubjected him to inſtant execution, in the ſummary way uſually practiſed with ſpies; but general Waſhington appointed a board of fourteen general officers to examine into his caſe, who reported, that he ought to be conſidered as a ſpy, and as ſuch to ſuffer death, which was inflicted on him at Tappan, in the province of New York.

The great expences of the American war, and the burthens which were thereby laid upon the people, naturally occaſioned much diſcontent, and ſeemed to convince perſons of all ranks of the neceſſity of public œconomy. Meetings were therefore held in various counties of the kingdom, at the cloſe of the year 1779 and the beginning of the year 1780, at which great numbers of freeholders were preſent, who agreed to preſent petitions to the houſe of commons, in which they earneſtly requeſted, "that before any new burthens were laid upon this country, "effectual meaſures might be taken by the houſe to inquire into and correct the "groſs abuſes in the expenditure of public money; to reduce all exorbitant emo-"luments; to reſcind and aboliſh all ſinecure places and unmerited penſions; and "to appropriate the produce to the neceſſities of the ſtate, in ſuch manner as to "the wiſdom of parliament ſhould ſeem meet." The firſt petition of this kind was agreed to in the county of York; and the example was followed by the counties of Cheſter, Hertford, Suſſex, Surry, Eſſex, Somerſet, Wilts, Glouceſter, Huntingdon, Dorſet, Cumberland, Norfolk, Devon, Berks, Nottingham, Bucks, Cambridge, Bedford, Suffolk, Northumberland, Hereford, and Denbigh. The cities of London and Weſtminſter, and ſeveral other towns and corporations, concurred in ſimilar petitions. In ſome counties committees were alſo appointed to carry on the neceſſary correſpondence with other counties, for effectually promoting the objects of the petition. Great expectations were at firſt formed of the effects which theſe would produce, and they were vigorouſly ſupported by the minority in parliament, where ſome attempts were made to remedy the grievances ſtated, but nothing important was effected; the miniſtry ſoon found means to regain their influence; a diverſity of ſentiment occaſioned diſunion among the popular leaders; and various cauſes conſpired to bring the greateſt part of the nation to a patient acquieſcence in the meaſures of adminiſtration.

The middle of the year 1780 was diſtinguiſhed by one of the moſt diſgraceful exhibitions of religious bigotry that had ever appeared in this country; eſpecially if it be conſidered as happening in an age, in which the principles of toleration were well underſtood, and very prevalent. An act of parliament had been lately paſſed "for relieving his majeſty's ſubjects profeſſing the Romiſh religion, from certain "penalties and diſabilities impoſed upon them in the 11th and 12th years of the "reign of king William III." This act was generally approved by men of ſenſe, and of liberal ſentiments, by whom the laws againſt Papiſts were juſtly deemed too ſevere. The act at firſt ſeemed to give little offence to perſons of any claſs in England, but in Scotland it excited much indignation, though it did not extend to that kingdom. Reſolutions were formed to oppoſe any law for granting indulgences to Papiſts in Scotland; and a Romiſh chapel was burned, and the houſes of ſeveral Papiſts demoliſhed, in the city of Edinburgh. The contagion of bigotry at length reached England; a number of perſons aſſembled themſelves together, with a view of promoting a petition to parliament, for a repeal of the late act in favour of the Papiſts, and they aſſumed the title of the Proteſtant Aſſociation.

They

They were chiefly Methodiſts, and bigoted Calviniſts, in the lower ranks of life; many of them well-intentioned perſons, and having a juſt diſlike to popery; but not ſufficiently enlightened to conſider, that a ſpirit of perſecution was one of the worſt characteriſtics of that ſyſtem of ſuperſtition, and that this was at leaſt as odious in Proteſtants as in Papiſts. They continued to hold frequent meetings; lord George Gordon, a young man, diſcontented at not being promoted from a lieutenant to a captain in the navy, became their preſident, and they increaſed in numbers. At a time when the nation was ſurrounded with real dangers, the heads of theſe weak men were filled with nothing but the fear of popery; and they even ſeemed to fancy that they were contending for religious liberty, when they were labouring to excite the legiſlature to prevent ſome of their fellow-ſubjects from worſhipping God according to the dictates of their conſciences. The Proteſtant aſſociation at length agreed to a petition, which was ſaid to have been ſubſcribed by more than one hundred thouſand perſons. It was then reſolved, in order to give the more weight to their petition, that it ſhould be attended by great numbers of the petitioners in perſon; and a public advertiſement was iſſued for that purpoſe, ſigned by lord George Gordon. Fifty thouſand perſons are ſuppoſed to have aſſembled with this view, on Friday the 2d of June, in St. George's Fields; from whence they proceeded, with blue cockades in their hats, to the houſe of commons, where their petition was preſented by their preſident. In the courſe of the day ſeveral members of both houſes of parliament were groſsly inſulted and ill-treated by the populace; and a mob aſſembled the ſame evening, by which the Sardinian chapel in Lincoln's-inn Fields, and another Romiſh chapel in Warwick-ſtreet, Golden-ſquare, were entirely demoliſhed. A party of the guards was then ſent for, to put a ſtop to the farther progreſs of theſe violences, and thirteen of the rioters were taken, five of whom were afterwards commited to Newgate, eſcorted by the military. On the Sunday following another mob aſſembled, and deſtroyed a Popiſh chapel in Ropemaker's-Alley, Moorfields. On Monday they demoliſhed a ſchool-houſe, and three dwelling-houſes, in the ſame place, belonging to the Romiſh prieſts, with a valuable library of books, and a maſs-houſe in Virginia-ſtreet. They alſo deſtroyed all the houſhold furniture of ſir George Savile, one of the moſt reſpectable men in the kingdom, becauſe he had brought in the bill in favour of the Papiſts. On Tueſday great numbers again aſſembled about the parliament-houſe, and behaved ſo tumultuouſly, that both houſes thought proper to adjourn. In the evening, a moſt daring and violent attempt was made to force open the gates of Newgate, in order to releaſe the rioters who were confined there: and the keeper having refuſed to deliver them, his houſe was ſet on fire, the priſon was ſoon in flames, and great part of it conſumed, though a new ſtone edifice of uncommon ſtrength; and more than three hundred priſoners made their eſcape, many of whom joined the mob. The Proteſtant aſſociation, as they thought proper to ſtyle themſelves, had been chiefly actuated by ignorance and bigotry; and their new confederates were animated by the love of miſchief, and the hope of plunder. Two other priſons, the houſes of lord Mansfield, and ſir John Fielding, and ſeveral other private houſes, were deſtroyed the ſame evening. The following day, the King's Bench priſon, the New Bridewell, in St. George's Fields, ſome Popiſh chapels, ſeveral private houſes of Papiſts, and other buildings, were deſtroyed by the rioters; ſome were pulled down, and others ſet on fire; and every part of the metropolis exhibited violence and diſorder, tumults and conflagrations.

During theſe extraordinary ſcenes, there was a ſhameful inactivity in the lord-mayor of London, and in moſt of the other magiſtrates of the metropolis, and its neighbourhood; and even the miniſtry appeared to be panic-ſtruck, and to be only attentive to the preſervation of their own houſes, and of the royal palace. The magiſtrates, at the beginning of the riots, declined giving any orders to the mili-

tary to fire upon the inſurgents; but at length, as all property began to be inſecure, men of all claſſes began to ſee the neceſſity of a vigorous oppoſition to the rioters; large bodies of troops were brought to the metropolis from many miles round it; and an order was iſſued, by the authority of the king in council, "for the military to act without waiting for directions from the civil magiſtrates, and to uſe force for diſperſing the illegal and tumultuous aſſemblies of the people." The troops exerted themſelves with diligence in the ſuppreſſion of theſe alarming tumults, great numbers of the rioters were killed, many were apprehended, who were afterwards tried and executed for felony *, and the metropolis was at length reſtored to order and tranquillity. It is pretended, that no member of the Proteſtant aſſociation was executed, or tried, for any ſhare in theſe riots. What truth there may be in that aſſertion, we cannot determine; the fact can only be aſcertained, by comparing the names of the perſons tried or convicted, with the numerous names on the petition, to which few perſons have had acceſs; and there can be no doubt, but that many who were engaged in the riots, were neither convicted nor tried. At all events, it was manifeſtly the bigotry of a few leaders of this pretended Proteſtant aſſociation, to which theſe riots owed their origin. The manner in which theſe tumults were ſuppreſſed by the operations of the military, without any authority from the civil magiſtrate, however neceſſary from the peculiar circumſtances of the caſe, was thought to be a very dangerous precedent; and that an act of indemnity ought to have been paſſed, not only with regard to inferior perſons who had acted in the ſuppreſſion of theſe riots, but alſo with reſpect to the miniſtry themſelves, for the part they had taken in this tranſaction.

While the internal peace of the kingdom was diſturbed by theſe commotions, there appeared reaſon to apprehend an increaſe of its foreign enemies. The American war had occaſioned various diſputes between Great Britain and Holland. Complaints were made by the Dutch, that their ſhips were ſeized by the Engliſh cruizers, without juſt cauſe. On the other hand, loud remonſtrances were made by the Britiſh miniſter to the States-general, complaining that a clandeſtine commerce was carried on between their ſubjects and the Americans; that this was particularly the caſe at St. Euſtatia; and that the enemies of Great Britain were ſupplied with naval and military ſtores by the Dutch. Theſe diſputes continued to increaſe; and on the firſt of January, 1780, commodore Fielding brought to Spithead ſeveral ſhips laden with naval ſtores, which were under the convoy of a Dutch admiral. The States-general alleged, that the naval ſtores which had been ſeized were not contraband goods, according to the expreſs tenor of the treaties between Great Britain and Holland, and that the conduct of the Engliſh commodore, which was approved by his ſovereign, was a direct inſult upon the Dutch flag, and a violation of the treaties ſubſiſting between the two nations. Previous to this tranſaction, the Britiſh miniſter had demanded of the States-general the ſuccours which were ſtipulated in the treaty of 1678, and others: and which were now claimed on account of the dangers with which Great Britain was threatened, and particularly the invaſion with which ſhe was menaced by her enemies. Repeated applications were made to the States-general on this ſubject, but they delayed giving any anſwer. On the 17th of April, a declaration was publiſhed by his Britannic majeſty, by which it was announced, that repeated memorials having been preſented by his majeſty's ambaſſador to the States-general, demanding the ſuccours ſtipulated by treaty; to which requiſitions they had given no anſwer, and thereby deſerted the alliance that had ſo long ſubſiſted between Great Britain

* Lord George Gordon was himſelf committed to the Tower, and tried for high-treaſon, but acquitted.

and

and the republic, and placed themſelves in the condition of a neutral power; his majeſty would conſider them henceforth as ſtanding only in that diſtant relation. He therefore declared, that the ſubjects of the United Provinces were henceforward to be conſidered upon the ſame footing with other neutral ſtates, not privileged by treaty; and he ſuſpended proviſionally, and till farther orders, all the particular ſtipulations reſpecting the ſubjects of the States-general, contained in the ſeveral treaties ſubſiſting between Great Britain and the republic.

An incident happened, which ſhewed how well founded this declaration was. On the third of September, the Mercury, a congreſs packet, was taken by the Veſtal, captain Keppel, near Newfoundland. On board this packet was Mr. Laurens, late preſident of the congreſs, who was bound on an embaſſy to Holland. Among his papers was found the ſketch of a treaty of amity and commerce between the republic of Holland and the United States of America. Indeed it did not appear that the States-general were at all conſulted upon the tranſaction, ſo that it was more properly a proviſional treaty with the ſtates of Amſterdam, or of the province of Holland, than with the United Provinces at large. This treaty appeared to be approved by Mr. Van Berkel, counſellor and penſionary of the city of Amſterdam. In conſequence of this diſcovery, his Britannic majeſty demanded a formal diſavowal of the whole tranſaction, and the exemplary puniſhment of the penſionary Van Berkel, and his accomplices, as diſturbers of the public peace, and violators of the rights of nations. The States-general not giving an immediate anſwer to this requiſition, freſh applications were made on this ſubject by the Britiſh miniſter; who received for anſwer, that his memorial had been taken *ad referendum* by the deputies of the reſpective provinces, according to their received cuſtom and conſtitution of government; and that they would endeavour to frame an anſwer to his memorial, as ſoon as the conſtitution of their government would permit. This gave ſo little ſatisfaction to the Britiſh court, that their ambaſſador was ordered to withdraw from the Hague; and a declaration of hoſtilities againſt Holland was publiſhed on the 20th of December, 1780. This meaſure ſeemed, at firſt, to be generally applauded by the Britiſh nation; but there were many who thought it a very raſh and impolitic ſtep, and that a war with Holland ought not to have been ſo much precipitated, at a time when Great Britain was already involved in hoſtilities with ſo many enemies.

The war with Holland was commenced with great vigour; and that republic ſoon ſuffered a very ſevere ſtroke in the loſs of the iſland of St. Euſtatia, which was taken by the Engliſh on the 3d of February, 1781. When admiral Rodney, and general Vaughan, who arrived there with a large fleet, and a conſiderable body of troops, ſummoned the place to ſurrender, the inhabitants were in ſuch conſternation, and in no expectation of an attack, that no reſiſtance was made. The private property, goods, merchandiſe, and ſpecie of the inhabitants, were ſeized, as well as the public military and naval ſtores. The capture of ſhipping was alſo very great; upwards of 200 veſſels being taken, beſides a 60 gun ſhip, and a frigate of 38 guns. The iſlands of St. Martin and Saba likewiſe ſurrendered, but the ſeizure of the private property, at St. Euſtatia, was thought a very rigorous and ſhameful meaſure; altogether unprecedented among civilized nations, and diſgraceful to the Britiſh name. The inhabitants of the iſland of St. Chriſtopher remonſtrated againſt it as a dangerous precedent; it was obſerved, that the French nation had acted in a much more humane manner in their late captures; and the Britiſh Weſt India planters petitioned the king on the occaſion, repreſenting to him, they had always conceived it to be a maxim among nations, and eſtabliſhed in humanity and ſound policy, that war ſhould be carried on with the leaſt poſſible injury to private property.

On the 5th of Auguſt, the ſame year, a very bloody engagement was fought between an Engliſh ſquadron of ſhips of war, under the command of admiral Hyde Parker, and a Dutch ſquadron, under the command of admiral Zoutman, off the Dogger Bank. According to the Engliſh accounts, the Dutch ſquadron conſiſted of eight ſhips of the line, and the Engliſh only of ſeven; but the Dutch repreſent their force to be inferior to that of the Engliſh. On both ſides they fought with great gallantry, and by both of the contending ſquadrons the victory was claimed. All the ſhips were greatly ſhattered, and a Dutch 74 gun ſhip ſunk after the action. The Engliſh had 104 men killed, and 339 wounded; and the loſs of the Dutch is ſuppoſed to have been much greater.

The war continued to be proſecuted with various ſucceſs; the French made themſelves maſters of the iſland of Tobago; and the Spaniards of Penſacola, and the whole province of Weſt Florida. Earl Cornwallis obtained a victory over the Americans commanded by general Green, at Guilford, in North Carolina, March 15, 1781, but it was a hard-fought battle, and the loſs on both ſides conſiderable. Indeed the victory was productive of all the conſequences of a defeat; for three days after, lord Cornwallis was obliged to leave part of his ſick and wounded behind him to the care of his enemy, and to make a circuitous retreat of 200 miles to Wilmington before they could find ſhelter, and ſo left South Carolina entirely expoſed to the American general. The generals Philips and Arnold committed ſome ravages in Virginia, deſtroyed much ſhipping, and about 8000 hogſheads of tobacco; but none of theſe events at that time promiſed any ſpeedy termination of the war; they rather contributed to draw the attention of the Americans and the French at Rhode Iſland to that quarter, where the next year the deciſive blow was ſtruck, which firmly eſtabliſhed American independence. Lord Cornwallis's ſituation at Wilmington was very diſagreeable, and his force reduced ſo low that he could not think of marching to Charles-Town by land; he turned his thoughts then to a co-operation in Virginia with Philips and Arnold, and began his march, April 25, 1781. In this central province, all the ſcattered operations of the war began at length to converge into a point. By different reinforcements, lord Cornwallis's force amounted to above 7000 excellent troops. Sir Henry Clinton, the commander in chief, amuſed by ſome intercepted letters of general Waſhington's, was prevented from ſending thoſe ſuccours to lord Cornwallis which he otherwiſe would have done, by his fears for New York, againſt which he apprehended Waſhington meditated a formidable attack.

But that general, having kept New York and its dependencies in a continued ſtate of alarm for about ſix weeks, ſuddenly marched acroſs the Jerſeys and through Pennſylvania to the head of the Elk, at the bottom of the Cheſapeak, from which the light troops were conveyed by ſhipping down the bay, and the bulk of the army, after reaching Maryland by forced marches, were alſo there embarked, and ſoon joined the other body under the marquis de la Fayette. Sir Henry Clinton receiving information that the count de Graſſe was expected every moment in the Cheſapeak, with a large French fleet to co-operate with Waſhington, now ſeriouſly attempted to reinforce lord Cornwallis, but without ſucceſs, for on the 5th of September, after a partial action of a few hours between the Britiſh fleet under admiral Graves, and that of the French under De Graſſe, Graves returned to New York to refit, and left the French maſters of the navigation of the Cheſapeak. Preſently the moſt effectual meaſures were adopted by general Waſhington for ſurrounding lord Cornwallis's army, and on the laſt of September it was cloſely inveſted in York-town, and at Glouceſter on the oppoſite ſide of the river, with a conſiderable body of troops on one ſide, and a large naval force on the other. The trenches were opened in the night between the 6th and 7th of October, with a conſiderable train of artillery. The works which had been raiſed by the Britiſh, ſunk under the weight of the enemies batteries; the troops were much diminiſhed

by the ſword and ſickneſs, and worn down by conſtant watching and fatigue, and all hope of relief failing, the 19th of October lord Cornwallis ſurrendered himſelf and his own army on capitulation*. Fifteen hundred ſeamen underwent the fate of the garriſon, but theſe, with the Guadaloupe frigate of 24 guns, and a number of tranſports, were aſſigned to M. de Graſſe, in return for his naval aſſiſtance.

The ſurrender of this ſecond Britiſh army may be conſidered as the cloſing ſcene of the continental war in America; for the immenſe expence of carrying it on ſo diſtant from the ſeat of preparations and power; the great accumulation of public debt it had brought upon the nation; the plentiful effuſion of blood it had occaſioned; the diminution of trade and the vaſt increaſe of taxes—Theſe were evils of ſuch a magnitude, as could ſcarcely be overlooked even by the moſt inſenſible and ſtupid. Accordingly on the 1ſt of March, 1782, after repeated ſtruggles in the houſe of commons, the houſe addreſſed the king, requeſting him to put a ſtop to any farther proſecution of the war with America. This event rendered a change of meaſures and of councils abſolutely neceſſary, and diffuſed univerſal joy throughout the kingdom. Thoſe country gentlemen who had generally voted with the miniſtry, ſaw the dangers to which the nation was expoſed in an expenſive war with France, Spain, and Holland, without a ſingle ally, and feeling the preſſure of the public burdens, they at length deſerted the ſtandard of adminiſtration, and a complete revolution in the cabinet was effected, March 27, 1782, under the auſpices of the marquis of Rockingham, who was appointed firſt lord of the treaſury.

Peace was the firſt object of attention with the new miniſtry. Mr. Grenville was inveſted with full powers to treat at Paris with all the parties at war, and was alſo directed to propoſe the independency of the Thirteen United Provinces of America in the firſt inſtance, inſtead of making it a condition of a general treaty. The commanders in chief in America were alſo directed to acquaint the Congreſs with the pacific views of the Britiſh court, and with the offer to acknowledge the independency of the United States.

The new miniſters alſo applied themſelves to make ſome retrenchment in the public expences, and to reform ſome of the various abuſes they had inveighed againſt when out of office. A bill was carried for excluding cuſtom-houſe and exciſe officers from voting at the elections for members of the houſe of commons.—Another for excluding all contractors from being members; and by another bill, which alſo received the royal aſſent, the board of trade, the board of works, the great wardrobe, and the different offices of third ſecretary of ſtate, treaſurer of the chamber, cofferer of the houſhold, the lords of the police in Scotland, the paymaſter of the penſions, maſter of the harriers, maſter of the ſtag-hounds, and clerks to the board of green-cloth, were aboliſhed, which, with other ſavings ſpecified in the bill, were computed to amount to 72,368l. per annum. On the 3d of May, it was alſo ordered by the houſe of commons, as, before mentioned, that, "All the declarations, orders, and reſolutions of that houſe reſpecting the election of John Wilkes, eſq. to be elected a member to ſerve in the ſaid parliament, ſhould be expunged from the journals of that houſe, as being ſubverſive of the rights of the whole body of electors of the kingdom."

A ſeries of loſſes had agitated the minds of the people. January 14th, 1782, the French took Nevis. On the 5th of February, the iſland of Minorca ſurrendered to the Spaniards; and on the 13th of the ſame month, the iſland of St. Chriſtopher's was given up to the French. The valuable iſland of Jamaica would ſoon probably have ſhared the ſame fate, had not the Britiſh fleet under admiral

* The American return made the number of priſoners 7,247, land and marine.

Rodney

Rodney fallen in with that of the French under the Count de Graffe in their way to join the Spaniſh fleet at St. Domingo. The van of the French was too far advanced to ſupport the centre, and a ſignal victory was obtained over them. The French admiral in the Ville de Paris of 110 guns (a preſent from the city of Paris to the French king) was taken, with two ſeventy-fours, and one of 64 guns; a 74 gun ſhip blew up by accident ſoon after ſhe was in our poſſeſſion, and another 74 ſunk during the engagement. A few days after, two more of the ſame fleet, of 64 guns each, were captured. By this victory of the 12th of April, the deſign againſt Jamaica was fruſtrated. The new miniſtry had ſuperſeded Admiral Rodney, and intended to have proſecuted the inquiry into his tranſaction at Euſtatia; but this victory ſilenced all, and procured him the dignity of an Engliſh peer.

May 8th, the Bahama iſlands ſurrendered to the Spaniards, while the credit of the Britiſh arms was gloriouſly ſuſtained at Gibraltar, under general Elliot. The formidable attack on the 13th September with floating batteries of 212 braſs cannon, &c. in ſhips from 1400 to 600 tons burden, ended in diſappointment, and the deſtruction of all the ſhips and moſt of the aſſailants. The garriſon was at length relieved by lord Howe in the month of October, who offered battle to the combined force of France and Spain, though 12 ſail of the line inferior. The military operations after this, were few and of little conſequence. Negapatnam, a ſettlement in the Eaſt Indies, and Trincomale on the iſland of Ceylon, were taken from the Dutch by the Britiſh forces; but the French ſoon receiving conſiderable ſuccours from Cuddalore, retook Trincomale, forced the Britiſh fleet in ſeveral actions, but none deciſive, and enabled Hyder Ally to reſiſt the efforts of ſir Eyre Coote and his troops.

The death of the marquis of Rockingham on the 1ſt of July occaſioned much commotion in the cabinet, and leſſened the hopes which had been formed of important national benefits from the new adminiſtration. Lord Shelburne ſucceeded the marquis as firſt lord of the treaſury, and it is ſaid, without the knowledge of his colleagues. This gave great offence to ſome, particularly to Mr. Fox, and lord John Cavendiſh; who, with others, reſigned their places, and commenced a fierce oppoſition in the houſe of commons. Mr. Fox declared, "that the principles on which the miniſtry firſt came in, were abandoned by lord Shelburne and his adherents; that the *old ſyſtem* was to be revived, moſt probably, with the *old men*, or indeed with any men that could be found. They were perſons whom neither promiſes could bind, nor principles of honour ſecure: they would abandon fifty principles for the ſake of power, and they would now ſtrive to ſtrengthen themſelves by any means which corruption could procure; and he expected to ſee, in a very ſhort time, they would be joined by thoſe very men whom that houſe had precipitated from their ſeats." The duke of Richmond, general Conway, and others, maintained, that there was no deviation in the preſent cabinet from the principles on which they had entered into office, and continued to act with lord Shelburne, till under his auſpices, the preliminaries for a general peace were ſettled. Then, the public beheld Mr. Fox, and even lord John Cavendiſh, coaleſcing with the old miniſters, lord North particularly; embracing the very men whom they had driven from their ſeats, and threatened with impeachments; and continuing to join with them in reprobating the peace as making too great conceſſions to the enemy, that they might ſtorm the cabinet, drive lord Shelburne and his friends from it, and ſeat themſelves and the men they had deſpiſed, in their places.

By the treaty of peace between Great Britain and France *, Great Britain reſtored to France the iſland of Tobago, in the Weſt Indies, and the river Senegal in Africa, with its dependencies and the forts on the river; and gave up a few diſtricts

* Preliminary articles ſettled January 20, 1783.

in

in the East Indies, as dependencies on Pondicherry, and Karichal; it reſtored alſo the iſlands of St. Lucia, St. Pierre, and Miquelon, and the iſland of Goree, with Pondicherry, Karical, Mahe, Chandernagore, and the factory of Surat. To prevent diſputes about boundaries in the Newfoundland fiſhery, it was agreed, that the French line for fiſhing ſhould begin from Cape St. John on the eaſtern ſide, and going round by the North, ſhould have for its boundary Cape Ray on the weſtern ſide; and Great Britain renounced every claim reſpecting the demolition of Dunkirk. France on the other hand was to reſtore to Great Britain the iſlands of Grenada, and the Grenadines, St. Chriſtopher's, St. Vincent, Dominica, Nevis, and Montſerrat; and guarantied Fort James in the river Gambia, agreeing that the gum trade ſhould remain in the ſame condition as before the war, 1755. The allies of each ſtate in the East Indies were to be invited to accede to the pacification, but if they were averſe to peace, no aſſiſtance on either ſide was to be given to them.

By the treaty with Spain, Great Britain gave up to that power East Florida, and ceded Weſt Florida and Minorca, which Spain had taken during the war. To prevent all cauſes of complaint and miſunderſtanding in future, it was agreed that Britiſh ſubjects ſhould have the right of cutting and carrying away logwood in the diſtrict lying between the rivers Wallis or Bellize, and Rio Hondo, taking the courſe of the ſaid rivers for unalterable boundaries. Spain agreed to reſtore the iſlands of Providence, and the Bahamas, to Great Britain, but they had been retaken before the peace was ſigned.

In the treaty with the United States of America, the king of Great Britain acknowledges New Hampſhire, Maſſachuſets Bay, Rhode Iſland, and Providence Plantations, Connecticut, New York, New Jerſey, Pennſylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, to be *free, ſovereign*, and *independent ſtates*, and for himſelf, his heirs and ſucceſſors, relinquiſhes all claims to the government, propriety, and territorial rights of the ſame, and every part thereof. To prevent diſputes in future on the ſubject of boundaries between theſe ſtates and the Britiſh provinces, lines were very minutely drawn, which will be noticed in the proper place, as well as delineated on the map of the United States of America: and ſome favourable clauſes were obtained for the loyaliſts. The navigation of the Miſſiſſippi to remain open to both parties, as alſo the Newfoundland fiſheries.

In the treaty with the Dutch, great difficulties aroſe, but at length it was ſtipulated, that Great Britain ſhould reſtore Trincomale in the iſland of Ceylon, but the French had already taken it, and that the Dutch ſhould yield to us the town of Negapatnam, with its dependencies, in the East Indies.

The terms of the peace were, to many, a ſubject of great regret; but had the war continued, it would have been neceſſary to borrow annually 17 millions and a half, by which a million *per annum*, would have been added to the taxes, and 25 millions at leaſt to the capital of the public debt, according to the uſual modes of funding. The ceſſions made on the part of Great Britain cannot be eſteemed worth the expence of but one year's war, eſpecially conſidering the exhauſted ſtate of the country and its revenues, and of the national ſpirit, through the rage of parties and the luſt of ambition. But no ſooner were the preliminary treaties with France and Spain, and the proviſional articles with America, preſented to parliament, than they met with a violent oppoſition, and were reprobated as highly injurious to the dignity and intereſt of the nation. The addreſs of thanks for the peace was carried however in the houſe of lords by a majority of 72 to 59, but loſt in the houſe of commons by a majority of 224 to 208.

The majority of the commons, thus enliſted under the banner of the *famous coalition leaders*, Mr. Fox and lord North, plainly indicated a miniſterial revolution, unleſs

unleſs the cabinet ſhould call a new parliament. As they did not, the peace-makers were obliged to withdraw from power. The two gentlemen juſt mentioned were made ſecretaries of ſtate, and the duke of Portland firſt lord of the Treaſury, on April 2, 1783. All plans of reformation in public offices, and for preſerving the nation, which lord Shelburne propoſed, ſeemed now to be dropt. Mr. Pitt's motion for correcting the defects in the repreſentation of parliament, was loſt by a majority of 293 to 149; and Mr. Sawbridge's motion, that leave be given to bring in a bill for ſhortening the duration of parliaments, was rejected by 123 to 56. Mr. Pitt alſo propoſed a bill for reforming the boards of the Treaſury, Admiralty, Ordnance, Exciſe, Stamps, and other offices, which was oppoſed by Mr. Burke and other members of adminiſtration, who had moſt ſtrenuouſly contended for that meaſure before they themſelves had attained lucrative places. This bill was ſuffered to paſs the commons to amuſe the public, but was rejected by the lords, 40 to 24. Every thing went on juſt as the coalition adminiſtration pleaſed, till Mr. Fox brought into parliament his famous bill for new regulating the government of the Eaſt India company, and their commercial affairs and territories; a plan of which bill, its progreſs and fate, are already given in our account of that trading company*. This bill being rejected in the houſe of lords, on December 17, by a majority of 19, occaſioned a great ferment in the cabinet and in both houſes of parliament. It was aſſerted in the lower houſe, that his majeſty had empowered lord T——e to report the following meſſage, that "*His majeſty* will not only conſider as not being *his friend*, every perſon who votes for the preſent India bill, but he will look upon thoſe who ſupport it, as *his enemies*; and if lord T—— e can find ſtronger words to convey his majeſty's wiſhes to that effect, he is at liberty to uſe them." After long debate, the commons reſolved by a conſiderable majority, "That it is now neceſſary to declare, that to report any opinion, or pretended opinion, of his majeſty, upon any bill, or other proceeding depending in either houſe of parliament, with a view to influence the votes of the members, is a high crime and miſdemeanour, derogatory to the honour of the crown, a breach of the fundamental privileges of parliament, and ſubverſive of the conſtitution of this country.

"Reſolved, that this houſe will, upon Monday morning next, reſolve itſelf into a committee of the whole houſe, to conſider of the ſtate of the nation.

"Reſolved, that it is neceſſary to the moſt eſſential intereſts of this kingdom, and peculiarly incumbent on this houſe, to purſue with unremitting attention the conſideration of a ſuitable remedy for the abuſes which have prevailed in the government of the Britiſh dominions in the Eaſt Indies, and that this houſe will conſider as an enemy to his country, any perſon who ſhall preſume to adviſe his majeſty to prevent, or in any manner to interrupt, the diſcharge of this important duty."

Theſe reſolutions, with ſome words which dropped from Mr. Fox, and lord North, the next day in the houſe of commons, in ſupport of a motion for adjournment to the next week, which was thought to be intended merely to protract the buſineſs of parliament, and prevent granting the ſupplies, occaſioned their diſmiſſion from miniſtry. A royal meſſage was ſent between 12 and 1 of the morning of the 19th of December, to deſire the two ſecretaries to reſign the ſeals of their office; and Mr. Pitt ſucceeded the duke of Portland as firſt lord of the Treaſury, bringing with him his friends into the reſpective departments, which formed the tenth adminiſtration ſince his majeſty's acceſſion.

A diſſolution of the houſe of commons being now feared by the coalition, they voted and carried an addreſs to the king, to repreſent the dangers which appeared to them likely to follow from a prorogation or diſſolution of the parliament in the

* Page 240.

preſent

preſent arduous and critical conjuncture of public affairs, and humbly to beſeech his majeſty to hearken to the advice of his faithful commons, and not to the *ſecret advices* of perſons who may have private intereſts of their own, ſeparate from the true intereſts of his majeſty and the people." The king aſſured them, he would not interrupt their meeting by any exerciſe of his prerogative, either of prorogation or diſſolution. Before the houſe adjourned over the holidays, it reſolved on the 24th of December, "that the lords of the treaſury ought not to conſent or authorize the Eaſt India directors to accept any more bills, or to a greater amount than 300,000l. unleſs they ſhall be able to prove to parliament, that they have ſufficient means to provide for the payment of them, after they ſhall have made their dividend and diſcharged the debt due to government, or unleſs they had the direction of that houſe." This was thought to convey an imputation, as if Mr. Pitt intended to make a bad uſe of the power veſted by law in the treaſury.

As ſoon as the houſe met, it was ſaid, that the two great rival parties who had coaleſced and forgotten their former differences and anathemas againſt each other, intended to monopolize all the power in the country. On the 12th of January, 1784, the coalition majority, in a committee on the ſtate of the nation, reſolved, "That it is the opinion of this committee, that for any perſon or perſons in his majeſty's treaſury, or in the exchequer, or in the bank of England; or for any perſons whatſoever, employed in the payment of public money; to pay, or direct to be paid any ſum or ſums of money, for or towards the ſupport of ſervices voted in the preſent ſeſſion of parliament, after the parliament ſhall have been prorogued or diſſolved, if it ſhall be prorogued or diſſolved, before any act of parliament ſhall have paſſed, appropriating the ſupplies to ſuch ſervices; will be a high crime and miſdemeanour, a daring breach of a public truſt, derogatory to the fundamental privileges of parliament, and ſubverſive of the conſtitution of this country. That it alſo is the opinion of this committee, in the preſent ſituation of his majeſty's dominions, it is peculiarly neceſſary that there ſhould be an adminiſtration which has the *confidence of this houſe* and the people. And an amendment being propoſed to inſert, after the word "confidence," the words "*of the crown*," it paſſed in the negative. They alſo reſolved, "That it is the opinion of this committee, that the late changes in his majeſty's councils were immediately preceded by dangerous and univerſal reports that his majeſty's ſacred name had been unconſtitutionally abuſed to affect the deliberations of parliament, and that the appointments made were accompanied by circumſtances new and extraordinary, and ſuch as do not conciliate or engage the confidence of this houſe." On the 16th of January, they carried the following reſolution: "That it is the opinion of this committee, it having been declared by this houſe, that in the preſent ſituation of his majeſty's dominions, an adminiſtration ſhould be formed, which poſſeſſed the confidence of this houſe, and the public; and the preſent adminiſtration being formed under circumſtances *new* and *extraordinary*, ſuch as were not calculated to conciliate the affections, or engage the confidence of the houſe; and his majeſty's *preſent miniſters* ſtill holding high and reſponſible offices, after ſuch a declaration, is *contrary to true conſtitutional principles*, and injurious to his majeſty and his people."

It was a new doctrine that the king ſhould diſcharge thoſe who had by no one act as yet rendered themſelves undeſerving confidence as miniſters, and appoint new ones, out of compliance to one part of the houſe of commons only; and it was impoſſible for him to comply with the reſolution, that he ſhould appoint ſuch as might have the confidence of that houſe, and of the public; for the majority of that houſe was compoſed of the members of the coalition, ſtriving for places and power, and the public, by their numerous addreſſes, were, in general, evidently averſe to their conduct, and incenſed at every thing belonging to the appellation of "Coalition."

alition." A diſſolution of parliament was the alone poſſible method to appoint an adminiſtration which had the confidence of the houſe of commons and the public; ſending the members to their conſtituents for approbation or rejection, and for freſh credentials. On the 23d of January, Mr. Pitt's Eaſt India bill was rejected in the houſe of commons, by 222 againſt 214 on the ſecond reading, without ſending it to a committee for diſcuſſion and amendment, and leave was given for Mr. Fox to prepare and bring in another. Now, ſome independent gentlemen (as they ſtyled themſelves) interpoſed to unite the contending parties, which had filled parliament and the country with diſtractions; but their endeavours to form what they called a firm, efficient, extended, and united adminiſtration, proved unſucceſsful.

The leaders of the coalition finding that miniſtry were reſolved to keep their places, procured a reſolution on February 2, "That it is the opinion of this houſe, that the preſent arduous and critical ſituation of public affairs requires the exertion of a firm, efficient, extended adminiſtration, entitled to the confidence of the people, and ſuch as may have a tendency to put an end to the unfortunate diviſions of this country." 2d. "That it is the opinion of this houſe, that the continuance of the preſent miniſters in their office is an *obſtacle* to the formation of ſuch an adminiſtration as may enjoy the confidence of this houſe, and tend to put an end to the unfortunate diviſions and diſtractions of the country." And the next day it was moved, "That the ſaid reſolutions be humbly laid before his majeſty by ſuch members of this houſe as are of his majeſty's moſt honourable privy council," which was carried by 211 againſt 187.

At laſt, February 4, the houſe of lords took up the affair, and particularly adverted to the reſolution of the commons reſpecting the Eaſt India bills. It was contended, that the houſe of commons had arrogated to itſelf that power which the conſtitution had refuſed, for it denied to the lords of the treaſury that right which the legiſlature in its complete capacity had inveſted them with, namely, the power of permitting the Eaſt India directors to accept bills to ſuch an amount as the diſcretion of the treaſury-board ſhould admit. That no one branch of the legiſlature could in any manner ſuperſede a ſpecific ſtatute of the three conſtituent parts. That it was an uſurpation in any one branch of the legiſlature, the king, lords, or commons, to aſſume a power of ſuſpending or diſpenſing with an act of the legiſlature; and that the reſolution of the commons aſſumed a control, pointing out a ſpecific conduct. Accordingly, by a majority of 100 to 53, they reſolved, that for any branch of the legiſlature to aſſume a power to direct or control an authority veſted in any ſet of men by act of parliament, and to be exerciſed by them at their own diſcretion, is unconſtitutional and illegal. They next reſolved, that the conſtitution veſted in the crown the right of appointing his miniſters; and then moved for, and carried, the following addreſs to the king: "We acknowledge with great ſatisfaction the wiſdom of our happy conſtitution, which places in your majeſty's hands the undoubted authority of appointing to all the great offices of executive government. We have the firmeſt reliance in your majeſty's known wiſdom and paternal goodneſs, that you will be anxious to call into your ſervice men the moſt deſerving of the confidence of parliament and the public in general. In this confidence, we beg leave to approach your majeſty with our moſt earneſt aſſurances, that we will upon all occaſions ſupport your majeſty in the juſt exerciſe of thoſe prerogatives which the wiſdom of the law has entruſted to your majeſty, for the preſervation of our lives and properties, and upon the due and uninterrupted exerciſe of which muſt depend the bleſſings which the people muſt derive from the beſt of all forms of government." To which the king replied, "I thank you for this dutiful and loyal addreſs; and I deſire you will reſt aſſured that I have no object in the choice of miniſters, but to call into my ſervice men

the moſt deſerving of the confidence of my parliament, and of the public in general. I cannot too often repeat my aſſurances, that my conſtant ſtudy, in the exerciſe of every prerogative entruſted to me by the conſtitution, is to employ it for the welfare of my people."

From theſe proceedings it was evident that a war would ariſe between the two houſes, which could only be put an end to by a diſſolution of parliament. The commons exclaimed againſt the lords, and proceeded to vindicate themſelves to the public by the following reſolutions:

1. "That this houſe hath not aſſumed to itſelf any right to ſuſpend the execution of law.

2. "That it is conſtitutional, and agreeable to uſage, for the houſe of commons to declare their ſenſe and opinion reſpecting the exerciſe of every diſcretionary power, which, either by act of parliament or otherwiſe, is veſted in any body of men whatever for the public ſervice.

3. "That it is a duty peculiarly incumbent on this houſe, entruſted by the conſtitution with the ſole and ſeparate grant of public money, to watch over, and by their timely admonitions and interference, to endeavour to prevent the raſh and precipitate exerciſe of any power, however veſted, which may be attended with any danger to public credit, or with heavy loſſes to the revenue, and conſequently burthenſome upon the people.

4. "That the reſolutions of the 24th of December laſt, which declared the ſenſe and opinion of this houſe, "That the commiſſioners of the treaſury ought not to give their conſent to the acceptance of any bills drawn, or to be drawn from India, until it ſhall be made appear to this houſe that ſufficient means can be provided for the payment of the ſame, when they reſpectively fall due, by a regular application of the clear effects of the company, after diſcharging in their regular courſe the cuſtoms and other ſums due to the public, and the current demands upon the company, or till this houſe ſhall otherwiſe direct," were conſtitutional, founded on a ſenſe of duty towards the people of this kingdom, and dictated by a becoming anxiety for the preſervation of the revenue, and the ſupport of public credit.

5. "That if this houſe had in the unſettled ſtate of the Eaſt India company, which was and ſtill is under the conſideration of parliament, in order to form ſome proviſions for the relief of that company, and the ſecurity of the public, neglected to paſs the ſaid reſolution of the 24th of December, to guard againſt a new charge, to a very conſiderable amount, being raſhly incurred before any means of anſwering it had been ſtated or provided, they would have been juſtly and highly reſponſible to their conſtituents for the increaſe of thoſe evils and difficulties which are too ſeverely felt.

6. "That this houſe will, with the utmoſt moderation, but with the moſt decided firmneſs, maintain inviolably the principles of the conſtitution, and will perſevere in the diligent and conſcientious diſcharge of the duties which they owe to their conſtituents and to their poſterity, equally ſolicitous to preſerve their own privileges, and to avoid any encroachments on thoſe of either of the other branches of the legiſlature."

Perſons of the moſt diſtinguiſhed and independent character in the houſe of commons, and in the kingdom, now wiſhed that a diſſolution had taken place weeks before, even at the firſt forming of the coalition. Many laboured for a conciliation between Mr. Pitt and Mr. Fox, and their confidential friends; and lord North, at length, conſented to be left out in the forming a new adminiſtration; but the coalition inſiſted on Mr. Pitt's reſignation as a preliminary, without which there could be no treaty. This being refuſed, a majority of 21 out of 333 members of the houſe of commons voted the following addreſs to the king:—"That this houſe,

impreſſed with the moſt dutiful ſenſe of his majeſty's paternal regard for the welfare of his people, relies on his majeſty's royal wiſdom, that he will take ſuch meaſures as, *by removing any obſtacle to the formation of ſuch an adminiſtration as this houſe has declared to be requiſite in the preſent critical and arduous ſtate of public affairs*, may tend to give effect to the wiſhes of his faithful commons, which have already been moſt humbly repreſented to his majeſty."

The reply was mild, but in favour of his ſervants. "Gentlemen, I am deeply ſenſible how highly it concerns the honour of my crown, and the welfare of my people, which is the object always neareſt my heart, that the public affairs ſhould be conducted by a firm, efficient, united, and extended adminiſtration, entitled to the confidence of my people, and ſuch as may have a tendency to put an end to the unhappy diviſions and diſtractions in this country.—Very recent endeavours have already been employed, on my part, to unite in the public ſervice, on a fair and equal footing, thoſe whoſe joint efforts appear to me moſt capable of producing that happy effect: theſe endeavours have not had the ſucceſs I wiſhed. I ſhall be always deſirous of taking every ſtep moſt conducive to ſuch an object; but I cannot ſee that it would, in any degree, be advanced by the diſmiſſion of thoſe at preſent in my ſervice.

"I obſerve, at the ſame time, that there is *no charge* or *complaint* ſuggeſted againſt my preſent miniſters, nor is any one or more of them ſpecifically objected to; and numbers of my ſubjects have expreſſed to me, in the warmeſt manner, their ſatisfaction in the late changes I have made in my councils. Under theſe circumſtances, I truſt, my faithful commons will not wiſh that the eſſential offices of executive government ſhould be vacated, until I ſee a proſpect that ſuch a plan of union as I have called for, and they have pointed out, may be carried into effect."

This anſwer brought things to a criſis: the oppoſition now talked of withholding all ſupplies, till the king diſmiſſed his miniſters, and proceeded, March 1ſt, to vote another addreſs of more length and greater freedom, which was carried by 201 to 189, as follows:—"That an humble addreſs be preſented to his majeſty, moſt humbly to repreſent to his majeſty the ſatisfaction his faithful commons derive from the late moſt gracious aſſurances we have received, that his majeſty concurs with us in opinion, that it concerns the honour of his crown, and the welfare of his people, that the public affairs ſhould be conducted by a firm, efficient, extended, united adminiſtration, entitled to the confidence of his people, and ſuch as may have a tendency to put an end to the unhappy diviſions and diſtractions of this country.

"To acknowledge his majeſty's paternal goodneſs in his late moſt gracious endeavours to give effect to the object of our late dutiful repreſentation to his majeſty.

"To lament that the failure of this his majeſty's moſt gracious endeavours ſhould be conſidered as a final bar to the accompliſhing ſo ſalutary and deſirable a purpoſe, and to expreſs our concern and diſappointment that his majeſty has not been adviſed to take any farther ſtep towards uniting in the public ſervice thoſe whoſe joint efforts have recently appeared to his majeſty moſt capable of producing ſo happy an effect.

"That this houſe with all humility claims it as its right, and on every proper occaſion feels it to be their bounden duty, to adviſe his majeſty touching the exerciſe of any branch of his royal prerogative.

"That we ſubmit it to his majeſty's royal conſideration, that the continuance of an adminiſtration which does not poſſeſs the confidence of the repreſentatives of the people muſt be injurious to the public ſervice.

"That this houſe can have no intereſt diſtinct and ſeparate from that of their conſtituents, and that they therefore feel themſelves called upon to repeat thoſe loyal and dutiful aſſurances they have already expreſſed of their reliance on his ma-

jeſty's paternal regard for the welfare of his people, that his majeſty would graciouſly enable them to execute thoſe important truſts which the conſtitution has veſted in them, with honour to themſelves, and advantage to the public, by the formation of a new adminiſtration, appointed under circumſtances which may tend to conciliate the minds of his faithful commons, and give energy and ſtability to his majeſty's councils.

" That as his majeſty's faithful commons, upon the matureſt deliberation, cannot but conſider the continuance of the preſent miniſters as an unwarrantable obſtacle to his majeſty's moſt gracious purpoſe, to comply with their wiſhes in the formation of ſuch an adminiſtration as his majeſty, in concurrence with the unanimous reſolution of this houſe, ſeems to think requiſite in the preſent exigencies of the country, they feel themſelves bound to remain firm in the wiſh expreſſed to his majeſty in their late humble addreſs, and do therefore find themſelves obliged again to beſeech his majeſty, that he would be graciouſly pleaſed to lay the foundation of a ſtrong and ſtable government, by the *previous removal* of his preſent miniſters."

To this addreſs, a ſtrong and deciſive anſwer was returned, which evidenced firmneſs in the king or his cabinet, as, " Gentlemen, I have already expreſſed to you how ſenſible I am of the advantages to be derived from ſuch an adminiſtration as was pointed out in your unanimous reſolution. And I aſſured you that I was deſirous of taking every ſtep moſt conducive to ſuch an object: I remain in the ſame ſentiments; but I continue equally convinced, that it is an object not likely to be obtained by the *diſmiſſion* of my preſent miniſters.

" I muſt repeat, that no charge or complaint, or any ſpecific objection, is yet made againſt any of them: if there were any ſuch ground for their removal at preſent, it ought to be *equally* a reaſon for not admitting them as a part of that extended and united adminiſtration which you ſtate to be requiſite.

" I did not conſider the failure of my recent endeavours as a final bar to the accompliſhment of the purpoſe which I had in view, if it could have been obtained on thoſe purpoſes of fairneſs and equality, without which it can neither be honourable to thoſe who are concerned, nor lay the foundation of ſuch a ſtrong and ſtable government as may be of laſting advantage to the country—but I know of *no further ſteps* which I can take, that are likely to remove the difficulties which obſtruct that deſirable end.

" I have never called in queſtion the right of my faithful commons to offer me their advice upon every proper occaſion, touching the exerciſe of any branch of my prerogative.

" I ſhall be ready at all times to exerciſe it, and give it the moſt attentive conſideration—they will ever find me diſpoſed to ſhew my regard to the true principles of the conſtitution, and to take ſuch meaſures as may beſt conduce to the ſatisfaction and proſperity of my kingdom."

The gentlemen who led the houſe of commons, or the ſmall majority of it, into thoſe reſolutions and addreſſes, began now to ſee their miſtake. Their arguments juſtified all the evils that had attended lord North's adminiſtration, ſince he had for many years the full confidence of the houſe, and would juſtify every other corrupt adminiſtration. But they had advanced too far, to retreat with decency, and accordingly proceeded to poſtpone the mutiny bill as a means of protracting their political exiſtence, which they carried by only a majority of nine. On March 8th, Mr. Fox made his laſt effort, and moved for a third addreſs, or rather *remonſtrance*, the ſtrongeſt preſented to any king ſince the unhappy days of Charles I.

Reſolved, " That an humble repreſentation be preſented to his majeſty, moſt humbly to teſtify the ſurpriſe and affliction of this houſe, on receiving the anſwer which

which his majeſty's miniſters have adviſed, to the dutiful and ſeaſonable addreſs of this houſe, concerning one of the moſt important acts of his majeſty's government.

" To expreſs our concern, that when his majeſty's paternal goodneſs has graciouſly inclined his majeſty to be ſenſible of the advantage to be derived from ſuch an adminiſtration as was pointed out in our reſolution, his majeſty ſhould ſtill be induced to prefer the opinions of individuals to the repeated advice of the repreſentatives of his people in parliament aſſembled, with reſpect to the means of obtaining ſo deſirable an end.

" To repreſent to his majeſty, that a preference of this nature is as injurious to the true intereſts of the crown, as it is wholly repugnant to the ſpirit of our free conſtitution; that ſyſtems founded on ſuch a preference are not in truth entirely new in this country; that they have been the characteriſtic features of thoſe unfortunate reigns, the maxims of which are now juſtly and univerſally exploded, while his majeſty and his royal progenitors have been fixed in the hearts of their people, and have commanded the reſpect and admiration of all the nations on the earth, by a conſtant and uniform attention to the advice of their commons, however adverſe ſuch advice may have been to the opinions of the executive ſervants of the crown.

" To aſſure his majeſty, that we neither have diſputed, nor mean in any diſtance to diſpute, much leſs to deny, his majeſty's undoubted prerogative of appointing to the executive offices of ſtate ſuch perſons as to his majeſty's wiſdom ſhall ſeem meet. But, at the ſame time, that we muſt, with all humility, again ſubmit to his majeſty's royal wiſdom, that no adminiſtration, however legally appointed, can ſerve his majeſty and the public with effect, which does not enjoy the confidence of this houſe. That in his majeſty's preſent adminiſtration we cannot confide: the circumſtances under which it was conſtituted, and the grounds upon which it continues, have created juſt ſuſpicions in the breaſts of his faithful commons, that principles are adopted and views entertained unfriendly to the privileges of this houſe, and to the freedom of our excellent conſtitution. That we have made no charge againſt any of them, becauſe it is their removal, and not their puniſhment, which we have deſired: and that we humbly conceive we are warranted, by the ancient uſage of this houſe, to deſire ſuch removal, without making any charge whatever. That confidence may be very prudently withheld where no criminal proceſs can be properly inſtituted.

" That although we have made no criminal charge againſt any individual of his majeſty's miniſters, yet, with all humility, we do conceive, that we have ſtated to his majeſty very diſtinct objections, and very forcible reaſons againſt their continuance. That, with regard to the propriety of admitting either the preſent miniſters, or any other perſons as a part of that extended and united adminiſtration which his majeſty, in concurrence with the ſentiments of this houſe, conſiders as requiſite; it is a point upon which we are too well acquainted with the bounds of our duty to preſume to offer any advice to his majeſty; well knowing it to be the undoubted prerogative of his majeſty, to appoint his miniſters without any previous advice from either houſe of parliament; and our duty humbly to offer to his majeſty our advice, when ſuch appointments ſhall appear to us to be prejudicial to the public ſervice.

" To acknowledge, with gratitude, his majeſty's goodneſs in not conſidering the failure of his recent endeavours as a final bar to the accompliſhment of the gracious purpoſe which his majeſty has in view; and to expreſs the great concern and mortification with which we find ourſelves obliged to declare, that the conſolation which we ſhould naturally have derived from his majeſty's moſt gracious diſpoſition, is conſiderably abated, by underſtanding that his majeſty's *adviſers* have not thought fit to

ſuggeſt

ſuggeſt to his majeſty any further ſteps to remove the difficulties which obſtruct ſo deſirable an end.

" To recall to his majeſty's recollection, that his faithful commons have already ſubmitted to his majeſty, moſt humbly, but moſt diſtinctly, their opinion upon this ſubject; that they can have no intereſts but thoſe of his majeſty and of their conſtituents; whereas it is needleſs to ſuggeſt to his majeſty's wiſdom and diſcernment, that individual adviſers may be actuated by very different motives.

" To expreſs our moſt unfeigned gratitude for his majeſty's royal aſſurances, that he does not call in queſtion the right of this houſe to offer their advice to his majeſty on every proper occaſion, touching the exerciſe of any branch of his royal prerogative; and of his majeſty's readineſs at all times to receive ſuch advice, and to give it the moſt attentive conſideration.

" To declare that we recogniſe, in theſe gracious expreſſions, thoſe excellent and conſtitutional ſentiments which we have ever been accuſtomed to hear from the throne ſince the glorious æra of the Revolution, and which have peculiarly characteriſed his majeſty and the princes of his illuſtrious houſe; but to lament that theſe moſt gracious expreſſions, while they inſpire us with additional affection and gratitude towards his majeſty's royal perſon, do not a little contribute to increaſe our ſuſpicions of thoſe men who have adviſed his majeſty, in direct contradiction to theſe aſſurances, to neglect the advice of his commons, and to retain in his ſervice an adminiſtration whoſe continuance in office we have ſo repeatedly and ſo diſtinctly condemned.

" To repreſent to his majeſty, that it has anciently been the practice of this houſe to withhold ſupplies until grievances were redreſſed; and that if we were to follow this courſe in the preſent conjuncture, we ſhould be warranted in our proceeding as well by the moſt approved precedents as by the ſpirit of the conſtitution itſelf; but if in conſideration of the very peculiar exigencies of the times we ſhould be induced to wave, for the preſent, the exerciſe in this inſtance of our undoubted legal and conſtitutional mode of obtaining redreſs, that we humbly implore his majeſty not to impute our forbearance to any want of ſincerity in our complaints, or diſtruſt in the juſtice of our cauſe.

" That we know and are ſure that the proſperity of his majeſty's dominions in former times has been, under Divine Providence, owing to the harmony which has for near a century prevailed uninterruptedly between the crown and this houſe. That we are convinced that there is no way to extricate this country from its preſent difficulties, but by purſuing the ſame ſyſtem to which we have been indebted, at various periods of our hiſtory, for our ſucceſſes abroad, and which is at all times ſo neceſſary for our tranquillity at home. That we feel a continuation of the preſent adminiſtration to be an innovation of that happy ſyſtem. That we cannot but expect from their exiſtence, under the diſpleaſure of this houſe, every misfortune naturally incident to a weak and diſtracted government. That if we had concealed from his majeſty our honeſt ſentiments upon this important criſis, we ſhould have been in ſome degree reſponſible for the miſchiefs which are but too certain to enſue.

" That we have done our duty to his majeſty and our conſtituents in pointing out the evil, and in humbly imploring redreſs; that the blame and reſponſibility muſt now lie wholly upon thoſe who have preſumed to adviſe his majeſty to act in contradiction to the uniform maxims which have hitherto governed the conduct of his majeſty, as well as every other prince of his illuſtrious houſe; upon thoſe who have diſregarded the opinions, and neglected the admonitions of the repreſentatives of his people; and who have thereby attempted to ſet up a new ſyſtem of executive adminiſtration, which, wanting the confidence of this houſe, and acting in defiance to our reſolutions, muſt prove at once inadequate by its *inefficiency* to the neceſ-

neceſſary objects of government, and dangerous by its example to the liberties of the people."

This repreſentation and addreſs of the commons to the crown, was carried by a majority of *one*, 191, to 190, and requiring no anſwer, terminated the diſpute between the different branches of the legiſlature. The coalition party gave up the conteſt, and looked forward to a ſpeedy diſſolution of the houſe. The national buſineſs went on regularly and quietly—the neceſſary bills were forwarded in both houſes, and March 24th an end was put to the ſeſſion by the following ſpeech from the throne:

My Lords and Gentlemen,

"On a full conſideration of the preſent ſituation of affairs, and of the extraordinary circumſtances which have produced it, I am induced to put an end to this ſeſſion of parliament: I feel it a duty which I owe to the conſtitution and to the country, in ſuch a ſituation, to recur as ſpeedily as poſſible to the ſenſe of my people, by calling a new parliament. I truſt that this means will tend to obviate the miſchiefs ariſing from the unhappy diviſions and diſtractions which have lately ſubſiſted; and that the various important objects which will require conſideration, may be afterwards proceeded upon with *leſs interruption*, and with *happier effect*. I can have no other object but to preſerve the true principles of our free and happy conſtitution, and to employ the powers entruſted to me by law, for the only end for which they were given, the good of my people."

The next day a proclamation was iſſued for diſſolving the parliament and calling a new one, agreeably to the deſires and addreſſes of a great part of the kingdom. At that juncture, the great ſeal was ſtolen from the houſe of the lord chancellor, which occaſioned many ſuſpicions as if done by more than ordinary felons; but nothing farther appeared, and a new ſeal was preſently made. On the 18th of May the new parliament aſſembled, and the commons choſe Mr. Cornwall, the ſpeaker of the late houſe, for their preſent ſpeaker. The next day, his majeſty addreſſed them from the throne, and concluded with theſe words: "The affairs of the Eaſt India company form an object of deliberation deeply connected with the general intereſts of the country. While you feel a juſt anxiety to provide for the good government of our poſſeſſions in that part of the world, you will, I truſt, never loſe ſight of the effect which any meaſure to be adopted for that purpoſe may have on our own conſtitution, and our dear intereſts at home. You will find me always deſirous to concur with you in ſuch meaſures as may be of laſting benefit to my people. I have no wiſh but to conſult their proſperity by a conſtant attention to every object of national concern, by an uniform adherence to the true principles of our free conſtitution, and by ſupporting and maintaining, in their juſt balance, the rights and privileges of every branch of the legiſlature." A very feeble oppoſition was made to the addreſs of thanks in the houſe of lords, and it ſoon appeared that the appeal to the people had turned out greatly in Mr. Pitt's favour. Many whom lord North had bound to him by good offices when in power were thrown out; and others deſerted him, finding his vaſt influence was at an end. Several of Mr. Fox's friends alſo loſt their ſeats, and in the firſt two conteſts, it was plain that the power of the coalition was broken; their views were diſappointed in turning out the peace-makers and ſeating themſelves in their room, their forces melted away, and the young miniſter obtained a complete triumph over them. The firſt queſtion on which they tried their ſtrength, was the Weſtminſter election. Mr. Fox wanted a vote of cenſure on the high bailiff for not making a return to the writ on the appointed day, but delaying it for a ſcrutiny. A previous queſtion was put on the motion, and carried by a majority of 147;—283 againſt 136. The ſame evening, May 24th, on a diviſion of the houſe for an addreſs to the king's ſpeech, the numbers for it, without any alteration or amendment, were 282 againſt 114.

Notwith-

Notwithſtanding ſo great a majority, ſtill the members of the oppoſition much impeded the wheels of government, and threw many difficulties in the way of adminiſtration. On the 14th of June, Mr. Burke, in a long ſpeech, expatiated on the merits of the laſt parliament, reprobated the king's ſpeech at the opening of the new one, and the addreſs of thanks for it, and ſtated that his purpoſe was to move, "That an humble remonſtrance be preſented to his majeſty, aſſerting the rights of the houſe of commons, and reprobating the conduct of the king's miniſters in having adviſed his majeſty to break his royal word, and diſſolve his parliament after he had pledged his faith to the laſt houſe of commons, that he would not make ſuch an exerciſe of his prerogative before they had got through the arduous buſineſs upon their hands; and likewiſe for having adviſed his majeſty to make a ſpeech to the new parliament from the throne, full of doctrines the moſt unconſtitutional and alarming." The motion conſiſted of many pages, which the ſpeaker was above an hour in reading to the houſe, containing a defence of the laſt houſe of commons, a detail of their conſtitutional rights, and a ſevere reprehenſion of his majeſty's miniſters for having violated them in various inſtances. It was negatived without a diviſion, but as the main queſtion was ſuffered to be put, the whole of the motion was of courſe entered on the journals of the houſe, which ſeems to have been the mover's only intention. The miniſter now went on with his ways and means for ſupplies, and by lowering the tea duty, which he thought would ruin the ſmugglers, he was forced to deviſe other taxes which are found very heavy and burdenſome to the public; the window tax eſpecially, which is both partial and oppreſſive, ſcreening the lordly and wealthy, who are to pay but for two houſes, and the higheſt ſum for each is only 20l.

Mr. Pitt brought in his famous Eaſt India bill the 5th of July, the leading particulars of which we have given in our account of that company *. Time alone can diſcover whether it be framed with wiſdom, and adequate to the great purpoſes intended, and held forth to view. With very little oppoſition, all the ſyſtem of new bills and taxes was framed and carried through both houſes, and the parliamentary campaign cloſed on the 20th of Auguſt, with a complimentary ſpeech from the throne, wiſhing his faithful ſubjects to meet the new heavy burdens with fortitude and patience.

On the 25th of January 1785, the parliament aſſembled. Amongſt a variety of matter which preſſed on their attention, none ſeemed of more conſequence than the ſtate of parliamentary repreſentation, the ſyſtem of fortifications propoſed by the duke of Richmond, the affairs of India, and the propoſitions for a trading intercourſe with Ireland. The buſineſs of parliamentary reform appears to have been taken up by Mr. Pitt as a miniſterial meaſure, and to have received from him a conſiderable ſhare of attention; he accordingly introduced a ſpecific plan for that purpoſe on the 18th of April, which he prefaced by a hiſtory of parliamentary repreſentation from a very remote period. The plan was to give one hundred members to the popular intereſt of the kingdom, and to extend the right of election to above one hundred thouſand perſons, who, by the exiſting proviſions of law, were excluded from it. This acceſſion to the popular intereſt was to be principally obtained by the ſuppreſſion of decayed boroughs, and the transfer of their repreſentatives to the counties; ſo that the number of the houſe of commons would remain the ſame. After a debate of conſiderable length it was rejected by a majority of 74; the noes being 248, and the ayes 174.

From the apprehenſions of the nation, during the late war, for the ſafety of the dock-yards, whilſt the combined fleets were in the channel, and no adequate naval force to oppoſe them, the duke of Richmond conceived the idea of fortifying them, as the beſt protection from future inſult or danger. Conſiderable ſums had been

* Page 241.

annually granted for this purpoſe, but the greatneſs of the expence at length attracted the attention of a reſpectable part of the houſe of commons, and after a full diſcuſſion of the utility of the plan it was determined (finally in the following ſeſſion) to diſcontinue the works as uſeleſs, and, in ſome reſpects, as dangerous.

The Iriſh propoſitions were another ſubject which engaged the attention of parliament. This new ſyſtem of intercourſe between Great Britain and Ireland was firſt introduced into the parliament of the latter kingdom by Mr. Orde on the 7th of February, in the form of ten propoſitions; theſe, by a ſmall altération, and the diſtribution of the ſubject of one of them into two heads, were increaſed to eleven. They received the aſſent of both houſes in that kingdom, and on the 22d of the ſame month, were communicated to the parliament of Great Britain by Mr. Pitt, chancellor of the exchequer. The leading principle in this plan, was the equalizing the duties on the produce and manufactures of both countries; and for the benefits communicated thereby to the ſiſter kingdom, ſhe was in return to give a certain portion of her hereditary revenue towards the maintenance of the navy of the empire.—The ſubject had received but little diſcuſſion, when the fears and prejudices of the manufacturers were rouſed in every part of the kingdom; innumerable petitions were preſented and evidences heard; committees were formed from aſſemblies of theſe manufacturers, who were directed to oppoſe the paſſing the propoſitions into a law. Theſe circumſtances, together with the ſtrength of oppoſition in the houſe of commons, produced ſuch an alteration in the propoſitions that they were extended to twenty. After having paſſed through both houſes, when they arrived in Ireland thus multiplied and thus altered, they met with the moſt violent oppoſition, and though there appeared in the Iriſh houſe of commons 127 againſt 108 in their favour, yet the majority being ſo ſmall, adminiſtration thought it prudent to avoid the riſque of a defeat in the progreſs of the bill, and therefore withdrew it in two days after. The firm diſpoſition of the people of Ireland obliged adminiſtration to ſoften their tone, and to bring in ſuch bills as were calculated to afford them effectual commercial relief.

The affairs of India, although they did not engage the public attention ſo much this year as the former, yet the proceedings of the board of controul afforded matter for much parliamentary debate, but no meaſure of conſequence aroſe from this ſource.

Amongſt the variety of new taxes impoſed in this ſeſſion, that called the ſhop-tax received the ſtrongeſt oppoſition; and by the perſevering applications of thoſe who were particularly aggrieved, its repeal was at length obtained.

In conſequence of ſevere prohibitions having been laid on the importation of Britiſh manufactures into the Auſtrian dominions, and ſeveral reſtrictions on their introduction into France, the miniſter opened a negotiation with the latter kingdom, for a more liberal commercial intercourſe between the two countries, and appointed Mr. Eden envoy extraordinary and miniſter plenipotentiary for that purpoſe. A treaty was accordingly concluded and ratified by both houſes of parliament. This was a meaſure of great political conſequence, as it tended to break aſunder the national prejudices, which had exiſted for many ages between the two countries.

Parliament aſſembled on the 24th of January 1786, and amongſt the various meaſures agitated, the plan for eſtabliſhing a ſinking fund, and employing a million annually for reducing the national debt, engaged their moſt immediate attention. This million is produced by the yearly income of the ſtate exceeding the permanent level of its expenditure by a ſum of 900,000l. which may be increaſed to a million by means in no wiſe burthenſome to the people. This meaſure which had the concurrence of every man, who deſired the emancipation of the ſtate from the accumulated load of debt and taxes, was carried into a law, which created commiſſioners for carrying the purpoſes of this valuable act into execution.

We

We come now to a very important tranſaction of the preſent times, the impeachment of Mr. Warren Haſtings, late governor general of Bengal. The characters both of the accuſer and of the perſon accuſed were ſuch as to give dignity and intereſt to the ſcope of the buſineſs. Mr. Burke, a man of the moſt original genius, of the moſt cultivated talents, and the moſt unwearied application. Mr. Haſtings, on the other hand, a man of ſtrong imagination, of boundleſs ſpirit and enterprize, and of extenſive obſervation. On the 17th of February, Mr. Burke explained, in ſome degree, the mode of proceeding he was deſirous to adopt; and, in the courſe of the ſeſſion moved for a multitude of papers to ground and ſubſtantiate his charges upon. Theſe were at length produced, and Mr. Haſtings heard at the bar of the houſe of commons in his defence. The debates which aroſe on the ſubject terminated in reſolutions, That certain of the charges contained matter of impeachment againſt the late governor general of Bengal. This important buſineſs is ſtill depending, notwithſtanding the ſtrenuous endeavours of the friends of Mr. Haſtings to maintain, at the opening of the preſent parliament, that the impeachment had naturally fallen to the ground by the diſſolution of the laſt parliament: a doctrine highly dangerous to the liberties of this country, by which it would be in the power of the crown to put a ſtop to any proſecution againſt the greateſt enemies to the ſtate; and the houſe of commons had the public ſpirit to reſolve that the trial of Mr. Haſtings ſhall ſtill proceed.

The feeble attempt of an obſcure and contemptible maniac, of the name of Margaret Nicholſon, againſt the life of the ſovereign, in the face of day, and in the ſight of a multitude of ſpectators, on the 2d of Auguſt, was productive of no other effect than to ſhew how much he was beloved by his ſubjects. The general exultation which prevailed after that event, reflected honour on the people as well as the king.

The conſolidation of the cuſtoms and exciſe was the moſt important circumſtance deſerving of attention in the year 1787. This was a meaſure of incredible labour and detail, as well as of infinite advantage to commerce, by facilitating and ſimplifying the intricacies attendant on mercantile tranſactions, and the payment of duties; a regulation which was duly and permanently effected. It had failed under the inert and feeble efforts of lord North; and its completion, ſo evidently productive of national benefit, drew the moſt generous applauſes even from the enemies and oppoſers of the miniſter. The plan for effecting this meaſure was not brilliant, but ſimple in its nature. It promiſed no flattering accumulation of revenue, but ſuch an arrangement as would relieve the officer of government from much trouble, and exempt the ſubject from embarraſſment and injuſtice.

The trade carried on by this country, and other European nations, upon the coaſt of Africa, for the purpoſe of purchaſing negro-ſlaves, to be employed in the cultivation of the Weſt-India iſlands, and certain ports of the continent of America, does not appear till of late years to have been conſidered with that general attention which ſuch a practice might have been expected to excite; a practice ſo abhorrent in its nature to the mild principles of modern policy and manners. This may probably have been owing, partly to the diſtance of the object, which tended both to conceal the ſufferings, and to leſſen the ſympathy of the public for the unfortunate ſufferers; and partly to the connivance of politicians, unwilling to examine too ſeverely into the neceſſity of the means by which diſtant colonies were enabled to pour luxury and wealth into the mother-countries. The firſt public attempt, we believe, that was made to put a ſtop to this traffic, was by the Quakers of the ſouthern provinces of America, who, ſoon after the eſtabliſhment of their independence, not only preſented for this purpoſe a ſtrong and pathetic addreſs to their ſeveral legiſlative aſſemblies, but actually proceeded, as is ſaid, in many inſtances to emancipate the ſlaves that were in their poſſeſſion. The meaſures taken

by the American legiſlatures, in conſequence of this application, are before the public. In Great Britain the ſame ſociety appears alſo to have taken the lead, and, after the example of their American brethren, preſented a ſimilar petition to the parliament of this kingdom. The cauſe ſoon after became extremely popular. A great number of pamphlets were publiſhed upon the ſubject; ſeveral eminent divines recommended it from the pulpit and in printed diſcourſes, and petitions were preſented to the legiſlature from the two univerſities, and from ſeveral of the moſt conſiderable towns and corporations in the kingdom.

His majeſty's miniſters thought it proper to inſtitute an enquiry, before a committee of the privy council, into the facts and allegations contained in the repreſentations of both parties upon the ſubject. The firſt public notice that was taken of the ſubject was an information communicated by Mr. Wilberforce, ſoon after the meeting of parliament, of his intention to bring forward a meaſure reſpecting the ſlave-trade. That gentleman being much indiſpoſed, Mr. Pitt came forward on the 9th of May, 1788, in the name of his friend, and moved the following reſolution, "That this houſe will early in the next ſeſſion of parliament proceed to take into conſideration the circumſtances of the ſlave-trade complained of in the petitions preſented to the houſe, and what may be fit to be done thereupon;" which was unanimouſly carried. After this on the 21ſt of May, ſir William Dolben moved the houſe for leave to bring in a bill to regulate the tranſportation of the natives of Africa to the Britiſh colonies in the Weſt Indies *. By the bill now propoſed, the number of ſlaves to be tranſported in any ſhip was to be regulated according to its bulk or tonnage, allowing nearly one ton to each man. This was only intended as a temporary relief till ſome more permanent expedient could be be deviſed by the legiſlature. Having paſſed through the commons, it was carried up to the lords, where it alſo paſſed, after having received ſeveral amendments; ſome of which being thought to interfere with the privileges of the lower-houſe, a new bill was brought in, which paſſed both houſes, and received the royal aſſent.

The year 1788, being the hundredth anniverſary of the glorious revolution in 1688, the 4th of November being the birth-day of king William, the inſtrument under Providence who completed that event, and the fifth of this month being the anniverſary of his landing, were obſerved by many ſocieties in London, and other parts of the kingdom, not only with feſtivity, but with devotion and thankſgiving. At Dublin this auſpicious anniverſary was obſerved at the caſtle with more than ordinary ſolemnity. The appearance of nobility and gentry at the levee was ſuch as evinced their attachment to the Revolution in favour of that illuſtrious monarch, and its happy conſequences in the eſtabliſhment of the preſent royal family on the throne of theſe realms. After the levee, his excellency, attended by a numerous train of the firſt perſonages in the kingdom, and eſcorted by the guard uſual on ſuch occaſions, went from the Caſtle to College-Green, and after ſaluting

* That there was a neceſſity for adopting this propoſition will moſt clearly appear from the facts which were proved in the courſe of the debate. It appeared that five feet ſix inches in length, and ſixteen inches in breadth was the ſpace allowed on an average to each ſlave. The lower deck of the veſſels was intirely covered with bodies, and the ſpace between the floor of that deck and the roof above, which ſeldom amounted to five feet eight inches, was divided by a platform alſo covered with bodies. Five perſons in every hundred periſhed at the loweſt computation in a voyage of ſix weeks continuance, which, according to the moſt accurate eſtimates of human life, was ſeventeen times the uſual rate of mortality. It was, indeed, much more, becauſe in the eſtimate of mortality, perſons of every age were included, while in an African voyage the aged were intirely excluded, and few infants were admitted. Such was the ruinous nature of the trade in the moſt favourable circumſtances; but, in the voyage to the more diſtant parts of Africa, the mortality was ſtated to be twice as great; and conſequently, thirty four perſons periſhed, at the loweſt eſtimation for one, that would have died in the courſe of nature.

the equeſtrian ſtatue of king William, proceeded from thence round Stephen's Green. The appearance on this occaſion was ſplendid, and the number of equipages greater than had been known for many years.—At Edinburgh this day was obſerved as a day of ſolemn thankſgiving, as directed by an act of the General Aſſembly of the church of Scotland paſſed on the 30th of May in this year; and by this act all the miniſters of that national church were enjoined to obſerve the ſame. By the publication of this act nearly ſix months before the annual return of the day, that aſſembly had the honour to take the lead, in their reſolution to celebrate this glorious event: and it ought to be mentioned, to the honour of that high-ſpirited and noble-minded people, that the principles of the Revolution are well underſtood and warmly embraced by them.—At Whittington, between Sheffield and Cheſterfield, adjoining to a decent modern building, is an old thatched cottage, the upper ſtory of which lighted by a very ſmall window, is ſhewn as the apartment called by the antirevolutioniſts, "the plotting parlour," in which the glorious buſineſs was planned. To this place the illuſtrious leaders, the earls of Devonſhire and Danby, lord Delamere, and Mr. John Darcy, came diſguiſed, and concerted the meaſures which happily produced ſo much good to this country; and, in an oaken cheſt, ſtill preſerved in a corner of the room, the minutes of the meeting were depoſited; here is alſo to be ſeen the old armed chair in which the earl of Devonſhire is ſaid to have ſat. The deſcendants of the illuſtrious houſes of Cavendiſh, Oſborne, Boothe, and Darcy (for the venerable duke of Leeds, whoſe age would not allow him to attend, had ſent his two grandſons, in whom the blood of Oſborne and Darcy is united); a numerous and powerful gentry; a wealthy and reſpectable yeomanry; a hardy, yet decent and attentive peaſantry; whoſe intelligent countenances ſhewed that they underſtood, and would be firm to preſerve that bleſſing, for which they were aſſembled to return thanks to Almighty God, preſented a truly ſolemn ſpectacle, and, to the eye of a philoſopher, the moſt intereſting that can be imagined. It was not the leaſt pleaſing circumſtance attending this meeting, that all party diſtinctions were forgotten. Perſons of all ranks and denominations wore orange and blue, in memory of our glorious deliverer. And the moſt reſpectable Roman-catholic families, ſatisfied with the mild toleration of government in the exerciſe of their religion, vied in their endeavours to ſhow how juſt a ſenſe they had of the value of civil liberty.

In the ſpace of only four years which had elapſed ſince the complete triumph of the ſovereign and the nation over the "Coalition," Great Britain, under the conduct of a miniſter, who had not yet attained his thirtieth year, had riſen from a ſtate of unexampled depreſſion to her ancient ſuperiority among the European kingdoms. The finances had been re-eſtabliſhed by a ſyſtem of unremitting and ſevere œconomy. Commerce, aided and emancipated by the wiſe regulations of an enlarged policy, opened new ſources, and navigated ſeas hitherto almoſt unexplored, in the proſecution of its objects. Public credit attained a point of elevation and permanence unparelleled ſince the commencement of the unfortunate war with America. The councils of England, conducted on principles not of a crooked duplicity, but of rectitude and magnanimity, excited reſpect and approbation in the ſurrounding ſtates, while they diffuſed proſperity and felicity over every part of the iſland.

Political alliances and connections on the continent added the proſpect of ſtability to every meaſure which was calculated for internal ſecurity or commercial advantage. The calamities of lord North's adminiſtration, and the anarchy which ſucceeded that unfortunate period: the defalcation of thirteen provinces, and of both the Floridas from the empire: the diſgraces of Saratoga, and of the Cheſapeake: the tumults and conflagration of London; in a word, the varied and accumulated misfortunes, which for a long ſeries of years oppreſſed, and had almoſt overwhelmed the commonwealth, were already eraſed from the recollection. A mild and happy

calm

calm had ſmoothed theſe troubled waves. The ſovereign was deſervedly dear to every rank and order of his ſubjects, who united in regarding him as their father and benefactor. The government, beloved at home, was reſpected abroad; and the people, happy beyond the example of former times, looked up with equal affection and veneration towards the ſource of theſe multiplied benefits.

But in the midſt of this flattering aſpect of affairs, an unexpected and diſaſtrous change was preparing to manifeſt itſelf, which no human prudence could have foreſeen, or precautions delayed. We were deſtined to experience in its fulleſt extent, the mutability of fortune and the fragility of greatneſs; to hold out a memorable leſſon to our own and to future times, that the ſplendor and felicity of man, however ſolid the foundations on which they may ſeem to repoſe, are in the hands of a ſuperior being, who confers or withdraws them in an inſtant. We are arrived at that awful period, which, from a variety of motives, we ſhould wiſh to cover under a veil of oblivion, if the publicity of the great leading facts, and ſtill more, if the inſtruction conveyed by the narration itſelf, as one of the moſt intereſting portions of modern annals, did not ſuperſede any perſonal inclinations. It is not, however, either in our plan or our intention to relate the *private* hiſtory of that extraordinary period; or to drag into day-light facts and anecdotes, which, curious and entertaining as they muſt appear to poſterity, are, in every ſenſe, unfit for the peruſal of the preſent age. Sentiments of duty, delicacy, and reſpect towards a prince inexpreſſibly dear to his people: towards a queen, who, during near thirty years, and in every relation of domeſtic life, has been blameleſs and exemplary: towards thoſe illuſtrious perſons, on whom the ſceptre of George III. muſt, in the ordinary progreſs of events, in ſome future, and, as we truſt, far diſtant period, devolve: even motives of prudence, decorum, and propriety, prevent us from giving any other but the outline of a picture, which muſt excite the moſt painful emotions in every generous mind to review.

It is not eaſy to imagine or to parallel, in the hiſtory of the preſent century, a period of more perfect ſecurity than that which England preſented in the autumn of 1788. The king, accompanied by the queen, and ſurrounded by his family, after having tried the effects of a relaxation from public buſineſs, and of the medicinal waters of Cheltenham, had returned to Windſor; not, indeed, in a ſtate of vigorous health, but by no means in any ſuch declining ſtate of indiſpoſition as to excite alarm among his ſubjects. The prince of Wales, as uſual, paſſed the ſummer at his Marine Pavilion at Brighthelmſtone; Mr. Pitt, occupied in the functions of his ſtation, was detained in the vicinity of the capital; while Mr. Fox, whoſe faculties of body and mind had been not a little exerciſed and exhauſted, by a toilſome attendance in Covent-garden, during the extreme heats of Auguſt, which was thought requiſite to ſecure the election of lord John Townſend as member for Weſtminſter, indulged a degree of neceſſary repoſe, and withdrew for a ſhort time from the hurry of political life. He quitted England, and repaired to Switzerland and Italy, as a ſcene calculated to amuſe and entertain while it reſtored and invigorated a conſtitution impaired by conſtant exertion. The great leaders of miniſtry and oppoſition, having laid aſide their political animoſities, were diſperſed in peaceful inactivity over every part of the kingdom. From this ſtate of public recreation and felicity, the nation was rudely and ſuddenly awoke, by the reports of his majeſty being attacked with an unexpected and dangerous illneſs. The preciſe nature of it was for ſeveral days unaſcertained and unexplained, even to thoſe whoſe reſidence near the court ſhould have enabled them to obtain early and authentic information. Meanwhile fame augmented the evil, and the death of the ſovereign was believed to have either already taken place, or to be imminent and inevitable.

The

The grief and diſtraction which were manifeſted in every part of the iſland, on the publication of this calamitous event, can be only compared with that of the Roman people, on the news of Germanicus being ſeized with mortal ſymptoms at Antioch; as the diſtreſsful ſituation of the queen bore ſome reſemblance to that of Agrippina. "*Paſſim ſilentia et gemitus, nihil compoſitum in oſtentationem; et quanquam neque inſignibus lugentium abſtinerent, altius animis mœrebant.*" Time, however, gradually divulged the truth, and changed the apprehenſions of the nation for the ſituation of the king. His diſorder was underſtood to have fallen upon the brain, and to have produced, as might be expected, a temporary privation of reaſon. As the cauſe of this alienation of mind was extraneous and violent, it might be hoped that it could only be of ſhort duration: but the iſſue was uncertain, while the ſuſpenſion of all government, and of every function attached to the kingly dignity, was immediate and indiſputable. A ſpecies of interregnum, in fact, took place; though unaccompanied by any of thoſe circumſtances which uſually characterize and accompany that unfortunate ſtate. The kingdom, anxious, and with eyes directed towards their ſovereign, betrayed no ſymptons of confuſion, anarchy, or civil commotion. The firſt miniſter continued to exerciſe, by a general ſubmiſſion and conſent, the powers delegated to him before the king's indiſpoſition; and the political machine, well conſtructed and properly organized, ſuſtained no derangement or injury whatſoever from this ſhock, except thoſe inſeparably connected with delay in the tranſactions or negotiations pending with foreign courts.

Meanwhile the heir to the monarchy had quitted Brighthelmſtone on the firſt information of his father's malady, and repaired to Windſor, whither he was followed by the duke of York. Phyſicians were called in, though ineffectually; and as the nature of the diſtemper and of its final termination opened a wide field to conjecture, change and alteration, an expreſs was ſent to overtake Mr. Fox in whatever part of the continent he might be found, and to intreat that he would return without delay to England.

The two houſes of parliament, in conſequence of the preceding prorogation, met in a few days ſubſequent to theſe extraordinary events. The general agitation and curioſity, even if they had not been aided by other emotions of hope and fear, of ambition, and of public duty, would alone have produced a numerous attendance. Mr. Pitt opened the ſubject of their meeting in a very conciſe and pathetic manner; lamented the occaſion, expreſſed his hope that the cauſe would ſpeedily be removed, and, in purſuance of that idea, adviſed an immediate adjournment of a fortnight. The propoſition was received in deep ſilence by the oppoſite ſide of the houſe, and aſſented to in mute acquieſcence. Their leader was not yet arrived, and conſequently time was wanted to adjuſt and determine on their plan of action under circumſtances ſo delicate and unprecedented. In the interval which took place, his majeſty was removed to the palace of Kew. The prince of Wales returned to Carlton Houſe; and Mr. Fox, impatiently expected, after a journey which he performed with incredible expedition from Bologna, in a very infirm and diſordered ſtate of health, arrived in London, and aſſumed his juſt pre-eminence in the councils of his party.

Thoſe councils evinced their nature and object, as ſoon as the late adjourment was at an end; and Mr. Fox generouſly, though perhaps injudiciouſly, ſtepping forward in the ſenate, rather laid claim to the vacant ſceptre, in the name and on the behalf of the heir apparent, as belonging and devolving to him of right, than preferred his pretenſions with modeſty and ſubmiſſion at the bar of the aſſembled nation. Perhaps a ſtep more injurious to the great perſonage whom it was intended to ſerve, or more pregnant with conſequences to be deprecated, of every kind, could not have been deviſed or executed. Perhaps, too, when time ſhall have withdrawn that curtain which is ſtill ſtretched acroſs theſe recent and intereſting events, we may

diſcover, that in advancing ſo unqualified a demand of the regency, he did not preciſely follow the dictates of his own elevated mind and illuminated judgment. It wakened a jealous ſpirit of enquiry into the ſuppoſed origin and foundation of that aſſerted right, in the breaſts even of the moſt liberal and unprejudiced. It compelled adminiſtration to probe that problematical and obſcure part of the Britiſh conſtitution. It reminded thoſe, to whom the writings of Shakeſpear were familiar, of that affecting and pathetic ſcene, where Henry IV. under a temporary privation of his faculties, finds, on his recovery, that his eldeſt ſon has carried away the inſignia of his royal dignity, which, had he only waited a few hours, would have been his by devolution.

The diſcernment of Mr. Pitt ſaw, and inſtantly enabled him to profit of this error in his antagoniſt. He demanded the diſcuſſion and deciſion of ſo great and leading a principle, which led to concluſions unlimited and undefined, as well as ſubverſive of the tenure on which a king of England had originally received his crown, previous to any ulterior diſpoſition and diſtribution of offices. He was joined by the majority of the houſe in this requiſition, and thus commenced his reſiſtance under auſpices and circumſtances peculiarly fortunate. It was in vain that the prince of Wales, already rendered ſenſible of the injury which his cauſe had ſuſtained, equally in parliament and among the people, by Mr. Fox's unqualified claim of right, endeavoured to wave and prevent all diſcuſſion of ſo invidious a ſubject. It was in vain that the duke of York, in his brother's name, and by his authority, renounced any ſuch aſſumption of power, and made this public declaration in the houſe of lords. Nor was Mr. Fox's attempt to qualify his firſt aſſertion, and to give it a more mitigated ſenſe, received with better ſucceſs in the other houſe. Parliament, roufed to a ſenſe of the neceſſity of declaring itſelf ſolely competent to fill the vacant throne, proceeded to that great act without circumlocution or delay; and having pronounced upon this important preliminary, then decided that the prince of Wales ſhould be invited and requeſted to accept the regency, under certain limitations.

The month of December elapſed in theſe conteſts, and the year 1789 commenced under the moſt gloomy preſages. Mutual aſperity and reproach embittered every debate. No appearances of convaleſcence or recovery, ſo ardently anticipated by the nation, had yet manifeſted themſelves in the malady of the king. In addition to the keeneſt ſenſations of private diſtreſs as a mother and a wife, the queen ſaw herſelf on the point of being placed in the moſt painful, though indiſpenſably neceſſary ſituation; that of being entruſted with the care of the royal perſon, and of ſtanding in a ſort of rivality and competition with her eldeſt ſon. The prince, who aſpired to a regency unfettered by any reſtrictions, betrayed, in his reply to a letter which the firſt miniſter addreſſed to him, and in which the great features of that intended delegation of the royal power were delineated, his warm reſentment and diſſatisfaction at many of thoſe defalcations. He concluded, however, by reluctantly and coldly conſenting to receive it, curtailed and degraded as it might be by miniſterial or parliamentary diſtruſt.

A ſecond examination of the phyſicians who had attended his majeſty during the courſe of his diſorder, which took place before a committee of the houſe of commons, and which was certainly not conducted, on the part of oppoſition, with either delicacy or judgment, tended to throw very little light on the great object of public enquiry, the probable duration and period of this afflicting malady. Mr. Pitt conſtantly and warmly maintained the probability of its happy termination; and, regarding it as neither diſtant or hopeleſs, made the reſumption of the royal power by the ſovereign with facility and celerity, as ſoon as he ſhould be enabled to wield the ſceptre, the firſt and leading principle of all his meaſures and propoſitions. The adherents of the prince of Wales ſaw the proſpect of his father's recovery through a very different medium, and conceived of it not only as improbable, but as hourly

augmenting

augmenting in that improbability. They were ſuſtained in this opinion by Warren, as the miniſter was confirmed in his oppoſite ſentiment by Willis; two phyſicians, on whoſe contradictory prognoſtics and apprehenſions each party implicitly relied. The former, at the ſummit of his profeſſion, and unqueſtionably poſſeſſed of great medical ſkill, was yet accuſed by the public voice of leaning in his inclination to the party of the prince. The latter brought from a diſtant province to attend the ſovereign under his ſevere diſorder, and having been peculiarly converſant in that ſpecies of diſeaſe, boldly and early aſſerted, that he entertained ſcarcely any doubts of the king's perfect re-eſtabliſhment at no remote period. The event fully juſtified his prediction.

Meanwhile the introduction of the propoſitions upon which the regency-bill was meant to be founded, and the reſtrictions intended to be impoſed upon the power of the future regent, which were brought forward by the firſt miniſter in the houſe of commons, carried the rage and virulence of party to its utmoſt height. The negation of the power of creating peers; the nomination of a council to aſſiſt the queen; and the complete reſervation of the royal houſehold, were all arraigned and condemned in the warmeſt terms by Mr. Fox, as dictated only by ambition, and not originating in ſtate-neceſſity, or even in regard to the ſituation of the monarch. The hiſtory of France, under the unhappy reign of Charles VI. was cited, as bearing a manifeſt reſemblance to the preſent diſaſtrous period; and a queen, equally venerated and beloved by the nation, was compared to the unnatural Iſabella of Bavaria; as her ſon the dauphin's abandoned and perſecuted ſtate was aſſerted to be ſimilar to that of the prince of Wales. Unmoved by theſe invectives, and ſuſtained by conſcious rectitude of intention, the miniſter ſteadily purſued his way: nor was he, in this critical and diſtreſſing moment, deſerted by either houſe of parliament. The chancellor, who at the commencement of the king's illneſs had been ſuppoſed to have liſtened to propoſals for forming a part of a new adminiſtration; anxious to evince the falſehood of ſo unjuſt an aſperſion, and to give the moſt unequivocal proofs of loyalty and of adherence to his ſovereign under the preſent circumſtances, collected all the energy of his mind in various appeals, which he ſucceſsfully made to the honour and patriotiſm of the houſe of lords.

In this ſtage of the public buſineſs, at a moment when the king's ſituation appeared moſt to exclude hope, and while the houſe of commons were fully occupied in framing the principal component parts of the act, which was to eſtabliſh the regency, Mr. Fox withdrew from the ſcene, and, quitting London, retired to Bath. His diſordered ſtate of health was aſſigned as a pretext for this acceſſion at ſo extraordinary and critical a juncture; but the public conceived the motives of it to originate in very different cauſes. Diſſention and jealouſy had already pervaded the counſels of Carlton houſe. The diſtribution of offices under the approaching regency had produced alienation among the chiefs. An interior cabinet, different in its views, and oppoſite in its objects to the great oſtenſible leaders of the party attached to the prince of Wales, had ſet up a ſeparate ſtandard, and formed a diſtinct intereſt. Difference of opinion had manifeſted itſelf upon ſome very delicate and perſonal points. Cabal and intrigue had penetrated into the cloſet. His royal highneſs was generally ſuppoſed to have experienced difficulties, if not peremptory refuſals of gratifying his wiſhes, on the part of the duke of Portland; and that, in relation to perſons and things peculiarly near his heart. Theſe numerous ſources of diſunion were ſtill, however, in ſome meaſure concealed from view, by their very nature, and the mutual intereſt or honour of the parties themſelves.

The great acts of parliamentary legiſlation proceeded, and were nearly approaching to their termination. A very ſhort period, probably not exceeding three days, muſt have completed the bill, which was to declare the incapacity of the ſovereign to conduct the national affairs, and to transfer the ſceptre, though with diminiſhed

influence, to his ſon. The members of adminiſtration were on the point of reſigning their charges, and the new miniſtry, already ſettled, prepared to enter on office: while the Engliſh people, fondly attached by every ſenſe of loyalty and affection to their monarch, as well as from gratitude and eſteem to the firſt miniſter, in dejection and ſilence looked on, and ſaw the government transferred to others, who, whatever abilities they might collectively poſſeſs, certainly neither merited nor enjoyed the general approbation and confidence.

But the term of inter-regnum and misfortune was now arrived; and the impending calamity which had menaced England with all the evils of a regency, far more to be deprecated and dreaded than thoſe from which the country had eſcaped in 1784, was ſuddenly and unexpectedly diſſipated. The diſorder, under which the king had ſuffered during three months, and whoſe violence had hitherto appeared to baffle all medical ſkill and exertion, gradually, but rapidly, ſubſided. Sanity of mind and reaſon reſumed their ſeat, and left no trace of their temporary ſubverſion. Time confirmed the cure, and reſtored to his ſubjects a prince, rendered ſupremely and peculiarly dear to them by the recent proſpect and apprehenſion of his loſs. The viſion of a regency faded and diſappeared, as the ſovereign came forward to public view, and was totally extinguiſhed by his reſumption of all the regal functions. The demonſtrations of national joy far exceeded any recorded in the Engliſh annals, and were probably more real and unfeigned than ever were offered on ſimilar occaſions. It was not only that a king, beloved and reſpected, was recovered from the moſt afflicting of all ſituations incident to humanity, and enabled to re-aſcend the throne. Sentiments of diſapprobation and of general condemnation, affixed to the meaſures and conduct of the oppoſite party, heightened the emotions of pleaſure, by a compariſon with that ſtate from which the kingdom had been ſo fortunately delivered. No efforts of deſpotiſm, or mandates of arbitrary power could have produced the illuminations which not only the capital but almoſt every town and village throughout the kingdom, exhibited in teſtimony of its loyalty; and theſe proofs of attachment were renewed, and even augmented, on the occaſion of his majeſty's firſt appearance in public, and his ſolemn proceſſion to St. Paul's (on the 23d of April 1789), to return thanks to Heaven for his recovery. Serenity and tranquillity, ſo long baniſhed, reſumed their place, and ſoon effaced the recollection of a calamity not more awful and alarming in its appearance and progreſs, than ſpeedily and happily extinguiſhed.

Whilſt the ancient government of France was intirely overthrown, and a revolution the moſt unexpected was effected by a nation of brave ſpirits ſtruggling for their liberty, it is difficult to imagine a picture of more complete ſerenity than England preſented; and this internal repoſe was accompanied with every circumſtance of external proſperity, and augmenting national conſideration. The year which immediately ſucceeded the malady of George the Third may be ranked among the happieſt of his reign, whether it be conſidered as perſonally affecting himſelf, or as productive of felicity to his people. The recent danger from which he had eſcaped, rendered his health and ſafety peculiarly precious to his ſubjects; as the animated expreſſions of their attachment and loyalty muſt have deeply touched the heart of a prince, infinitely ſenſible to theſe genuine marks of affection. The character of the ſovereign was not more formed to produce, than that of his adminiſtration was to perpetuate the general tranquillity. The conduct of Mr. Pitt, during the whole progreſs of the late commotions in France, may be held up as a model of political honour and rectitude; perhaps equally ſo of wiſdom. Unlike to Richlieu, who fomented the cauſes of diſcord between Charles the Firſt and his parliament; unlike to Vergennes, who ſtimulated the Americans to reſiſtance; and after a ſeries of indirect and inſidious arts, violated the moſt ſolemn treaties, in order to inſure

their

their final independence; the Engliſh miniſter ſteadily and ſyſtematically adhered to the moſt exact neutrality.

The period which is comprized between the months of May 1789 and 1790, like the reign of Antoninus Pius, affords few materials for hiſtory, drawn from the interior events of the time. England, at peace with all the world, in the boſom of repoſe, ſaw her commerce and manufactures extend, her credit augment, and her name excite reſpect among the moſt diſtant nations; while many of the great ſurrounding European kingdoms were either involved in foreign war, or deſolated by domeſtic troubles. This tranquillity was not however allied to an ignominious and enervate ſloth; but, on the contrary, was ſecured by vigilance, activity, and exertion. In conjunction with Pruſſia and Holland, Great Britain indirectly extended her attention and ſuccour to Guſtavus the Third, ſinking under an unequal conteſt with the vaſt empire of Ruſſia. She reſtrained and arreſted Denmark, even after that power, as an auxiliary of the court of Peterſburgh, had already taken up arms, and committed hoſtilities againſt Sweden. She ſignified to Leopold, who had recently ſucceeded to the thrones of Hungary and Bohemia, her deſire that he would recall his troops from the banks of the Danube; and ſhe ſuſtained by her negociations the firmneſs of the Ottoman counſels, while ſhe ſilently, but not leſs decidedly, impoſed limits on the ambition of their great enemy Catherine the Second, by prohibiting her fleet from preſuming to quit the Baltic, and to complete the deſtruction of the Turks in the Archipelago.

In this happy ſituation, a ſtorm unexpectedly and ſuddenly aroſe from a quarter, where, it would ſeem, that no foreſight or precautions could have anticipated the danger. Among the new and unexplored paths of commerce, which the ſpirit of a diſcerning and adventurous people had attempted to open ſince the peace of 1783, were particularly two, which appeared to promiſe the moſt beneficial returns. The firſt was a whale-fiſhery, ſimilar to that which had been carried on for ages near the coaſts of Greenland; but transferred to the ſouthern hemiſphere, near the extremity of Patagonia, and in the ſtormy ſeas which ſurround Cape Horn; as well as in the Pacific Ocean. In the courſe of a few years, this branch of trade had augmented rapidly, and was found on trial to afford very important advantages; nor had it received any impediments from the vague pretenſions of the Spaniſh crown to the ſovereignty of the ſhores waſhed by that ocean, which was the ſcene of their exertions.

The ſecond of theſe enterprizes, original in its own nature, able in its conception, bold in its execution, and having no precedent for its guidance, was directed to counties and to objects almoſt as much unknown to geographical, as to commercial knowledge or experience. It demanded many qualities rarely and difficultly combined: a conſiderable capital; miniſterial approbation; faithful and capable conductors; dextrous navigators, and above all, much time and perſeverance to ripen, and ultimately recompence the perſons engaging in ſo eccentric and expenſive an expedition. This extraordinary union of talents and circumſtances was, however, found in men of no ſuperior deſcription among the mercantile inhabitants of London; and it will remain a ſtriking monument to future ages, of the energy, capacity, and nautical ability, which diſtinguiſh the preſent century and the Britiſh nation, above the moſt enlightened periods of any ancient or modern people.

The north weſt coaſt of America, the part of the earth to which this embarkation was deſtined, was not only ſo remote, but ſo undefined, that its very exiſtence remained unknown or doubtful, before the diſcoveries of the reign of George the Third. This immenſe tract of land, extending northward from California and New Albion to the Frozen ſea, had been partly explored and faintly traced by capt. Cook; but much remained for future enterprize and induſtry to accompliſh, before this diſcovery could be converted to any purpoſe of public utility. He had, however,

aſcertained the exiſtence of the continent; and he had received from the barbarous natives, with whom he eſtabliſhed a ſpecies of barter, ſome valuable ſpecimens of furs, in exchange for European commodities of a far inferior nature.

The hope of procuring a conſiderable quantity of theſe rare and coſtly ſkins, for the ſale of which a very advantageous market preſented itſelf at Canton in China, was the leading inducement to the adventurers, who engaged in the expedition. But, in the purſuit of private emolument, objects of general and national conſequence were neceſſarily implicated and interwoven. Behind this coaſt to the eaſtward, lay the vaſt continent of America; opening a field to commercial activity and reſearch, in which the imagination itſelf was loſt. The diſcovery of a communication through this unexplored country, and which may ultimately connect it, to a certain degree, with our ſettlements in Hudſon's Bay, appears from their account, not to be totally viſionary, though it was regarded as ſuch by our juſtly celebrated but unfortunate countryman.

Animated by theſe views, and having received the moſt affirmative marks of the protection of government previous to their departure, five ſhips were fitted out from London in 1785, and the two ſucceeding years. Four of theſe veſſels, after doubling Cape Horn, arrived ſafely on the north-weſt coaſt of America. The ſanguine expectations which had been entertained of effecting a lucrative exchange of commodities with the natives, were fully and ſpeedily realized. Cargoes of the fineſt furs were procured, and ſold to the Chineſe, even under great commercial diſcouragements, and pecuniary impoſitions, at ſo high a price, as amply to reimburſe, and enrich the adventurers. Other attempts of a ſimilar nature, were made from Bengal; and two veſſels were ſucceſſively diſpatched from the Ganges to the ſame coaſt in the year 1786. A factory was eſtabliſhed at Nootka Sound, a port ſituated in the fiftieth degree of northern latitude, on the ſhore of America. Poſſeſſion of it was ſolemnly taken in the name of the ſovereign and crown of England: amicable treaties were concluded with the chiefs of the neighbouring diſtricts; and a tract of land was purchaſed from one of them, on which the new proprietors proceeded to form a ſettlement, and to conſtruct ſtorehouſes. Every thing bore the appearance of a riſing colony, and each year opened new ſources of commerce and advantage.

Although individuals, occupied in exertions of this private nature, could not be expected to extend their views or efforts to objects of public utility, yet ſome further information was collaterally and incidentally required reſpecting the continent of America, in the courſe of their voyages. It is even pretended that a ſloop named the "Waſhington," navigated for ſome hundred miles along a vaſt number of iſlands, ſcattered in a ſea, which interſects that continent in a north-eaſt direction, and though the accounts hitherto received or tranſmitted, of this extraordinary and intereſting fact, are not either ſo minute, or ſo accurate, as by any means to entitle them to be implicitly received, yet they appear to be not totally deſtitute of foundation or probability. Every proſpect either of national advantage, and of private emolument, which the commerce of theſe coaſts ſeemed to promiſe to Great Britain, was, however, deſtined to experience a ſudden and unexpected ſuſpenſion.

That, upon every principle of the law of nations, upon the eſtabliſhed uſage in all ſimilar caſes, and as being *the firſt ſettlers*, the Britiſh adventurers had an undoubted title to the place in queſtion, is beyond diſpute. Notwithſtanding this in the month of May 1789, a Spaniſh ſhip of war from St. Blas, called the Princeſſa, commanded by M. Martinez, and mounting 20 guns, anchored there. The various avocations of trade having led the greater part of the perſons employed at this ſettlement to different parts of the coaſt, the only Engliſh trading ſhip remaining in the ſound was the Iphigenia. The Princeſſa was ſoon joined by a Spaniſh ſnow of 16 guns; and, for ſome time mutual civilities paſſed between the Spaniards and Engliſh.

Engliſh. Theſe, however, were at length interrupted, by an order being ſent to capt. Douglas (the commander of the Iphigenia) to come on board of the Princeſſa; when he was informed by M. Martinez, that he had the king of Spain's orders to ſeize all veſſels which he might find upon that coaſt, and that he (capt. Douglas) was his priſoner. In conſequence of this M. Martinez took poſſeſſion of the Iphigenia in the name of his catholic majeſty, and conveyed the crew priſoners on board the Spaniſh ſhips, where they were ironed. M. Martinez alſo took poſſeſſion of the ſettlement, hoiſted the Spaniſh flag, and proceeded to erect various buildings, on which he employed, together with his own men, ſome of the crew of the Iphigenia. He afterwards permitted captain Douglas to reſume the command of his ſhip; and on his repreſenting, that he had been ſtript of his merchandize, and other ſtores, M. Martinez gave him a ſmall ſupply of ſtores and proviſions (for which he took bills on the owners) by means of which, about a fortnight after he was at firſt detained, he was enabled to proceed to China.

Shortly afterwards, the Engliſh veſſels, the North-weſt America, the Argonaut, and the Princeſs Royal, arriving ſeparately at Nootka, from their trading voyages, were captured by M. Martinez, their crews were made priſoners, and their cargoes ſeized. After ſome detention the crew of the North-weſt America were ſent to China, the two other veſſels with their crews were ſent to St. Blas in Mexico, and ſome Chineſe, who had been brought to the ſettlement by our people, were detained and employed as labourers.

Of the North-weſt America, ſent to China, no authentic account has been received; but on the arrival of the two veſſels at St. Blas, a repreſentation of their caſe having been made to the Spaniſh governor, the ſhips were reſtored (on the officers giving ſecurity to indemnify the governor, ſhould it be proved they were lawful prizes) the crews were furniſhed with proviſions, ſtores, and money, to enable them to reſume their voyage.

Of theſe tranſactions only a partial, vague, and uncircumſtantial account was known by his majeſty's miniſters till the 30th of April 1790, when captain Meares preſented his memorial to Mr. Grenville. This paper indeed conveyed an intelligence of a very different nature from that which had been previouſly received. Within one week after the affair was communicated, the moſt active and formidable preparations were made, a poſitive demand of preliminary ſatisfaction and reſtitution was ſent to Madrid, and the people of England were called upon to adopt the national vindication. The firſt communication of this buſineſs to the public was by his majeſty's meſſage to parliament on the 5th of May; in which two objects, in their natures perfectly diſtinct, were brought forward; *the firſt*, a ſatisfaction for the national inſult, and for the individual injury which was declared to be a *ſine qua non*, and to be antecedent to any other diſcuſſion. *The ſecond*, an inveſtigation of the reſpective claims and demands of the two countries, by which their ſeveral intereſts might be aſcertained, and all occaſion of diſpute in future removed. This was the language of the king's meſſage; and it was afterwards the language of Mr. Pitt, in moving the addreſs to his majeſty, as well as in his reply to Mr. Fox in the houſe of commons.

With regard to the firſt of theſe objects, a partial ſatisfaction, as it appears, had been given on the ſubject of the cruelties exerciſed upon the ſailors. Theſe the court of Spain diſavowed, and actually ordered M. Martinez, who had perpetrated them, to be arreſted and tried for his miſconduct, immediately on the firſt intelligence arriving at Madrid, and before any repreſentation was made on the ſubject by our court. The remaining ſubjects of diſcuſſion, immediately ariſing from the tranſactions at Nootka, were, therefore, the ſeizure of the ſettlement, and of the veſſels and property. An attention to the honour of their country made it, therefore, neceſſary for our miniſters, to call upon the court of Spain itſelf to give direct ſatisfaction

faction for an injury committed by an officer acting under its immediate commiſſion, and grounded on its pretenſion of an excluſive right to the whole continent of America. To do this it was neceſſary for his catholic majeſty to acknowledge that *ſuch an injury* had been committed, and this was moſt expreſly declared and ſigned by count de Florida Blanca, in the name and by the order of his Catholic majeſty, at Madrid the 24th July, 1790. The acknowledgement of the injury was an expreſſion which implied a conceſſion that the court of Spain had no right to uſe force in preventing Britiſh ſubjects from viſiting the coaſts in queſtion for the purpoſes of trade and ſettlement.

The public were waiting with painful anxiety for the determination of the objects of the depending negotiation; deprecating indeed the dreadful alternative of appealing to the ſword for the vindication of our rights; yet ſatisfied of the juſtice of our cauſe, and confidently looking forward to an honourable and happy termination of a conteſt, originating in the violent proceedings, and unfounded claims of the court of Spain, when the agreeable news arrived that a convention was agreed upon between his Britannic majeſty and the king of Spain, and ſigned at the Eſcurial the 28th of October, 1790, by their plenipotentiaries Alleyne Fitzherbert, eſq. on the part of his Britannic majeſty, and by count de Florida Blanca on that of his Catholic majeſty; which was finally ratified by the court of Spain, and exchanged with Mr. Fitzherbert againſt his majeſty's ratification on the 22d of November, 1790, at the palace of the Eſcurial, by his catholic majeſty's miniſter.

That Great Britain by this convention obtained points and objects, hitherto refuſed by the court of Madrid, in every treaty ſince the termination of the reign of Philip IV. is inconteſtible. Time alone can completely aſcertain the value and intrinſic worth of theſe conceſſions, which are, in a great degree, dependent on the induſtry and enterprize exerted, in converting them to national advantage. That jealous and tenacious power, which originally diſcovered and conquered the New World, over which ſhe has always endeavoured to draw the deepeſt veil, while ſhe excluded every European ſtate from any participation in her vaſt acquiſitions, has, for the firſt time, receded from her high and excluſive pretenſions. The pretended donation of the ſee of Rome, and all the antiquated claims which long preſcription had rendered venerable, have been for ever relinquiſhed and abandoned by the preſent convention. The navigation of the Pacific Ocean is, in effect, declared to be as free as that of the Atlantic. The right, claimed by England, of purſuing the fiſhery on thoſe parts of the coaſt of South America, unoccupied and uncolonized by Spain, is not only avowed, but a vaſt tract of the Magellanic regions, on either ſide of Cape Horn, compriſing the whole coaſt below the moſt ſouthern ſettlement already made by the Spaniards, is declared to be free to both countries, for every purpoſe of temporary accommodation: while the two crowns are equally interdicted and reſtrained from forming future permanent eſtabliſhments on that inhoſpitable ſhore. In return for this liberal and ample conceſſion, England ſubmits to the equitable demand, of not permitting her veſſels to approach within ten leagues of the coaſts and countries actually occupied by Spain upon the Pacific Ocean.

On the the north-weſt coaſt of America, the original diſcovery, occupancy, and ſovereignty of which, appear to furniſh matter of infinite doubt and diſcuſſion, ſtill greater advantages are ſecured by the convention. Not only clear and immediate ſatisfaction is ſtipulated as to the primary ground of diſpute; but the whole continent, north of the ſettlements already poſſeſſed by Spain, is left open to both nations; with only a reciprocal right of entry for purpoſes of trade, into the ports or places which either may occupy.

The ſame general and equal principle is laid down as the baſis of accommodation, in the ſouthern and northern hemiſphere, and forms the predominant feature of the treaty.

treaty. It was not denied by the miniſter, and it was juſtly aſſerted by his opponents, when the convention was agitated in the houſe of commons, that to render it perfect, and exempt from future poſſible miſinterpretation, a preciſe limit ſhould have been drawn, both on the coaſt of North and South America. But the evils, inſeparable from a prolongation of the diſpute, muſt have ſo greatly outweighed the benefit to be derived from any line of demarcation which could have been inſtantly ſettled, that no poſſible cenſure can be affixed on that account; ſince its expediency was not more obvious, than its immediate execution was difficult and impracticable. Nor can it be reaſonably doubted that where ſo clear a principle is by mutual conſent eſtabliſhed, no eſſential obſtacle can ariſe, in the courſe of future negociations between the two courts, for the final ſettlement of [illegible] boundaries.

To complete this great act of public benefit and national glory, it only remained to meet the expence occaſioned by it with promptitude and alacrity. The miniſter, ſo far from avoiding or protracting that neceſſary, but painful and arduous taſk, followed the convention, with the immediate production of accounts reſpecting the naval and military armaments, and the pecuniary impoſitions which he meant to propoſe for their ſpeedy liquidation. He propoſed to raiſe, not merely the intereſt of the debt recently incurred; but to extinguiſh the principal itſelf, in the ſpace of four years; though amounting to above three millions ſterling. The effect of ſo judicious and provident a meaſure, which muſt evince the reſources of the country which adopted it, will be felt through every kingdom of Europe.

Genealogical List of the Royal Family of Great Britain.

George William Frederic III. born June 4, 1738; proclaimed king of Great Britain, France and Ireland, and elector of Hanover, October 26, 1760; and married, September 8, 1761, to the princeſs Sophia Charlotte, of Mecklenburgh Strelitz, born May 16, 1744, crowned September 22, 1761, and now have iſſue:

1. George Auguſtus Frederic, prince of Wales, born Auguſt 12, 1762.
2. Prince Frederic, born Auguſt 16, 1763, elected biſhop of Oſnaburgh, February 27, 1764, created duke of York and Albany, November 7, 1784.
3. Prince William Henry, born Auguſt 21, 1765, created duke of Clarence.
4. Princeſs Charlotte, born September 29, 1766.
5. Prince Edward, born November 2, 1767.
6. Princeſs Auguſta Sophia, born November 8, 1768.
7. Princeſs Elizabeth, born May 22, 1770.
8. Prince Erneſt Auguſtus, born June 5, 1771.
9. Prince Frederic Auguſtus, born January 27, 1773.
10. Prince Adolphus Frederic, born February 24, 1774.
11. Princeſs Mary, born April 25, 1776.
12. Princeſs Sophia, born November 3, 1777.
13. Princeſs Amelia, born Auguſt 7, 1783.

Iſſue of the late prince of Wales by the princeſs Auguſta of Saxe Gotha, now living:

1. Her royal highneſs Auguſta, born Auguſt 11, 1737; married the hereditary prince of Brunſwick Lunenburg, January 16, 1764.
2. His preſent majeſty.
3. Prince William Henry, duke of Glouceſter, born November 25, 1743.

WALES.

THOUGH this principality is politically included in England, yet as it has diſtinction in language and manners, I have, in conformity with the common cuſtom, aſſigned it a ſeparate article.

Extent and Situation.

	Miles.		Degrees.	
Length	130	between	51 and 54	North latitude.
Breadth	96		2.41 and 4.56	Weſt longitude.

Area in ſquare miles 7011.

Name and language.] The Welch, according to the beſt antiquaries, are deſcendents of the Belgic Gauls, who made a ſettlement in England about fourſcore years before the firſt deſcent of Julius Cæſar, and thereby obtained the name of Galles or Walles (the G and W being promiſcuouſly uſed by the ancient Britons), that is, *Strangers*. Their language has a ſtrong affinity with the Celtic or Phœnician, and is highly commended for its pathetic and deſcriptive powers.

Boundaries.] Wales was formerly of greater extent than it is at preſent, being bounded only by the Severn and the Dee; but after the Saxons had made themſelves maſters of all the plain country, the Welch, or ancient Britons, were obliged gradually to retreat weſtward. It does not however appear that the Saxons ever made any farther conqueſts in their country than Monmouthſhire and Herefordſhire, which formerly belonged to Wales, but now form part of England. This country is divided into four circuits, comprehending twelve counties. See England.

Climate, soil, and water.] The ſeaſons are pretty much the ſame as in the northern parts of England, and the air is ſharp, but wholeſome. The ſoil of Wales, eſpecially towards the North, is mountainous, but contains rich vallies, which produce crops of wheat, rye, and other corn. Wales contains many quarries of free-ſtone and ſlate, ſeveral mines of lead, and abundance of coal-pits. This country is well ſupplied with wholeſome ſprings; and its chief rivers are the Clywd, the Wheeler, the Dee, the Severn, the Elwy, and the Allen, which furniſh Flintſhire with great quantities of fiſh.

Mountains.] It would be endleſs to particularize the mountains of this country. Snowdon, in Caernarvonſhire, and Plinlimmon, which lies partly in Montgomery and partly in Cardiganſhire, are the moſt famous; and their mountainous ſituation greatly aſſiſted the natives in making ſo noble and long a ſtruggle againſt the Roman, Anglo-Saxon, and Norman powers.

Vegetable and animal productions by sea and land.] In theſe particulars Wales differs little from England. Their horſes are ſmaller, but can endure vaſt fatigue, and their black cattle are ſmall likewiſe, but excellent beef, and their cows are remarkable for yielding large quantities of milk. Great numbers of goats feed on the mountains. Some very promiſing mines of ſilver, copper, lead, and iron, have been diſcovered in Wales. The Welch ſilver may be known by its being ſtamped with the oſtrich feathers, the badge of the prince of Wales.

Population, inhabitants, manners, and customs.] The inhabitants of Wales are ſuppoſed to amount to about 300,000, and though not in general wealthy, they are provided with all the neceſſaries, and many of the conveniences

veniences of life. The land-tax of Wales brought in ſome years ago about forty-three thouſand ſeven hundred and fifty-two pounds a year. The Welch are, if poſſible, more jealous of their liberties than the Engliſh, and far more iraſcible, but their anger ſoon abates; and they are remarkable for their ſincerity and fidelity. They are very fond of carrying back their pedigrees to the moſt remote antiquity, but we have no criterion for the authenticity of their manuſcripts, ſome of which they pretend to be coëval with the incarnation. It is however certain, that great part of their hiſtory, eſpecially the eccleſiaſtical, is more ancient, and better atteſted, than that of the Anglo-Saxons. Wales was formerly famous for its bards and poets, particularly Thalieſſin, who lived about the year 450, and whoſe works were certainly extant at the time of the Reformation, and clearly evince, that Geoffrey of Monmouth was not the inventor of the hiſtory which makes the preſent Welch the deſcendants of the ancient Trojans. This poetical genius ſeems to have influenced the ancient Welch with an enthuſiaſm for independency, for which reaſon Edward I. is ſaid to have made a general maſſacre of the bards. The Welch may be called an unmixed people, as may be proved by their keeping up the ancient hoſpitality, and their ſtrict adherence to ancient cuſtoms and manners. This appears even among gentlemen of fortune, who in other countries commonly follow the ſtream of faſhion. We are not, however, to imagine that many of the nobility and gentry of Wales do not comply with the modes and manner of living in England and France. All the better ſort of the Welch ſpeak the Engliſh language, though numbers of them underſtand the Welch.

RELIGION.] I have already mentioned the maſſacre of the Welch clergy by Auguſtine the popiſh apoſtle of England, becauſe they would not conform to the Romiſh ritual. Wales, after that, fell under the dominion of petty princes, who were often weak and credulous. The Romiſh clergy inſinuated themſelves into their favour, by their pretended power of abſolving from crimes; and the Welch, when their ancient clergy were extinct, conformed themſelves to the religion of Rome. The Welch clergy, in general, are but poorly provided for; and in many of the country congregations they preach both in Welch and Engliſh. Their poverty was formerly a vaſt diſcouragement to religion and learning, but the meaſures taken by the ſociety for propagating Chriſtian knowledge has in a great degree removed the reproach of ignorance from the poorer ſort of the Welch. In the year 1749, a hundred and forty-two ſchoolmaſters were employed, to remove from place to place for the inſtruction of the inhabitants; and their ſcholars amounted to 72,264. No people have diſtinguiſhed themſelves more, perhaps, in proportion to their abilities, than the Welch have done by acts of national munificence. They print at a vaſt expence Bibles, Common Prayers, and other religious books, and diſtribute them gratis to the poorer ſort. Few of their towns are unprovided with a free-ſchool.

The eſtabliſhed religion in Wales is that of the church of England; but the common people in many places are ſo tenacious of their ancient cuſtoms, that they retain ſeveral of the Romiſh ſuperſtitions, and ſome ancient families among them are ſtill Roman Catholics. It is likewiſe ſaid, that Wales abounds with Romiſh prieſts in diſguiſe. And it is certain, that the principality contains great numbers of Proteſtant Diſſenters.

For BISHOPRICKS. (See England). We are to obſerve, that in the former times, Wales contained more biſhoprics than it does now; and about the time of the Norman invaſion, the religious foundations there far exceeded the wealth of all the other parts of the principality.

LEARNING AND LEARNED MEN.] Wales was a ſeat of learning at a very early period; but it ſuffered an eclipſe by the repeated maſſacres of the bards and clergy. Wickliffiſm took ſhelter in Wales when it was perſecuted in England. The

Welch and Scotch diſpute about the nativity of certain learned men, particularly four of the name of Gildas. Giraldus Cambrenſis, whoſe hiſtory was publiſhed by Camden, was certainly a Welchman; and Leland mentions ſeveral learned men of the ſame country, who flouriſhed before the Reformation. The diſcovery of the famous king Arthur's and his wife's burying-place was owing to ſome lines of Thalieſſin, which were repeated before Henry II. of England, by a Welch bard. Since the Reformation, Wales has produced ſeveral excellent antiquaries and divines. Among the latter were Hugh Broughton, and Hugh Holland, who was a Roman Catholic, and is mentioned by Fuller in his Worthies. Among the former were ſeveral gentlemen of the name of Llhuyd, particularly the author of that invaluable work the Archæologia. Rowland, the learned author of the Mona Antiqua, was likewiſe a Welchman; as was that great ſtateſman and prelate, the lord keeper Williams, archbiſhop of York in the time of king Charles I. After all, it appears, that the great merit of the Welch learning, in former times, lay in the knowledge of the antiquity, language, and hiſtory of their own country. Wales, notwithſtanding all that Dr. Hicks, and other antiquaries, have ſaid to the contrary, furniſhed the Anglo-Saxons with an alphabet. This is clearly demonſtrated by Mr. Llhuyd, in his Welch preface to his Archæologia, and is confirmed by various monumental inſcriptions of undoubted authority (See Rowland's Mona Antiqua.) Another inſtance of Welch erudition we have in the excellent hiſtory of Henry VIII. written by lord Herbert of Cherbury.

With regard to the preſent ſtate of literature among the Welch, it is ſufficient to ſay, that ſome of them make a conſiderable figure in the republic of letters, and that many of their clergy are excellent ſcholars. The Welch Paternoſter is as follows:

Ein Tad, yr hwn wyt yn y nefoedd, ſanctteiddier dy enw; deued dy deyrnas; bydded dy ewyllys ar y ddaear, megis y mae yn y nefoed: dyro in i heddyw ein bara beunyddiol; a maddeu i ni ein dyledion, fel y maddeuwn ni i'n dyledwyr; ac nac arwain ni i brofedigaeth, eithr gwared ni rhag drwg: canys eiddot ti yw'r deyrnas, a'r gallu, a'r gogoniant, yn eos eoſoedd. Amen.

CITIES, TOWNS, FORTS, AND OTHER EDIFICES, PUBLIC AND PRIVATE. } Wales contains no cities or towns that are remarkable either for populouſneſs or magnificence. Beaumaris is the chief town of Angleſey *, and has a good harbour. Brecknock trades in cloathing. Cardigan is a large populous town, and lies in the neighbourhood of lead and ſilver mines. Caermarthen has a large bridge, and is governed by a mayor, two ſheriffs, and aldermen, who wear ſcarlet gowns, and other enſigns of ſtate. Pembroke is well inhabited by gentlemen and tradeſmen; and part of the country is ſo fertile and pleaſant, that it is called Little England. The other towns of Wales, have nothing particular. It is proper, however, to obſerve that Wales, in ancient times, was a far more populous and wealthy country than it is at preſent; and though it contains no regular fortifications, yet many of its old caſtles are ſo ſtrongly built, and ſo well ſituated, that they might be turned into ſtrong forts at a ſmall expence: witneſs the vigorous defence which many of them made in the civil wars, between Charles I. and his parliament.

ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL. } Wales abounds in remains of antiquity. Several of its caſtles are ſtupendouſly large; and in ſome the remains of Roman architecture are plainly diſcernible. The architecture of others is doubtful; and ſome appear to be partly Britiſh, and partly Roman. In Brecknockſhire are ſome rude ſculptures, upon a ſtone ſix feet high,

* The Iſle of Angleſey, whcih is the moſt weſtern county of North Wales, is furrounded on all ſides by the Iriſh ſea, except on the ſouth-eaſt, where it is divided from Britain by a narrow ſtrait, called Meneu, which in ſome places may be paſſed on foot at low water; the iſland is about 24 miles long, and 18 broad, and contains 74 pariſhes. It was the ancient ſeat of the Britiſh Druids.

called

called the Maiden-Stone; but the remains of the Druidical inſtitutions, and places of worſhip, are chiefly diſcernible in the iſle of Angleſey, the ancient Mona, mentioned by Tacitus, who deſcribes it as being the chief ſeminary of the Druidical rites and religion. To give a deſcription of the Roman altars, antiquities, and utenſils, which have been diſcovered in Wales, would be endleſs, but future antiquaries may make great diſcoveries from them. Among the other artificial curioſities, is king Offa's dyke, which is ſaid to have been a boundary between the Saxons, and the Welch or Britons. Cherphilly-caſtle in Glamorganſhire, is ſaid to have been the largeſt in Great Britain, excepting Windſor; and the remains of it ſhew it to have been a moſt beautiful fabric. One half of a round tower has fallen quite down, but the other over-hangs its baſis more than nine feet, and is as great a curioſity as the leaning tower of Piſa in Italy.

Near the town of Flint are the remains of a large caſtle, in which Richard II. was confined, ſome time before his depoſition; and a variety of Roman antiquities have been found in this town, which is ſuppoſed to have been a Roman ſtation.

Some coins of Welch princes are ſaid to be found in the cabinets of the curious; but it does not ſeem that they have been ſerviceable in aſcertaining the ancient hiſtory of the country.

Among the natural curioſities of this country, are the following. At a ſmall village called Newton, in Glamorganſhire, is a remarkable ſpring nigh the ſea, which ebbs and flows contrary to the ſea. In Merionethſhire is Kader Idris, a mountain remarkable for its height, which affords variety of Alpine plants. In Flintſhire is a famous well, known by the name of St. Wenefred's well, at which, according to the legendary tales of the common people, miraculous cures have been performed. The ſpring boils with vaſt impetuoſity out of a rock, and is formed into a beautiful polygonal well, covered with a rich arch ſupported by pillars, and the roof is moſt exquiſitely carved in ſtone. Over the ſpring is alſo a chapel, a neat piece of Gothic architecture, but in a very ruinous ſtate. King James II. paid a viſit to the well of St. Wenefred in 1686, and was rewarded for his piety by a preſent of the ſhift in which his great-grandmother, Mary Stuart, loſt her head. The ſpring is ſuppoſed to be one of the fineſt in the Britiſh dominions; and by two different trials and calculations lately made, is found to fling out about twenty-one tons of water in a minute. It never freezes, and varies but little in the quantity of water in droughts, or after the greateſt rains; but in conſequence of the latter is diſcoloured by a wheyiſh tinge. The ſmall town adjoining to the well, is known by the name of Holywell. In Caernarvonſhire is the high mountain of Penmanmawr, acroſs the edge of which the public road lies, and occaſions no ſmall terror to travellers; from one hand the impending rock ſeems ready every minute to cruſh them to pieces, and the great precipice below, which hangs over the ſea, is ſo hideous, and till very lately, when a wall was raiſed on the ſide of the road, ſo full of danger, that one falſe ſtep was of diſmal conſequence. Snowdon hill is by triangular meaſurement 1240 yards perpendicular height.

There are a great many pleaſing proſpects and pictureſque views in Wales; and this country is highly worthy the attention of the curious traveller.

COMMERCE AND MANUFACTURES.] The Welch are on a footing, as to their commerce and manufactures, with many of the weſtern and northern counties of England. Their trade is moſtly inland, or with England, into which they ſend numbers of black cattle. Milford-haven, which is reckoned the fineſt in Europe, lies in Pembrokeſhire; but the Welch have hitherto reaped no great benefit from it, though of late conſiderable ſums have been granted by parliament for its fortification. The making it the principal harbour of the kingdom would meet with ſtrong oppoſition from the numerous Corniſh and Weſt-country members, the benefit of whoſe eſtates muſt be greatly leſſened by the diſuſe of Plymouth and Portſ-

mouth, and other harbours. The town of Pembroke employs near 200 merchant ſhips, and its inhabitants carry on an extenſive trade. In Brecknockſhire are ſeveral woollen manufactures; and Wales in general carries on a great coal trade with England and Ireland.

CONSTITUTION AND GOVERNMENT.] Wales was united, and incorporated with England, in the 27th of Henry VIII. when, by act of parliament, the government of it was modelled according to the Engliſh form; all laws, cuſtoms, and tenures, contrary to thoſe of England, being abrogated, and the inhabitants admitted to a participation of all the Engliſh liberties and privileges, particularly that of ſending members to parliament, viz. a knight for every ſhire, and a burgeſs for every ſhire-town, except Merioneth. By the 34th and 35th of the ſame reign, there were ordained four ſeveral circuits for the adminiſtration of juſtice in the ſaid ſhires, each of which was to include three ſhires; ſo that the chief juſtice of Cheſter has under his juriſdiction the three ſeveral ſhires of Flint, Denbigh, and Montgomery, The ſhires of Caernarvon, Merioneth, and Angleſey, are under the juſtices of North Wales. Thoſe of Caermarthen, Pembrokeſhire, and Cardigan, have alſo their juſtices; as have likewiſe thoſe of Radnor, Brecknock, and Glamorgan. By the 18th of queen Elizabeth, one other juſtice-aſſiſtant was ordained to the former juſtices; ſo that now every one of the ſaid four circuits has two juſtices, viz. one chief-juſtice, and a ſecond juſtice aſſiſtant.

REVENUES.] As to the revenues, I have already mentioned the land-tax; and the crown has a certain though ſmall property, in the product of the ſilver and lead-mines; but it is ſaid that the revenue accruing to the prince of Wales from his principality does not exceed 7 or 8000l. a year.

ARMS. The arms of the prince of Wales differ from thoſe of England, only by the addition of a label of three points. His cap, or badge of oſtrich feathers, was occaſioned by a trophy of that kind, which Edward the Black Prince took from the king of Bohemia, when he was killed at the battle of Poictiers, and the motto is *Ich dien*, I ſerve. St. David, commonly called St. Taffy, is the tutelar ſaint of the Welch, and his badge is a leek, which is worn on his day, the 1ſt of March.

HISTORY.] The ancient hiſtory of Wales is uncertain, on account of the number of petty princes who governed it. That they were ſovereign and independent, appears from the Engliſh hiſtory. It was formerly inhabited by the three different tribes of Britons; the Silures, the Dimetæ, and the Ordovices. Theſe people made ſuch violent oppoſition to the Romans, that they do not appear ever to have been entirely ſubdued; though part of their country, as appears from the ruins of caſtles, was bridled by garriſons. Though the Saxons, as hath been already obſerved, conquered the counties of Monmouth and Hereford, yet they never penetrated farther, and the Welch remained an independent people, governed by their own princes and their own laws. About the year 870, Roderic, king of Wales, divided his dominions among his three ſons; and the names of theſe diviſions were, Demetia, or South Wales; Poveſia, or Powis-land; and Venedotia, or North Wales. This diviſion gave a mortal blow to the independency of Wales. About the year 1112, Henry I. of England planted a colony of Flemings on the frontiers of Wales, to ſerve as a barrier to England, none of the Welch princes being powerful enough to oppoſe them. They made, however, many brave attempts to maintain their liberties againſt the Norman kings of England. In 1237, the crown of England was firſt ſupplied with a handle for the future conqueſt of Wales; their old and infirm prince Llewellin, in order to be ſafe from the perſecutions of his undutiful ſon Griffyn, having put himſelf under ſubjection and homage to king Henry III.

But

But no capitulation could ſatisfy the ambition of Edward I. who reſolved to annex Wales to the crown of England; and Llewellin prince of Wales, diſdaining the ſubjection to which old Llewellin had ſubmitted, Edward raiſed an army at great expence, with which he penetrated as far as Flint, and taking poſſeſſion of the iſle of Angleſey, he drove the Welch to the mountains of Snowdon, and obliged them to ſubmit to pay tribute. The Welch, however, made ſeveral efforts under young Llewellin: but, at laſt, in 1285, he was killed in battle. He was ſucceeded by his brother David, the laſt independent prince of Wales, who, falling into Edward's hands through treachery, was by him moſt barbarouſly and unjuſtly hanged; and Edward, from that time, pretended that Wales was annexed to his crown of England. It was about this time probably that Edward perpetrated the inhuman maſſacre of the Welch bards. Perceiving that his cruelty was not ſufficient to complete his conqueſt, he ſent his queen in the year 1282, to be delivered in Caernarvon caſtle, that the Welch having a prince born among themſelves, might the more readily recognize his authority. This prince was the unhappy Edward II. and from him the title of prince of Wales ever ſince deſcended to the eldeſt ſons of the Engliſh kings. The hiſtory of Wales and England became thenceforth the ſame. It is proper, however, to obſerve, that the kings of England have always found it their intereſt to ſoothe the Welch with particular marks of their regard. Their eldeſt ſons not only held the titular dignity, but actually kept a court at Ludlow; and a regular council, with a preſident, was named by the crown, for the adminiſtration of all the affairs of the principality. This was thought ſo neceſſary a piece of policy, that when Henry VIII. had no ſon, his daughter Mary was created princeſs of Wales.

ISLE OF MAN.

THE Mona mentioned by Tacitus was not in this iſland but the iſle of Angleſea. Some think that Man takes its name from the Saxon word *Mang* (or among), becauſe lying in St. George's Channel, it is almoſt at an equal diſtance from the kingdoms of England, Scotland, and Ireland; but Mona ſeems to have been a generical name with the ancients for any detached iſland. Its length from north to ſouth is rather more than thirty miles, its breadth from eight to fifteen; and the latitude of the middle of the iſland is fifty-four degrees ſixteen minutes north. It is ſaid, that on a clear day the three Britannic kingdoms may be ſeen from this iſland. The air here is wholeſome, and the climate, only making allowance for the ſituation, pretty much the ſame as that in the north of England, from which it does not differ much in other reſpects. The hilly parts are barren, and the champaign fruitful in wheat, barley, oats, rye, flax, hemp, roots, and pulſe. The ridge of mountains, which, as it were, divides the iſland, of which Snafield is the higheſt, riſing 1640 feet above the level of the ſea, both protects and fertilizes the vallies, where there is good paſturage. The better ſort of inhabitants have good ſizeable horſes, and a ſmall kind, which is ſwift and hardy; nor are they troubled with any noxious animals. The coaſts abound with ſea-fowl; and the puffins, which breed in rabbit-holes, are almoſt a lump of fat, and eſtemed very delicious. It is ſaid, that this iſland abounds with iron, lead, and copper mines, though unwrought; as are the quarries of marble, ſlate, and ſtone.

The Iſle of Man contains ſeventeen pariſhes and four towns on the ſea-coaſts. Caſtle-town is the metropolis of the iſland, and the ſeat of its government; Peele, of late years begins to flouriſh; Douglas has the beſt market and beſt trade

in

in the iſland, and is the richeſt and moſt populous town, on account of its excellent harbour, and its fine mole, extending into the ſea; Ramſey has likewiſe a conſiderable commerce on account of its ſpacious bay, in which ſhips may ride ſafe from all winds except the north-eaſt. The reader, by throwing his eyes on the map, may ſee how conveniently this iſland is ſituated for being the ſtorehouſe of ſmugglers, which it was till within theſe few years, to the inexpreſſible prejudice of his majeſty's revenue; and this neceſſarily leads us to touch upon the hiſtory of the iſland.

During the time of the Scandinavian rovers on the ſeas, who have been before mentioned, this iſland was their rendezvous, and their chief force was here collected; from whence they annoyed the Hebrides, Great Britain, and Ireland. The kings of Man are often mentioned in hiſtory; and though we have no regular account of their ſucceſſion, and know but a few of their names, yet they undoubtedly were for ſome ages maſters of thoſe ſeas. About the year 1263, Alexander II. king of Scotland, a ſpirited prince, having defeated the Danes, laid claim to the ſuperiority of Man, and obliged Owen, or John, its king, to acknowledge him as lord paramount. It ſeems to have continued, either tributary or in property of the kings of Scotland, till it was reduced by Edward I. and the kings of England, from that time, exerciſed the ſuperiority over the iſland; though we find it ſtill poſſeſſed by the poſterity of its Daniſh princes, in the reign of Eward III. who diſpoſſeſſed the laſt queen of the iſland, and beſtowed it on his favourite, Montague, earl of Saliſbury. His family-honours and eſtate being forfeited, Henry IV. beſtowed Man, and the patronage of the biſhoprick, firſt upon the Northumberland family, and that being forfeited, upon ſir John Stanley, whoſe poſterity, the earls of Derby, enjoyed it till, by failure of heirs male, it devolved upon the duke of Athol, who married the ſiſter of the laſt lord Derby. Reaſons of ſtate rendered it neceſſary for the crown of Great Britain to purchaſe the cuſtoms and the iſland from the Athol family; and the bargain was completed by 70,000l. being paid to the duke in 1765. The duke, however, retains his territorial property in the iſland, though the form of its government is altered; and the king has now the ſame rights, powers, and prerogatives, as the duke formerly enjoyed. The inhabitants alſo retain many of their ancient conſtitutions and cuſtoms.

The eſtabliſhed religion in Man is that of the church of England. The biſhop of Sodor and Man enjoys all the ſpiritual rights and pre-eminences of other biſhops, but does not ſit in the Britiſh houſe of peers; his ſee never having been erected into an Engliſh barony. One of the moſt excellent prelates who ever adorned the epiſcopal character, was Dr. Thomas Wilſon, biſhop of Man, who preſided over that dioceſe upwards of fifty-ſeven years, and died in the year 1755, aged ninety-three. He was eminently diſtinguiſhed for the piety and exemplarineſs of his life, his benevolence and hoſpitality, and his unremitting attention to the happineſs of the people entruſted to his care. He encouraged agriculture, eſtabliſhed ſchools for the inſtruction of the children of the inhabitants of the iſland, tranſlated ſome of his devotional pieces into the Mank language, to render them more generally uſeful to them, and founded parochial libraries in every pariſh of his dioceſe. Some of his notions reſpecting government and church diſcipline were not of the moſt liberal kind: but his failings were ſo few, and his virtues ſo numerous and conſpicuous, that he was a great bleſſing to the Iſle of Man, and an ornament to human nature. Cardinal Fleury had ſo much veneration for his character, that, out of regard to him, he obtained an order from the court of France, that no privateer of that nation ſhould ravage the Iſle of Man.

The eccleſiaſtical government is well maintained in this iſland, and the livings are comfortable. The language, which is called the Manks, and is ſpoken by the common people, is radically Erſe, or Iriſh, but with a mixture of other languages.

The New Teſtament and Common Prayer Book have been tranſlated into the Mank language. The natives, who amount to above 20,000, are inoffenſive, charitable, and hoſpitable. The better ſort live in ſtone houſes, covered with ſlate, and the poorer in thatched; and their ordinary bread is made of oatmeal. Their products for exportation conſiſt of wool, hides, and tallow; which they exchange with foreign ſhipping for commodities they may have occaſion for from other parts. Before the ſouth promontory of Man, is a little iſland called the Calf of Man: it is about three miles in circuit, and ſeparated from Man by a channel about two furlongs broad.

This iſland affords ſome curioſities which may amuſe an antiquary. They conſiſt chiefly of Runic ſepulchral inſcriptions and monuments, of ancient braſs daggers, and other weapons of that metal, adorned with pure gold, which indicates the ſplendor of its ancient poſſeſſors.

ISLE OF WIGHT.

THIS iſland is oppoſite to the coaſt of Hampſhire, from which it is ſeparated by a channel, varying in breadth from two to ſeven miles: it is conſidered as part of the county of Southampton, and is within the dioceſe of Wincheſter. Its greateſt length, extending from eaſt to weſt, meaſures nearly twenty-three miles; its breadth from north to ſouth about thirteen. The air is in general healthy, particularly the ſouthern parts; the ſoil is various, but ſo great is its fertility, that more wheat grows here in one year, than can be conſumed by the inhabitans in eight: and it is ſuppoſed that its preſent produce, under the great improvements of agriculture, and the additional quantity of land lately brought into tillage, has more than kept pace with the increaſe of population. A range of hills, which affords fine paſture for ſheep, extends from eaſt to weſt, through the middle of the iſland. The interior parts of the iſland, as well as its extremities, afford a great number of beautiful and pictureſque proſpects, not only in the paſtoral, but alſo in the great and romantic ſtyle. Of theſe beauties, the gentlemen of the iſland have availed themſelves, as well in the choice of ſituation of their houſes, as in their other improvements. Domeſtic fouls and poultry are bred here in great numbers; the outward-bound ſhips and veſſels at Spithead, the Mother-bank, and Cowes, commonly furniſhing themſelves from this iſland.

Such is the purity of the air, the fertility of the ſoil, and the beauty and variety of the landſcapes of this iſland, that it has been called the garden of England; it has ſome very fine gentlemen's ſeats; and it is often viſited by parties of pleaſure on account of its delightful ſcenes.

The iſland is divided into thirty pariſhes: and, according to a very accurate calculation made in the year 1777, the inhabitants then amounted to eighteen thouſand and twenty-four, excluſive of the troops quartered there. Moſt of the farm-houſes are built with ſtone, and even the cottages appear neat and comfortable, having each its little garden.

The town of Newport ſtands nearly in the centre of the iſland, of which it may be conſidered as the capital. The river Medina empties itſelf into the channel at Cowes harbour, diſtant about five miles, and being navigable up to the quay, is very commodious for trade. The three principal ſtreets of Newport extend from

eaſt

eaſt to weſt, and are croſſed at right angles by three others, all which are ſpacious, clean, and well paved.

Cariſbrooke caſtle, in the Iſle of Wight, has been rendered remarkable by the confinement of king Charles I. who, taking refuge here, was detained a priſoner from November 1647, to September 1648. After the execution of the king, this caſtle was converted into a place of confinement for his children; and his daughter, the princeſs Elizabeth, died in it. There are ſeveral other forts in this iſland, which were all erected about the 36th year of the reign of Henry VIII. when many other forts and blockhouſes were built in different parts of the coaſts of England.

THE ISLANDS OF JERSEY, GUERNSEY, ALDERNEY, SARK, LUNDY, &c.

IN the Engliſh channel four of theſe are ſituated, and are ſubject to England: theſe are Jerſey, Guernſey, Alderney, and Sark: which though much nearer to the coaſt of Normandy than to that of England, are within the dioceſe of Wincheſter. They lie in a cluſter in Mount St. Michael's bay, between Cape la Hogue in Normandy, and Cape Frebelle in Britany. The computed diſtance between Jerſey and Sark is four leagues; between that and Guernſey, ſeven leagues; and between the ſame and Alderney, nine leagues.

JERSEY, anciently CÆSAREA, was known to the Romans; and lies fartheſt within the bay, in forty-nine degrees ſeven minutes north latitude, and in the ſecond degree twenty-ſix minutes weſt longitude, eighteen miles weſt of Normandy, and eighty-four miles ſouth of Portland. The north ſide is inacceſſible through lofty cliffs, the ſouth is almoſt level with the water; the higher land, in its midland part, is well planted, and abounds with orchards, from which is made an incredible quantity of excellent cyder. The vallies are fruitful and well cultivated, and contain plenty of cattle and ſheep. The inhabitants neglect tillage too much, being intent upon the culture of cyder, the improvement of commerce, and particularly the manufacture of ſtockings. The honey in Jerſey is remarkably fine: and the iſland is well ſupplied with fiſh and wild-fowls almoſt of every kind, ſome of both being peculiar to the iſland, and very delicious.

The iſland is not above twelve miles in length; but the air is ſo ſalubrious, that, in Camden's time, it was ſaid there was here no buſineſs for a phyſician. The inhabitants in number are about 20,000, and are divided into twelve pariſhes. The capital town is St. Helier, or Hilary, which contains above 400 houſes, has a good harbour and caſtle, and makes a handſome appearance. The property of this iſland belonged formerly to the Carterets, a Norman family, who have been always attached to the royal intereſt, and gave protection to Charles II. both when king and prince of Wales, at a time when no part of the Britiſh dominions durſt recogniſe him. The language of the inhabitants is French, with which moſt of them intermingle Engliſh words; yet French is moſt generally the language of the pulpit and the bar. Knit ſtockings and caps form their ſtaple commodity; but they carry on a conſiderable trade in fiſh with Newfoundland, and diſpoſe of their cargoes in the Mediterranean. The governor is appointed by the crown of England, but the civil adminiſtration reſts with a bailiff, aſſiſted by twelve jurats. As this iſland is the principal remain of the duchy of Normandy depending on the kings of England, it preſerves the old feudal forms, and particularly the aſſembly of ſtates,

which forms a miniature of the Britiſh parliament, as ſettled in the time of Edward I.

GUERNSEY is thirteen miles and a half from ſouth-weſt to north-eaſt, and twelve and a half where broadeſt, eaſt and weſt; has only ten pariſhes, to which there are but eight miniſters: four of the pariſhes are united, and Alderney and Sark, which are appendages of Guernſey, having one a-piece. Though this is naturally a finer iſland than that of Jerſey, yet it is far leſs valuable, being poorly cultivated and thinly inhabited. It abounds in cyder; the inhabitants ſpeak French: want of firing is the greateſt inconveniency that both iſlands labour under. The only harbour here is at St. Peter la Port, which is guarded by two forts; one called the Old-Caſtle, and the other Caſtle Cornet. Guernſey is likewiſe part of the ancient Norman patrimony.

ALDERNEY is about eight miles in compaſs, and is by much the neareſt of all theſe iſlands to Normandy, from which it is ſeparated by a narrow ſtrait, called the Race of Alderney, which is a dangerous paſſage in ſtormy weather, when the two currents meet; otherwiſe it is ſafe, and has depth of water for the largeſt ſhips. To the weſt lie a range of rocks for near three leagues together, called the Caſkets; among which are ſeveral whirlpools or eddies, very dreadful to mariners. The ſons of king Henry I. were caſt away and drowned here, paſſing to Normandy; and it is freſh in memory how fatal this ſtrait proved to the Victory man of war, commanded by admiral Blachen. This iſland is healthy, and the ſoil is remarkable for a fine breed of cows.

SARK is a ſmall iſland depending upon Guernſey; the inhabitants are long-lived, and enjoy from nature all the conveniences of life; their number is about 300. The inhabitants of the three laſt-mentioned iſlands together are thought to be about 20,000. The religion of all the four iſlands is that of the church of England.

SCILLY ISLANDS and ROCKS, anciently called the SILURES, are a cluſter of dangerous rocks to the number of 140, lying about 30 miles from the Land's End in Cornwall, of which county they are reckoned a part, and to which they are ſuppoſed to have been formerly joined, but ſeparated from it and from each other, by ſome violent eruption of the ſea, which is here between 40 and 60 fathoms deep. *Scilly*, which gives name to all the reſt, was once the chief; but St. Mary's Iſland, though only nine miles in circumference, is the largeſt, as well as the moſt fruitful, and has a very good harbour, fortified with a caſtle, which was built by queen Elizabeth. St. Mary's contains more inhabitants than all the reſt put together, and who are alſo the richeſt. In this, and in two or three others of the largeſt iſlands, there are various antiquities, particularly the remains of a temple of the Druids, and ancient ſepulchres. But the greateſt ornament of this iſland is the light-houſe, in height 51 feet, and the gallery four. The ſaſh lights eleven feet 3 inches high, by 3 feet 2 inches broad; it ſtands on high land, and makes a very fine appearance. By their ſituation, between the Engliſh Channel and St. George's Channel, they have been the deſtruction of many ſhips and lives, eſpecially in the night time, having miſtaken their reckonings, and been here daſhed to pieces. This was the fate of the brave ſir Cloudeſley Shovel's ſquadron, 22d October 1707, as it was returning home from Toulon.

LUNDY ISLAND, though 50 miles in the ſea, off the north-weſt coaſt of Devonſhire, has ſprings of freſh water. It is five miles long, and two broad, but ſo encompaſſed with inacceſſible rocks, that it has but one entrance to it, ſo narrow that two men can ſcarely go abreaſt: it had once a fort and chapel. On the north part is a high pyramidical rock, called the Conſtable. Here are horſes, kine, hogs, and goats, with great ſtore of ſheep and rabbits; but their chief commodity is fowl with which they abound. In the reign of Henry VIII. one William Moriſco, who

had conſpired to murder him at Woodſtock, fled to this iſland which he fortified, turned pirate, and did much damage to this coaſt, till he was taken by ſurpriſe at length, with 16 of his accomplices, and put to death.

HOLY ISLAND is ſituated ten miles ſouth-eaſt of Berwick upon Tweed; is called by the monks, who lived in it retired from the world, by the name of Landisfern, by reaſon of its ſituation over againſt the river Landis. It was anciently a biſhop's ſee, and had 22 biſhops ſucceſſively. It has plenty of fiſh and fowl, but the air and ſoil are bad. It is three miles in compaſs, and has a town, a church, and caſtle, under which is a commodious harbour. It is encompaſſed with water, at every flood, but ſand at ebb. It lies not above a mile and a half from the land; from whence, at low water, people ride over to it.

IRELAND.

SITUATION, BOUNDARIES, AND EXTENT.

THE iſland of Ireland is ſituated on the weſt ſide of England, between 6 and 10 degrees weſt longitude, and between 51 and 55 degrees 20 minutes north latitude, or between the middle parallel of the eighth climate, where the longeſt day is 16½ hours, and the 24th parallel, or the end of the 10th clime, where the longeſt day is 17½ hours.

The extent or ſuperficial content of this kingdom, is, from the neareſt computation and ſurvey, found to be in length 285 miles from Fairhead north to Miſſenhead ſouth; and from the Eaſt part of Down to the Weſt part of Mayo, its greateſt breadth 160 miles, and to contain 11,067,712 Iriſh plantation acres, which makes 17,927,864 acres of Engliſh ſtatute meaſure, and is held to bear proportion to England and Wales as 18 to 30. Mr. Templeman, who makes the length 275, and the breadth 159 miles, gives it an area of 27,457 ſquare miles. From the eaſt part of Wexford to St. David's in Wales, it is reckoned 45 miles, but the paſſage between Donaghadee and Portpatrick in Scotland is little more than 20 miles, and the paſſage from Holyhead in North Wales about 52 miles.

NAMES AND DIVISIONS, ANCIENT AND MODERN. Many conjectures have been formed as to the Latin (Hibernia) the Iriſh (Erin) as well as the Engliſh name of this iſland. It probably takes its riſe from a Phœnician or Gaëlic term, ſignifying the fartheſt habitation weſtward.

It is pretty extraordinary, that even modern authors are not agreed as to the diviſions of Ireland; ſome dividing it into five circuits, and ſome into four provinces, thoſe of Leinſter, Ulſter, Connaught, and Munſter. The laſt diviſion is the moſt common, and likewiſe the moſt ancient. We ſhall, therefore in the firſt place, give this, and then ſubjoin the other diſtribution into Circuits.

Provinces.	*Counties.*	*Chief Towns.*
Leinſter, 12 counties.	Dublin	Dublin

Dublin county, and the county of the city of Dublin, are two ſeparate juriſdictions, and the laws in both are adminiſtered under ſpecial commiſſions or at quarter ſeſſions; the former at Kimainham, and the latter in the court of king's bench in the ſaid city.

CLIMATES, SEASONS, AND SOIL.] The climate of Ireland differs not much from that of England, except that it is more moiſt. The ſoil is rocky, but extremely fertile, perhaps beyond that of England itſelf. Paſturage, tillage, and meadow ground abound in this kingdom; but of late tillage was too much diſcountenanced, though the ground is excellent for the culture of all grains; and in ſome of the northern parts of the kingdom abundance of hemp and flax are raiſed, a cultivation of infinite advantage to the linen manufacture. Ireland rears vaſt numbers of black cattle and ſheep, and the Iriſh wool is excellent. The prodigious ſupplies of butter and ſalt proviſions (fiſh excepted) ſhipped at Cork, and carried to all parts of the world, afford the ſtrongeſt proofs of the natural fertility of the Iriſh ſoil.

The bogs of Ireland are very extenſive: that of Allen extends 80 miles, and is computed to contain 300,000 acres. There are others very extenſive, and ſmaller ones ſcattered over the whole kingdom: but theſe in general are very uſeful for fuel.

RIVERS, BAYS, HARBOURS, AND LAKES.] The numerous rivers, enchanting lakes, ſpacious bays, commodious havens, harbours, and creeks, with which Ireland abounds, greatly enrich and beautify this country. The Shannon iſſues from Lough Allen, in the county of Leitrim, ſerves as a boundary between Connaught and the three other provinces, and after a courſe of 150 miles, forming in its progreſs many beautiful lakes, it falls into the Atlantic Ocean, between Kerry-point and Loop-head, where it is nine miles broad. The navigation of this river is interrupted by a ridge of rocks ſpreading quite acroſs it, ſouth of Killaloe; but this might be remedied by a ſhort canal, at the expence of 10 or 12,000l. and communications might alſo be made with other rivers, to the great benefit of the nation. The Ban falls into the ocean near Coleraine, the Boyne falls into St. George's Channel at Drogheda, as does the Liffey at the Bay of Dublin, and is only remarkable for watering that capital, where it forms a ſpacious harbour. The Barrow, the Nore, and the Suir, water the ſouth part of the kingdom, and, after uniting their ſtreams below Roſs, they fall into the channel at Waterford Haven.

But the bays, havens, harbours, and creeks, which every where indent the coaſt, form the chief glory of Ireland, and render that country, beyond any other in Europe, the beſt fitted for foreign commerce. The moſt conſiderable are thoſe of Carrickfergus, Strangford, Dundrum, Carlingford, Dundalk, Dublin, Waterford, Dungarvan, Cork, Kinſale, Baltimore, Glandore, Dunmanus, Bantry, Kenmare,

mare, Dingle, Shannon-mouth, Galway, Sligo, Donegall, Killebegs, Lough-Swilly, and Lough-Foyle.

Ireland contains a vaſt number of lakes, or, as they were formerly called, loughs, particularly in the provinces of Ulſter and Connaught. Many of them produce large quantities of fine fiſh; and the great lake Neagh, between the counties of Antrim, Down, and Armagh, is remarkable for its petrifying quality. Some of the Iriſh lakes afford the moſt beautiful and romantic proſpects, particularly that of Killarney, which takes its name from a ſmall town in the county of Kerry. This lake, which may be divided into three, is entirely ſurrounded with mountains, rocks, and precipices, the immenſe declivities of which are covered with woods, intermixed with evergreens, from near their tops to the lakes themſelves; among which are a number of rivulets tumbling over the precipices, ſome from heights of little leſs than 300 feet. On the top of one of the ſurrounding mountains is a ſmall round lake of about a quarter of a mile in diameter, called the Devil's Punch Bowl. From the ſurface of the lake to the top of the cavity, or brim of the bowl, may be about 300 yards, and when viewed from the circular top has a moſt aſtoniſhing appearance. The depth of it is vaſtly great, but not unfathomable as the natives pretend. The diſcharge of the ſuperfluous waters of this bowl, through a chaſm into the middle lake, forms one of the fineſt caſcades in the world, viſible for 150 yards. The echoes amongſt the hills ſurrounding the ſouthern part of the lake, which is moſtly inloſed, are equally delightful and aſtoniſhing. The proprietor, the earl of Kenmore, has placed ſome cannon in the moſt proper places for the amuſement of travellers; and the diſcharge of theſe pieces is tremendous, reſembling moſt the rolling of a violent peal of thunder; which ſeems to travel the ſurrounding ſcenery, and die away among the diſtant mountains. Here alſo muſical inſtruments, eſpecially the French horn and trumpet, afford the moſt delightful entertainment, and raiſe a concert ſuperior to that of a hundred performers. Among the vaſt and craggy heights that ſurround the lake, is one ſtupendous and frightful rock, the front of which towards the water is a moſt horrid precipice, called the *Eagle's neſt*, from the number of thoſe birds which have their neſts in that place. Though theſe loughs, in the main, have but few properties that are not in common with the like bodies of water in other countries, yet they have given riſe to many traditionary accounts among the natives, which diſfigure and diſgrace their true hiſtory; and even modern geographers have been more copious on that head than either truth or the ſubject can admit of. The Iriſh are ſo fond of loughs, that, like the Scots, they often give that term to inlets of the ſea.

INLAND NAVIGATION.] The inland navigation of Ireland is very improveable, as appears from the canals that have lately been cut through different parts of the kingdom; one in particular reaching an extent of 60 miles, between the Shannon and the Liffey at Dublin, which opens a communication from the Channel to the Atlantic Ocean. In ſurveying the grounds for this canal, it was found neceſſary to carry it through a bog 24 miles over, which, from the ſpungy nature of that ſoil, became a work of incredible labour and expence, in ſtrengthening the ſides, and other works, to prevent falling in.

MOUNTAINS.] The Iriſh language has been more happy in diſtinguiſhing the ſize of mountains than perhaps any other. A *knock* ſignifies a low hill, unconnected with any other eminence; *ſlieve* marks a craggy high mountain, gradually aſcending and continued in ſeveral ridges; a *bienn*, or binn, ſignifies a pinnacle, or mountain of the firſt magnitude, ending in a ſharp or abrupt precipice. The two laſt are often ſeen and compounded together in one and the ſame range. Ireland however, when compared with ſome other countries, is far from being mountainous. The mountains of Mourne and Iveagh, in the county of Down, are reckoned among ſome of the higheſt in the kingdom; of which Slieu-Denard has been

calculated at a perpendicular height of 1056 yards. Many other mountains are found in Ireland, but they contain little or nothing particular, if we except the fabulous hiſtories that are annexed to ſome of them. Some theſe mountains contain in their bowels beds of minerals, coals, ſtone, ſlate and marble, with veins of iron, lead, and copper.

FORESTS.] The chief foreſts in Ireland lie in Leinſter, the King's and Queen's counties, and thoſe of Wexford and Carlow. In Ulſter there are great foreſts, and in the county of Donegall, and in the north part of Tyrone; alſo in the county of Fermanagh, along Loagh Earne, and in the north part of the county of Down, wherein is ſome good timber; and the oak is eſteemed as good as any of the Engliſh growth, and as fit for ſhip-building.

METALS AND MINERALS.] The mines of Ireland are late diſcoveries. Several contain ſilver and lead, and it is ſaid that thirty pounds of their lead-ore produce a pound of ſilver; but the richeſt ſilver mine is at Wicklow. A copper and lead mine have been diſcovered at Tipperary: as likewiſe iron ore, and excellent free-ſtone for building. In one part of the kingdom is a ſtream of water, very much impregnated with copper, which yields great quantities of that metal. The method taken to obtain it, is by putting broad plates of iron into a place where the water falls from ſome height, ſo that they may receive the whole power of the falling water. The acid, which holds the copper in ſolution, lets it fall in order to diſſolve the iron, to which it has a ſtronger affinity. On the iron the other metal appears in its proper form, in cruſting the plate, and gradually penetrating it; ſo that at laſt a plate of copper is left inſtead of iron. Hence it is ſaid by the vulgar, that this water has a power of changing iron into copper; but this is a miſtake, for the iron is all diſſolved and carried down the ſtream by the acid, which formerly held the copper in ſolution, while the latter, deprived of its ſolvent, which then rendered it inviſible, only makes its appearance when the water lets it fall. Some of the Iriſh marble quarries contain a kind of porphyry, being red ſtriped with white. Quarries of fine ſlate are found in moſt of the counties. The coals that are dug at Kilkenny emit very little ſmoke; and it contains a cryſtalline ſtream which has no ſediment. Thoſe peculiarities, with the ſerenity of the air in that place, have given riſe to the well-known proverb, That Kilkenny contains fire without ſmoke, water without mud, and air without fog.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.] There is little that falls under this head that is peculiar to Ireland, her productions being much the ſame as thoſe of England and Scotland. Ireland affords excellent turf and moſs, which are of vaſt ſervice for firing, where wood and coals are ſcarce. A few wolves were formerly found in Ireland; but they have been long ſince exterminated by their wolf-dogs, which are much larger than maſtiffs, ſhaped like greyhounds, yet as gentle and governable as ſpaniels. What I have already obſerved about the Iriſh exportation of ſalt proviſions, ſufficiently evinces the prodigious number of hogs and ſheep, as well as black cattle, bred in that kingdom. Rabbits are ſaid to be more plentiful there than in England. The fiſh that are caught upon the coaſts of Ireland are likewiſe in greater plenty than on thoſe of England, and ſome of them larger and more excellent in their kind.

POPULALION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.] Ireland is ſaid to contain two millions and a half of inhabitants; but I ſuſpect that the calculation is overcharged by near half a million. As it is of great conſequence to aſcertain, as nearly as poſſible, the number of inhabitants of Ireland of both religions, we ſhall give them according to the beſt accounts as they ſtood in the four provinces in 1733.

In Ulſter

	Proteſtant Families:		Popiſh Families
In Ulſter	62,620		38,459
Leinſter	25,238		92,424
Munſter	13,337		106,407
Connaught	4,299		44,133
Total	105,494	Total	281,423

Which, at five to each family in the country, and ten for Dublin, and ſeven for Cork city, makes in all 2,015,229 ſouls. I am apt to think, when we conſider the waſte of war by ſea and land, and the vaſt emigrations of the Iriſh to England, the Britiſh colonies, and other nations, that the above calculation may nearly ſerve for the preſent times, though the balance of number is certainly greatly riſen on the ſide of Proteſtantiſm; but, in ſome late debates in the Iriſh parliament in 1786, it has been aſſerted, that the number of inhabitants of Ireland amount to three millions. Other accounts, which appear rather exaggerated, make the population of this kingdom amount to four millions.

As to the manners of the ancient Iriſh Dr. Leland obſerves, that if we make our enquiries on this ſubject in Engliſh writers, we find their repreſentations odious and diſguſting: if from writers of their own race, they frequently break out into the moſt animated encomiums of their great anceſtors. The one can ſcarcely allow them any virtue: the other, in their enthuſiaſtic ardour, can ſcarcely diſcover the leaſt imperfection in their laws, government, or manners. The hiſtorian of England ſometimes regards them as the moſt deteſtable, and contemptible of the human race. The antiquary of Ireland raiſes them to an illuſtrious eminence, above all other European countries. Yet, when we examine their records, without regard to legendary tales or poetic fiction, we find them, even in their moſt brilliant periods, advanced only to an imperfect civilization, a ſtate which exhibits the moſt ſtriking inſtances both of the virtues and the vices of humanity.

With reſpect to the preſent deſcendants of the old Iriſh, or, as they are termed by the Proteſtants, the *mere Iriſh*, they are generally repreſented as an ignorant, uncivilized, and blundering ſort of people. Impatient of abuſe and injury, they are implacable and violent in all their affections; but quick of apprehenſion, courteous to ſtrangers, and patient of hardſhips. Though in theſe reſpects there is, perhaps, little difference between them and the more uninformed part of their neighbours, yet their barbariſms are more eaſy to be accounted for from accidental than natural cauſes. By far the greateſt number of them are Papiſts, and it is the intereſt of their prieſts, who govern them with an abſolute ſway, to keep them in the moſt profound ignorance. They have alſo laboured under many diſcouragements, which in their own country have prevented the exertion both of their mental and bodily faculties; but when employed in the ſervice of foreign princes, they have been diſtinguiſhed for intrepidity, courage, and fidelity. Many of their ſurnames have an *O*, or *Mac*, placed before them, which ſignify grandſon and ſon: formerly the *O* was uſed by their chiefs only, or ſuch as piqued themſelves upon the antiquity of their families. Their muſic is the bag-pipe, but their tunes are generally of a melancholy ſtrain; though ſome of the lateſt airs are lively, and, when ſung by an Iriſhman, extremely diverting. The old Iriſh is generally ſpoken in the interior parts of the kingdom, where ſome of the old uncouth cuſtoms ſtill prevail, particularly their funeral howlings; but this cuſtom may be traced in many countries of the continent. Their cuſtom of placing a dead corpſe before their doors, laid out upon tables, having a plate upon the body to excite the charity of paſſengers, is practiſed even in the ſkirts of Dublin, though one would wiſh to ſee it aboliſhed. Their convivial meetings on Sunday afternoon, with dancing to the bagpipe, and more often quarrelling among themſelves, is offenſive to every ſtranger. But, as we have already obſerved, theſe cuſtoms are chiefly confined to the

more

more unpoliſhed provinces of the kingdom, particularly Connaught; the common people there having the leaſt ſenſe of law and government of any in Ireland, while their tyrannical landlords or leaſeholders ſqueeze the poor without mercy. The common Iriſh, in their manner of living, ſeem to reſemble the ancient Britons, as deſcribed by Roman authors, or the preſent Indian inhabitants of America. Mean huts or cabins built of clay and ſtraw, partitioned in the middle by a wall of the ſame materials, ſerve double purpoſes, one part accommodating the family, who live and ſleep promiſcuouſly, having their fires of turf in the middle of the floor, with an opening through the roof for a chimney; the other being occupied by a cow, or ſuch pieces of furniture as are not in immediate uſe.

Their wealth conſiſts of a cow, ſometimes a horſe, ſome poultry, and a ſpot for potatoes. Coarſe bread, potatoes, eggs, milk, and fiſh, conſtitute their food; for however plentifully the fields may be ſtocked with cattle, theſe poor natives ſeldom taſte butcher's meat of any kind. Their children, plump, robuſt and hardy, ſcarcely know the uſe of cloaths, and are not aſhamed to appear naked on the roads, and gaze upon ſtrangers.

The Spaniards and French, particularly the latter, have not failed to avail themſelves of the uncomfortable ſituation in which the Iriſh were at home, by alluring them to enter their ſervice; and in this they have hitherto been aſſiſted by prieſts and Jeſuits, whoſe intereſt it was to infuſe into the minds of their credulous diſciples an averſion to the Britiſh government; but we have now the pleaſing proſpect of a happy reformation among theſe people, in conſequence of the late laws paſſed by the parliament of Great Britain in favour of Ireland, as well as from the numerous Engliſh proteſtant working ſchools lately eſtabliſhed over the kingdom; which inſtitutions will undoubtedly ſtrike deeper at the root of popery than all the endeavours of the Britiſh monarchs to reduce them.

The deſcendants of the Engliſh and Scots, ſince the conqueſt of Ireland by Henry II. though not the moſt numerous, form the wealthieſt part of the nation. Of theſe are moſt of the nobility, gentry, and principal traders, who inhabit the eaſtern and northern coaſts, where moſt of the trade of Ireland is carried on; eſpecially Belfaſt, Londonderry, and other parts of the province of Ulſter, which, though the pooreſt ſoil, is, next to Dublin and its neighbourhood, the beſt cultivated and moſt flouriſhing part of the kingdom. Here a colony of Scots, in the reign of James I. and other Preſbyterians, who fled from perſecution in that country, in the ſucceeding reigns, planted themſelves, and eſtabliſhed that great ſtaple of Iriſh wealth the linen manufactory, whith they have ſince carried on and brought to the utmoſt perfection. From this ſhort review it appears, that the preſent inhabitants are compoſed of three diſtinct claſſes of people; the old Iriſh, poor, ignorant, and depreſſed, who inhabit, or rather exiſt, upon the interior or weſtern parts; the deſcendants of the Engliſh, who inhabit Dublin, Waterford, and Cork, and who gave a new appearance to the whole coaſt facing England, by the introduction of arts, commerce, ſcience, and more liberal and cultivated ideas of the true God and primitive Chriſtianity; thirdly, emigrants from Scotland in the northern provinces, who, like the others, are ſo zealouſly attached to their own religion and manner of living, that it will require ſome ages before the inhabitants of Ireland are ſo thoroughly conſolidated and blended as to become one people. The gentry, and better ſort of the Iriſh nation, in general differ little in language, dreſs, manners, and cuſtoms, from thoſe of the ſame rank in Great Britain, whom they imitate. Their hoſpitality is well known, but in this they are ſometimes ſuſpected of more oſtentation than real friendſhip.

Religion.] The eſtabliſhed religion and eccleſiaſtical diſcipline of Ireland is the ſame with that of England. Among the bulk of the people, in the moſt uncultivated parts, popery, and that too of the moſt abſurd, illiberal kind, is prevalent.

The

The Iriſh papiſts ſtill retain their nominal biſhops and dignitaries, who ſubſiſt on the voluntary contributions of their votaries. But even the blind ſubmiſſion of the latter to their clergy, does not prevent Proteſtaniſm from making a very rapid progreſs in the towns and communities. How far it may be the intereſt of England, that ſome kind of balance between the two religions ſhould be kept up, I ſhall not here enquire. Ireland contains at leaſt as many ſectaries as England, particularly or to-Preſbyterians, Baptiſts, Quakers, and Methodiſts, who are all of them connived at, or tolerated. Great efforts have been made, ever ſince the days of James I. in erecting free-ſchools for civiliſing and converting the Iriſh Papiſts to Proteſtaniſm. The inſtitution of the incorporated ſociety for promoting Engliſh Proteſtant working-ſchools, though of no older date than 1717, has been amazingly ſucceſsful, as have many inſtitutions of the ſame kind, in introducing induſtry and knowledge among the Iriſh. Toward promoting theſe uſeful purpoſes, the parliament of Ireland has been uncomly liberal; but many of its grants have been miſmanaged or miſapplied.

ARCHBISHOPRICKS AND BISHOPRICKS.] The archbiſhopricks are four; Armagh, Dublin, Caſhel, and Tuam.

The biſhopricks are eighteen, viz. Clogher, Clonfert, Cloyne, Cork, Derry, Down, Dromore, Elphin, Kildare, Killala, Kilmore, Killaloe, Leighlin, Limeric, Meath, Oſſory, Raphoe, and Waterford.

LANGUAGE.] The language of the Iriſh is fundamentally the ſame with the Britiſh and Welch, and a dialect of the Celtic, which is made uſe of by the Scotch Highlanders, oppoſite the Iriſh coaſts. It is, however, in a great meaſure defaced by provincial alterations, but not ſo altered as to render the Iriſh, Welch, and Highlanders, unintelligible to each other. The uſage of the Iriſh language occaſions among the common people, who ſpeak both that and the Engliſh, a diſagreeable tone in ſpeaking, which diffuſes itſelf among the vulgar in general, and even among the better ſort, who do not underſtand Iriſh. It is probable, however, that a few ages hence the latter will be accounted among the dead languages.

LEARNING AND LEARNED MEN.] Learning ſeems to have been cultivated in Ireland at a very early pepiod. Mr. O'Halloran ſays that the Iriſh 'appear to have 'been, from the moſt remote antiquity, a poliſhed people, and that with propriety 'they may be called, the Fathers of Letters.' We are even told, that Egypt received arts and letters from Niulus the Phœnician, who is repreſented as the great anceſtor of the Iriſh nation. But theſe accounts are conſidered by many as fabulous: and it has been obſerved that no literary monuments have yet been diſcovered in Ireland earlier than the introduction of Chriſtianity into this country; and that the evidence of any tranſactions previous to this period, reſts entirely on the credit of Chriſtian writers, and their collections from old poets, or their tranſcripts of records deemed to have been made in the times of Paganiſm.

It is ſaid, that when St. Patrick * landed in Ireland, he found many holy and learned Chriſtian preachers there, whoſe votaries were pious and obedient. Camden obſerves, that 'the Iriſh ſcholars of St. Patrick profited ſo notably in Chriſtianity, 'that, in the ſucceeding age, Ireland was termed *Sanctorum Patria*. Their monks 'ſo greatly excelled in learning and piety, that they ſent whole flocks of moſt 'learned men into all parts of Europe, who were the firſt founders of Lieuxeu 'abbey, in Burgundy; of the abbey Bobie, in Italy; of Wirtzburgh, in Franco-'nia; St. Gall, in Switzerland; and of Malmſbury, Lindisfarran, and many other 'monaſteries in Britain.' We have alſo the teſtimony of Venerable Bede, that about the middle of the ſeventh century, many nobles, and other orders of the Anglo-Saxons, retired from their own country into Ireland, either for inſtruction,

* It has been affirmed, that St. Patrick was a Scotchman; but Mr. O'Halloran denies this, and ſays, that "it appears from the moſt authentic records, that Patrick was from Wales."

or for an opportunity of living in monaſteries of ſtricter diſcipline: and that the Scots (as he ſtyles the Iriſh) maintained them, taught them, and furniſhed them with books, without fee or reward: 'a moſt honourable teſtimony,' ſays lord Lyttleton, 'not only to the learning, but likewiſe to the hoſpitality and bounty of 'that nation.' Dr. Leland remarks, that a conflux of foreigners to a retired iſland, at a time when Europe was in ignorance and confuſion, gave peculiar luſtre to this ſeat of learning: nor is it improbable or ſurpriſing, that ſeven thouſand ſtudents ſtudied at Armagh, agreeably to the accounts of Iriſh writers, though the ſeminary of Armagh was but one of thoſe numerous colleges erected in Ireland.

In modern times, the Iriſh have alſo diſtinguiſhed themſelves in the republic of letters. Archbiſhop Uſher does honour to his country. Dean Swift, who was a native of Ireland, has perhaps never been equalled in the walks of wit, humour, and ſatire. The ſprightlineſs of Farquhar's wit is well known to all lovers of the drama. And among the men of diſtinguiſhed genius whom Ireland has lately produced, may alſo be particularly mentioned ſir Richard Steele, biſhop Berkeley, Parnel, Sterne, and Goldſmith.

UNIVERSITY.] Ireland contains but one univerſity, which is denominated Trinity-college. It conſiſts of two ſquares, in the whole of which are thirty-three buildings, of eight rooms each. Three ſides of one of the ſquares are of brick, and the fourth is a very ſuperb library, but being built of bad ſtone, it is unfortunately mouldering away. The inſide is beautiful and commodious, and embelliſhed with the buſts of ſeveral ancient and modern worthies. A great part of the books on one ſide were collected by archbiſhop Uſher, who was one of the original members of this body. The new ſquare, three ſides of which have been lately built, by parliamentary bounty, and from thence called Parliament Square, is of hewn ſtone; and the front of it, next the city of Dublin, is ornamented with pilaſters, feſtoons, &c. The provoſt's houſe has an elegant little front, entirely of Portland ſtone. The chapel is a very mean ſtructure, as is alſo the old hall, wherein college exerciſes are performed: but the new hall, in which the members of the college dine, is a fair and large room. In their muſeum, is a ſet of figures in wax, repreſenting females in every ſtate of pregnancy. They are done upon real ſkeletons, and are the labours of almoſt the whole life of a French artiſt.

This ſeminary was founded and endowed by queen Elizabeth; but the original foundation conſiſted only of a provoſt, three fellows, and three ſcholars; which has from time to time, been augmented to twenty-two fellows, ſeventy ſcholars, and thirty ſizers. However, the whole number of ſtudents is at preſent about four hundred; who are of three claſſes, fellow-commoners, penſioners, and ſizers, or ſervitors. Of the fellows, ſeven are called ſeniors, and the annual income of each of theſe is about ſeven hundred pounds. The provoſtſhip is ſuppoſed to be worth three thouſand pounds a year. Trinity-college has a power of conferring degrees of bachelors, maſters, and doctors, in all the arts and faculties. The viſitors are, the chancellor or vice-chancellor, and the archbiſhop of Dublin.

ANTIQUITIES AND CURIOSITIES NATURAL AND ARTIFICIAL.] I have already mentioned the wolf-dogs in Ireland. The Iriſh goſ-hawks and ger-falcons are celebrated for their ſhape and beauty. The mooſe-deer is thought to have been formerly a native of this iſland, their horns being ſometimes dug up of ſo great a ſize, that one pair has been found near eleven feet from the tip of the right horn to the tip of the left; but the greateſt natural curioſity in Ireland is the Giant's Cauſeway in the county of Antrim, about eight miles from Colerain, which is thus deſcribed by Dr. Pococke, late biſhop of Oſſory, a celebrated traveller and antiquary. He ſays, 'that he meaſured the moſt weſterly point at high water, to the diſtance of 360 feet from the cliff; but was told, that at low water it extended 60

feet farther upon a deſcent, till it was loſt in the ſea. Upon meaſuring the eaſtern point, he found it 540 feet from the cliff; and ſaw as much more of it as of the other, where it winds to the eaſt, and is like that loſt in the water.

'The cauſeway is compoſed of pillars all of angular ſhapes, from three ſides to eight. The eaſtern point, where it joins the rock, terminates in a perpendicular cliff, formed by the upright ſides of the pillars, ſome of which are thirty-three feet four inches high. Each pillar conſiſts of ſeveral joints or ſtones, lying one upon another, from ſix inches to about one foot in thickneſs; and what is very ſurpriſing, ſome of theſe joints are ſo convex, that their prominences are nearly quarters of ſpheres, round each of which is a ledge, which holds them together with the greateſt firmneſs, every ſtone being concave on the other ſide, fitting in the exacteſt manner the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally conſiſt of about forty joints, moſt of which ſeparate very eaſily, and one may walk along upon the tops of the pillars as far as to the edge of the water.

'But this is not the moſt ſingular part of this extraordinary curioſity, the cliffs themſelves being ſtill more ſurpriſing. From the bottom, which is of black ſtone, to the height of about ſixty feet, they are divided at equal diſtances by ſtripes of a reddiſh ſtone, that reſembles a cement, about four inches in thickneſs; upon this there is another ſtratum of the ſame black ſtone, with a ſtratum five inches thick of the red. Over this is another ſtratum ten feet thick, divided in the ſame manner; then a ſtratum of the red ſtone twenty feet deep, and above that a ſtratum of upright pillars; above theſe pillars lies another ſtratum of black ſtone, twenty feet high; and, above this again, another ſtratum of upright pillars, riſing in ſome places to the tops of the cliffs, in others not ſo high, and in others again above it, where they are called the chimneys. The face of theſe cliffs extends about three Engliſh miles.'

The cavities, the romantic proſpects, cataracts, and other pleaſing and uncommon natural objects to be met with in Ireland, are too numerous to be called rarities, and ſeveral pamphlets have been employed in deſcribing them. As to the artificial rarities in Ireland, the chief are the round Pharos, or ſtone towers, found upon the coaſts, and ſuppoſed to be built by the Danes and Norwegians in their piratical excurſions, who made uſe of them as ſpy-towers or barbicans, light-houſes or beacons.

CITIES, TOWNS, FORTS, AND OTHER EDIFICES, PUBLIC AND PRIVATE. Dublin, the capital of Ireland, is in magnitude and populouſneſs, the ſecond city in the Britiſh dominions; much about the ſize of Stockholm, Copenhagen, Berlin, and Lyons, and is ſuppoſed to contain near 200,000 inhabitants. It is ſituated 270 miles north-weſt of London, and near ſixty miles weſt from Holyhead in North Wales, the uſual ſtation of paſſage veſſels between Great Britain and Ireland. Dublin ſtands about ſeven miles from the ſea, at the bottom of a large and ſpacious bay, to which it gives name, upon the river Liffey, which divides it almoſt into two equal parts, and is banked in through the whole length of the city, on both ſides, which forms ſpacious and noble quays, where veſſels below the firſt bridge load and unload before the merchants' doors and ware-houſes. A ſtranger, upon entering the bay of Dublin, which is about ſeven miles broad, and in ſtormy weather extremely dangerous, is agreeably ſurpriſed with the beautiful proſpect on each ſide, and the diſtant view of Wicklow mountains; but Dublin, from its low ſituation, makes no great appearance. Dublin has greatly increaſed within twenty years laſt paſt, and it is generally ſuppoſed that 7000 houſes have been added to the city and ſuburbs ſince the reign of queen Anne. The number of houſes in the year 1777, was 17,151, and there have been many new buildings

erected ſince. In its appearance, this city bears a near reſemblance to London. The houſes are of brick; the old ſtreets are narrow and mean, but the new ſtreets are as elegant as thoſe of the metropolis of Great Britain. Sackville-ſtreet, which is ſometimes called the Mall, is particularly noble. The houſes are elegant, lofty, and uniformly built, and a gravel walk runs through the whole at an equal diſtance from the ſides.

The river Liffey, though navigable as far as the cuſtom-houſe, or centre of the city, is but ſmall, when compared with the Thames at London. Over it are two handſome ſtone-bridges, lately built in imitation of that at Weſtminſter, and there are three others that have little to recommend them. Formerly the centre of Dublin, towards the cuſtom-houſe, was crowded and inconvenient for commercial purpoſes; but of late a new ſtreet has been opened, leading from Eſſex-bridge to the caſtle, where the lord-lieutenant reſides. A new exchange has likewiſe been erected, an elegant ſtructure of white ſtone, richly embelliſhed with ſemi-columns of the Corinthian order, a cupola, and other ornaments.

The barracks are pleaſantly ſituated on an eminence near the river. They conſiſt of four large courts, in which are generally quartered four battalions of foot, and one regiment of horſe; from hence the caſtle and city guards are relieved daily. They are ſaid to be the largeſt and completeſt building of the kind in Europe, being capable of containing 3000 foot and 1000 horſe.

The linen hall was erected at the public expence, and opened in the year 1728, for the reception of ſuch linen cloths as were brought to Dublin for ſale, for which there are convenient apartments. It is entirely under the direction of the truſtees for the encouragement of the linen manufactory of Ireland, who are compoſed of the lord chancellor, the primate, the archbiſhop of Dublin, and the principal part of the nobility and gentry. This national inſtitution is productive of great advantages, by preventing many frauds which otherwiſe would be committed in a capital branch of trade, by which many thouſands are employed, and the kingdom greatly enriched.

Stephen's Green is a moſt extenſive ſquare, round which is a gravel walk of near a mile. Here genteel company walk in the evenings, and on Sundays after two o'clock; and in fine weather make a very gay appearance. Many of the houſes round the green are very ſtately, but a want of uniformity is obſervable throughout the whole. Ample amends will be made for this defect by another ſpacious ſquare near Stephen's Green, now laid out and partly built. The front of Trinity-college, extending above 300 feet, is built of Portland ſtone in the fineſt taſte.

The parliament houſe was begun in 1729, and finiſhed in 1739, at the expence of 40,000l. This ſuperb pile is, in general, of the Ionic order. The portico is magnificent; the internal parts have many beauties, and the manner in which the building is lighted, has been much admired. But one of the greateſt and moſt laudable undertakings that this age can boaſt of, is the building a ſtone wall abo[illegible] the breadth of a moderate ſtreet, and of a proportionate height, and three miles in length, to confine the channel of the bay, and to ſhelter veſſels in ſtormy weather.

The civil government of Dublin is by a lord-mayor, &c. the ſame as in London. Every third year, the lord-mayor, and the twenty-four companies, by virtue of an old charter, are obliged to perambulate the city, and its liberties, which they call riding the franchiſes. Upon this occaſion the citizens vie with each other in ſhow and oſtentation, which is ſometimes productive of diſagreeable conſequences to many of their families. In Dublin there are two large theatres, that are generally well filled, and which ſerve as a kind of nurſery to thoſe in London. In this city are 18 pariſh churches, 8 chapels, 3 churches for French, and 1 for Dutch proteſtants, 7 preſbyterian meeting houſes, 1 for methodiſts, 2 for quakers, and 16 Roman catholic chapels. A royal hoſpital, like that at Chelſea, for invalids; a lying-

lying-in hoſpital, with gardens, built and laid out in the fineſt taſte; an hoſpital for lunatics, founded by the famous dean Swift, who himſelf died a lunatic; and ſundry other hoſpitals for patients of every kind. Some of the churches have been lately rebuilt, and others are rebuilding with more taſte. And, indeed, which ever way a ſtranger turns himſelf in this city, he will perceive marks of elegance; and if he extends his views over the whole kingdom, he will conclude that works of ornament and public utility are no where more encouraged than in Ireland, chiefly through the munificence of parliament.

It is, however, matter of ſurpriſe, that with all this ſpirit of national improvement, few or no good inns are to be met with in Ireland. Even in the capital, there is not one inn which deſerves that name. This may, in ſome meaſure, be accounted for by the long, and ſometimes dangerous paſſage from Cheſter and Holyhead to Ireland, which prevents the gentry of England, with their families, from viſiting that iſland; but as it is now propoſed to make turnpike roads to Portpatrick in Scotland, from whence the paſſage is ſhort and ſafe, the roads of Ireland may by this means become more frequented, eſpecially when the rural beauties of that kingdom are more generally known. For though in England, France, and Italy, a traveller meets with views the moſt luxuriant and rich, he is ſometimes cloyed with a ſameneſs which runs through the whole: but in thoſe counties of North Britain and Ireland, the rugged mountains, whoſe tops look down upon the clouds, the extenſive lakes, enriched with buſhy iſlands, the cavities, glens, cataracts, the numerous feathered creation, hopping from cliff to cliff, and other pleaſing and uncommon natural objects, that frequently preſent themſelves in various forms and ſhapes, have a wonderful effect upon the imagination, and are pleaſing to the fancy of every admirer of nature, however rough and unadorned with artificial beauties.

Cork is deſervedly reckoned the ſecond city in Ireland, in magnitude, riches, and commerce. It lies 129 miles ſouth-weſt of Dublin, and contains above 8500 houſes. Its haven is deep, and ſheltered from all winds; but ſmall veſſels only can come up to the city, which ſtands about ſeven miles up the river Lee. This is the chief port of merchants in the kingdom; and there is, perhaps, more beef, tallow, and butter, ſhipped off here, than in all the other ports of Ireland together. Hence there is a great reſort of ſhips to this port, particularly of thoſe bound from Great Britain to Jamaica, Barbadoes, and all the Caribbee iſlands, which put in here to victual and complete their lading. It appears, that in the reign of Edward IV. there were eleven churches in Cork, though there are now only ſeven, and yet it has ever ſince that time been eſteemed a thriving city; but it muſt be obſerved, that beſide the churches, there are at this time ſix maſs houſes, two diſſenting meeting-houſes, another for quakers, and a chapel for French proteſtants.—Kinſale is a populous and ſtrong town, with an excellent harbour, and conſiderable commerce and ſhipping: and it is, moreover, an excellent ſtation for the royal navy; for which end this port is furniſhed with proper naval officers and ſtorekeepers.—Waterford comes next to Cork for riches and ſhipping, and contains 2561 houſes. It is commanded by Duncannon Fort, and on the weſt ſide of the town is a citadel.—Limerick is a handſome, populous, commercial, ſtrong city, it lies on both ſides the Shannon, and contains 5257 houſes.

Belfaſt, is a large ſea-port and trading town at the mouth of the Lagen Water, where it falls into Carrickfergus bay.—Downpatrick has a flouriſhing linen manufacture.—Carrickfergus (or Knockfergus), by ſome deemed the capital town of the province, has a good harbour and caſtle, but little commerce.—Derry (or Londonderry, as it is moſt uſually called) ſtands on Lough-Foyl, is a ſtrong, but ſmall city, having linen manufactures, with ſome commerce and ſhipping. This northern part of Ireland is ſituated ſo near to Scotland, that they are in ſight of each other's coaſts.—Donegal, the county-town of the ſame name (otherwiſe called

the

the county of Tyrconnel), is a place of ſome trade; as is likewiſe Enniſkilling. All which laſt mentioned places, and others leſs conſiderable are moſt induſtriouſly employed in the manufacturing of linen, and linen thread, to the great benefit of the whole kingdom, which, by its vaſt annual exportations of linen into England, is enabled to pay for the great annual importations from England into Ireland; and likewiſe to render the money conſtantly drawn from Ireland into England, by her abſentees, leſs grievous to her.

Though Ireland contains no ſtrong places, according to the modern improvements in fortification, yet it has ſeveral forts and garriſons, that ſerve as comfortable ſinecures to military officers. The chief are Londonderry and Culmore Fort, Cork, Limerick, Kinſale, Duncannon, Roſs-Caſtle, Dublin, Charlemont, Galway, Carrickfergus, Maryborough, and Athlone. Each of theſe forts is furniſhed with deputy-governors, under various denominations, who have pecuniary proviſions from the government.

It cannot be pretended, that Ireland is as yet furniſhed with any public edifices, to compare with thoſe to be found in countries where ſovereigns and their courts reſide, but it has ſome elegant public buildings, which do honour to the taſte and public ſpirit of the inhabitants. The parliament-houſe, caſtle, Eſſex bridge, and ſeveral edifices about Dublin, already mentioned, are magnificent; and elegant pieces of architecture, and many noble Gothic churches, and other buildings, are to be ſeen in Ireland. The Iriſh nobility, and gentry of fortune, now vie with thoſe of England in the magnificent ſtructure of their houſes, and the elegance of their ornaments; but it would be unjuſt, where there are ſo many equal in taſte and magnificence to particularize any. In ſpeaking of the public buildings of this kingdom, I muſt not forget the barracks where the ſoldiers are lodged, equally to the eaſe and convenience of the inhabitants.

COMMERCE AND MANUFACTURES.] The exports of Ireland are linen-cloth, yarn, lawns, and cambrics, horſes, black cattle, beef, pork, green hides, tanned leather, calf ſkins dried, tallow, butter, candles, cheeſe, ox and cow-horns, ox-hair, horſe-hair, lead, copper-ore, herrings, dried fiſh, rabbit-ſkins and fur, otter-ſkins, goat-ſkins, and ſalmon; but it is probable that the exports of Ireland will be greatly increaſed by the late laws paſſed in favour of the trade of that kingdom. It is certain that the Iriſh have carried their inland manufactures, even thoſe of luxury, to a conſiderable height, and that their lord-lieutenants, and their court, have of late greatly encouraged them, and while they are in that government, make uſe of no other.

COMMERCIAL INSTITUTIONS.] The Dublin ſociety for the encouragement of manufactures and commerce was incorporated 1750. The linen-hall erected at Dublin, is under as juſt and nice regulations as any commercial houſe in Europe.

CONSTITUTION AND GOVERNMENT.] Ireland was formerly entitled the dominion or lordſhip of Ireland, and the king's ſtyle was no other than Dominus Hiberniæ, lord of Ireland, till the 33d year of king Henry VIII. when he aſſumed the title of king, which is recogniſed by act parliament in the ſame reign. But as England and Scotland are now one and the ſame kingdom, and yet differ in their municipal laws; ſo England and Ireland are diſtinct kingdoms, and yet in general agree in their laws. For after the conqueſt of Ireland by king Henry II. the laws of England were received and ſworn to by the Iriſh nation, aſſembled at the council of Liſmore; and as Ireland, thus conquered, planted, and governed, continued in a ſtate of dependence, it was thought neceſſary, that it ſhould conform to, and be obliged by, ſuch laws as the ſuperior ſtate thought proper to preſcribe.

But this ſtate of dependence being almoſt forgotten, and ready to be diſputed by the Iriſh nation, it was thought neceſſary ſome years ago, to declare how that matter ſtood: and therefore, by ſtatute 6th of George I. it is declared, "that the king-

kingdom of Ireland ought to be ſubordinate to, and dependent upon, the imperial crown of Great Britain, as being inſeparably united thereto: and that the king's majeſty, with the conſent of the lords and commons of Great Britain, in parliament, hath power to make laws to bind the people of Ireland." This determination of the Britiſh parliament occaſioned much diſſatisfaction among the Iriſh, who at length, feeling their own ſtrength by means of their volunteer aſſociations, and encouraged and favoured by the ſeveral parties contending for the adminiſtration in England, obtained, in the year 1782, a formal repeal of the above ſtatute, which was conſidered as a renunciation on the part of the parliament of Great Britain of every claim of legiſlation over Ireland.

The conſtitution of the Iriſh government, as it ſtands at preſent, with regard to diſtributive juſtice, is nearly the ſame with that of England. A chief governor, who generally goes by the name of lord lieutenant, is ſent over from England by the king, whom he repreſents; but his power is in ſome meaſure reſtrained, and in others enlarged, according to the king's pleaſure, or the exigency of the times. On his entering upon this honourable office, his letters patent are publicly read in the council-chamber; and having taken the uſual oaths before the lord-chancellor, the ſword, which is to be carried before him, is delivered into his hands, and he is ſeated in the chair of ſtate, attended by the lord chancellor, the members of the privy-council, the peers and nobles, the king at arms, a ſerjeant at mace, and other officers of ſtate; and he never appears publickly without being attended by a body of horſe-guards. Hence, with reſpect to his authority, his train, and ſplendor, there is no viceroy in Chriſtendom that comes nearer to the grandeur and majeſty of a king. He has a council compoſed of the great officers of the crown; namely, the chancellor, treaſurer, and ſuch of the archbiſhops, earls, biſhops, barons, judges, and gentlemen, as his majeſty is pleaſed to appoint. The parliament here, as well as in England, is the ſupreme court, which is convened by the king's writ and generally ſits once every year. It conſiſts, as in England, of a houſe of lords and commons. Of the former, many are Engliſh or Britiſh peers, or commons of Great Britain; a few are papiſts, who cannot ſit without being properly qualified; and the number of commons amount to about three hundred. Since the acceſſion of his preſent majeſty, Iriſh parliaments have been rendered octennial. The repreſentation of the people in the ſenate of Ireland, is in many inſtances like that of England, partial, and inadequate. The acts paſſed by the houſe of lords and commons are ſent to England for the approbation of his majeſty and council, which having obtained, they paſs the great ſeal of England, and are returned.

For the regular diſtribution of juſtice, there are in Ireland four terms held annually for the deciſion of cauſes; and four courts of juſtice, the chancery, king's-bench, common-pleas, and exchequer. The high ſheriffs of the ſeveral counties were formerly choſen by the people, but are now nominated by the lord-lieutenant. From this general view it appears, that the civil and eccleſiaſtical inſtitutions are almoſt the ſame in Ireland as in England.

Revenues.] In Ireland the public revenue ariſes from hereditary and temporary duties, of which the king is the truſtee, for applying it to public purpoſes; but there is, beſides this, a private revenue ariſing from the ancient demeſne lands, from forfeitures for treaſon and felony, priſage of wines, light-houſe duties, and a ſmall part of the caſual revenue, not granted by parliament; and in this the crown has the ſame unlimited property that a ſubject has in his own freehold. The extent of that revenue is perhaps a ſecret to the public.

The revenue of Ireland amounts nearly to 1,000,000l. and the public expenditure exceeds that ſum. The Iriſh complain greatly, and juſtly, that of this revenue, about 70,000l. is granted in penſions, and a great part to abſentees. Very large ſums are alſo granted by their own parliament for more valuable purpoſes, the

improvement

improvement of their country, and civilizing the people; ſuch as the inland navigation, bridges, high-ways, churches, premiums, proteſtant ſchools, and other particulars, which do honour to the wiſdom and patriotiſm of that parliament. In 1787 the national debt was 2,302,146l. chiefly contracted for national improvements.

COINS.] The coins of Ireland are at preſent of the ſame denominations and the like fabric with thoſe of England, only an Engliſh ſhilling paſſes in Ireland for thirteen pence. What the ancient coins of the Iriſh were, is at preſent a matter of mere curioſity and great uncertainty.

MILITARY STRENGTH.] Ireland now maintains and pays an army of 15,000 men; and the military force of Ireland has been greatly increaſed by the many volunteer aſſociated companies, which have been lately formed in that kingdom. Thoſe parts of Ireland that are moſt cultivated, contain numbers of inhabitants that have very little ſenſe either of divine or human laws, and regular forces are abſolutely neceſſary for keeping them in order; witneſs the late inſurrections of the Whiteboys, and other banditti, inſtigated, it is ſaid, by their prieſts, though it muſt be owned that many of the common people of Ireland have laboured under ſuch oppreſſions as afforded them juſt grounds for diſcontent: amongſt which we may reckon the hardſhip of the far greater number being obliged to ſupport the religious eſtabliſhment of the few. It does not, however, appear that the bulk of the Iriſh Catholics are fond of a revolution in government, as few or none of them joined Thurot in his deſcent upon Carrickfergus, or took any part with the Pretender in the laſt rebellion.

ORDER OF ST. PATRICK.] This order was inſtituted February 5, and the inſtallation of the firſt knights was performed on the 17th of March 1783. It conſiſts of the ſovereign and fifteen other knights companions. The lord lieutenants of Ireland for the time being officiate as grand maſters of the order, and the archbiſhop of Armagh is the prelate, the archbiſhop of Dublin the chancellor, and the dean of St. Patrick the regiſter of the order. The knights are inſtalled in the cathedral of St. Patrick, Dublin. Their robes are ſplendid, and the badge is three crowns united together on a croſs, with the motto round *Quis ſeparabit*, 1783, faſtened by an Iriſh harp to the crown imperial. A ſtar of eight points encircles it on the coat.

HISTORY.] The hiſtory of Ireland has been carried to a very remote antiquity, and may, with greater juſtice than that of almoſt any other country, be diſtinguiſhed into the legendary and authentic. In the reign of Edward II. an Ulſter prince boaſted to the pope of an uninterrupted ſucceſſion of one hundred and ninety-ſeven kings of Ireland, to the year 1170. Even the more moderate Iriſh antiquaries carry their hiſtory up to about 500 years before the Chriſtian æra, at which time they aſſert, that a colony of Scythians, immediately from Spain, ſettled in Ireland, and introduced the Phœnician language and letters into that country: and that however it might have been peopled ſtill earlier from Gaul or Britain, yet Heber, Heremon, and Ith, the ſons of Mileſius, gave a race of kings to the Iriſh, diſtinguiſhed by the names of Gadelians and Scuits, or Scots. But as our limits will not permit us to enlarge on the dark and conteſted part of the Iriſh hiſtory, we ſhall only obſerve, that it was about the middle of the fifth century that the great apoſtle of Ireland, St. Patrick, was employed in the propagation of Chriſtianity in that kingdom, though Chriſtian miſſionaries had been there long before, by whoſe means it had made a conſiderable progreſs among the inhabitants of Ireland. After this period, Ireland was occaſionally invaded by the Saxon kings of England: but in the year 795 and 798 the Danes and Normans, or as they were called, the Eaſterlings, invaded the coaſts of Ireland, and were the firſt who erected ſtone edifices there. The common habitations of the Iriſh, till that time, were of hurdles

covered

covered with ſtraw and ruſhes, and but very few of ſolid timber. The natives defended themſelves bravely againſt the Eaſterlings, who built Dublin, Waterford, Limerick, Wexford, and Cork; but they reſided chiefly at Dublin, or in its neighbourhood, which, by the old Iriſh, was called Fingal, or the Land of Strangers. The natives, about the year 962, ſeemed to have called to their aſſiſtance the Anglo-Saxon king Edgar, who had then a conſiderable maritime power; and this might have given occaſion for his clergy to call him king of great part of Ireland. It is certain that Dublin was about that time a flouriſhing city, and that the native Iriſh gave the Eaſterlings ſeveral defeats, though ſupported by their countrymen from the continent, the Iſle of Man, and the Hebrides.

In the twelfth century, Henry the Second of England formed a deſign of annexing Ireland to his dominions. He is ſaid to have been induced to this by the provocation he had received from ſome of the Iriſh chieftains, who had afforded conſiderable aſſiſtance to his enemies. His deſign was patroniſed by the pope, and a fair pretext of attacking Ireland offered about the year 1168. Dermot Mac Murrough, king of Leinſter, and an oppreſſive tyrant, quarrelled with all his neighbours, and carried off the wife of a petty prince, O'Roirk. A confederacy being formed againſt him, under Roderic O'Connor (who it ſeems was the paramount king of Ireland) he was driven from his country, and took refuge at the court of Henry II. who promiſed to reſtore him, upon taking an oath of fealty to the crown of England for himſelf, and all the petty kings depending on him, who were very numerous. Henry, who was then in France, recommended Mac Dermot's cauſe to the Engliſh barons, and particularly to Strongbow, earl of Pembroke, Robert Fitz Stephen, and Maurice Fitz Gerald. Thoſe noblemen undertook the expedition upon much the ſame principles as the Norman and Breton lords did the conqueſt of England under William I. and Strongbow was to marry Mac Dermot's daughter Eva. In 1169, the adventurers reduced the towns of Wexford and Waterford; and the next year Strongbow arriving with a ſtrong reinforcement, his marriage was celebrated.

The deſcendants of the Danes continued ſtill poſſeſſed of Dublin, which, after ſome ineffectual oppoſition made by king O'Connor, was taken and plundered by the Engliſh ſoldiers; but Mac Turkil, the Daniſh king, eſcaped to his ſhipping. Upon the death of Dermot, Henry II. became jealous of earl Strongbow, ſeized upon his eſtate in England and Wales, and recalled his ſubjects from Ireland. The Iriſh, about the ſame time, to the amount of above 60,000, beſieged Dublin, under king O'Connor; but though all Strongbow's Iriſh friends and allies had now left him, and the city was reduced to great extremity, he forced the Iriſh to raiſe the ſiege with great loſs; and going over to England he appeaſed Henry by ſwearing fealty to him and his heirs, and reſigning into his hand all the Iriſh cities and forts he held. During Strongbow's abſence, Mac Turkil returned with a great fleet, attempted to retake the city of Dublin, but was killed at the ſiege; and in him ended the race of the Eaſterling princes in Ireland.

In 1172, Henry II. attended by 400 knights, 4000 veteran ſoldiers, and the flower of his nobility, landed near Waterford: and not only all the petty princes of Ireland, except the king of Ulſter, but the great king Roderic O'Connor, ſubmitted to Henry; who pretended that O'Connor's ſubmiſſion included that of Ulſter, and that conſequently he was the paramount ſovereign of Ireland. Be that as it will, he affected to keep a magnificent court, and held a parliament at Dublin, where he parcelled out the eſtates in Ireland, as William the Conqueror had done in England, to his Engliſh nobility. He then ſettled a civil adminiſtration at Dublin, as nearly as poſſible to that of England, to which he returned in 1173, having firſt ſettled an Engliſh colony from Briſtol in Dublin, with all the liberties and free

cuſtoms, ſay their charters, which the citizens of Briſtol enjoyed. From that time Dublin began to flouriſh. Thus the conqueſt of Ireland was effected by the Engliſh, almoſt with as much eaſe as that of Mexico was by the Spaniards; and for much the ſame reaſons, the rude and unarmed ſtate of the natives, and the differences that prevailed among the princes or leaders.

Henry gave the title of lord of Ireland to his ſon John, who, in 1185, went over in perſon to Ireland; but John and his giddy Norman courtiers made a very ill uſe of their power, and rendered themſelves odious to the Iriſh, who were otherwiſe very well diſpoſed towards the Engliſh. Richard I. was too much taken up with the cruſades to pay much regard to the affairs of Ireland; but king John, after his acceſſion, made amends for his behaviour towards the Iriſh. He enlarged his father's plan of introducing into Ireland Engliſh laws and officers, and he erected that part of the provinces of Leinſter and Munſter, which was within the Engliſh pale, into twelve counties; but the deſcendants of the ancient princes in other places paid him no more than a nominal ſubjection. They governed by their old Brehon laws, and exerciſed all acts of ſovereignty within their own ſtates; and indeed this was pretty much the caſe ſo late as the reign of James I. The unſettled reign of Henry III. his wars and captivity, gave the Iriſh a very mean opinion of the Engliſh government during his reign; but they ſeem to have continued quiet under his ſon Edward I. Gaveſton, the famous favourite of Edward II. acquired great credit while he acted as lieutenant of Ireland; but the ſucceſſes of the Scotch king, Robert Bruce, had almoſt proved fatal to the Engliſh intereſt, and ſuggeſted to the Iriſh the idea of transferring their allegiance from the kings of England to Edward Bruce, king Robert's brother. That prince accordingly invaded Ireland, where he gave repeated defeats to the Engliſh governors and armies; and being ſupported by his brother in perſon, he was actually crowned king at Dundalk, and narrowly miſſed being maſter of Dublin. The younger Bruce ſeems to have been violent in the exerciſe of his ſovereignty, and he was at laſt defeated and killed by Bermingham, the Engliſh general. After this Edward II. ruled Ireland with great moderation, and paſſed ſeveral excellent acts with regard to that country.

But during the minority of Edward III. the commotions were again renewed in Ireland, and not ſuppreſſed without great loſs and diſgrace on the ſide of the Engliſh. In 1333 a rebellion broke out, in which the Engliſh inhabitants had no inconſiderable ſhare. A ſucceſſion of vigorous, brave governors, at laſt quieted the inſurgents; and about the year 1361, prince Lionel, ſon to Edward III. having married the heireſs of Ulſter, was ſent over to govern Ireland, and, if poſſible, to reduce its inhabitants to an entire conformity with the laws of England. In this he made a great progreſs, but did not entirely accompliſh it. It appears, that at this time the Iriſh were in a very flouriſhing condition, and that one of the greateſt grievances they complained of was, that the Engliſh ſent over men of mean birth to govern them. In 1394, Richard II. finding that the execution of his deſpotic ſchemes in England muſt be abortive without farther ſupport, paſſed over to Ireland with an army of 34,000 men, well armed and appointed. As he made no uſe of force, the Iriſh regarded his preſence as a high compliment to their nation, and admired the magnificence of his court. Richard, on the other hand, courted them by all the arts he could employ, and beſtowed the honour of knighthood on their chiefs. In ſhort, he behaved ſo as entirely to win their affections. But in 1399, after having acted in a very deſpotic manner in England, he undertook a freſh expedition into Ireland, to revenge the death of his lord-lieutenant the earl of March, who had been killed by the wild Iriſh. His army again ſtruck the natives with conſternation, and they threw themſelves upon his mercy.

It

It was during this expedition, that the duke of Lancaſter landed in England; and Richard, upon his return, finding himſelf deſerted by his Engliſh ſubjects on account of his tyranny, and that he could not depend upon the Iriſh, ſurrendered his crown to his rival.

The Iriſh, after Richard's death, ſtill retained a warm affection for the houſe of York; and upon the revival of that family's claim to the crown, embraced its cauſe. Edward IV. made the earl of Deſmond lord-lieutenant of Ireland for his ſervices againſt the Ormond party and other adherents of the houſe of Lancaſter, and he was the *firſt Iriſh chieftain* that obtained this honour. Even the acceſſion of Henry VII. to the crown of England did not reconcile the Iriſh to his title as duke of Lancaſter; they therefore readily joined Lambert Simnel, who pretended to be the eldeſt ſon of Edward IV. but for this they paid dear, being defeated in their attempt to invade England. This made them ſomewhat cautious at firſt of joining Perkin Warbeck, who was, however, at laſt recognized as king by the Iriſh; and in the preceding pages under the hiſtory of England, the reader may learn the event of his pretenſions. Henry behaved with moderation towards his unfortunate partizans, and was contented with requiring the Iriſh nobility to take a freſh oath of allegiance to his government. This lenity had the deſired effect, during the adminiſtration of the two earls of Kildare, the earl of Surry, and the earl of Ormond. Henry VIII. governed Ireland by ſupporting its chiefs againſt each other, but they were tampered with by the emperor Charles V. upon which Henry made his natural ſon, the duke of Richmond, his lord-lieutenant. This did not prevent the Iriſh from breaking out into rebellion in the year 1540, under Fitz Gerald, who had been lord-deputy, and was won over by the emperor, but was at laſt hanged at Tyburn. After this, the houſe of Auſtria found their account in their quarrels with England, to form a ſtrong party among the Iriſh.

About the year 1542, James V. king of Scotland, formed ſome pretenſions to the crown of Ireland, and was favoured by a ſtrong party among the Iriſh themſelves. It is hard to ſay, had he lived, what the conſequence of his claim might have been. Henry underſtood that the Iriſh had a mean opinion of his dignity, as the kings of England had hitherto aſſumed no higher title than that of lords of Ireland. He therefore took that of king of Ireland, which had a great effect with the native Iriſh, who thought that allegiance was not due to a lord; and, to ſpeak the truth, it was ſomewhat ſurpriſing that this expedient was not thought of before. It produced a more perfect ſubmiſſion of the native Iriſh to Henry's government than ever had been known; and even O'Neil, who pretended to be ſucceſſor to the laſt paramount king of Ireland, ſwore allegiance to Henry, who created him earl of Tyrone.

The pope, however, and the princes of the houſe of Auſtria, by remitting money and ſometimes ſending over troops to the Iriſh, ſtill kept up their intereſt in that kingdom, and drew from them vaſt numbers of men to their armies, where they proved as good ſoldiers as any in Europe. This created inexpreſſible difficulties to the Engliſh government, even in the reign of Edward VI. but it is remarkable, that the Reformation took place in the Engliſh part of Ireland with little or no oppoſition. The Iriſh ſeem to have been very quiet during the reign of queen Mary; but they proved thorns in the ſide of queen Elizabeth. The perpetual diſputes ſhe had with the Roman catholics both at home and abroad, gave her great uneaſineſs; and the pope and the houſe of Auſtria always found new reſources againſt her in Ireland. The Spaniards poſſeſſed themſelves of Kinſale; and the rebellions of Tyrone, who baffled and outwitted her favourite general the earl of Eſſex, are related in the Engliſh hiſtory.

The lord-deputy-Mountjoy, who ſucceeded Eſſex, was the firſt Engliſhman who

gave a mortal blow to the practices of the Spaniards in Ireland, by defeating them and the Iriſh before Kinſale, and bringing Tyrone priſoner to England; where he was pardoned by queen Elizabeth in 1602. This lenity, ſhewn to ſuch an offender, is a proof of the dreadful apprehenſions Elizabeth had from the popiſh intereſt in Ireland. James I. confirmed the poſſeſſions of the Iriſh; but ſuch was the influence of the pope and the Spaniards, that the earls of Tyrone and Tyrconnel, and their party planned a new rebellion, and attempted to ſeize the caſtle of Dublin; but their plot being diſcovered, their chiefs fled beyond ſeas. They were not idle abroad, for in 1608 they inſtigated ſir Calim O'Dogharty to a freſh rebellion, by promiſing him ſpeedy ſupplies of men and money from Spain. Sir Calim was killed in the diſpute, and his adherents were taken and executed. The attainders of the Iriſh rebels, which paſſed in the reigns of James and Elizabeth, veſted in the crown 511,464 acres, in the ſeveral counties of Donnegal, Tyrone, Colerain, Fermanagh, Cavan, and Armagh; and enabled the king to make that proteſtant plantation in the North of Ireland, which now, from the moſt rebellious province of the kingdom, is the moſt quiet and reformed.

Thoſe prodigious attainders, however juſt and neceſſary they might be, operated fatally for the Engliſh in the reign of Charles I. The Iriſh Roman Catholics, in general, were influenced by their prieſts to hope not only to repoſſeſs the lands of their forefathers, but to reſtore the popiſh religion in Ireland. They therefore entered into a deep and deteſtable conſpiracy for maſſacring all the Engliſh proteſtants in that kingdom. In this they were encouraged by the unhappy diſſenſions that broke out between the king and his parliaments in England and Scotland. Their bloody plan being diſcovered by the Engliſh government at Dublin, prevented that city from falling into their hands. They, however, partly executed, in 1641, their horrid ſcheme of maſſacre; but authors have not agreed as to the numbers who were murdered; perhaps they have been exaggerated by warm proteſtant writers, ſome of whom make them amount to an hundred and fifty, or two hundred thouſand, but the moſt moderate, and probably the moſt reaſonable account is that they were about forty thouſand.* What followed in conſequence of this rebellion, and the reduction of Ireland by Cromwell, who retaliated the cruelties of the Iriſh papiſts, belongs to the hiſtory of England. It is certain they ſmarted ſo ſeverely, that they were quiet during the reign of Charles II. His popiſh ſucceſſor and brother James II. even after the Revolution took place, found an aſylum in Ireland; and was encouraged to hope, that, by the aſſiſtance of the natives there, he might remount his throne: but he was deceived, and his own puſillanimity co-operated with his diſappointment. He was driven out of Ireland by his ſon-in-law, after the battle of the Boyne, the only victory that king William ever gained in perſon; a victory, however, on which depended the ſafety of the proteſtant religion, and the liberties of the Britiſh empire. Had James been victorious, he probably would have been reinſtated on the throne, and nothing elſe could be expected than that being irritated by oppoſition, victorious over his enemies, and free from every reſtraint, he would have trampled upon all rights, civil and religious, and purſued more arbitrary deſigns than before. The army of William conſiſted of 36,000 men, that of James of 33,000 but advantageouſly ſituated. But James fought at the head of an undiſciplined rabble; and his French auxiliaries were far from behaving like heroes.

The forfeitures that fell to the crown, on account of the Iriſh rebellions and the Revolution, are almoſt incredible; and had the acts of parliament which gave them away been ſtrictly enforced, Ireland muſt have been peopled with Britiſh inhabitants. But many political reaſons occurred for not driving the Iriſh to deſpair. The friends

* See Hume's Hiſt. of England vol. vi. p. 377, 8vo. edit.

of the Revolution and the proteſtant religion were ſufficiently gratified out of the forfeited eſtates. Too many of the Roman Catholics might have been forced abroad; and it was proper that a due balance ſhould be preſerved between the Roman Catholic and the proteſtant intereſt. It was therefore thought prudent to relax the reins of government, and not to put the forfeitures too rigorouſly into execution. The experience of half a century has confirmed the wiſdom of the above conſiderations. The lenity of the meaſures purſued in regard to the Iriſh Roman Catholics, and the great pains taken for the inſtruction of their children, with the progreſs which knowledge and the arts made in that country, greatly diminiſhed the popiſh intereſt. The ſpirit of induſtry enabled the Iriſh to know their own ſtrength and importance; towards which effect ſome accidental circumſtances concurred. All her ports were opened for the exportation of wool and woollen yarn to any part of Great Britain; and of late years, acts of parliament were made occaſionally for permitting the importation of ſalt beef, pork, butter, cattle, and tallow, from Ireland to Great Britain.

But though ſome laws and regulations had occaſionally taken place favourable to Ireland, it muſt be acknowledged, that the inhabitants of that country laboured under conſiderable grievances, in conſequence of ſundry injudicious reſtraints of the parliament of England reſpecting their trade. Theſe reſtraints had injured Ireland without benefiting Great Britain. The Iriſh had been prohibited from manufacturing their own wool, in order to favour the woollen manufactory of England; the conſequence of which was, that the Iriſh wool was ſmuggled over into France, and the people of that country were thereby enabled to rival us in our woollen manufacture, and to deprive us of a part of that trade. An embargo had alſo been laid on the exportation of proviſions from Ireland, which had been extremely prejudicial to that kingdom. The diſtreſſes of the Iriſh manufacturers, as well as thoſe of Great Britain, had likewiſe been much increaſed by the conſequences of the American war. Theſe circumſtances occaſioned great murmuring in Ireland, and ſome unſucceſsful attempts were made for the relief of the inhabitants of that kingdom in the Britiſh parliament. But a large body of the king's troops being withdrawn from Ireland, in order to be employed in the American war, a conſiderable number of Iriſh gentlemen, farmers, traders, and other perſons, armed and formed themſelves into volunteer aſſociations, for the defence of Ireland againſt foreign invaders. By degrees, theſe volunteer aſſociations became numerous and well-diſciplined: and it was ſoon diſcovered, that they were inclined to maintain their rights at home, as well as to defend themſelves againſt foreign enemies. When theſe armed aſſociations became numerous and formidable, the Iriſh began to aſſume an higher tone than that to which they had before been accuſtomed; and it was ſoon manifeſt, that their remonſtrances met with unuſual attention, both from their own parliament and from that of Great Britain. The latter, on the 11th of May 1779, preſented an addreſs to the king, recommending to his majeſty's moſt ſerious conſideration the diſtreſſed and impoveriſhed ſtate of the loyal and well-deſerving people of Ireland, and deſiring him to direct that there ſhould be prepared, and laid before parliament, ſuch particulars relative to the trade and manufactures of Great Britain and Ireland, as ſhould enable the national wiſdom to purſue effectual meaſures for promoting the common ſtrength, wealth, and commerce of his majeſty's ſubjects in both kingdoms. To this addreſs the king returned a favourable anſwer: and in October, the ſame year, both houſes of the Iriſh parliament alſo preſented addreſſes to his majeſty, in which they declared, that nothing but granting Ireland a free trade could ſave it from ruin. Notwithſtanding which, it being ſoon after ſuſpected by many of the people of that kingdom, that the members of their parliament would not exert themſelves with vigour in promoting the intereſts

of

of the nation, a very daring and numurous mob aſſembled before the parliament-houſe in Dublin, crying out for a *free trade*, and a *ſhort money-bill*. They aſſaulted the members, and endeavoured to compel them to ſwear, that they would ſupport the intereſt of their country by voting for a ſhort money-bill; and they demoliſhed the houſe of the attorney-general. The tumult at length ſubſided; and two Iriſh money-bills, for ſix months only, were ſent over to England, where they paſſed the great ſeal, and were immediately returned, without any diſſatisfaction being expreſſed by government at this limited grant.

In the mean time, the members of the oppoſition, in the Engliſh parliament, very ſtrongly repreſented the neceſſity of an immediate attention to the complaints of the people of Ireland, and of a compliance with their wiſhes. The arguments on this ſide of the queſtion were alſo enforced by the accounts which came from Ireland, that the volunteer aſſociations in that kingdom amounted to forty thouſand men, unpaid, ſelf-appointed, and independent of government, well armed and accoutred, daily improving in diſcipline, and which afterwards increaſed to eighty thouſand. The Britiſh miniſtry appeared for ſome time undetermined what part they ſhould act in this important buſineſs: but the remembrance of the fatal effects of rigorous meaſures reſpecting America, and the very critical ſituation of Great Britain, at length induced the firſt lord of the treaſury to bring in ſuch bills as were calculated to afford effectual commercial relief to the people of Ireland. Laws were accordingly paſſed, by which all thoſe acts were repealed, which had prohibited the exportation of wollen manufactures from Ireland, and other acts by which the trade of that kingdom to foreign countries had been reſtrained: and it was likewiſe enacted, that a trade between Ireland and the Britiſh colonies in America, and the Weſt Indies, and the Britiſh ſettlements on the coaſts of Africa, ſhould be allowed to be carried on in the ſame manner, and ſubject to ſimilar regulations and reſtrictions, with that carried on between Great Britain and the ſaid colonies and ſettlements.

Theſe laws in favour of Ireland were received with much joy and exultation in that kingdom: and the Iriſh nation being indulged in their requiſitions reſpecting trade, now began alſo to aim at important conſtitutional reformations: and in various counties and cities of Ireland, the right of the Britiſh parliament to make laws which ſhould bind that kingdom was denied in public reſolutions. By degrees, the ſpirit which had been manifeſted by the Iriſh parliament ſeemed a little to ſubſide; and a remarkable inſtance of this was, their agreeing to a perpetual mutiny bill, for the regulation of the Iriſh army, though that of England had always been paſſed, with a true conſtitutional caution, only from year to year. This was much exclaimed againſt by ſome of the Iriſh patriots; and it is indeed not eaſy to clear their parliament from the charge of inconſiſtency: but this bill was afterwards repealed, and the commercial advantages offered them by late acts in their favour, have greatly contributed to promote the proſperity of Ireland. As before obſerved, by the act repealing the ſtatute of the 6th of George I. they are now fully and completely emancipated from the juriſdiction of the Britiſh parliament. The appellant juriſdiction of the Britiſh houſe of peers in Iriſh cauſes was alſo given up, and the political connection which ſo long ſubſiſted between the two nations is now reduced to this one circumſtance, that both being governed by the ſame king, Ireland is neceſſarily ſubject to the imperial crown of Great Britain. But though the Iriſh have obtained ſo great an extenſion of their liberties, it is very queſtionable whether it will terminate to their country's real advantage: their parties and diſſenſions increaſe, and it remains to eſtabliſh ſuch a commercial and political connection between the two kingdoms as will promote the intereſt and happineſs of both countries, and make them one great, ſtable, and invulnerable body.

Having brought down the hiſtory of this kingdom, as it ſtands connected with that of Great Britain, to the preſent year 1791; we ſhall only make a ſhort retroſpect to two or three other events of great publicity.

In the year 1783, the government, the nobility, and the people of Ireland, vied with each other in countenancing, and giving an aſſylum to many families of the Geneveſe, who were baniſhed from their city, and to others who voluntarily exiled themſelves for the cauſe of liberty, not willing to ſubmit to an ariſtocracy of their own citizens; ſupported by the ſwords of France and Sardinia. A large tract of land in the county of Waterford was allotted for their reception, a town was marked out, entitled *New Geneva*, and a ſum of money granted for erecting the neceſſary buildings. Theſe preparations for their accommodation were, however, rendered ultimately uſeleſs, by ſome miſunderſtandings, (not fully comprehended) which aroſe between the parties; and the ſcheme accordingly fell to the ground.

Upon the occaſion of the unhappy malady with which the king was afflicted, the lords and Commons of Ireland came to a reſolution to addreſs the prince of Wales, requeſting him to take upon him the government of that kingdom during his Majeſty's indiſpoſition, under the ſtyle and title of *Prince Regent* of *Ireland*, and to exerciſe and adminiſter, according to the laws and conſtitution of the realm, all the royal authorities, juriſdictions, and prerogatives, to the crown and government thereof belonging. The Marquis of Buckingham, being then lord lieutenant, having declined preſenting the addreſs, as contrary to his oath and the laws, the two houſes reſolved on appointing delegates from each: the lords appointed the duke of Leinſter, and the earl of Charlemont; and the commons, four of their members. The delegates proceeded to London, and preſented the addreſs to his royal highneſs, by whom they were moſt graciouſly received; but his majeſty having, to the infinite joy of all his ſubjects, recovered from his ſevere indiſpoſition, the prince returned them an anſwer fraught with the warmeſt ſentiments of regard for the kingdom, and of gratitude to parliament, for the generous manner in which they propoſed inveſting him with the Regency, but, that the happy recovery of his royal father had now rendered his acceptance of it unneceſſary.

FRANCE.

HAVING gone over the kingdom of Ireland, we ſhall now return to the continent, beginning with the extenſive and mighty kingdom of France, being the neareſt to England; though part of Germany and Poland lies to the northward of France.

Extent and Situation.

	Miles.		Degrees.
Length	600	between	5 Weſt and 8 Eaſt longitude.
Breadth	500		42 and 51 North latitude.

Boundaries.] It is bounded by the Engliſh channel and the Netherlands, on the North; by Germany, Switzerland, and Italy, Eaſt; by the Mediterranean and the Pyrenean mountains, which divide it from Spain, South; and by the Bay of Biſcay, Weſt.

Diviſions.

DIVISIONS.] This kingdom is divided, and the dimenſions of the ſeveral parts diſtinctly ſpecified in the following table, by Mr. Templeman.

France.	Countries Names,	Square Miles.	Length.	Breadth.	Chief Cities.
Papiſts -	Orleannois - -	22,950	230	180	Orleans.
	Guienne - -	12,800	216	120	Bourdeaux.
	Gaſcoigne - -	8,800	125	90	Aux, or Augh.
	Languedoc - -	13,175	200	115	Thouloufe.
	Lyonnois - -	12,500	175	130	Lyons.
	Champagne - -	10,000	140	110	Rheims.
	Bretagne - -	9,100	170	105	Rennes.
	Normandy - -	8,200	155	85	Rouen.
	Provence - -	6,800	95	92	Aix.
	Burgundy - -	6,700	150	86	Dijon.
	Dauphine - -	5,820	107	90	Grenoble.
	Iſle of France -	5,200	100	85	PARIS { N. Lat. 48-50. E. Lon. 2-25.
	Franche Comte -	4,000	100	60	Beſançon.
	Picardy - -	3,650	120	87	Amiens.
	Rouſillon - -	1,400	50	44	Perpignan.
Netherlands	Artois - -	990	63	32	Arras.
	Hainault - -	800	57	22	Valenciennes.
	Flanders - -	760	58	22	Liſle
	Luxemburg - -	292	48	13	Thionville.
Germany	Lorrain - -	2,500	—	—	Metz.
	Alſace - -	2,250	95	30	Straſburgh.
	Total	138,687			

To theſe is to be added the iſland of Corſica; but the city of Avignon, with the Venaiſſin, was in 1774 ceded to the pope.

The kingdom of France has alſo been ſubdivided in the following manner:

Prov. Parts	Subdivions.	Chief Towns.	Port Towns.
Picardy, Higher	Amienois	Amiens	Calais, &c.
	Tierache	Guiſe	
	Vermandois	St. Quintin	
	Santerae	Peronne	
Picardy, Lower	Ponthieu	Abbeville	
	Boulonois	Boulogne	
	Ardres	Ardre	
	Reconquered Country	Calais, Creſſy, Guiſnes.	

Prov.	Parts	Subdivisions.	Chief Towns	Port Towns
Normandy	Higher	Rouenois	Rouen	Dieppe, Havre-de-Grace, Harfleur, Cherburg, Honfleur.
		Paix Caux	Gaudebec	
		Evereux	Evreux	
		Bray	Gourny	
	Lower	Caen	Caen	
		Lifieux	Lifieux	
		Bayeux	Bayeux	
		Goutantin	Countance	
		Averanches	Avranche	
		Seez	Seez	
		Alenfon	Alenfon	

Iſlands—Guernſey, Jerſey, and Alderney, ſubject to Great Britain.

Towns from whence Engliſh Noblemen take their titles, viz. Aumale or Albemarle, and Granville.

Iſle of France	S. W. N. E. of the Seine	Iſle of France Proper	Paris	
		Valois	Senlis, Creſpy	
		Vexin François	Pontoiſe	
		Beauvoiſin	Beauvois	
		Soiſſons	Soiſſons	
		Laonois	Laon	
		Brie	Meaux, Lagny	
		Haurepoix	Melun	
	S. W.	Mantois	Mants	
		Ganenois, Part	Nemours	

Palaces—Verſailles, Marli, Fontainbleau, and St. Germains.

Champagne	Lower	Champagne Proper	Troyes	
		Sennois	Sens	
		Baſſigni	Langres	
		Brie Champenois	Provins	
	Upper	Rhemois	Rhemes	
		Rethelois	Rethel	
		High Champagne, or Perthois	St. Dix	
		Chalonois	Chalons	
		Valage	Jomvis	

Bretagne	Higher	Rennes	Rennes	Morlaix, Port Louis, or Blavet, Port L'Orient, Breſt.
		Nantois	Nants	
		Brieux	Brieux	
		St. Malo	St. Malo	
		Dole	Dole	
	Lower	Vannes	Vannes	
		Triguer	Triguer	
		St. Pol de Leon	Breſt	
		Quimper Corentin	Quimper	

Iſlands——Uſhant, Belleiſle, and Port Mourtier.

Prov.	Parts	Subdivisions.	Chief Towns.	Port Towns.
Orleannois	On the Loire, N. of Loire	Orleannois Proper	Orleans	
		Blaſois	Blois	
		Tourain	Tours	
		Anjou	Augers	
			Beaufort, from whence the Duke of Beaufort takes his title	
		Nivernois	Nivers	
		Maine	Mans

			Bigorre	Terbe	
			Conſerans	St. Lizir.	

NAME AND CLIMATE.] France took its name from the Francs, or *Freemen*, a German nation, reſtleſs and enterpriſing, who conquered the Gauls, the ancient inhabitants; and the Roman force not being able to repreſs them, they were permitted to ſettle in the country by treaty. By its ſituation, it is the moſt compact kingdom perhaps in the world, and well fitted for every purpoſe both of power and commerce; and ſince the beginning of the 15th century, the inhabitants have availed themſelves of many of their natural advantages. The air, particularly that of the interior parts of the kingdom, is, in general, mild and wholeſome; but ſome late authors think it is not nearly ſo ſalubrious as is pretended; and it muſt be acknowledged, that the French have been but too ſucceſsful in giving the inhabitants of Great Britain falſe prepoſſeſſions in favour of their own country. It muſt indeed be owned, that their weather is more clear and ſettled than in England. In the northern provinces, however, the winters are more intenſely cold, and the inhabitants not ſo well ſupplied with firing, which in France is chiefly of wood.

SOIL AND WATER.] France is happy in an excellent ſoil, which produces corn, wine, oil, and almoſt every luxury of life. Some of their fruits have a higher fla-

vour

vour than thoſe of England, but neither the paſturage nor tillage are comparable to ours. The heats in many parts parch the ground, and deſtroy the verdure, and the ſoil barely produces as much rye and cheſnuts as ſerve to ſubſiſt the poor inhabitants; but the chief misfortune attending the French ſoil is, that the inhabitants having been uncertain of enjoying the full fruits of their labour, have not applied themſelves ſufficiently to agriculture.*

The French have of late endeavoured to ſupply the loſs ariſing from their precarious title to their lands by inſtituting academies of agriculture, and propoſed premiums for its improvements, as in England; but thoſe expedients, however ſucceſsful they may be in particular inſtances, can never become of general utility in any but a free country, where the huſbandman is ſure of enjoying the fruit of his labour. No nation is better ſupplied than France is with wholeſome ſprings and water; of which the inhabitants make excellent uſe, by the help of art and engines, for all the conveniences of life. Of their canals and mineral waters diſtinct notice will be hereafter taken.

MOUNTAINS.] The chief mountains in France, or its borders, are, the Alps, which divide France from Italy; the Pyrenees, which divide France from Spain; Vauge, which divide Lorraine from Burgundy and Alſace; Mount Jura, which divides Franche Compte from Switzerland; the Cevennes, in the province of Languedoc; and Mount Dor, in the province of Auvergne.

RIVERS AND LAKES.] The principal rivers in France are the Loire, the Rhone, the Garonne, and the Seine. The Loire takes its courſe north and north-weſt, being with all its windings, from its ſource to the ſea, computed to run about 500 miles. The Rhone flows on the ſouth-weſt to Lyons, and then runs on due ſouth till it falls into the Mediterranean. The Garonne riſes in the Pyrenean mountains, takes its courſe, firſt north-eaſt, and has a communication with the Mediterranean by means of a canal, the work of Lewis XIV. The Seine, ſoon after its riſe, runs to the north-weſt, viſiting Troyes, Paris, and Rouen, in its way, and falls into the Engliſh channel at Havre. To theſe we may add, the Soane, which falls into the Rhone at Lyons; the Charente, which riſes near Havre de Grace, and diſcharges itſelf into the bay of Biſcay at Rochfort. The Rhine, which riſes in Switzerland is the eaſtern boundary between France and Germany, and receives the Moſelle and the Sarte in its paſſage. The Somme which runs north-weſt through Picardy, and falls into the Engliſh channel below Abbeville. The Var, which riſes in the Alps, and runs ſouth, dividing France from Italy, and falling into the Mediterranean, weſt of Nice. The Adour runs from eaſt to weſt, through Gaſcoigne, and falls into the bay of Biſcay, below Bayonne.

The vaſt advantage, both in commerce and conveniency, which ariſes to France from thoſe rivers, is wonderfully improved by the artificial rivers and canals which form the chief glory of the reign of Lewis XIV. That of Languedoc was begun in the year 1666, and completed in 1680: it was intended for a communication between the ocean and the Mediterranean, for the ſpeedier paſſage of the French fleet; but though it was carried on at an immenſe expence, for 100 miles, over hills and vallies, and even through a mountain in one place, it has not anſwered the end in view. By the canal of Calais, travellers eaſily paſs by water from thence to St. Omer, Graveline, Dunkirk, Ypres, and other places. The canal of Orleans is another noble work, and runs a courſe of eighteen leagues, to the immenſe benefit of the public and the royal revenue. France abounds with other canals of the like kind, which render her inland navigation inexpreſſibly commodious and beneficial.

* It is computed that of this extenſive kingdom, only 36 millions [redacted] are cultivated.

Few

Few lakes are found in this country. There is one at the top of a hill near Alegre, which the vulgar report to be bottomleſs. There is another at Iſſoire, in Auvergne; and one at La Beſſe, in which if you throw a ſtone, it cauſes a noiſe like thunder.

MINERAL WATERS AND REMARKABLE SPRINGS.] The waters of Bareges, which lie near the borders of Spain, under the Pyrenean mountains, have of late been preferred for ſalubrity to all others in France. The beſt judges think, however, that the cures performed by them, are more owing to their accidental ſucceſs, with ſome great perſons, and the dryneſs of the air and ſoil, than to the virtue of the waters. The waters of Sultzbach in Alſace are ſaid to cure the palſy, weak nerves, and the ſtone. At Bagueiis, not far from Bareges, are ſeveral wholſome minerals and baths, to which people reſort, as to the Engliſh baths, at ſpring and autumn. Forges, in Normandy, is celebrated for its mineral waters; and thoſe of St. Amand cure the gravel and obſtructions. It would be endleſs to enumerate all the other real or pretended mineral wells in France, as well as many remarkable ſprings: but there is one near Aigne in Auvergne, which boils violently, and makes a noiſe like water thrown upon lime; it has little or no taſte, yet poſſeſſes a poiſonous quality, and the birds that drink of it die inſtantly.

METALS AND MINERALS.] Languedoc is ſaid to contain veins of gold and ſilver. Alſace has mines of ſilver and copper, but they are too expenſive to be wrought. Alabaſter, black marble, jaſper and coal, are found in many parts of the kingdom. Bretagne abounds in mines of iron, copper, tin, and lead. At Laverdau, in Cominges, there is a mine of chalk. At Berry there is a mine of Oker, which ſerves for melting of metals, and for dying, particularly the beſt drab-cloths; and in the province of Anjou are ſeveral quarries of fine white ſtone. Some excellent turquoiſes (the only gem that France produces) are found in Languedoc; and great care is taken to keep the mines of marble and free-ſtone open all over the kingdom.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND.] France abounds in excellent roots, and in all kinds of ſeaſoning and ſallads. The province of Gaſtenois produces great quantities of ſaffron, 1,600,000 acres are laid out in vineyards. The wines of Champagne, Burgundy, Gaſcony, Bourdeaux, and other provinces of France, are ſo well known, that they need only be mentioned. It is ſufficient to obſerve, that though they differ very ſenſibly in their taſte and properties, yet all of them are excellent, particularly thoſe of Champagne, Burgundy, Bourdeaux, Pontack, Hermitage, and Frontiniac; and there are few conſtitutions, be they ever ſo valetudinary, to which ſome one or other of them is not adapted. Oak, elm, aſh, and other timber, common in England, is found in France; but it is ſaid, that the internal parts of the kingdom begin to feel the want of fuel. A great deal of ſalt is made at Rhee, and about Rochfort, on the coaſt of Saintoign. Languedoc produces an herb called kali, which, when burnt, makes excellent barilla, or pot-aſhes. The French formerly were famous for horticulture, but they are at preſent far inferior to the Engliſh both in the management and diſpoſition of their gardens. Prunes and capers are produced at Bourdeaux and near Toulon.

France contains few animals, either wild or tame, that are not to be found in England, except wolves. Their horſes, black cattle, and ſheep, are far inferior to the Engliſh; nor is the wool of their ſheep ſo fine. The hair and ſkins of the chamois, or mountain goats, are very valuable. We know of no difference between the marine productions of France and thoſe of England, but that the former is not ſo well ſerved, even on the ſea-coaſts, with ſalt water fiſh.

FORESTS.] The chief foreſts of France, are thoſe of Orleans, which contain 14,000 acres of wood of various kinds, oak, elm, aſh, &c. and the foreſt of Fontainbleau near as large; and near Morchiſmoir is a foreſt of tall, ſtraight timber, of 4000 trees. Beſides theſe, large numbers of woods, ſome of them deſerving the name of foreſts, lie in different provinces; but too remote from ſea-carriage to be of much national utility.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS.] According to the lateſt and beſt calculations, France contains at preſent about 24,000,000 of inhabitants. It was lately ſuppoſed by ſome ſpeculative men, that the population of France had for many years been upon the decline: but, upon an accurate inveſtigation, the reverſe appeared to be the fact; though this country certainly loſt a great number of valuable inhabitants by the revocation of the edict of Nantes*.

The French, in their perſons, are rather lower than their neighbours; but they are well proportioned and active, and more free than other nations in general from bodily deformities. The ladies are celebrated more for their ſprightly wit than perſonal beauty; the peaſantry in general are remarkably ordinary, and are beſt deſcribed by being contraſted with thoſe of the ſame rank in England. The nobility and gentry accompliſh themſelves in the academical exerciſes of dancing, fencing, and riding; in the practice of which they excel all their neighbours in ſkill and gracefulneſs. They are fond of hunting; and the gentry have now left off their heavy jack-boots, their huge war-ſaddle, and monſtrous curb-bridle in that exerciſe, and accomodate themſelves to the Engliſh manner. The land-owners were (till of late) as jealous of their game as they are in England, and equally niggardly of it to their inferiors. A few of the French princes of the blood, and nobility, are more magnificent in their palaces and equipages than any of the Engliſh; but the other ranks of life loſe by a compariſon with the riches, elegance, and opulence of the middling ranks in England.

The genius and manners of the French are well known, and have been the ſubject of many able pens. A national vanity is their predominant foible; and they are perhaps the only people who have derived great utility from this weakneſs. It confirms their ſenſe of honour, ſupports them under misfortunes, and impels them to actions to which true courage inſpires other nations. This character, however, is conſpicuous only in the higher and middling ranks, where it produces excellent officers; for the common ſoldiers of France have few or no ideas of heroiſm. Hence it has been obſerved, with great juſtice, of the French and Engliſh, that the French officers will lead if their ſoldiers will follow, and the Engliſh ſoldiers will follow if their officers will lead. This ſame principle of vanity is of admirable uſe to government, becauſe the lower ranks, when they ſee their ſuperiors elated, as in the war of 1756 with England, under the moſt diſgraceful loſſes never think that they are unfortunate; and from thence proceeds the paſſive ſubmiſſion of the French under all their calamities.

This lively people affect freedom and wit; but faſhionable dreſſes and diverſions engroſs too much of their converſation. Their diverſions are much the ſame with thoſe of the Engliſh, but their gallantry is of a very different complexion. Their attention to the fair degenerates into groſs foppery in the men, and in the ladies

* In the year 1598, Henry IV. who was a Proteſtant, and juſtly ſtyled the Great, after fighting his way to the crown of France, paſſed the famous edict of Nantes, which ſecured to the proteſtants the free exerciſe of their religion; but this edict was revoked by Lewis XIV. which, with the ſucceeding perſecutions, drove that people to England, Holland, and other Proteſtant countries, where they eſtabliſhed the ſilk manufacture, to the great prejudice of the country that perſecuted them.

it is ſometimes kept up by admitting of indecent freedoms; but the ſeeming levities of both ſexes are ſeldom attended with that criminality which, to people not uſed to their manners, they ſeem to indicate; nor are the huſbands ſo indifferent, as ſtrangers are apt to imagine, about the conduct of their wives. The French are exceſſively credulous and litigious; but of all people in the world they bear adverſity and reduction of circumſtances with the beſt grace; though in proſperity many of them are apt to be inſolent, vain, arbitrary, and imperious. An old French officer is an entertaining and inſtructive companion, and indeed the moſt rational ſpecies of all the French gentry.

The French are eminently diſtinguiſhed for their politeneſs and good manners, which may be traced, though in different proportions, through every rank, from the greateſt of the nobility to the loweſt mechanic: and it has been remarked as a very ſingular phænomenon, that politeneſs, which in every other country is confined to people of a certain rank in life, ſhould here pervade every ſituation and profeſſion. Indeed, the poliſhed mildneſs of French manners, the gay and ſociable turn of the nation, and the affable and eaſy conduct of maſters to their ſervants, in ſome degree ſupplied the deficiencies, and corrected the errors of their late government and rendered the condition of the common people in France, but particularly at Paris, better than in ſeveral other countries in Europe. The French have been much cenſured for inſincerity; but this charge has been carried too far, and the imputation is generally owing to their exceſs of civility, which throws a ſuſpicious light upon their candour. The French, in private life, have certainly many amiable characters, and a great number of inſtances of generoſity and diſintereſtedneſs may be found amongſt them.

It is doing the French no more than juſtice to acknowledge, that, as they are themſelves polite, ſo they have given a poliſh to the ferocious manners, and even the virtues of other nations. They have long poſſeſſed the lead in taſte, faſhion, and dreſs; but it ſeems now to be in the wane, and they themſelves think very favourably of the Engliſh. This alteration of opinion has not, however, entirely taken its riſe from their wits and learned men, and ſtill leſs from their courtiers, or the middle ranks of life. The ſuperior orders of men in France are of a very different caſt from thoſe below them. They ſee with indignation the frivolouſneſs of their court; and, however complying they may appear in public, when retired they keep themſelves ſacred from its follies. Independent by their rank and fortunes, they think and act for themſelves. They are open to conviction, and examine things to the bottom. They ſaw during the war before the laſt, the management of their armies, their finances, and fleets, with ſilent indignation, and their reſearches were favourable to the Engliſh. The concluſion of the peace of Fontainbleau, and the viſits which they have ſince paid to England, have improved that good opinion; the courtiers themſelves have fallen in with it; and, what ſome years ago would have been thought incredible, people of faſhion in France now ſtudy the Engliſh language, and imitate them in their cuſtoms, amuſements, dreſs, and buildings. They imitate and admire our writers; the names of Bacon, Locke, Newton, Milton, Pope, Addiſon, Hume, Robertſon, Richardſon, and many others of the laſt and preſent century, are ſacred among the French of any education; and, to ſay the truth, the writings of ſuch men have equally contributed, with our military reputation, to raiſe the name of Great Britain to that degree in which it has been held of late by foreign nations; and to render our language more univerſal, and even a neceſſary ſtudy among foreign nobility. But we cannot quit this article of the manners and cuſtoms of the French, without giving a more minute view of ſome ſtriking peculiarities among that whim-

cal people in private life, and this from the remarks of a late ingenious traveller, who was alſo diſtinguiſhed by various other productions in polite literature.

" The natural levity of the French, ſays Smollet, is reinforced by the moſt prepoſterous education, and the example of a giddy people, engaged in the moſt frivolous purſuits. A Frenchman is by ſome prieſt or monk taught to read his mother tongue, and to ſay his prayers in a language he does not underſtand. He learns to dance and to fence by the maſters of thoſe ſciences. He becomes a complete connoiſſeur in dreſſing hair, and in adorning his own perſon, under the hand and inſtructions of his barber and valet-de-chambre. If he learns to play upon the flute or the fiddle, he is altogether irreſiſtible. But he piques himſelf upon being poliſhed above the natives of any other country by his converſation with the fair ſex. In the courſe of this communication, with which he is indulged from his tender years, he learns like a parrot, by rote, the whole circle of French compliments, which are a ſet of phraſes, ridiculous even to a proverb; and theſe he throws out indiſcriminately to all women without diſtinction, in the exerciſe of that kind of addreſs which is here diſtinguiſhed by the name of gallantry. It is an exerciſe, by the repetition of which he becomes very pert, very familiar, and very impertinent. A Frenchman, in conſequence of his mingling with the females from his infancy, not only becomes acquainted with all their cuſtoms and humours, but grows wonderfully alert in performing a thouſand little offices, which are overlooked by other men, whoſe time hath been ſpent in making more valuable acquiſitions. He enters, without ceremony, a lady's bed-chamber while ſhe is in bed, reaches her whatever ſhe wants, airs her ſhift, and helps to put it on. He attends at her toilette, regulates the diſtribution of her patches, and adviſes where to lay on the paint. If he viſits her when ſhe is dreſſed, and perceives the leaſt impropriety in her coiffure, he inſiſts upon adjuſting it with his own hands. If he ſees a curl, or even a ſingle hair amiſs, he produces his comb, his ſciſſars, and pomatum, and ſets it to rights with the dexterity of a profeſſed frizeur. He ſquires her to every place ſhe viſits, either on pleaſure or buſineſs; and, by dedicating his whole time to her, renders himſelf neceſſary to her occaſions. In ſhort, of all the coxcombs on the face of the earth, a French *petit-maître* is the moſt impertinent; and they are all *petits-maîtres*, from the marquis who glitters in lace and embroidery, to the *garçon barbier* (barber's boy) covered with meal, who ſtruts with his hair in a long queue, and his hat under his arm.

" A Frenchman will ſooner part with his religion than his hair. Even the ſoldiers in France wear a long queue; and this ridiculous foppery has deſcended, as I ſaid before, to the loweſt claſs of people. The boy who cleans ſhoes at the corner of a ſtreet, has a tail of this kind hanging down to his rump; and the beggar who drives an aſs, wears his hair *en queue*, though, perhaps, he has neither ſhirt nor breeches.

" I ſhall only mention one cuſtom more, which ſeems to carry human affectation to the very fartheſt verge of folly and extravagance: that is, the manner in which the faces of the ladies are primed and painted. It is generally ſuppoſed, that part of the fair ſex, in ſome other countries, make uſe of *fard* and vermillion for very different purpoſes; namely, to help a bad or faded complexion, to heighten the graces, or conceal the defects of nature, as well as the ravages of time. I ſhall not enquire whether it is juſt and honeſt to impoſe in this manner on mankind; if it is nor honeſt, it may be allowed to be artful and politic, and ſhews at leaſt a deſire of being agreeable. But to lay it on, as the faſhion in France preſcribes to all the ladies of condition, who indeed cannot appear without this badge of diſtinction, is to diſguiſe themſelves in ſuch a manner, as to render them odious and deteſtable to every ſpectator who has the leaſt reliſh left for nature and propriety. As for the

ſard, or *white*, with which their necks and ſhoulders are plaiſtered, it may be in ſome meaſure excuſable, as their ſkins are naturally brown, or ſallow; but the *rouge*, which is daubed on their faces, from the chin up to the eyes, without the leaſt art or dexterity, not only deſtroys all diſtinction of features, but renders the aſpect really frightful, or at leaſt conveys nothing but the idea of diſguſt and averſion. Without this horrible maſk, no married lady is admitted at court, or in any polite aſſembly; and it is a mark of diſtinction which none of the lower claſſes dare aſſume."

The above picture of French manners is drawn with wit and ſpirit, and is in ſome reſpects highly characteriſtic; but it is certainly not a flattering portrait, and the faults and failings of this vivacious people are too much magnified. With all their defects, the French have many good qualities, and their country affords a very agreeable reſidence on account of the great attention they pay to ſtrangers, and the general taſte for literature which prevails among thoſe in the better ranks of life. The French literati have great influence even in the gay and diſſipated city of Paris. Their opinions not only determine the merit of works of taſte and ſcience, but they have conſiderable weight with reſpect to the manners and ſentiments of people of rank, and of the public in general, and conſequently are not without effect in the meaſures of government.

DRESS.] The French dreſs of both ſexes is ſo well known, that it is needleſs to expatiate upon them here; but, indeed, their dreſs in cities and towns is ſo variable, that it is next to impoſſible to deſcribe it. They certainly have more invention in that particular than any of their neighbours, and their conſtantly changing their faſhions is of infinite ſervice to their manufactures. With regard to dreſs, they poſſeſs one capital ſuperiority, which is, that the cloaths of both ſexes, and their ornaments, are at leaſt one-third cheaper, than in England.

When a ſtranger arrives in Paris, he finds it neceſſary to ſend for a taylor, perruquier, hatter, ſhoemaker, and every other tradeſman concerned in the equipment of the human body. He muſt even change his buckles, and the form of his ruffles; and, though at the riſk of his life, ſuit his cloaths to the mode of the ſeaſon. For example, though the weather ſhould be ever ſo cold, he muſt wear his *habit d'été*, or *demi-ſaiſon*, without preſuming to put on a warm dreſs before the day which faſhion has fixed for that purpoſe; and neither old age nor infirmity will excuſe a man for wearing his hat upon his head, either at home or abroad. Females are, if poſſible, ſtill more ſubject to the caprices of faſhion. All their ſacks and negligees muſt be altered and new trimmed. They muſt have new caps, new laces, new ſhoes, and their hair new cut. They muſt have their taffeties for the ſummer, their flowered ſilks for the ſpring and autumn, their ſattins and damaſks for winter. The men too muſt provide themſelves with a camblet ſuit trimmed with ſilver for ſpring and autumn, with ſilk cloaths for ſummer, and cloth laced with gold, or velvet for winter; and he muſt wear his bag-wig *à la pigeon*. This variety of dreſs is indiſpenſable for all thoſe who pretend to any rank above the mere vulgar; all ranks, from the king downwards, uſe powder, and even the rabble, according to their abilities, imitate their ſuperiors in the fopperies of faſhion. The common people of the country, however, ſtill retain without any material deviation, the old-faſhioned mode of dreſs, the large hat and moſt enormous jack-boots, with ſuitable ſpurs; and this contraſt is even perceivable a few miles from Paris. In large cities, the clergy, lawyers, phyſicians, and merchants, generally dreſs in black; and it has been obſerved, that the French nation, in their modes of dreſs, are in ſome meaſure governed by commercial circumſtances.

RELIGION.] The religion of France is Roman Catholic, in which their kings have been ſo conſtant, that they have obtained the title of Moſt Chriſtian; and the

pope, in his bull, gives the king of France the title of Eldeſt Son of the Church. The Gallican church has more than once attempted to ſhake off the yoke of the popes, and made a very great progreſs in the attempt during the reign of Lewis XIV. but it was defeated by the ſecret bigotry of that prince, who, while he was bullying the pope, was inwardly trembling under the power of the Jeſuits; an order now univerſally aboliſhed. Every endeavour, which they made to get free from the papal power failed of ſucceſs until the late revolution. It is, nevertheleſs, very difficult to ſay at preſent how religious matters ſtand in that country, as the affairs of the nation are not yet thoroughly ſettled. In the ſouthern parts of France, the perſecutions of the proteſtants, or, as they are called, Hugonots, who are very numerous in thoſe provinces, continued till very lately. Since their alliance with America, the proteſtants have been more encouraged, and their aſſemblies for worſhip in many places not diſturbed. We ſhall not enter into the antiquated diſputes between the Moliniſts and the Janſeniſts, or the different ſects of Quietiſts and Bourignons, and others that prevail among the Roman Catholics themſelves, or into the diſputes that prevail between the parliament and clergy about the bull Unigenitus, which advances the pope's power above that of the crown. The ſtate of religion in France previous to the late revolution is a ſtrong proof of the paſſive diſpoſition of the natives, and the bigotry of their kings, who, in complaiſance to the pope, have deprived their kingdom, as already hinted, of ſome of its moſt uſeful inhabitants. It muſt at the ſame time be owned, that the Hugonots, while they ſubſiſted in a manner as a ſeparate ſtate within France, ſhewed ſome diſpoſitions not very favourable to that deſpotic ſyſtem of government which, till very lately, was eſtabliſhed in the kingdom; and on ſome occaſions they did not diſplay much moderation in matters of religion; but, in general, their oppoſition to the rulers and court, proceeded from repeated attacks on their liberties, and the perſecutions they ſuffered.

ARCHBISHOPRICKS, BISHOPRICKS, &c.] In the whole kingdom there are 17 archbiſhops, 113 biſhops, 770 abbies for men, 317 abbies and priories for women, beſides a great number of leſſer convents, and 250 commanderies of the order of Malta. A propoſal, however, was made during the late revolution, for ſuppreſſing all the religious houſes, ſo that it is difficult now to ſay any thing concerning them. The eccleſiaſtics of all ſorts were computed at near 200,000, and their revenues at about ſix millions ſterling. The king had the power of nominating all archbiſhops, biſhops, abbots, and priors, and could tax the clergy without a papal licence or mandate: accordingly, not many years ſince, he demanded the twentieth penny of the clergy, and, to aſcertain that, required them to deliver in an inventory of their eſtates and incomes; to avoid which they voluntarily made an offer of the annual ſum of twelve milions of livres, over and above the uſual free gift, which they paid every five years. This demand was often repeated in a time of war.

The archbiſhop of Lyons was count and primate of France. The archbiſhop of Sens had the title of primate of France and Germany. The archbiſhop or Paris was duke and peer of the realm; and the archbiſhop of Rheims, duke and peer, and legate of the holy ſee: but as all titles are now aboliſhed, ſo conſequently are thoſe of theſe dignitaries of the church.

LANGUAGE.] One of the wiſeſt meaſures of Lewis XIV. was his encouragement of every propoſal that tended to the purity and perfection of the French language. He ſucceeded ſo far as to render it the moſt univerſal of all the living tongues; a circumſtance that contributed equally to his greatneſs and his glory, for his court and nation thereby became the ſchool of arts, ſciences, and politeneſs. The French language, at preſent, is chiefly compoſed of words radically derived from the Latin, with many German derivatives introduced by the Franks. It is now rather on the decay; its corner ſtones, fixed under Lewis XIV. are as it were looſen-

ed; and in the preſent mode of writing, and expreſſing themſelves, the modern French too often abandon that grammatical ſtandard, which alone can render a language claſſical and permanent.

As to the properties of the language, it wants the dignity and energy of the Engliſh, but is well adapted to ſubjects void of elevation or paſſion, and well accommodated to dalliance, compliments, and common converſation.

The Lord's Prayer in French is as follows; *Nôtre Pére qui es aux cieux, ton nom ſoit ſanctifié. Ton regne vienne. Ta volonté ſoit faite en la terre comme au ciel. Donne nous aujourd'hui notre pain quotidien. Pardonne nous nos offences, comme nous pardonnons à ceux qui nous ont offencez. Et ne nous indui point en tentation, mais nous delivre du mal: car à toi eſt le regne, la puiſſancè, & la gloire aux ſiécles des ſiécles.* Amen.

LEARING AND LEARNED MEN.] The French, like the other nations of Europe, were for many centuries immerſed in barbarity. The firſt learning they began to acquire was not of that kind which improves the underſtanding, corrects the taſte, or regulates the affections. It conſiſted in a ſubtile and quibbling logic, which was more adapted to pervert than to improve the faculties. But the ſtudy of the Greek and Roman writers, which firſt aroſe in Italy, diffuſed itſelf among the French, and gave a new turn to their literary purſuits. This, together with the encouragement which the polite and learned Francis I. gave to all men of merit, was extremely beneficial to French literature. During this reign, many learned men appeared in France, who greatly diſtinguiſhed themſelves by their writings; among whom were Budeus, Clement Marot, Peter du Chatel, Rabelais, and Peter Ramus. The names of Henry and Robert Stephens are alſo mentioned by every real ſcholar with reſpect. It was not, however, till the ſeventeeth century, that the French began to write with elegance in their own language. The Academie Françoiſe was formed for promoting this purpoſe; and though their labours, conſidered as a body, were not ſo ſucceſsful as might have been expected, ſome particular academicians have done great ſervice to letters. In fact, literary copartnerſhips are ſeldom very ſucceſsful. Of this we have a remarkable inſtance in the preſent caſe. The academy publiſhed a dictionary for improving the French language: it was generally condemned. Furetieres, a ſingle academician, publiſhes another: it meets with univerſal approbation.

Lewis XIV. was the Auguſtus of France. The protection he gave to letters, and the penſions he beſtowed on learned men, both at home and abroad, which, by calculation, did not amount to above 12,000l. per annum, have gained him more glory than all the military enterpriſes upon which he expended ſo many millions. The learned men who appeared in France during this reign are too numerous to be mentioned. The tragic poets, Racine and Corneille, have deſervedly obtained a very high reputation: the firſt was diſtinguiſhed for his ſkill in moving the paſſions; the ſecond for majeſty; and both, for the ſtrength and juſtneſs of their painting, the elegance of their taſte, and their ſtrict adherence to the rules of the drama. Moliere would have exhauſted the ſubjects of comedy, were they not every where inexhauſtible, and particularly in France. In works of ſatire and in criticiſm, Boileau, who, was a cloſer imitator of the ancients, poſſeſſed uncommon merit. But France has not yet produced an epic poem that can be mentioned with Milton's; nor a genius of the ſame extenſive and univerſal kind with Shakſpeare, equally fitted for the gay and the ſerious, the humorous and the ſublime. In the eloquence of the pulpit and of the bar, the French are greatly our ſuperiors: Boſſuet, Bourdaloue, Flecheir, and Maſſillon, have carried pulpit eloquence to a degree of perfection which we may approach to, but can hardly be expected ever to ſurpaſs. The genius, however, of their religion and government, is extremely unfavourable to all improvements in the moſt uſeful branches of philoſophy. All the eſtabliſhments of Lewis XIV.

XIV. for the advancement of ſcience, were not able to counterbalance the influence of the clergy, whoſe intereſt it is to limit the enquiries of men in matters of religion and morality; and the influence of the court and miniſtry, who have an equal intereſt in concealing the natural rights of mankind, and every ſound principle of government. The French have not therefore ſo many good writers on moral, religious, or political ſubjects, as have appeared in Great Britain. But France has produced ſome great men who do honour to humanity; whoſe career no obſtacle could ſtop, whoſe freedom no government, however deſpotic, no religion, however ſuperſtitious, could curb or reſtrain. As an hiſtorian, De Thou is entitled to the higheſt praiſe: and who is ignorant of Paſcal, or of the archbiſhop of Cambray? Few men have done more ſervice to religion, either by their writings or their lives. As for Monteſquieu, he is an honour to human nature; he is the legiſlator of nations; his works are read in every country and language, and wherever they go, they enlighten and invigorate the human mind. And, indeed, ſeveral writers have lately appeared in France, whoſe writings breathe ſuch ſentiments of liberty as did but ill accord with an arbitrary government; ſentiments which have made rapid progreſs among men of letters, and perſons in the higher ranks of life, and which there can be no doubt have been one conſiderable cauſe in producing the late important revolution.

In the Belles Letters and miſcellaneous way, no nation ever produced more agreeable writers; among whom we may place Montaigne, D'Argens, and Voltaire, as the moſt conſiderable.

Before the immortal Newton appeared in England, Deſcartes was the greateſt philoſopher in modern times. He was the firſt who applied algebra to the ſolution of geometrical problems, which naturally paved the way to the analytical diſcoveries of Newton. Many eminent mathematicians have flouriſhed in the preſent age, particularly Clairaut, Bezout, and D'Alembert; the latter of whom, to the preciſion of a geometrician, has united the talents of a fine writer.

Since the beginning of the preſent century, the French have almoſt vied with the Engliſh in natural philoſophy. Buffon would deſerve to be reckoned among men of ſcience, were he not more remarkable for his eloquence than his philoſophy. He is to be regarded as a philoſophical painter of nature; and, under this view, his Natural Hiſtory is the firſt work of its kind.

Their painters, Pouſſin, Le Brun, and above all Le Sueur, did honour to the age of Lewis XIV. They have none at preſent to compare with them in the more noble kinds of painting; but Mr. Greuſe, for portraits and converſation-pieces, never perhaps was excelled.

Sculpture is in general better underſtood in France than in moſt other countries of Europe. Their engravings on copper plates have been univerſally and juſtly celebrated; but ſuch a liberal patronage has been afforded to Engliſh artiſts, that that they are now thought to excel their ingenious neighbours, and have rivalled them alſo in the manufacture of the paper proper for ſuch impreſſions. Their treatiſes on ſhip-building and engineering ſtand unrivalled; but in the practice of both they are outdone by the Engliſh. No genius has hitherto equalled Vauban in the theory or practice of fortification. The French were our ſuperiors in architecture; though we now bid fair for ſurpaſſing them in this art.

We ſhall conclude this head with obſerving, that the French have now new-modelled the Encyclopedia, or General Dictionary of Arts and Sciences, which was drawn up by the moſt able maſters in each branch of literature, in 28 volumes in folio (ſix of which are copper-plates), under the direction of Meſſieurs D'Alembert and Diderot, and is the moſt complete collection of human knowledge we are acquainted with.

UNIVERSITIES AND PUBLIC COLLEGES.] Theſe literary inſtitutions ſuſtained a conſiderable loſs by the expulſion of the Jeſuits, who made the languages, arts, and ſciences, their particular ſtudy, and taught them all over France; but as the extinction of this body of men will probably leſſen the influence of ſuperſtition in France, there is reaſon to believe that the intereſts of real learning and ſcience will, upon the whole, be promoted by that event. It is not within the plan of this work to deſcribe the different governments and conſtitutions of every univerſity or public college in France; but they are in number twenty-eight, as follow; Aix, Angiers, Arles, Avignon, Beſançon, Bourdeaux, Bourges, Caen, Cahors, Dol, Douay, La Fleche, Montauban, Montpellier, Nantes, Orange, Orleans, Paris, Perpignan, Poitiers, Point Mouſon, Richlieu, Rheims, Soiſſons, Straſbourg, Toulouſe, Tournoiſe, and Valence.

ACADEMIES.] There are eight academies in Paris, namely, three literary ones, the French Academy, that of Inſcriptions, and that of the Sciences: one of painting and ſculpture, one of architecture, and three for riding the great horſe, and other military exerciſes.

ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL.] Few countries, if we except Italy, can boaſt of more valuable remains of antiquity than France. Some of the French antiquities belong to the time of the Celts, and conſequently, compared to them, thoſe of Rome are modern. Father Mabillon has given us a moſt curious account of the ſepulchres of their kings, which have been diſcovered ſo far back as Pharamond; and ſome of them, when broke upon, were found to contain ornaments and jewels of value. At Rheims, and other parts of France, are to be ſeen triumphal arches; but the moſt entire is at Orange, erected on account of the victory obtained over the Cimbri and Teutones, by Caius Marius and Luctatius Catulus. After Gaul was reduced to a Roman province, the Romans took vaſt delight in adorning it with magnificent edifices, both civil and ſacred; ſome of which are more entire than any to be met with in Italy itſelf. The ruins of an amphitheatre are to be found in Chalons, and likewiſe at Vienna. Niſmes, however, exhibits the moſt valuable remains of ancient architecture of any place in France. The famous Pont du Garde was raiſed in the Auguſtan age by the Roman colony of Niſmes, to convey a ſtream of water between two mountains for the uſe of that city, and the building is freſh to this day; it conſiſts of three bridges, or tiers of arches one above another; the height is 174 feet, and the length extends to 723. The moderns are indebted for this, and many other ſtupendous aqueducts, to the ignorance of the ancients that all ſtreams will, when confined in pipes, riſe as high as the fountain from which they proceed. Many other ruins of antiquity are found at Niſmes; but the chief, are the temple of Diana; the amphitheatre, which is thought to be the fineſt and moſt entire of the kind of any in Europe; but above all, the houſe erected by the emperor Adrian, called the Maiſon Carreè. The architecture and ſculpture of this building are ſo exquiſitely beautiful, that it enchants even the moſt ignorant; and it is ſtill entire, being very little affected either by the ravages of time, or the havock of war. At Paris, in La Rue de la Harpe, may be ſeen the remains of a palace, or Thermæ, ſuppoſed to have been built by the emperor Julian, ſurnamed the Apoſtate, about the year 356, after the ſame model as the baths of Dioclefian. The remains of this ancient edifice conſiſt of many arches, and within them a large ſaloon. It is fabricated of a kind of maſtic, the compoſition of which is not now known, intermixed with ſmall ſquare pieces of free-ſtone and bricks.

At Arles in Provence is an obeliſk of oriental granite, 52 feet high, and ſeven feet diameter at the baſe, and all but one ſtone. Roman temples and aqueducts are frequent in France. The moſt remarkable are in Burgundy and Guienne. The

paſſage

paſſage cut through the middle of a rock near Briançon in Dauphiny, is thought to be a Roman work, if not of greater antiquity. The round buckler of maſſy ſilver, taken out of the Rhone in 1665, being twenty inches in diameter, and weighing twenty-one pounds, containing the ſtory of Scipio's continence, is thought to be coëval with that great general. It would be endleſs to recount the different monuments of antiquity to be found in France, particularly in the cabinets of the curious.

CITIES AND TOWNS.] Theſe are numerous; of which we ſhall mention only Paris, Liſle, and their principal ſea-ports, Breſt and Toulon.

Liſle, in French Flanders, is thought to be the moſt regular and ſtrongeſt fortification in Europe, and was the maſter-piece of the famous Vauban. It is generally garriſoned with above 10,000 regulars; and for its munificence and elegance, it is called Little Paris. Its manufactures of ſilk, cambric, and camblets, are very conſiderable; and its inhabitants amount to about 100,000. Every reader is acquainted with the hiſtory of Dunkirk, which the French were obliged by the treaty of Utrecht to demoliſh, but it is ſtill a thorn in the ſide of the Engliſh, by being a harbour for their ſmugglers, and may now, by an article in the late treaty of peace, be put into what condition the French miniſtry may pleaſe. The reſt of French Flanders, and its Netherlands, abound with fortified towns, which carry on very gainful manufactures.

Moving ſouthward, we come to the Iſle of France; the capital of which, and of the whole kingdom, is Paris. This city has been ſo often deſcribed, that it may appear ſuperfluous to mention it more particularly, were it not that the vanity of the French has given it a preference which it by no means deſerves, to all the capitals in the world, in every reſpect, not excepting even population. Many of the Engliſh have been impoſed upon in this point: particularly by the computing from the births and burials within the bills of mortality, which exclude the moſt populous pariſhes about London. Another miſtake lies in computing from births and marriages. The number of diſſenters of all kinds in and about London, who do not regiſter the births of their children, is very great; and many of the poorer ſort will not afford the ſmall expence of ſuch a regiſtration. Another peculiarity exiſting in London is, that moſt of the Londoners in affluent circumſtances, when they find themſelves conſumptive, or otherwiſe indiſpoſed, retire into the country, where they are buried, and thereby excluded from the bills of mortality. The population of Paris, therefore, where the regiſters are more exact and acceſſible to the poor, and where the religion and the police are more uniform and ſtrict, is far more eaſily aſcertained than that of London; and by the beſt accounts, it does not exceed 7 or 800,000, which is far ſhort of the inhabitants of London and the contiguous pariſhes.

Paris is divided into three parts; the city, the univerſity, and that which was formerly called the Town. The city is old Paris; the univerſity and the town are the new. Paris contains more works of public munificence than utility. Its palaces are ſhewy, and ſome of its ſtreets, ſquares, hotels, hoſpitals, and churches, ſuperbly decorated with a profuſion of paintings, tapeſtry, images, and ſtatues; but Paris, notwithſtanding its boaſted police, is greatly inferior to London in many of the conveniencies of life, and the ſolid enjoyments of ſociety. Without entering into more minute diſquiſitions, Paris, it muſt be owned, is the paradiſe of ſplendor and diſſipation. The tapeſtry of the Gobelines * is unequalled for beauty and richneſs. The Louvre is a building that does honour to architecture itſelf; and

* One *Goblei*, a noted dyer at Rheims, was the firſt who ſettled in this place, in the reign of Francis I. and the houſe has retained his name ever ſince; and here the great Colbert, about the year 1667, eſtabliſhed that valuable manufactory.

the

the inſtitution of the French academy far exceeds any thing of the kind in England, or elſewhere. The Tuilleries, the palace of Orleans, or, as it is called, Luxembourg, where a valuable collection of paintings are ſhewn, the royal palace, the king's library, the guild-hall, and the hoſpital for the invalids, are ſuperb to the higheſt degree. The city of Paris is ſaid to be fifteen miles in circumference. The hotels of the French nobleſſe at Paris take up a great deal of room with their court-yards and gardens; and ſo do their convents and churches. The ſtreets are very narrow, and the houſes very high, many of them ſeven ſtories. The houſes are built of ſtone, and are generally mean, even to wretchedneſs, owing partly to their containing a different family on every floor. The river Seine, which runs through the centre of the city, is not half ſo large as the Thames at London: it is too far diſtant from the ſea for the purpoſes of navigation, and furniſhed with boats only for the purpoſe of paſſing from one ſide of the river to the other, in places diſtant from the bridges. The ſtreets of Paris are generally crowded, particularly with coaches, which gives that capital the appearance of wealth and grandeur, though in reality there is more ſhow than ſubſtance. The glittering carriages that dazzle the eyes of ſtrangers are moſtly common hacks, hired by the day or week to the numerous foreigners who viſit that city; and in truth, the greateſt part of the trade of Paris ariſes from the conſtant ſucceſſion of ſtrangers that arrive daily from every nation and quarter of the globe. This aſcendancy over other nations is undoubtedly owing to the reputation of their language, their politeneſs and magnificence, their libraries, and collections of paintings, that are open to the public; the cheapneſs of proviſions, excellency of the French wines, and above all, the purity of the air and climate in France. With all theſe advantages, Paris, in general, will not bear a compariſon with London, in the more eſſential circumſtances of a thriving foreign and domeſtic trade, the cleanlineſs of their ſtreets, elegance of their houſes, eſpecially within; the plenty of water, and that of a better quality than the Seine, which it is ſaid diſagrees with ſtrangers, as do likewiſe their ſmall wines. In the houſes of Paris moſt of the floors are of brick, and have no other kind of cleaning than that of being ſprinkled with water, and ſwept once a day. Theſe brick floors, the ſtone ſtairs, the want of wainſcotting in the rooms, and the thick party-walls of ſtone, are, however, good preſervatives againſt fire, which ſeldom does any damage in this city. Inſtead of wainſcotting, the walls are covered with tapeſtry or damaſk. The beds in general are very good, and well ornamented with teſter and curtains; but bugs are here a moſt intolerable nuiſance, which frequently oblige ſtrangers to ſleep on the floor, during the exceſſive heat of the ſummer. Their ſhops are but poorly ſtored with goods; and the ſhop-keepers and tradeſmen, an indolent, loitering people, ſeldom make their appearance before dinner in any other than a morning dreſs, of velvet cap, ſilk night-gown, and Morocco ſlippers; but when they intend a viſit, or going abroad, all the punctilios of a courtier are attended to, and hardly the reſemblance of a man remains. There is a remarkable contraſt between this claſs of people and thoſe of the ſame rank in London. In Paris, the women pack up parcels, enter the orders, and do moſt of the drudgery buſineſs of the ſhop, while the huſband loiters about, talks of the great, of faſhions and diverſions, and the invincible force of their armies. The ſplendour of the grand monarque uſed alſo to be with them a favourite topic of converſation, previous to the change in their political ſyſtem. The Pariſians, however, as well as the natives of France in general, are remarkably temperate in their living; and to be intoxicated with liquor is conſidered as infamous. Bread, and all manner of butchers meat and poultry, are extremely good in Paris; the beef is excellent; the wine they generally drink, is a very thin kind of Burgundy. The common people, in the ſummer ſeaſon, live chiefly on bread, butter, grapes, and ſmall wine.

The

The Pariſians ſcarcely know the uſe of tea, but they have coffee in plenty. The police of Paris is ſo well attended to, that quarrels, accidents, or felonies, ſeldom happen; and ſtrangers, from all quarters of the globe, let their appearance be ever ſo uncommon, meet with the moſt polite treatment. The ſtreets are patrolled at night by horſe and foot; ſo judiciouſly ſtationed, that no offender can eſcape their vigilance. They likewiſe viſit the publicans preciſely at the hour of twelve at night to ſee that the company are gone; for in Paris no liquor can be had after that time. The public roads in France are under the ſame excellent regulation, which, with the torture of the rack, which was uſed till of late, prevented robberies in that kingdom; but for the ſame reaſon, when robberies did happen, they were always attended with the death of the unfortunate traveller; and indeed this is the general practice in every country of Europe, Great Britain excepted.

The environs of Paris are very pleaſant, and contain a number of fine ſeats, ſmall towns and villages; ſome of them, being ſcattered on the edges of lofty mountains riſing from the Seine, are remarkably delightful.

The palace of Verſailles, which ſtands twelve miles from Paris, though magnificent and expenſive beyond conception, and adorned with all that art can furniſh, is properly a collection of buildings, each of exquiſite architecture, but not forming a whole, agreeable to the grand and ſublime of that art. The gardens, and waterworks (which are ſupplied by means of prodigious engines acroſs the Seine at Marli, about three miles diſtance), are aſtoniſhing proofs of the fertile genius of man, and highly worthy of a ſtranger's attention. Trianon, Marli, St. Germain en Laye, Moudon, and other royal palaces, are laid out with taſte and judgment; each has its peculiar beauties for the entertainment and amuſement of a luxurious court; but ſome of them are in a ſhameful condition, both as to repairs and cleanlineſs.

Breſt is a ſmall, but very ſtrong town, upon the Engliſh channel, with a moſt ſpacious and fine fortified road and harbour, the beſt and ſafeſt in the kingdom; yet its entrance is difficult, by reaſon of many rocks lying under water. At Breſt is a court of admiralty, and academy for ſea-affairs, docks, and magazines for all kinds of naval ſtores, rope-yards, ſtore-houſes, &c. inſomuch that it may now be termed the capital receptacle for the navy-royal of France, and it is admirably well adapted for that end.

Lewis XIV. rendered Toulon, from a pitiful village, a ſea-port of great importance. He fortified both the town and harbour, for the reception and protection of the navy-royal. Its old and its new harbour lie contiguous; and by means of a canal, ſhips paſs from one to the other, both of them having an outlet into the ſpacious outer harbour. Its arſenal, eſtabliſhed alſo by that king, has a particular ſtorehouſe for each ſhip of war, its guns, cordage, &c. being ſeparately laid up. Here are ſpacious workſhops for blackſmiths, joiners, carpenters, lockſmiths, carvers, &c. Its rope-walk, of ſtone, is 320 toiſes or fathoms in length, with three arched walks. Its general magazine ſupplies whatever may be wanting in the particular ſtorehouſes, and contains an immenſe quantity of all kinds of ſtores, diſpoſed in the greateſt order.

COMMERCE AND MANUFACTURES.] Next to Henry IV. juſtly ſtyled the Great, the famous Colbert, miniſter to Lewis XIV. may be called the father of the French commerce and manufactures. Under him there was a great appearance that France would make as illuſtrious a figure as a trading, as ſhe did then as a warlike people; but the truth is, the French do not naturally poſſeſs that undaunted perſeverance which is neceſſary for commerce and colonization, though no people, in theory, underſtand them better. It is to be conſidered at the ſame time, that France, by

her ſituation, by the turn of her inhabitants for certain manufactures, and the happineſs of her ſoil, muſt be always poſſeſſed of great inland and neighbouring trade, which enriches her, and makes her the moſt reſpectable power upon the continent of Europe. Her natural commodities have already been enumerated; to which may be added, her manufactures of ſalt-petre, ſilk, embroidery, ſilver, ſtuffs, tapeſtry, cambrics, lawns, fine laces, fine ſerges and ſtuffs, velvets, brocades, paper, brandy, which is diſtilled from wine, a prodigious variety of toys, and other articles; many of which are ſmuggled into Great Britain, for which they are paid in ready money.

The ſilk manufacture was introduced into France ſo late as the reign of Henry IV. and in the age of his grandſon Lewis XIV. the city of Tours alone employed 8000 looms, and 800 mills. The city of Lyons then employed 18,000 looms; but after the impolitic and unjuſt revocation of the edict of Nantes, the expulſion of the Proteſtants, and the ruinous war maintained by France, they decreaſed to 4000; and their ſilk manufacture is now rivalled by that of England, where the French Proteſtants took refuge, and were happily encouraged. On the other hand, the French woollen cloths and ſtuffs, more eſpecially at Abbeville, are ſaid to be now little inferior to thoſe of England and Holland, aſſiſted by the clandeſtine importation of Engliſh and Iriſh wool, and workmen from this country. It is a doubtful point whether the crown of France was a loſer by its ceſſion of Canada and part of Louiſiana at the late peace. But the moſt valuable part of Hiſpaniola in the Weſt Indies, which ſhe poſſeſſes by the partiality and indolence of Spain, is a moſt improveable acquiſition, and the moſt valuable of all her foreign colonies. In the Weſt Indies ſhe likewiſe poſſeſſes the moſt important ſugar iſlands of Martinico, Guadaloupe, St. Lucia, Tobago, St. Bartholomew, Deſeada, and Marigalante. Her poſſeſſions in North America, are only a ſmall tract upon the Miſſiſſippi.

The French poſſeſſions in the Eaſt Indies, are not very conſiderable; though had their genius been more turned for commerce than war, they might have engroſſed more territory and revenues than are now in poſſeſſion of the Engliſh; but they over-rated both their own power and their courage, and their Eaſt India company never did much. At preſent (ſays Mr. Anderſon), 'her land trade to Switzerland and Italy is by way of Lyons—To Germany, through Metz and Straſburgh—To the Netherlands, through Liſle—To Spain (a moſt profitable one), through Bayonne and Perpignan. As for her naval commerce, her ports in the channel, and on the weſtern ocean, are frequented by all the trading nations in Europe, to the great advantage of France, more eſpecially reſpecting what is carried on with England, Holland, and Italy. The trade from her Mediterranean ports (more particularly from Marſeilles) with Turkey and Africa, has long been very conſiderable. The negro trade from Guinea ſupplies her ſugar colonies, beſides the gold, ivory, and drugs got from thence.'

In the year 1739, France may be ſaid to have been in the zenith of her commerce. Favoured by Spain and dreaded by moſt of the other powers of Europe, her fleets covered the occean; but ſhe truſted too much to her own ſelf-importance. Cardinal de Fleury, who then directed her affairs, took no care to protect her trade by proper naval armaments; ſo that the greater it was, it became the more valuable prey to the Engliſh when war broke out. One great diſadvantage to the commerce of France is, that the profeſſion of a merchant is not ſo honourable as in England and ſome other countries, ſo that the French nobility think it below them; which is the reaſon that the church, the law, and the army, are ſo full of that order. A great number of the cities of France have the privilege of coinage, and each of them a parti-

a particular mark to diſtinguiſh their reſpective pieces; which muſt be very embarraſſing, eſpecially to ſtrangers.

PUBLIC TRADING COMPANIES.] The inſtitution of public trading companies to Canada or New France, and the Eaſt and Weſt Indies, formerly coſt the French crown immenſe ſums; but we know none of them now ſubſiſting, though no doubt their Weſt India trade, which is ſtill very conſiderable, eſpecially in ſugar, is under proper regulations, preſcribed by their councils of commerce.

CONSTITUTION AND GOVERNMENT.] In ſpeaking upon this article, we muſt rather confine ourſelves to a hiſtory of the paſt conſtitution and government of this kingdom, than preſume to give any circumſtantial account of them at preſent. The late changes in theſe have been ſo great and remarkable, that, as matters are not yet fully ſettled, we muſt defer what we have to ſay on that head, till we come to treat of the hiſtory of the nation. The conſtitution of France in feudal times, was very unfavourable to monarchy; but the oppreſſions of the great land-holders, by degrees, grew ſo irkſome to the ſubjects, that they preferred the monarchical to the ariſtocratical government. Ariſtocracy, however, ſtill ſubſiſted in ſome degree to the beginning of the laſt century, chiefly through the neceſſity which the Hugonots or proteſtants were under to have princes of the blood, and men of great quality, for their leaders; but Richlieu in the time of Lewis XIII. gave it a mortal blow; and all the civil diſputes in France ſince, have been among great men for power and places, and between the kings and their parliaments; but the latter were ſeldom or never attended with any ſanguinary effects.

The parliament of France has no analogy with that of Great Britain. It was originally inſtituted to ſerve as a kind of law aſſiſtant to the aſſembly of the ſtates, which was compoſed of the great peers and landholders of the kingdom; and ever ſince it continued to be a law and at laſt a money court; and the members had the courage of late to claim a kind of a negative power to the royal edicts, which they pretended could be of no validity till regiſtered by them. His moſt Chriſtian Majeſty had often tried to invalidate their acts, and to intimidate their perſons; but, deſpotic as he was, he never ventured to inflict any farther puniſhment than a ſlight baniſhment or impriſonment, for their moſt provoking acts of diſobedience.

The kingdom of France was divided into thirty governments, over each of which was appointed a king's lieutenant-general, a ſuperintendant, who pretty much reſembled the lord-lieutenants in England, but their executive powers were far more extenſive. Diſtributive juſtice in France was adminiſtered by parliaments, chambers of accounts, courts of aid, preſidial courts, generalities, elections, and other courts. The parliaments were in number fifteen; thoſe of Paris, Toulouſe, Rouen, Grenoble, Bourdeaux, Dijon, Aix, Rheims, Pau, Metz, Baſançon, Douay, Perpignan, Colmar, and Arras. Several of theſe parliaments, however, united in one. The parliament of Paris was the chief, and took the lead in all national buſineſs. It was divided into ten chambers. The grand chamber was appropriated chiefly for the trial of peers. The Tournelle Civile judged in all matters of property above the value of 1000 livres. The Tournelle Criminelle received and decided appeals from inferior courts in criminal caſes. Beſides theſe three capital chambers, there were five of requeſts, for receiving the depoſitions of witneſſes, and determining cauſes, pretty much in the ſame manner as our bills and anſwers in chancery and the exchequer.

The next court of judicature in France was the chamber of accounts; where all matters of public finances were examined, treaties of peace and grants regiſtered, and the vaſſalages due from the royal fiefs received. The chambers were in number twelve, and held in the cities of Paris, Rouen, Dijon, Nantes, Montpelier, Grenoble, Aix, Pau, Blois, Liſle, Aire, and Dole.

The third court of judicature was the court of aid, where all matters that relate to the royal revenue, and the raiſing of money, were determined.

The fourth were the preſidial courts, and compoſed of judges for determining matters in appeal from magiſtrates of little towns and villages.

The next court was the generalities, who proportioned the taxes to be raiſed in their diſtricts, according to the ſum that is appointed to be levied. They likewiſe took cognizance of matters relating to the crown-lands, and certain branches of the revenue. Theſe courts were in number twenty-three, each conſiſting of twenty-three perſons; and they were diſtributed over the kingdom for the more convenient diſpatch of buſineſs.

Subject to theſe generalities, were the courts of elections, which ſettled the ſmaller proportions of taxes to be paid by pariſhes and inferior diſtricts, and how much each individual in the ſame was to pay. This was done by a collector, who returned the aſſeſſment to the court of generalities. Beſides the above courts, the French had intendants of juſtice, police, and finances, whoſe powers, when properly executed, were of great ſervice to the peace of the community.

After the reader has been told of the excellency of the climate, and fertility of the ſoil in France; her numerous manufactures and extenſive commerce, her great cities, numerous towns, ſea-ports, rivers, and canals; the cheapneſs of proviſions, wines, and liquors; the formidable armies and fleets ſhe has ſent forth, to the terror of Europe; and the natural character of her inhabitants, their ſprightlineſs and gaiety; he will undoubtedly conclude, that the French is the moſt powerful nation, and her people the moſt opulent and happy in Europe. But this is not the caſe; for the French reſources, by a wrong application, have often proved ruinous to the people. The moſt obvious cauſes of this, are the ambition and vanity of their kings and leading men, which led them into ſchemes of univerſal dominion, to promote the aggrandiſement of their name, and the enſlaving of Chriſtendom. Their wars, which they ſometimes carried on againſt one half of Europe, and in which they were generally unfortunate, led them into difficulties to which the ordinary revenues were inadequate; and hence proceeded the arbitrary demands upon the ſubject under various pretences, in the name of loans, free-gifts, &c. When theſe failed, other methods, more deſpotic and unwarrantable, ſuch as raiſing and reducing the value of money as it ſuited their own purpoſes, national bankruptcies, and other grievous oppreſſions were adopted, which gave the finiſhing blow to public credit, and ſhook the foundations of trade, commerce, and induſtry, the fruits of which no man could call his own.

When we conſider the motives of theſe wars, a deſire to enſlave and render miſerable the nations around them, that man muſt be devoid of humanity, whoſe breaſt is not raiſed with indignation at the bare mention of the blood that has been ſpilt, the miſeries and deſolations that have happened, and the numerous places that have fallen ſacrifices to their ambition. It appears too plain, from their late attack upon Corſica, that their own misfortunes had not taught them wiſdom or humanity; for while they thus graſped after foreign conqueſt, their own country exhibited a picture of miſery and beggary. Their towns, a very few excepted, make a moſt diſmal and ſolitary appearance. The ſhops are mean beyond deſcription; and the paſſengers, who ſaunter through a labyrinth of narrow dirty ſtreets, appear to be chiefly compoſed of prieſts and devotees, paſſing to and from maſs, hair-dreſſers, and beggars. That this is the appearance of their towns, and many of their cities, we may appeal to the obſervation of any one who has been in that kingdom. Were it poſſible to mention a people more indigent than theſe citizens, we might deſcribe the farmers and peaſantry. We have in another place mentioned the natural advantages of France, where the hills are covered with grapes, and moſt extenſive plains

produce

produce excellent crops of corn, rye, and barley. Amidſt this profuſion of plenty, the farmer and his family barely exiſt upon the gleaning, and his cattle, which are ſeldom numerous, pick a ſubſiſtence in the ſummer months from the ſkirts of his fields. Here the farmer, meagre, diſpirited, and diſtreſſed, exhibits a ſpectacle of indigence hardly credible; and to ſee him plowing the ground with a lean cow, aſs, and a goat yoked together, excites in an Engliſh traveller that pity to which human nature is entitled—he forgets the country, while he feels for the man.

Many of the taxes and revenues in France were let out for a time to the beſt bidder, or as it is there called, farmed; and theſe harpies, the farmers general, and their underlings, made no ſcruple of fleecing the people moſt unmercifully; and the reſidue, if any did remain, went to ſatisfy the cravings of a numerous clergy, who in their turn were obliged, as well as the laity, to advance the government immenſe ſums, under the names of tenths and free gifts, excluſive of which, they were taxed with a certain ſum, to be paid annually.

Revenues.] It is not eaſy to ſay any thing certain concerning the revenues of a prince who till of late commanded the purſes of all his ſubjects. In 1716, the whole ſpecie of France, in gold and ſilver, was computed to be about ſeventeen millions ſterling; and though the crown was then doubly a bankrupt, being in debt about 100 millions ſterling, or 2000 milions of livres, yet by laying hold of almoſt all the current money in the kingdom, and by arbitrarily raiſing or lowering the value of coins, in four years time the duke regent of France publiſhed a general ſtate of the public debts, by which it appeared that the king ſcarcely owed 340 millions of livres. This being done by a national robbery, we can form no idea but that of deſpotiſm, of the means by which ſo great a reduction was effected. The French court has not ſince that time bluſhed to own, as towards the concluſion of the former war, and alſo in 1769, that their king was bankrupt; and his miniſters have purſued meaſures pretty much ſimilar to thoſe practiſed by the regent, to recruit the royal finances.

The following ſtate of the revenues and expences of France for 1787 is extracted from an account printed by order of the king.

REVENUE.	Livres.
General	574,000,000
Particular	32,000,000
Islands.	
Dominique	6,940,000
Martinique	1,100,000
Guadaloupe	900,000
Cayenne	60,000
Total	615,000,000
Or, 28,000,000*l.* ſterling.	

EXPENCES OF GOVERNMENT.	Livres.
Intereſt of national debt	211,000,000
Army and Ordnance	105,000,000
Navy	45,200,000
Penſions	26,000,000
Sundries, viz. encouragement of commerce, agriculture, &c. &c.	347,800,000
Total	735,000,000
Or, 33,400,000*l.* ſterling.	

From this account it appears, that the revenue of France amounted in the year 1787, to 28,000,000*l.* ſterling, (allowing 22 livres to the pound ſterling) and the expences were 33,400,000*l.* ſterling, of which 9,590,000*l.* ſterling is the intereſt of national debt, ſo that the expences exceeded the national income by 5,454,000*l.* The collection of this revenue coſt 2,700,000*l.* which is at the rate of about 10½*l.* per cent.

Their taxes were raiſed by the taille, or land-tax; the tallion, which the nobility were obliged to pay as well as the commons, is only another land-tax; by aids, which we call cuſtoms on merchandiſe: by gabels, which is a tax upon ſalt; by a capitation, or poll-tax; by the tenths of eſtates and employments; by the ſale of all offices of juſtice; by confiſcations and forfeitures; and by a tenth, or free-gift of the

the clergy, excluſive of the annual ſum of twelve millions of livres, which that body of late advanced to the king.

MILITARY AND MARINE STRENGTH.] There is no nation in Europe where the art of war, particularly that part of it relating to gunnery and fortification, is better underſtood than in France. Beſides other methods for cultivating it, there is a royal military academy eſtabliſhed for training up 500 young gentlemen, in the ſeveral branches of this great art. In time of peace the crown of France maintained 228,497 men, but at a very ſmall comparative expence, the pay of the common men being little more than two-pence half-penny per day. In a time of war 400,000 have been brought into the field; but thoſe that are raiſed from the militia are very indifferent troops. In 1784, the ſtanding military force amounted to 212,924. In the reign of Lewis XIV. the French had at one time 100 ſhips of the line, which was almoſt equal to the marine force of all Europe beſides. The French have, however, at ſea been generally defeated by the Engliſh. The engagement at La Hogue, which happened in 1692, gave a blow to the French marine, which it was long before it recovered. The late king Lewis XV. has more than once made prodigious efforts towards re-eſtabliſhing his navy; but his officers and ſeamen were ſo much inferior to thoſe of England, that ſhe ſeemed, during the war of 1756, to have built ſhips of force for the ſervice of Great Britain, ſo frequent were the captures made by the Engliſh. However, after the commencement of hoſtilities between Great Britain and France, on account of the conduct of the latter in aſſiſting the revolted American colonies, it has appeared that the French navy is become more formidable than at any preceding period, their miniſtry have exerted their utmoſt efforts to eſtabliſh a powerful marine. The preſent navy of France conſiſts of about 100 ſhips of the line, beſides a great number of frigates.

ROYAL TITLES, ARMS, NOBILITY, AND ORDERS.] The title aſſumed by the French king is ſimply, king of France and Navarre; and by way of compliment he is called his Moſt Chriſtian Majeſty. The national aſſembly have choſen this ſhort title for their monarch, *The King of the French.* His arms are three fleurs-de-lis, or, in a field argent, ſupported by two angels in the habits of Levites, having each of them a banner in his hand, with the ſame arms. The motto is *Lilia non laborant neque nent.*

About the year 1349, Hubert, the laſt count of Dauphiny, being accidentally the occaſion of his ſon's death, annexed that country to the crown of France, upon condition that the eldeſt ſon of France ſhould be, for the time to come, ſtyled Dauphin.

The French nobility were of four kinds; firſt, the princes of the blood; ſecondly, dukes and counts, peers of France; thirdly, the ordinary nobility; fourthly, the nobility lately made, or thoſe made in the preſent reign. The firſt prince of the blood is the perſon who ſtands next to the crown after the king's ſons. The knights of the Holy Ghoſt were ranked among the higher nobility; as alſo the governors and lieutenants-general of provinces.

In France there were ſeveral orders; *firſt*, that "*of St. Michael*," inſtituted in 1469 by L[illegible] XI. originally compoſed of thirty-ſix knights, but afterwards enlarged to a hu[illegible]d. It is generally conferred on artiſts, phyſicians, magiſtrates, &c. they wear a black watered ribbon, ſaſh-ways over the right ſhoulder, to which is pendant a medallion of the ſame figure, with that deſcribed in the order of the Holy Ghoſt, enamelled green. Their badge is a golden oval medallion, in which is St. Michael trampling the dragon under his feet. A perſon muſt be a knight of this order before he can enter into the *ſecond* "*of the Holy Ghoſt*," which was founded in 1579 by Henry III. and is compoſed of a hundred perſons excluſive of the ſovereign, and conferred only on princes of the blood, and perſons of the higheſt rank. All are to be papiſts, and, except the 14 commanders, which conſiſt of cardinals, prelates,

lates, and the officers of the order, are all to prove the nobility of their deſcent for above 100 yèars. The Dauphin is received in both orders on the day of his birth. The badge is a ſilver ſtar or croſs of eight points, with a fleur-de-lis on each angle, and a dove, the emblem of the Holy Ghoſt, in the centre, embroidered on the left ſide of the outer garment as the ſtar of our knight of the Garter is, and a ſky-blue watered ribband ſaſh ways, over the right ſhoulder, to which is pendant a medallion of the figure of the ſtar, enamelled white, with fleurs-de-lis, or, at the great angles, having a dove on one ſide, and St. Michael with the dragon on the other. *Third*, the order "*of St. Louis*," which was inſtituted in the year 1693 by Lewis XIV. merely for military merit, and is worn by almoſt every officer, and even ſubalterns. The firſt claſs conſiſts of 40 knights, who are ſtyled *Chevaliers du Grand Croix*, and they wear a ſtar, with the badge on the left ſide of their garment: the ſecond claſs are 80 in number, ſtyled *Chevaliers Commandrins*, &c. but have no ſtar: the third claſs is unlimited: they wear the badge at the button-hole of their coat; the badge is the image of St. Louis in armour, holding in his left hand a crown of thorns, and in his right, a crown of laurel, with the inſcription *Ludovicus Magnus inſtituit anno* 1693; on the reverſe, a ſword erect, the point through a chaplet of laurel, bound with a white ribband, enamelled with this motto *Bellicæ virtutis præmium*. The knights of the firſt two claſſes have penſions, and the order gives them the privileges of the *Nobleſſe*, but doth not ennoble the family. As of this order all muſt be papiſts, Lewis XV. inſtituted the order of *Military Merit* in the year 1759, in favour of the proteſtant officers of foreign regiments in the ſervice of France. In all other reſpects the ſtatutes are the ſame with thoſe of the order of St. Lewis. There are two Chevaliers du Grand Croix, four of the ſecond claſs, and an unlimited number of ordinary knights. The badge of the order is a croſs of eight points, enamelled white, on the one ſide a ſword in pale, with the motto, *Pro virtute bellica*, and on the reverſe a chaplet of laurel within this inſcription, *Ludovicus* XV. *inſtituit anno* 1759. The order of *St. Lazare*, revived by Henry IV. in 1607, and united to that of *Notre Dame de Mount Carmel*, hath fallen into diſrepute, but ſtill continues, and conſiſts of 100 knights under a grand-maſter: the badge is a croſs of eight points, in the angles four fleurs-de-lis, with the Virgin Mary and her child Jeſus in the centre of it.

HISTORY.] The hiſtory of no country is better authenticated than that of France, and it is particularly intereſting to a Britiſh reader. This kingdom, which was by the Romans called Tranſalpine Gaul, or Gaul beyond the Alps, to diſtinguiſh it from Ciſalpine Gaul, on the Italian ſide of the Alps, was probably peopled from Italy, to which it lies contiguous. Like other European nations, it ſoon became a deſirable object to the ambitious Romans; and, after a brave reſiſtance, was annexed to their empire by the invincible arms of Julius Cæſar, about forty-eight years before Chriſt. Gaul continued in the poſſeſſion of the Romans till the downfal of that empire in the fifth century, when it became a prey to the Goths, the Burgundians, and the Franks, who ſubdued, but did not extirpate the ancient natives. The Franks themſelves, who gave it the name of France, or Frankenland, were a collection of ſeveral people inhabiting Germany, and particularly the Salii, who lived on the banks of the river Sale, and who cultivated the principles of juriſprudence better than their neighbours. Theſe Salii had a rule, which the reſt of the Franks are ſaid to have adopted, and which has been by the modern Franks applied to the ſucceſſion of the throne, to exclude all females from the inheritance of ſovereignty, and is well known by the name of the *Salic Law*.

The Franks and Burgundians, after eſtabliſhing their power, and reducing the original natives to a ſtate of ſlavery, parcelled out the lands among their principal leaders; and ſucceeding kings found it neceſſary to comfirm their privileges,

allowing them to exercise sovereign authority in their respective governments, until they at length assumed an independency, only acknowledging the king as their head. This gave rise to those numerous principalities that were formerly in France, and to the several parliaments; for every province became, in its policy and government, an epitome of the whole kingdom; and no laws were made, or taxes raised, without the concurrence of the grand council, consisting of the clergy and of the nobility.

Thus, as in other European nations, immediately after the dissolution of the Roman empire, the first government in France seems to have been a kind of mixed monarchy, and the power of their kings extremely circumscribed and limited by the feudal barons.

The first Christian monarch of the Franks (according to Daniel, one of the best French historians) was Clovis, who began his reign anno 481, and was baptized, and introduced Christianity in the year 496. The mind of Clovis had been affected by the pathetic tale of the Passion and the Death of Christ; and insensible of the beneficial consequences of the mysterious sacrifice, he exclaimed, with religious fervour, "Had I been present with my valiant Franks, I would have revenged his injuries." But though he publicly professed to acknowledge the truth of the gospel, the divine precepts which it inculcated were but little respected by the aspiring barbarians; he calmly assassinated all the princes of the Merovingian race; and, though the only monarch in the christian world free from the stain or imputation of heresy, was perpetually employed in the aggrandisement of his dominions by the violation of every moral and religious duty. From this period the French history exhibits a series of great events; and we find them generally engaged in domestic broils or in foreign wars. The first race of their kings, prior to Charlemagne, found a cruel enemy in the Saracens, who then over-ran Europe, and retaliated the barbarities of the Goths and Vandals upon their posterity. In the year 800, Charlemagne, king of France, whom we have often mentioned as the glory of those dark ages, became master of Germany, Spain, and part of Italy, and was crowned king of the Romans by the pope; he divided his empire by will among his sons, which proved fatal to his family and posterity. Soon after this, the Normans, a fierce warlike people from Norway, Denmark, and other parts of Scandinavia, ravaged the kingdom of France, and, about the year 900, obliged the French to yield up Normandy and Bretagne to Rollo, their leader, who married the king's daughter, and was persuaded to profess himself a Christian. This laid the foundation of the Norman power in France; which afterwards gave a king to England, in the person of William duke of Normandy, who subdued Harold, the last Saxon king, in the year 1066. This event proved unfortunate and ruinous to France, as it engaged that country in almost perpetual wars with England, for whom it was not an equal match, notwithstanding its numbers, and the assistanee it received from Scotland.

The rage of crusading, which broke out at this time, was of infinite service to the French crown in two respects: in the first place, it carried off thousands of its turbulent subjects, and their leaders, who were almost independent of the king: in the next, the king succeeded to the estates of many of the nobility, who died abroad without heirs.

But passing over the dark ages of the crusades, their expeditions to the Holy Land, and wars with England, which have already been mentioned, we shall proceed to that period when the French began to extend their influence over Europe; and this brings us to the reign of Francis I. contemporary with Henry VIII. of England. This prince, though he was brave to excess in his own person, and had defeated the Swiss, who till then were deemed invincible, was an unfortunate warrior. He had great abilities and great defects. He was a candidate for the empire

of Germany, but loſt the imperial crown; Charles V. of the houſe of Auſtria, and king of Spain, being choſen. In the year 1520, Francis having invited Henry VIII. of England to an interview, the two kings met in an open plain near Calais, where they and their attendants diſplayed their magnificence with ſuch emulation and profuſe expence, as procured it the name of the *Field of the Cloth of Gold*. Feats of chivalry, parties of gallantry, together with ſuch exerciſes and paſtimes as were in that age reckoned manly or elegant, rather than ſerious buſineſs occupied both courts during eighteen days that they continued together *. Francis made ſome dazzling expeditions againſt Spain, but ſuffered his mother, of whom he was very fond, to abuſe his power; by which he diſobliged the conſtable of Bourbon, the greateſt of his ſubjects, who joined in a confederacy againſt him with the emperor and Henry VIII. of England. In a capital expedition he undertook into Italy, he was taken priſoner at the battle of Pavia, in the year 1524, and obliged to agree to diſhonourable terms, which he never meant to perform, to regain his liberty. His non-performance of thoſe conditions was afterwards the ſource of many wars between him and the emperor; and he died in 1547.

France, at the time of his death, notwithſtanding the variety of diſagreeable events during the late reign, was in a flouriſhing condition. Francis I. was ſucceeded by his ſon, Henry II. who, upon the whole, was an excellent and fortunate prince. He continued the war with the emperor of Germany to great advantage for his own dominions; and was ſo well ſerved by the duke of Guiſe, that though he loſt the battle of St. Quintin, againſt the Spaniards and the Engliſh, he retook Calais from the latter, who never ſince had any footing in France. He married his ſon, the Dauphin, to Mary queen of Scots, in hopes of uniting that kingdom to his crown; but in this ſcheme he, or rather his country, was unfortunate, as may be ſeen in the hiſtory of Scotland. He was killed in the year 1559, at an unhappy tilting-match, by the count of Montgomeri.

He was ſucceeded by his ſon Francis II. a weak, ſickly, inactive prince, and only thirteen years of age, whoſe power was entirely engroſſed by a prince of the houſe of Guiſe, uncle to his wife, the beautiful queen of Scotland. This engroſſment of power encouraged the Bourbon, the Montmorenci, and other great families, to form a ſtrong oppoſition againſt the government. Anthony, king of Navarre, was at the head of the Bourbon family; but the queen-mother, the famous Catherine of Medicis, being obliged to take part with the Guiſes, the confederacy, who had adopted the cauſe of Hugonotiſm, was broken in pieces, when the ſudden death of Francis happened, in the year 1560.

This event took place while the prince of Condé, brother to the king of Navarre, was under ſentence of death for a conſpiracy againſt the court; but the queen-mother ſaved him, to balance the intereſt of the Guiſes; ſo that the ſole direction of affairs fell into her hands, during the minority of her ſecond ſon, Charles IX. Her regency was a continued ſeries of diſſimulation, treachery, and murder. The duke

* The French and Engliſh hiſtorians deſcribe the pomp of this interview, and the various ſpectacles, with great minuteneſs. One circumſtance mentioned by the marechal de Fleuranges, who was preſent, and which appears ſingular in the preſent age, is commonly omitted. "After the tournament," ſays he, "the French and Engliſh wreſtlers made their appearance, and wreſtled in preſence of the kings "and the ladies; and as there were many ſtout "wreſtlers there, it afforded excellent paſtime; but "as the king of France had neglected to bring any "wreſtlers out of Bretagne, the Engliſh gained the "prize.—After this, the kings of France and England retired to a tent, where they drank together, "and the king of England ſeizing the king of France "by the collar, ſaid, *My brother, I muſt wreſtle "with you*, and endeavoured once or twice to trip "up his heels; but the king of France, who was a "dexterous wreſtler, twiſted him round, and threw "him on the earth with prodigious violence. The "king of England wanted to renew the combat, but "was prevented." Memoirs de Fleuranges, 12mo. Paris, 1753. p. 329.

of Guiſe, who was the ſcourge of the Proteſtants, was aſſaſſinated by one Poltrot, at the ſiege of Orleans; and the murderer was unjuſtly thought to have been inſtigated by the famous Coligni, admiral of France, who was then at the head of the proteſtant party. Three civil wars ſucceeded. At laſt the court pretended to grant the Hugonots a very advantageous peace, and a match was concluded between Henry, the young king of Navarre, a Proteſtant, and the French king's ſiſter. The heads of the Proteſtants were invited to celebrate the nuptials at Paris, with the infernal view of butchering them all, if poſſible, in one night. This project proved but too ſucceſsful, though it was not completely executed, on St. Bartholomew's day 1572. The king himſelf aſſiſted in the maſſacre, in which the admiral Coligni fell. The ſigns for the inhuman ſlaughter of ſo many thouſands, was to be made by ſtriking the great bell of the palace. At that dreadful knell the work of death was begun, and humanity recoils from the horrors of the fatal night of St. Bartholomew; yet the reader may expect amidſt the general carnage ſome few moments ſhould be devoted to the fate of Coligni. He had long retired to reſt, when he was arouſed by the noiſe of the aſſaſſins who had ſurrounded his houſe. A German named Beſme entered his chamber, and the admiral, apprehending his intentions, prepared to meet death with that fortitude which had ever diſtinguiſhed him. Incapable of reſiſtance from the wounds he had received by two balls in a late attempt to aſſaſſinate him, with an undiſmayed countenance, he had ſcarce uttered the words, "young man, reſpect theſe grey hairs, nor ſtain them with blood," when Beſme plunged his ſword into his boſom, and with his barbarous aſſociates threw the body into the court. The young duke of Guiſe contemplated it in ſilence, but Henry, count d'Angouleſme, natural brother to Charles, ſpurned it with his foot, exclaiming, "Courage, my friend, we have begun well, let us finiſh in the ſame manner." It is ſaid that about 30,000 Proteſtants were murdered at Paris, and in other parts of France; and this brought on a fourth civil war. Though a freſh peace was concluded in 1573 with the Proteſtants, yet a fifth civil war broke out the next year, when the bloody Charles IX. died without heirs.

His third brother the duke of Anjou, had ſome time before been choſen king of Poland; and hearing of his brother's death, he with ſome difficulty, eſcaped to France, where he took quiet poſſeſſion of that crown, by the name of Henry III.

Religion at that time ſupplied to the reformed nobility of France the feudal powers they had loſt. The heads of the Proteſtants could raiſe armies of Hugonots. The governors of provinces behaved in them as if they had been independent of the crown; and the parties were ſo equally balanced, that the name of the king alone turned the ſcale. A *holy league* was formed for the defence of the catholic religion, at the head of which was the duke of Guiſe. The Proteſtants under the prince of Condé, and the duke of Alençon, the king's brother, called in the German princes to their aſſiſtance; and a ſixth civil war broke out in 1577, in which the king of Spain took the part of the League, in revenge of the duke of Alençon declaring himſelf lord of the Netherlands. This civil war was finiſhed within the year, by another ſham peace. The king, ever ſince his acceſſion to the crown had plunged himſelf into a courſe of infamous debauchery and religious extravagance. He was entirely governed by his profligate favourites, but he poſſeſſed natural good ſenſe. He began to ſuſpect that the proſcriptions of the Proteſtants, and the ſetting aſide from the ſucceſſion the king of Navare, on account of his religion, which was aimed at by the Holy League, was with a view to place the duke of Guiſe, the idol of the Roman Catholics, on the throne, to which that duke had ſome diſtant pretenſions. To ſecure himſelf on the throne; a ſeventh civil war broke out in 1579, and another in the year 1585, both of them to the diſadvan-

tage of the Proteſtants, through the abilities of the duke of Guiſe. The king thought him now ſo dangerous, that after inviting him in a friendly manner to court, both he, and his brother the cardinal were, by his majeſty's orders, and in a manner under his eye, baſely aſſaſſinated in 1588. The Leaguers, upon this, declared that Henry had forfeited his crown, and was an enemy to religion. This obliged him to throw himſelf into the arms of the Proteſtants; but while he was beſieging Paris, where the Leaguers had their greateſt force, he was in his turn aſſaſſinated by one Clement, a young enthuſiaſtic monk, in 1589. In Henry III. ended the line of Valois.

The readers of hiſtory are well acquainted with the difficulties, on account of his religion, which Henry IV. king of Navarre *, head of the houſe of Bourbon, and the next heir by the Salic law, had to encounter before he mounted the throne. The Leaguers were headed by the duke of Main, brother to the late duke of Guiſe; and they drew from his cell the decrepit popiſh cardinal of Bourbon, uncle to the king of Navarre, to proclaim him king of France. Being ſtrongly ſupported by the power of Spain and Rome, all the glorious actions performed by Henry, his courage and magnanimity, ſeemed only to make him more illuſtriouſly unfortunate; for he and his little court were ſometimes without common neceſſaries. He was, however, perſonally beloved; and no objection lay againſt him but that of his religion. The Leaguers, on the other hand, ſplit among themſelves; and the French nation in general, were jealous of the Spaniards, who availed themſelves of the public diſtractions. Henry, after experiencing a variety of good and bad fortune, came ſecretly to a reſolution of declaring himſelf a Roman Catholic. This was called a meaſure of prudence if not of neceſſity, as the king of Spain had offered his daughter Iſabella Clara Eugenia to be queen of France, and would have married her to the young duke of Guiſe.

In 1593 Henry went publicly to maſs, as a mark of his converſion. This complaiſance wrought wonders in his favour; and having with great difficulty obtained abſolution from the pope, all France ſubmitted to his authority, and he had only the crown of Spain to contend with, which he did for ſeveral years with various fortune. In 1598 he publiſhed the famous edict of Nantes, which ſecured to his old friends the proteſtants the free exerciſe of their religion; and next year the treaty of Vervins was concluded with Spain. Henry next chaſtiſed the duke of Savoy, who had taken advantage of the late troubles in his kingdom; and applied himſelf with wonderful attention and ſucceſs (aſſiſted in all his undertakings by his miniſter, the great Sully) to promote the happineſs of his people, by encouraging manufactures, particularly that of ſilk, the benefit of which France feels at this day. Having re-eſtabliſhed the tranquility, and, in a great meaſure, ſecured the happineſs of his people, he formed connexions with the neighbouring powers for reducing the ambition of the houſe of Auſtria; for which purpoſe, it is ſaid, he had formed great ſchemes, and collected a formidable army; others ſay (for his intention does not clearly appear) that he deſigned to have formed Chriſtendom into a great republic, of which France was to be the head, and to drive the Turks out of Europe; while others attribute his preparations to more ignoble motives, that of a criminal paſſion for a favourite princeſs, whoſe huſband had carried her for protection into the Auſtrian dominions. Whatever may be in theſe conjectures, it is certain, that while he was making preparations for the coronation of his queen, Mary of Medicis, and was ready to enter upon his grand expedition,

* A ſmall kingdom lying upon the Pyrenean mountains, of the greateſt part of which, Upper Navarre, Henry's predeceſſors had been unjuſtly diſpoſſeſſed, by Ferdinand, king of Spain, about the year 1512.

he was aſſaſſinated in his coach in the ſtreets of Paris, by one Ravilliac, a young enthuſiaſt, in 1610.

Lewis XIII. ſon to Henry IV. was but nine years of age at the time of his father's death. As he grew up he diſcarded his mother and her favourites, and choſe for his miniſter the famous cardinal Richlieu, who put a period, by his reſolute and bloody meaſures, to the remaining liberties of France and to the religious eſtabliſhment of the Proteſtants there, by taking from them Rochelle, though Charles I. of England, who had married the French king's ſiſter, made ſome weak efforts by his fleet and arms to prevent it. This put an end to the civil wars, on account of religion, in France. Hiſtorians ſay, that in theſe wars above a million of men loſt their lives; that 150,000,000 livres were ſpent in carrying them on; and that nine cities, four hundred villages, two thouſand churches, two thouſand monaſteries, and ten thouſand houſes, were burnt, or otherwiſe deſtroyed, during their continuance.

Richlieu, by a maſterly train of politics, though himſelf bigotted to popery, ſupported the Proteſtants of Germany and Guſtavus Adolphus, againſt the houſe of Auſtria; and after quelling all the rebellions and conſpiracies which had been formed againſt him in France, he died ſome months before Lewis XIII. who, in 1643, left his ſon, afterwards the famous Lewis XIV. to inherit his kingdom.

During that prince's non-age, the kingdom was torn in pieces, under the adminiſtration of his mother Anne of Auſtria, by the factions of the great, and the diviſions between the court and parliament, for the moſt trifling cauſes, and upon the moſt deſpicable principles. The prince of Condé flamed like a blazing ſtar; ſometimes a patriot, ſometimes a courtier, and ſometimes a rebel. He was oppoſed by the celebrated Turenne, who from a proteſtant had turned papiſt. The nation of France was involved at once in civil and domeſtic wars; but the queen-mother having made choice of cardinal Mazarine for her firſt miniſter, he found means to turn the arms even of Cromwell againſt the Spaniards, and to divide the domeſtic enemies of the court ſo effectually among themſelves, that when Lewis aſſumed the reins of government in his own hands, he found himſelf the moſt abſolute monarch that had ever ſat upon the throne of France. He had the good fortune, on the death of Mazarine, to put the domeſtic adminiſtration of his affairs into the hands of Colbert, who formed new ſyſtems for the glory, commerce, and manufactures of France, all which he carried to a ſurpriſing height.

To write the hiſtory of this reign, would be to write that of all Europe. Ignorance and ambition were the only enemies of Lewis: through the former, he was blind to every patriotic duty of a king, and promoted the intereſts of his ſubjects only that they might the better anſwer the purpoſes of his greatneſs: by the latter, he embroiled himſelf with all his neighbours, and wantonly rendered Germany a diſmal ſcene of devaſtation. By his impolitic and unjuſt revocation of the edict of Nantes, in the year 1685, and his perſecutions of the Proteſtants, he obliged them to take ſhelter in England, Holland, and different parts of Germany, where they eſtabliſhed the ſilk manufactories, to the great prejudice of their own country. He was ſo blinded by flattery, that he arrogated to himſelf the divine honours paid to the pagan emperors of Rome. He made and broke treaties for his conveniency, and at laſt raiſed againſt himſelf a confederacy of almoſt all the other princes of Europe; at the head of which was king William III. of England. Lewis was ſo well ſerved, that he made head for ſome years againſt this alliance; but having provoked the Engliſh by his repeated infidelities, their arms under the duke of Marlborough, and of the Auſtrians under prince Eugene, rendered the latter part of his life as miſerable as the beginning of it was ſplendid. His reign, from the year 1702 to 1711, was one continued ſeries of defeats and calamities; and he had the mortification of ſeeing thoſe

thoſe places taken from him, which in the former part of his reign, were acquired at the expence of many thouſand lives. Juſt as he was reduced, old as he was, to the deſperate reſolution of collecting his people, and dying at their head, he was ſaved by the Engliſh tory miniſtry deſerting the cauſe, withdrawing from their allies, and concluding the peace of Utrecht, in 1713. He ſurvived his deliverance but two years; and in his laſt hours he diſplayed a greatneſs of mind worthy of his elevated ſituation. "Why do you weep," ſaid he to his domeſtics, "did you think me immortal?" He died on the firſt of September 1715, and was ſucceeded by his great-grandſon, Lewis XV. the late king.

The partiality of Lewis XIV. to his natural children might have involved France in a civil war, had not the regency been ſeized upon by the duke of Orleans, a man of ſenſe and ſpirit, and the next legitimate prince of the blood. We have already ſeen in what manner he diſcharged the national debt of France; but having embroiled himſelf with Spain, the king was declared of age in 1722, and the regent on the fifth of December, 1723, was carried off by an apoplexy.

Among the firſt acts of Lewis XVth. was his nominating his preceptor, afterwards cardinal Fleury, to be his firſt miniſter. Though his ſyſtem was entirely pacific, yet the ſituation of affairs in Europe, upon the death of the king of Poland, in 1734, more than once embroiled him with the houſe of Auſtria. The intention of the French king was to replace his father-in-law, Staniſlaus, on the throne of Poland. In this he failed through the interpoſition of the Ruſſians and Auſtrians; but Staniſlaus enjoyed the title of king, and the revenues of Lorrain, during the remainder of his life. The connection between France and Spain forced the former to become principals in a war with Great Britain; in the management of which the latter was ſo ill ſeconded by her allies, that it was finiſhed by the peace of Aix la Chapelle in 1748.

In the year 1757, Francis Damien, an unhappy wretch, whoſe ſullen mind, naturally unſettled, was inflamed by the diſputes between the king and his parliament relative to religion, embraced the deſperate reſolution of attempting the life of his ſovereign. In the duſk of the evening, as the king prepared to enter his coach, he was ſuddenly wounded, though ſlightly, with a penknife, between the fourth and fifth ribs, in the preſence of his ſon, and in the midſt of his guards. The daring aſſaſſin had mingled with the crowd of courtiers, and was inſtantly betrayed by his diſtracted countenance. He declared it never was his intention to kill the king, but that he only meant to wound him that God might touch his heart, and incline him to reſtore the tranquillity of his dominions by re-eſtabliſhing the parliament, and baniſhing the archbiſhop of Paris, whom he regarded as the ſource of the preſent commotions. In theſe frantic and incoherent declarations he perſiſted amidſt the moſt exquiſite tortures; and after human ingenuity had been exhauſted in deviſing new modes of torment, his judges, tired out with his obſtinacy, conſigned him to death, the inhumanity of which is increaſed by the evident madneſs that ſtimulated him to the fatal attempt; and which might fill the hearts of ſavages with horror. He was conducted to the common place of execution, amidſt a vaſt concourſe of the populace; ſtripped naked and faſtened to the ſcaffold by iron gyves. One of his hands was then burnt in liquid flaming ſulphur. His thighs, legs and arms were torn with red hot pincers; boiling oil, melted lead, roſin and ſulphur were poured into the wounds; and to complete the awful cataſtrophe, light ligatures being tied round his limbs, he was torn to pieces by young and vigorous horſes.

The Jeſuits having rendered themſelves univerſally odious by their ſhare in the conſpiracy againſt the life of the king of Portugal, fell in France under the laſh of the civil power, for certain fraudulent mercantile productions. They refuſed to diſcharge the debts of one of their body, who had become bankrupt for a large

ſum,,

ſum, and who was ſuppoſed to act for the benefit of the whole ſociety. As a monk, indeed, he muſt neceſſarily do ſo. The parliaments eagerly ſeized an opportunity of humbling their ſpiritual enemies. The Jeſuits were every where cited before thoſe high tribunals in 1761, and ordered to do juſtice to their creditors. They ſeemed to acquieſce in the deciſion, but delayed payment under various pretences. New ſuits were commenced againſt them, in 1762, on account of the pernicious tendency of their writings. In the courſe of theſe proceedings, which the king endeavoured in vain to prevent, they were compelled to produce their *Inſtitute*; or the rules of their order, hitherto ſtudiouſly concealed. That myſterious volume, which was found to contain maxims ſubverſive of all civil government, and even of the fundamental principles of morals, completed their ruin. All their colleges were ſeized, all their effects confiſcated; and the king aſhamed or afraid to protect them, not only reſigned them to their fate, but finally expelled them the kingdom, by a ſolemn edict, and utterly aboliſhed the order of Jeſus in France.

Elated with this victory over eccleſiaſtical tyranny, the French parliaments attempted to ſet bounds to the abſolute power of the crown, and ſeemed determined to confine it within the limits of law. Not ſatisfied with refuſing, as uſual, to regiſter certain opppreſſive edicts, or with remonſtrating againſt them, they ordered criminal proſecutions to be commenced againſt the governors of ſeveral provinces, acting in the king's name, who had enforced the regiſtration of thoſe edicts. The magnanimity of theſe aſſemblies had awakened new ideas in the boſoms of the French; they were taught by the late remonſtrances to conſider their inherent rights; and the glorious flame in the ſucceeding reign, burſt forth with accumulated force, and overwhelmed the throne of deſpotiſm.

As to the war with Great Britain, which was ended by the peace of Fontainbleau, in 1763, the chief events attending it, ſo humiliating to France, have been already mentioned in the hiſtory of England, and therefore need not be recapitulated here.

Corſica, a ſmall iſland in the Mediterranean, had long reſiſted with manly firmneſs the oppreſſive councils of the Genoeſe, who claimed the ſovereignty over it, by right of conqueſt. But, unable to ſupport thoſe pretenſions, Genoa transferred them to France, on condition that Lewis ſhould put her in full poſſeſſion of the adjacent iſland of Capraia, which the Corſicans had lately invaded and reduced. To execute his engagements, powerful armaments were fitted out by Lewis, at Antibes and Toulon; twenty battalions of French were landed in Corſica; and the natives, whoſe free ſuffrages had ſummoned Paoli, one of their principal chiefs, to the ſupreme government of the iſland, determined to defend their liberties to the utmoſt. A ſharp and bloody war, ſuch as ſuited the inferior numbers of the inhabitants and the nature of the country, was carried on in all the faſtneſſes and mountainous parts of the iſland. And it was not till after the French had fatally experienced, in two ſucceſſive campaigns, the enthuſiaſtic courage which animates the champions of Freedom, that they overwhelmed by their ſuperior numbers this unfortunate people; nor had Lewis much reaſon to triumph in an acquiſition, to attain which he had ſacrificed ſeveral thouſands of his braveſt troops, and only extended his dominion over a rugged and unproductive iſland.

The preſent king, Lewis XVI. ſucceeded his grandfather, Lewis XV. on the 10th of May 1774. Several regulations have taken place, ſince his acceſſion, highly favourable to the general intereſts of the nation, particularly the ſuppreſſion of the muſquetairs, and ſome other corps, which being adapted more to the parade of guarding the royal perſon than any real military ſervice, were ſupported at a great expence, without an adequate return of benefit to the ſtate. But one of the moſt remarkable circumſtances which attended the preſent reign, was the placing of Mr. Necker, a Proteſtant, and a native of Switzerland, at the head of the French finances,

in

in 1776. Poſſeſſed of diſtinguiſhed and acknowledged abilities, his appointment would have excited no ſurprize, had it not been contrary to the conſtant policy of France, which had carefully excluded the aliens of her country and faith from the controul of the revenue. It now ſtood forward as a new inſtance of enlargement of mind and liberality of ſentiment; and will to poſterity mark the prominent features of the reign of Lewis the Sixteenth. Under the direction of this gentleman, a general reform took place in France, throughout every department in the revenue. When hoſtilities commenced in 1777, between France and Great Britain, in conſeſequence of the aſſiſtance afforded by the former to the revolted Britiſh colonies in America, the people of France were not burthened with new taxes for carrying on the war; but the public revenue was augmented by his œconomy, improvements, and reformation, that were introduced into the management of the finances.

With a moſt laudable zeal to extend the dominion of ſcience, Lewis fitted out ſeveral veſſels on aſtronomical diſcoveries. The chevalier de Borda was inſtructed to aſcertain the exact poſition of the Canary iſlands and Cape de Verd; and the different degrees of the coaſt of Africa from Cape Spartal to the iſland of Goree: the chevalier Grenier, who had traverſed the Indian ſeas to improve the charts and correct the errors of former navigators, was liberally rewarded by a monarch who aſpired to immortalize the æra of his power by expeditions beneficial to mankind.

The viſit of the emperor to the court of Paris was another occurrence that excited the attention of Europe. Averſe to pomp, he choſe to travel under the humble title of count Falkenſtein; he was received by Lewis with that reſpect which was due to the imperial dignity, and the regard that he was impatient to teſtify to the brother of his royal conſort. During ſix weeks that the emperor remained at Paris, his hours were inceſſantly devoted to examine the various eſtabliſhments of that capital, and in viewing the manufactures. With the ſame ſpirit of enquiry he made a tour through different provinces of the kingdom, and in his journey endeavoured to glean whatever might be advantageous to his own dominions.

Amidſt the fury of war, Lewis diſplayed that regard for ſcience which had early formed a ſtriking characteriſtic of his reign; and while he poured the thunder of his arms on his enemies, two ſhips were marked by an honourable exemption from the attempts of the fleets of France. Previous to the commencement of hoſtilities, the Engliſh had ſent two veſſels into the South Seas, commanded by Captains Cook and Clerke, to explore the coaſts and iſlands of Japan and California; the return of thoſe veſſels was hourly expected in Europe; and Lewis, with a conſiderate humanity which reflects the higheſt luſtre on his character, by a circular letter to all his naval officers, commanded them to abſtain from all hoſtilities againſt theſe ſhips, and to treat them as neutral veſſels. The letters mentioned alſo in terms of the higheſt reſpect captain Cook, who had long diſtinguiſhed himſelf in ſucceſſive voyages of diſcovery. But death allowed not that celebrated navigator to enjoy this grateful teſtimony to his merit; and in one of the newly diſcovered iſlands he had already fallen a victim to the blind fury of the ſavage inhabitants.

At the beginning of the year 1780, in conſequence of the repreſentations of Mr. Necker, a variety of unneceſſary offices in the houſehold of the king and queen were aboliſhed; and ſundry other important regulations adopted, for the eaſe of the ſubject, and the general benefit of the kingdom. He changed the exceſs of diſburſements at leaſt one million ſterling, of the year 1776, into an exceſs of revenue in the year 1780, to the amount of 445,000l. But the meaſures of Mr. Necker were not calculated to procure him friends at court; the vain, the intereſted, and the ambitious, naturally became his enemies; and the king appears not to have poſſeſſed ſufficient firmneſs of mind to ſupport an upright and able miniſter. He was therefore diſplaced, and is ſaid to have been particularly oppoſed by the queen's party.

The miniſters of Great Britain, whoſe imprudence and incapacity had plunged their country in a war as calamitous in the concluſion, as it was impolitic in the origin, were at length, by the clamour of the multitude, and the indignation of parliament removed from the councils of their ſovereign; and they were ſucceeded by men who no longer nouriſhed the frantic idea of controuling the independence of America. The freedom of that continent had been the grand object of France, and that having been acknowledged in the fulleſt and moſt expreſs terms by Great Britain; the preliminary articles of peace were ſigned at Paris on the 20th of January 1783; but the immenſe expences incurred were found at laſt to be much more than the revenues of the kingdom could by any means ſupport; and the miſerable exigencies to which government was reduced, contributed no doubt to bring about the preſent revolution.

In the various wars of France with England, particularly in the laſt and preſent centuries, no object appears of more conſequence to her naval operations than the obtaining a port in the channel. With a view of obviating this want, the government of France took up this important object with the greateſt zeal and vigour; and having employed the ableſt engineers in that kingdom, have proceeded, by the moſt aſtoniſhing and ſtupendous works, to render the port of Cherburg capable of receiving and protecting a royal navy. Since the laſt peace, they have proſecuted this work at an annual expence of upwards of 200,000l. and expectation is ſo ſanguine, that it is thought a year or two more will effect this arduous and important undertaking.

In the year 1786 a treaty of navigation and commerce was concluded between the two courts of London and Verſailles, of which ſome notice has been previouſly taken in our account of England; and this having concluded the tranſactions between the two kingdoms we have now only to give an account of the late revolution; an event indeed no leſs remarkable for the greatneſs of the object, than the firmneſs and unanimity with which it was concluded.

The policy of the French government which led it to the ſtandards of liberty in America and Holland, excited a ſpirit amongſt the people, which could not well unite with the continuance of arbitrary power at home. The diſmiſſion of Monſieur Necker from the direction of public affairs, and ſucceeding miniſters being endowed neither with his integrity or abilities, the finances of the nation were on the point of being entirely ruined, when the edict for regiſtering the loan at the concluſion of 1785, and which amounted to the ſum of three millions, three hundred and thirty thouſand pounds, was preſented to the parliament of Paris, the murmurs of the people, and the remonſtrances of that aſſembly, aſſumed a more legal and formidable form. The king, however, ſignified to the ſelect deputation that were commiſſioned to convey to him their remonſtrances, that he expected to be obeyed without farther delay. The ceremony of the regiſtering took place on the next day, but was accompanied with a reſolution, importing that public œconomy was the only genuine ſource of abundant revenue, the only means of providing for the neceſſities of the ſtate, and reſtoring that credit, which borrowing had reduced to the brink of ruin.

This proceeding was no ſooner known than the king required the attendance of the grand deputation of parliament; he eraſed from their records the reſolution that had been adopted; and obſerved, though it was his pleaſure that the parliament ſhould communicate by its reſpectful repreſentations whatever might intereſt the good of the public, yet he never would conſent that they ſhould ſo far abuſe his confidence and mercy as to erect themſelves into the cenſors of his adminiſtration; he expected in future they ſhould confine their expreſſions within the limits of wiſdom and loyalty; he declared himſelf ſatisfied with the conduct of Monſieur Calonne, his comptroller

troller general; and more ſtrongly to mark his diſapprobation, he directed the diſmiſſion from farther ſervice of one their officers who had appeared moſt active in forwarding the late reſolution.

However gratified by the ſupport of his ſovereign, Monſieur de Calonne could not fail of finding himſelf deeply mortified by the oppoſition of the parliament. His addreſs to conciliate that aſſembly had proved ineffectual, and he experienced their inflexible averſion at the critical juncture, when their acquieſcence might have proved of the moſt eſſential ſervice. An anxious enquiry into the ſtate of the public finances had convinced him that the expenditure had far exceeded the revenues; in the preſent ſituation, to impoſe new taxes was impoſſible, to continue the method of borrowing was ruinous, and to have recourſe only to œconomical reforms, would be found wholly inadequate; and he heſitated not to declare that it would be impoſſible to place the finances on a ſolid baſis, but by the reformation of whatever was vicious in the conſtitution of the ſtate.

To give weight to this reform, the miniſter was ſenſible that ſomething more was neceſſary than royal authority; he perceived that the parliament was neither a fit inſtrument for introducing a new order into public affairs, nor would ſubmit to be a paſſive machine for ſanctioning the plans of a miniſter, even if thoſe plans were the emanations of perfect wiſdom. Though originally a body of lawyers, indebted for their appointments to the king, there was not an attribute of genuine legiſlative aſſembly that they did not ſeem deſirous to engroſs to themſelves; and they had been ſupported in their pretenſions by the plaudits of the people, who were ſenſible that there was no other body in the nation who could plead their cauſe againſt royal oppreſſion.

Under theſe circumſtances, the only alternative that ſeemed to remain was to have recourſe to ſome other aſſembly, more dignified and ſolemn in its character, and that ſhould conſiſt in a greater degree of members from the various orders of the ſtate, and the different provinces of the kingdom. This promiſed to be a popular meaſure; it implied a deference to the people at large, and might be expected to prove greatly acceptable; but the true and legitimate aſſembly of the nation, the ſtates-general, had not met ſince the year 1614; nor could the miniſter flatter himſelf with the hope of obtaining the royal aſſent to a meeting which a deſpotic ſovereign could not but regard with ſecret jealouſy. Another aſſembly had occaſionally been ſubſtituted in the room of the ſtates-general; this was diſtinguiſhed by the title of the *Notables*, or men of note, and conſiſted of a number of perſons from all parts of the kingdom, chiefly ſelected from the higher orders of the ſtate, and nominated by the king himſelf. This aſſembly had been convened by Henry the Fourth, and again by Lewis the Thirteenth; and was now once more ſummoned by the authority of the preſent monarch.

The writs for calling together the aſſembly of the notables were dated on the 29th of December, 1786; they were addreſſed to ſeven princes of the blood, nine dukes and peers of France, eight field mareſchals, twenty-two nobles, eight counſellors of ſtate, four maſters of requeſts, eleven archbiſhops and biſhops, thirty-ſeven of the heads of the law, twelve deputies of the pays d'etats, the lieutenant civil, and twenty-five magiſtrates of the different towns of the kingdom. The number of members was one hundred and four; and the 29th of January, 1787, was the period appointed for their opening.

It was at the moment when the members of the notables had arrived at Paris, and when the attention of all claſſes in the kingdom was fixed upon their meeting as an important æra in the national hiſtory, that the miniſter found himſelf yet unprepared to ſubmit his ſyſtem to their inſpection, and poſtponed the opening of the council to the 7th of February. This delay was injudicious in the higheſt degree; and to

his the ſubſequent revolution is ſaid immediately to have been owing. Politics had occupied the minds of men, particularly in the metropolis, to the excluſion of every other ſubject; and, during this interval, an opportunity was given to the members of converſing with each other, communicating their complaints, and forming ſchemes for redreſs. A ſecond delay to the 14th of the ſame month was occaſioned by the indiſpoſition of Monſieur de Calonne himſelf, and that of the count de Vergennes, preſident of the council of finance, and firſt ſecretary of ſtate; and a third procraſtination, owing to the death of the count, poſtponed the meeting to the 22d of February.

It was under theſe difficulties that Monſieur Calonne firſt met the aſſembly of the notables, and opened his long expected plan. He began by ſtating that the public expenditure had for centuries paſt exceeded the revenue, that a very conſiderable deficiency had of courſe exiſted, and that at his own acceſſion to office it was three millions, three hundred and thirty thouſand pounds.

To remedy this evil the comptroller-general recommended a territorial impoſt, in the nature of the Engliſh land-tax, from which no rank or order of men were to be exempted; an enquiry into the poſſeſſions of the clergy, which hitherto had been deemed ſacred, from their proportion of the public burthens; the various branches of internal taxation were alſo to undergo a ſtrict examination; and a conſiderable reſource was preſented in mortgaging the demeſne lands of the crown.

Before Monſieur Necker retired from the management of the finances, he had publiſhed his Compte rendu au Roi, in which France was repreſented as poſſeſſing a clear ſurplus of four hundred and twenty-five thouſand pounds ſterling. This performance had been read with avidity, and had been conſidered as an æra in the hiſtory of France. The credit of this ſtatement was ably vindicated by Monſieur de Brienne, archbiſhop of Thouloufe, and by the count de Mirabeau, a ſtill more formidable enemy to Calonne. His eloquence, however, might have ſucceſsfully vindicated his ſyſtem and reputation againſt the calculations of Brienne, and the invectives of Mirabeau; but the genius of the comptroller-general ſunk under the influence of the three great bodies of the nation. The grand and eſſential object of reform was to equalize the public burthens, and by rendering the taxes general, to diminiſh the load of the lower and moſt uſeful claſſes of the people. The ancient nobility and the clergy had ever been free from all public aſſeſſments; the crouds of new nobleſſe, who had purchaſed their patents, were by that ſhameful cuſtom exempted, both themſelves and their poſterity, from contributing proportionally to the expences of the ſtate; the magiſtracies likewiſe throughout the kingdom enjoyed their ſhare of theſe exemptions; ſo that the whole weight of the taxes fell on thoſe who were leaſt able to bear them. Thus the nobility, the clergy, and the magiſtracy, were united againſt the miniſter, and the event was ſuch as might be expected. The intrigues of thoſe three bodies raiſed againſt him ſo loud a clamour, that finding it impoſſible to ſtem the torrent, Monſieur de Calonne not only reſigned his place on the 12th of April, but ſoon after retired to England from the ſtorm of perſecution.

The notables proceeded in their enquiries, and it was now ſuggeſted that an aſſembly of the ſtates ſhould be called, as the notables were not competent to impoſe a new tax. As the deliberations of the notables were not carried on in ſecret, this propoſal was inſtantly circulated through the capital, and ſuppoſed to be a new diſcovery. The notables were ſoon after diſſolved, without having accompliſhed anything except the juſtification of M. Necker.

The ſtamp-act, however, was eſtabliſhed, and a bed of juſtice was held by the king on the fifth of Auguſt, 1787, at which the parliament of Paris was obliged to attend, and the edict was regiſtered, notwithſtanding their proteſt to the contrary: but the parliament, though defeated, were far being ſubdued. On the day after

the king had held his bed of juſtice, they entered a formal proteſt againſt the conceſſion that had been extorted from them. They declared that the edict had been regiſtered againſt their approbation and conſent, by the king's expreſs command; that it neither ought, nor ſhould have any force; and the firſt perſon who ſhould preſume to attempt to carry it into execution, ſhould be adjudged a traitor, and condemned to the galleys.

This declaration left to the crown no other alternative than either proceeding to extremities in ſupport of its authority, or giving up for ever after the power of raiſing money upon any occaſion without the conſent of parliament. Painful as every appearance of violence muſt have proved to the mild diſpoſition of Lewis, he could not conſent to ſurrender, without a ſtruggle, that authority which had been ſo long exerciſed by his predeceſſors. Since the commencement of the preſent diſcontents, the capital had been gradually filled with conſiderable bodies of troops; and about a week after the parliament had entered the proteſt, an officer of the French guards, with a party of ſoldiers, went at break of day to the houſe of each individual member, to ſignify to him the king's command, that he ſhould immediately get into his carriage, proceed to Troyes, a city of Champagne, about ſeventy miles from Paris, without writing or ſpeaking to any perſon out of his own houſe before his departure. Theſe orders were ſerved at the ſame inſtant, and before the citizens of Paris were acquainted with the tranſaction, the parliament were already on the road to the ſcene of their baniſhment.

But previous to their removal, they had preſented a remonſtrance on the late meaſures of government, and the alarming ſtate of public affairs. In ſtating their opinions on taxes, they declared that neither the parliaments, nor any other authority, excepting that of the three ſtates of the kingdom, collectively aſſembled, could warrant the laying of any permanent tax upon the people; and they ſtrongly enforced the renewal of thoſe national aſſemblies, which had rendered the reign of Charlemagne ſo great and illuſtrious.

So great was the reſentment of the whole nation againſt the baniſhment of the parliament, that after a month's exile it was recalled. This was ſcarcely done, when they were deſired to regiſter a loan; at which they heſitated, notwithſtanding all the manœvres of the miniſter. At laſt the king came to the houſe, and held what is called a royal ſeſſion. The edicts were now regiſtered, but the Duke of Orleans proteſted, in the preſence of the king, againſt the legality of the proceeding. The parliament proteſted againſt the legality of the ſeſſion itſelf, but to no purpoſe. The Duke of Orleans, with four others, were baniſhed; the king called for the journals of the houſe, deſtroyed the proteſt, and forbad it to be inſerted again. Great clamours were raiſed by the baniſhment of the Duke of Orleans, and the other members of parliament; remomſtrances were preſented by the parliaments of Paris, Bourdeaux, and Rennes, but the exiles were not recalled till the ſpring of 1788.

The parliament of Paris had not confined their demands to the liberation of thoſe gentlemen, but had echoed the remonſtrances of the parliament of Grenoble, and had loudly inveighed againſt the execution of *lettres de cachet*. So free and pointed were the ſpeeches of two of the members that Lewis was once more prevailed upon to recur to ſeverity, and Meſſrs. d'Eſpremevil and Monſambert were committed to ſeparate ſtate-priſons.

The remonſtrance of the parliament on this new inſtance of deſpotiſm, exceeded in boldneſs all the former repreſentations of that aſſembly, they declared they were now more ſtrongly confirmed, by every proceeding, of the entire innovation which was aimed at in the conſtitution. "But, Sire," added they, "the French nation "will never adopt the deſpotic meaſures to which you are adviſed, and whoſe "effects alarm the moſt faithful of your magiſtrates; we ſhall not repeat all the

" unfortunate circumſtances which afflict us; we ſhall only repreſent to you with " reſpectful firmneſs, that the fundamental laws of the kingdom *muſt* not be " trampled upon; and that *your authority can only be eſteemed, ſo long as it is tempered* " *with juſtice.*"

Language ſo bold and deciſive, and which aſſerted the controlling power of the laws above the regal authority, could not fail of ſeriouſly alarming the royal boſom. No alternative remained now to Lewis but to plunge his country into all the calamities of civil war, or to comply with the wiſhes of his people, and re-eſtabliſh the ſtates-general. In the firſt caſe, he muſt have expected to encounter the majority of the people, animated by the exhortations and examples of their magiſtrates; the peers of the realm had expreſſed the ſtrongeſt diſapprobation of his meaſures, nor could he even depend any longer on the princes of his blood; but what afforded moſt ſerious matter of alarm was the ſpirit lately diſplayed among the military, who, during the diſturbances in the provinces, had reluctantly been brought to draw their ſwords againſt their countrymen; and many of whoſe officers, ſo recently engaged in eſtabliſhing the freedom of America, publicly proclaimed their abhorrence of deſpotiſm.

Yet it was not till after many a painful ſtruggle, that Lewis could reſolve to reſtore an aſſembly, whoſe influence muſt naturally over-ſhadow that of the crown, and whoſe juriſdiction would confine, within narrow limits, the boundleſs power he had inherited from his predeceſſor. During the two preceding reigns, the ſtates general had been wholly diſcontinued; and though the queen-regent, during the troubles which attended the minority of Lewis the Fourteenth, frequently expreſſed her intention of calling them together, ſhe was conſtantly diſſuaded by the repreſentations of the crafty Mazarine. It is probable that the preſent monarch ſtill flattered himſelf with the fallacious hope of being able to allure the members of that aſſembly to the ſide of the court; and having employed them to eſtabliſh ſome degree of regularity in the finances, and to curb the ſpirit of the parliaments, he would again diſmiſs them to obſcurity.

It was under theſe impreſſions, in the beginning of Auguſt, an arret was publiſhed, which fixed the meeting of the ſtates-general to the firſt of May in the enſuing year, viz. 1789; at the ſame time every ſtep was taken to ſecure the favourable opinion of the public. New arrangements took place in the admiſtration, and Monſieur Necker, whom the confidence of the people had long followed, was againſt introduced into the management of the finances; the torture, which by a former edict had been reſtricted in part, was now entirely aboliſhed; every perſon accuſed was allowed the aſſiſtance of counſel, and permitted to avail himſelf of any point of law; and it was decreed that in future, ſentence of death ſhould not be paſſed on any perſon, unleſs the party accuſed ſhould be pronounced guilty by a majority at leaſt of three judges.

But the moſt important conſideration that occupied the attention of the ſovereign and his miniſters, was the means of re-aſſembling the ſtates-general. The laſt meeting, in the year 1614, had been convened by application to the bailiwicks; but this mode was liable to ſeveral ſtrong objections; the bailiwicks had been increaſed in number and juriſdiction, and ſince that period ſeveral provinces had been united to France; nor were the numbers and quality of the members leſs an object of ſerious deliberation; and it was not till the cloſe of the year that the propoſal of Monſ. Necker was adopted, and publicly regiſtered, which fixed the number of deputies at one thouſand and upwards; and ordained that the repreſentatives of the third eſtate or commons, ſhould equal in number thoſe of the nobility and clergy united.

The eyes of all Europe were now turned on the ſtates-general, or national aſſembly, whoſe re-eſtabliſhment, in the month of May, 1789, preſented a new æra in the government

government of France. But the moment of their meeting was far from auſpicious to the court, but greatly ſo to the intereſt of the nation. The minds of the French had long been agitated by various humours; the unanimity that had been expected from the different orders of the ſtates was extinguiſhed by the jarring pretenſions of each; and their mutual jealouſies were attributed by the ſuſpicions of the people to the intrigues of the court, who were ſuppoſed already to repent of the haſty aſſent that had been extorted. A dearth that pervaded the kingdom increaſed the general gloom and diſcontent, and the people preſſed by hunger, and inflamed by reſentment, were ripe for revolt. The ſovereign alſo, equally impatient of the obſtacles he inceſſantly encountered, could not conceal his chagrin; the influence of the queen in the cabinet was again eſtabliſhed, and was attended by the immediate removal of Monſ. Necker. This ſtep, which evinced a total change of reſolutions, and which, from the popularity of the miniſter, was likely to produce a violent fermentation in every order of men, was followed by others equally injudicious. The ſtates-general were driven into the "Salle des Etats," where they held their meetings, by detachments of the guards, who ſurrounded them, and who waited only the orders of the court, to proceed to greater extremities againſt the obnoxious repreſentatives of the nation.

Had theſe manifeſtations of vigour been only ſuſtained by inſtantly attacking and entering Paris, it is not to be doubted that unprepared as it ſtill was, and unwilling to expoſe to the licence of an incenſed ſoldiery the lives and properties of its citizens, the capital would have been without difficulty reduced to obedience. But the delay which ſucceeded gave the inhabitants time to recover from their firſt emotions of ſurprize and apprehenſion. They ſaw the timidity and imbecility of the government, who, having ſounded the charge, dared not advance to the attack. They profited by this want of exertion; and paſſing from one extreme rapidly to another, they almoſt unanimouſly took up arms againſt their rulers and oppreſſors. Joined by the French guards, who, from a long reſidence in the capital, had been peculiarly expoſed to ſeduction, and who at this deciſive moment abandoned their ſovereign, the Pariſians broke through every obſtacle by which they had hitherto been reſtrained. The ſupplies of arms and ammunition, which had been provided for their ſubjugation, were turned againſt the crown; and the "Hotel des Invalides," the great repoſitory of military ſtores, after a faint reſiſtance ſurrendered.

The prince de Lambeſc, who alone, of all the officers commanding the royal troops in the vicinity of Paris, attempted to carry into execution the plan for diſarming the capital, was repulſed in a premature and injudicious attack, which he made at the head of his dragoons, near the entrance of the garden of the Tuilleries. Already the "Provot des Marchands," Monſieur de Fleſſels, convicted of entertaining a correſpondence with the court, and detected in ſending private intelligence to Monſieur de Launay, governor of the Baſtile, had been ſeized by the people, and fallen the firſt victim to the general indignation. His head, borne on a lance, exhibited an alarming ſpectacle of the danger to which adherence to the ſovereign muſt expoſe, in a time of anarchy and inſurrection.

The Baſtile alone remained; and while it continued in the power of the crown, Paris could not be regarded as free, or even ſecure from the ſevereſt chaſtiſement. It was inſtantly inveſted on the 14th of July, 1789, by a mixed multitude, compoſed of citizens, and ſoldiers who had joined the popular banner. De Launay, who commanded in the caſtle, by an act of perfidy, unjuſtifiable under any circumſtances, and which rendered his fate leſs regretted, rather accelerated, than delayed the capture of this important fortreſs. He diſplayed a flag of truce, and demanded a parley; but abuſing the confidence which theſe ſignals inſpired, he diſcharged a heavy fire from the cannon and muſquetry of the place upon the beſiegers, and made a conſiderable

carnage. Far from intimidating, he only augmented, by ſo treacherous a breach of faith, the rage of an incenſed populace. They renewed their exertions with a valour raiſed to frenzy, and were crowned with ſucceſs. The Baſtile, that awful engine of deſpotiſm, whoſe name alone diffuſed terror, and which for many ages had been ſacred to ſilence and deſpair, was entered by the victorious aſſailants. De Launay, ſeized and dragged to the "Place de Greve," was inſtantly diſpatched, and his head carried in triumph through the ſtreets of Paris.

In this priſon were found the moſt horrible engines for putting to the ſevereſt tortures thoſe unhappy perſons, whom the cruelty or jealouſy of the monarch, or even of his favourite miſtreſs, had determined to deſtroy. An iron cage, about twelve tons in weight was found with the ſkeleton of a man in it, who had probably lingered out a great part of his days in that horrible manſion. Among the priſoners releaſed by its deſtruction were major White, a Scotſman, earl Mazarine, an Iriſh nobleman, and the count de Lorges. The former appeared to have his intellectual faculties almoſt totally impaired by the long confinement and miſeries he had endured; and, by being unaccuſtomed to converſe with any human creature, he had forgotten the uſe of ſpeech. Earl Mazarine, on his arrival at the Britiſh ſhore, eagerly jumped out of the boat, fell down on his knees, and kiſſing the ground thrice, exclaimed, "God bleſs this land of liberty." The count de Lorges, at a very advanced period of life, was alſo liberated, and exhibited to the public curioſity in the "Palais Royal." His ſqualid appearance, his white beard which deſcended to his waiſt, and above all, his imbecility, reſulting probably from the effect of an impriſonment of thirty-two years, were objects highly calculated to operate upon the ſenſes and paſſions of every beholder. It is indeed impoſſible, not to participate in the exultation, which a capital and a country ſo highly illuminated, and ſo long oppreſſed, muſt have experienced, at the extinction of this deteſtable and juſtly dreaded priſon of ſtate.

With the Baſtile expired the royal authority and conſideration. The deſpotiſm of the French princes, which long preſcription, ſubmiſſion, and military ſtrength ſeemed to render equally ſacred and unaſſailable: which neither the calamities of the cloſe of Lewis the Fourteenth's reign, the profligacy and enormities of the ſucceeding regency, nor the ſtate of degradation into which the monarchy ſunk under Lewis the Fifteenth, had ever ſhaken: that power, which appeared to derive its ſupport almoſt as much from the loyalty and veneration, as from the dread and terrors of the ſubject, fell proſtrate in the duſt, and never betrayed a ſymptom of returning life.

Every friend to the natural rights and liberties of man, every man who has any drops of the "milk of human kindneſs" in his conſtitution, muſt rejoice in the overthrow of a government ſo deſpotic as was that of France, and in the formation of a new conſtitution upon the broad baſis of the natural equality of men. That coolneſs, that patriotiſm and good ſenſe which the national aſſembly have diſcovered, prove them to be worthy of the high truſt which has been repoſed in them. With unwearied pains they have been forming a new conſtitution, of which the following are fundamental poſitions, 1. Men are born and always continue free, and equal in reſpect of their rights. Civil diſtinctions therefore can be founded only on public utility. 2. The end of all political aſſociations is the preſervation of the natural, and impreſcriptible rights of man; and theſe rights are liberty, property, ſecurity, and reſiſtance of oppreſſion. 3. The nation is eſſentially the ſource of all ſovereignty, nor can any individual, or any body of men, be entitled to any authority which is not expreſsly derived from it.

Though the national aſſembly have not yet thoroughly ſettled the new conſtitution on a firm baſis, they have made ſeveral excellent regulations, which promiſe

to

to make that kingdom, from one of the moſt deſpotic in Europe, a greater ſeat of liberty than even Britain itſelf. No inſtitution, however, does the aſſembly more honour than the unlimited toleration in religious matters which has at length taken place in that once intolerant country; and what is very remarkable, this important point was carried without a diviſion. By this act all citizens are admiſſible to civil and military offices, without any other *teſt* than that of being good ſubjects to the ſtate. All orders and titles of nobility are aboliſhed, and no other diſtinction known than what ariſes from a man's perſonal character. Juſtice is to be executed without any expence to the people. A new diviſion of the kingdom has taken place, and the number of deputies ſent to the national aſſembly by each diſtrict, to be in proportion to the population, taxes, and territory, jointly conſidered.

Notwithſtanding the ſolemn oath which his majeſty had taken to ſupport the new conſtitution, on the night of Monday the 20th of June, 1791, about twelve o'clock, the king and queen of France, with their infant children, and Monſieur and Madame, commenced the execution of their long meditated project to the army of royaliſts. The centinels it is ſaid were gained by means of bribes. His majeſty and the royal family were abſent ſix hours before a diſcovery took place, and a paper was left behind him in which the king declared, "*that he ſolemnly revoked all the acts to which he had ſet his name.*"

This unexampled eſcape, which menaced France with the convulſions of anarchy and the horrors of civil war, has happily produced none of thoſe effects which the enemies of freedom predicted with ſo much triumph, and her friends expected with ſo much alarm. No life was ſacrificed, no property was violated, by the populace of Paris. They ſeemed inſpired, by the greatneſs of their cauſe, with a magnanimity which counteracted their terror, and diſarmed their reſentment. After a few hours of ferment and alarm, they ſubſided into a tranquil and confident ſubmiſſion to their auguſt repreſentatives.

That body, to whom the abdication of the king had now devolved the dictatorſhip of France, diſplayed a ſerenity, a firmneſs, a magnanimity, to which no parallel is recorded in hiſtory. Unappalled by the tempeſt which threatened their exiſtence, and the ſhipwreck of their ſyſtem, they fixed their ſteady eye on the grand object of giving nerve to public order. They paſſed no vindictive decree—they enflamed no popular reſentment. But the detail of their proceedings from the morning of Tueſday, when they learned the flight of the king, to the evening of Wedneſday, when the news of his capture arrived in Paris, will be the moſt ample and fair eulogy on the manlineſs and wiſdom of that aſſembly.

The rout of the royal fugitives, which had been expected to be towards the Auſtrian Netherlands, the neareſt frontiers of the kingdom, was in fact directed towards Metz, from the preſence of ſo gallant and accompliſhed a royaliſt as M. de Bouillé in that quarter, from its vicinity to the prince of Conde's army in Germany, and from the probable reluctance of Leopold to hazard the tranquillity of his Netherlands, by permitting any incurſion from them into France. They reached St. Menehoud, a ſmall town, about 150 miles from Paris. The king was there recognized by the poſtillion, who ſaid to him, "*Mon Roi, je vous connois mais je ne vous trahirai pas.*" "I know you, my king, but I will not betray you." But the poſt-maſter, M. Drouet, leſs full of monarchic prejudice, and more ſolicitous for the tranquillity of his country adopted a different conduct. He refrained with great dexterity and preſence of mind from betraying his knowledge of the rank of the royal travellers, being much ſtruck with the reſemblance which his majeſty's countenance bore to his effigy on an aſſignat of 50 livres. The carriages taking the road to Varennes, he went a croſs-road, in order to rejoin them; and arriving before them at Varennes, he alarmed the town, and aſſembled the national guards, who, notwithſtanding the

detachment

detachment of huſſars to protect his route, diſarmed them, and the KING was then *made a priſoner:* and at ſix o'clock in the afternoon of the 25th of June, their majeſties, with the Dauphin and Madame Royale arrived at the Tuilleries.

The enemies of the revolution imagined perhaps that it was only deſired at Paris, and that the body of the people held oppoſite ſentiments; but from the addreſſes to the national aſſembly from various parts of the empire, from the zeal and ardour for the new conſtitution, which ſeems to inſpire all ranks and orders of men, they appear all to be animated with but one ſoul. The ſame firmneſs, the ſame knowledge, the ſame patriotiſm, is evident in them all.

What the deciſion of the national aſſembly will be as to the treatment of the king, could not be known, when this part of our work went to the preſs, but we heſitate not to predict that it will be moſt perfectly conſiſtent with the wiſdom, the dignity, and the temperance, which guided the councils and conduct of this illuſtrious band of legiſlators, in the hour of alarm, uncertainty, and peril.

Lewis XVI. king of France and Navarre, was born in 1754, ſucceeded his grandfather Lewis XV. in 1774, married, 1770, to Maria Antonietta, ſiſter of the emperor of Germany, born 1755. Their iſſue are Madame Maria Thereſa Charlotte, born on the 19th of December 1778; and Lewis Joſeph Xavier Francis, dauphin of France, born October 22, 1781.

His majeſty's brothers and ſiſters are,

1. L. Stan. Xavier, count de Provence, born 1755.
2. Charles Philip, count d'Artois, born 1757.
3. Maria Adelaid Clotilda Xaveria, born 1759.
4. Elizabeth Philippa Maria Helena, born 1764.

Iſſue of Lewis XV. now living, are,

1. Maria Adelaide, ducheſs of Lorrain and Bar, born 1732.
2. Victoria Louiſa Maria Thereſa, born 1733.
3. Sophia Philippina Elizabeth Juſtinia, born 1734.
4. Louiſa Maria, born 1737, who went into a convent of Carmelites, and took the veil in 1770.

NETHERLANDS.

THE ſeventeen provinces which are known by the name of the Netherlands, were formerly part of Gallia Belgica, and afterwards of the circle of Belgium or Burgundy, in the German empire. They obtained the general name of Netherlands, Pais-Bas, or Low Countries, from their ſituation in reſpect of Germany.

EXTENT, SITUATION, AND BOUNDARIES OF THE SEVENTEEN PROVINCES.

	Miles.		Degrees.
Length	360	between	49 and 54 North lat.
Breadth	260		2 and 7 Eaſt lon.

They are bounded by the German ſea on the North; by Germany, Eaſt; by Lorrain and France, South; and by the Britiſh channel, Weſt.

I ſhall for the ſake of perſpicuity, and to avoid repetition, treat of the ſeventeen provinces under two great diviſions: firſt, the *Northern*, which contains the ſeven United

United Provinces, uſually known by the name of HOLLAND: ſecondly, the *Southern* containing the Auſtrian, and French Netherlands. The United Provinces are, properly ſpeaking, eight, viz. Holland, Overyſſel, Zealand, Frieſland, Utrecht, Groningen, Gelderland, and Zutphen; but the two latter forming only one ſovereignty, they generally go by the name of the Seven United Provinces.

SITUATION AND EXTENT OF THE UNITED PROVINCES.

Miles.		Degrees.			
Length 153 Breadth nearly the ſame.	between	51 and 54	North lat.
		3 and 7	Eaſt lon.

The following, from Templeman's ſurvey of the globe, is the moſt ſatisfactory account we meet with of their geographical diviſion, including the Texel, and other iſlands.

Countries Names, United Provinces.		Square Miles.	Length.	Breadth.	Chief Cities.
Calviniſts.	Overyſſel	1,900	66	50	Deventer
	Holland	1,800	84	52	AMSTERDAM
	Gelderland	986	50	40	Nimeguen
	Frieſland	810	44	34	Leuwarden
	Zutphen	644	37	33	Zutphen
	Groningen	540	45	37	Groningen
	Utrecht	450	41	22	Utrecht
	Zealand	303	29	24	Middleburg
	Texel and other iſlands	113			
	Total —	7,546			

The ſubdiviſions of the United Provinces, with their chief towns, have alſo been given in the following manner;

Prov.	Subdiv.	Chief Towns.	Prov.	Subdiv.	Chief Towns.
1. Holland.	South Holland.	Amſterdam	1. Holland.	North Holland.	Saardam
		Rotterdam			Edam
		Delft			Hoorn
		Hague			Euchuſen
		Haerlem			Alkemaer
		Leyden			Monckdam
		Dort			Puermerent
		Williamſtadt			
		Naerden	Iſlands of Holland.	Voorn	Briel
		Gorcum		Iſlemond	Helvoetſluys
		Heuſden		Goree	Goree
				Overflake	Somerdyke
				Texel	Burg
				Vlie	Two Villages
				Schelling	Five Villages

Prov.	Subdiv.	Chief Towns.
2. Iſlands of Zealand.	Walchereh	Middleburg, Fluſhing, Terveer, Rammekins
	Schowen	Zurickſee, Brewerſhaven
	N. Beveland	Tolen
	S. Beveland	Cats
	Duyveland	Tergoes
3. Frieſland N. E. of Holland.	Oſtergoe	Lewarden, Dockum
	Weſtergoe	Franker, Harlingen
	Sevenwolden	Sloot
4. Groningen N. E. of Holland.	Groningen	Groningen, Winſchoten
	The Omlands	Dam
5. Overyſſel E. of the Zuider ſea.	Iſeland	Daventer, Zwoll
	The Drente	Covarden, Otmarſen
6. Gelderland and Zutphen, S. E. of Holland.	Velew	Anheim, Loo palace, Hardewicke
	Betewe, olim Batavia	Nimeguen, Skenkenſchans, Bommel
	Zutphen	Zutphen, Doeſhurg, Groll
	Gelder quarter	Gelder, Venlo

The town of Gelder is ſubject to Pruſſia, and hath been ſince 1713.

7. UTRECHT in the Middle.

Subdiviſions.	Chief Towns.
On the old channel of the Rhine	Utrecht
North of the Old Rhine	Amerfort
South of the Old Rhine	Dueſtardwyck

AIR, SEASONS, SOIL, AND FACE OF THE COUNTRY.] Theſe provinces lie oppoſite to England, at the diſtance of 90 miles, upon the eaſt ſide of the Engliſh channel, and are only a narrow ſlip of low ſwampy land, lying between the mouths of ſeveral great rivers, and what the induſtry of the inhabitants have gained from the ſea by means of dykes, which they have raiſed and ſtill ſupport with incredible labour and expence. The air of the United Provinces is therefore foggy and groſs, until it is purified by the froſt in winter, when the eaſt wind uſually ſets in for about four months, and their harbours are frozen up. The moiſture of the air cauſes metals to ruſt, and wood to mould, more than in any other country, which is the reaſon of their perpetually rubbing and ſcouring, and of the brightneſs and cleanlineſs in their houſes ſo much taken notice of. The ſoil is unfavourable to vegetation, but, by the induſtry of the inhabitants in making canals, it is rendered fit for paſture, and in many places for tillage. Holland, with all its commercial advantages, is not a deſirable country to live in, eſpecially to foreigners. Here are no mountains nor riſing grounds, no plantations, purling ſtreams, or cataracts. The whole face of the country, when viewed from a tower or ſteeple, has the appearance of a continued marſh or bog, drained at certain diſtances by innumerable ditches; and many of the canals, which in that country ſerve as high-roads, are in the ſummer months no better than offenſive ſtagnated waters.

RIVERS AND HARBOURS.] The rivers are an important conſideration to the United Provinces; the chief of which are the Rhine, one of the largeſt and fineſt rivers in Europe; the Meaſe, the Scheld, and the Vecht. There are many ſmall rivers that join theſe, and a prodigious number of canals; but there are few good harbours in the United Provinces; the beſt, are thoſe of Rotterdam, Helvoetſluys, and

and Flushing; that of Amsterdam, though one of the largest and safest in Europe, has a bar at the entrance of it, over which large vessels cannot pass without being lightened.

VEGETABLE AND ANIMAL PRODUCTIONS BY SEA AND LAND. The quantity of grain produced here is not sufficient for home consumption; but by draining their bogs and marshes they have many excellent meadows, which fatten lean German and Danish cattle to a vast size; and they make prodigious quantities of the best butter and cheese in Europe. Their country produces turf, madder, tobacco, some fruit, and iron; but all the pit-coal and timber used there, and indeed many of the comforts, and even the necessaries of life, are imported. They have a good breed of sheep, whose wool is highly valued; and their horses and horned cattle are of a larger size than in any other country in Europe. It is said, there are some wild bears and wolves here. Storks build and hatch on their chimnies; but, being birds of passage, they leave the country about the middle of August, with their young, and return the February following. Their river-fish is much the same as ours, but their sea-fish is generally larger, owing perhaps to their fishing in deeper water. No herrings visit their coasts; but they have many excellent oyster-beds about the islands of the Texel, producing very large and well-tasted oysters. Notwithstanding all these inconveniencies, the industry of the Hollanders furnishes as great a plenty of the necessaries and commodities of life, and upon as easy terms (except to travellers and strangers) as they are to be met with in any part of Europe.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, AND DIVERSIONS. The Seven United Provinces are perhaps the best peopled of any spot of the same extent in the world. They contain, according to the best accounts, 113 cities and towns, 1400 villages and 2,758,632 inhabitants, according to a public account given in 1785. Besides the twenty-five towns, and the people in what is called the Lands of the Generality, or conquered countries and towns of other parts of the Netherlands *. The manners, habits, and even the minds of the Dutch (for so the inhabitants of the United Provinces are called in general) seem to be formed by their situation, and to arise from their natural wants. Their country, which is preserved by mounds and dykes, is a perpetual incentive to labour; and the artificial drains with which it is every where intersected, must be kept in perpetual repair. Even what may be called their natural commodities, their butter and cheese, are produced by a constant attention to the laborious parts of life. Their principal food they earn out of the sea by their herring-fisheries; for they dispose of most of their valuable fishes to the English, and other nations, for the sake of gain. The air and temperature of their climate incline them to phlegmatic, slow dispositions, both of body and mind; and yet they are irascible, especially if heated with liquor. Even their virtues are owing to their coldness, with regard to every object that does not immediately concern their own interests; for in all other respects they are quiet neighbours and peaceable subjects. Their attention to the constitution and independency of their country is owing to the same principle; for they were never known to effect a change of government but when they thought themselves on the brink of perdition.

The valour of the Dutch becomes warm and active when they find their interest at stake; witness their sea wars with England and France. Their boors, though

* Monsieur de Wit, at the beginning of this century, computed the people of Holland at 2,500,000, but Mr. Templeman estimates them only at 2,000,000, which, in proportion to the populousness of England is more than six to one, considering the extent of the country. Holland is also reckoned to have as many souls as the other six provinces, which, if true, the people of the seven provinces with their appendages must be very numerous.

ſlow of underſtanding, are manageable by fair means. Their ſeamen are a plain, blunt, but rough, ſurly, and ill-mannered ſort of people, and appear to be inſenſible of public ſpirit and affection for each other. Their tradeſmen in general are reckoned honeſt in their dealings, and very ſparing of their words. Smoking tobacco is practiſed by old and young of both ſexes; and as they are generally plodding upon ways and means of getting money, no people are ſo unſociable. A Dutchman of low rank, when drunk, is guilty of every ſpecies of brutality. The Dutch have alſo been known to exerciſe the moſt dreadful inhumanities for intereſt abroad, where they thought themſelves free from diſcovery; but they are in general quiet and inoffenſive in their own country, which exhibits but few inſtances of murder, rapine, or violence. As to the habitual tippling and drinking charged upon both ſexes, it is owing in a great meaſure to the nature of their ſoil and climate. In general, all appetites and paſſions ſeem to run lower and cooler here than in moſt other countries, that of avarice excepted. Their tempers are not airy enough for joy, or any unuſual ſtrains of pleaſant humour, nor warm enough for love; ſo that the ſofter paſſions ſeem no natives of this country; and love itſelf is little better than a mechanical affection, ariſing from intereſt, conveniency, or habit; it is talked of ſometimes among the young men, but as a thing they have heard of rather than felt, and as a diſcourſe that becomes them rather than affects them.

In whatever relates to the management of pecuniary affairs, the Dutch are certainly the moſt expert of any people; as to the knowledge of acquiring wealth they unite the no leſs neceſſary ſcience of preſerving it. It is a kind of general rule for every man to ſpend leſs than his income, be that what it will; nor does it often enter into the heads of this ſagacious people, that the common courſe of expence ſhould equal the revenue; and when this happens, they think at leaſt they have lived that year to no purpoſe; and the report of it uſed to diſcredit a man among them, as much as any vicious or prodigal extravagance does in other countries. But this rigid frugality is not ſo univerſal among the Dutch as it was formerly; for a greater degree of luxury and extravagance has been introduced among them, as well as the other nations of Europe. Gaming is likewiſe practiſed by many of their faſhionable ladies, and ſome of them diſcover more propenſity to gallantry than was known here in former times. No country can vie with Holland in the number of thoſe inhabitants, whoſe lot, if not riches, is at leaſt a comfortable ſufficiency; and among whom fewer failures or bankruptcies occur. Hence, in the midſt of a world of taxes and contributions, ſuch as no other country experiences, they flouriſh and grow rich. From this ſyſtematic ſpirit of regularity and moderation, joined to the moſt obſtinate perſeverance, they ſucceeded in the ſtupendous works of draining their country of thoſe immenſe deluges of water that had overflowed ſo large a part of it during many ages, while at the ſame time they brought under their ſubjection and command the rivers and ſeas that ſurround them, by dykes of incredible thickneſs and ſtrength, and made them the principal bulwarks on which they rely for the protection and ſafety of their territories againſt the danger of an enemy This they have done by covering their frontiers and cities with innumerable ſluices; by means of which, at the ſhorteſt notice, the moſt rapid inundations are let in, and they become in a few hours inacceſſible. From that frugality and perſeverance by which they have been ſo much characteriſed, they were enabled, though labouring under the greateſt difficulties, not only to throw off the Spaniſh yoke, but to attack that powerful nation in the moſt tender parts, by ſeizing her rich galleons, and forming new eſtabliſhments in Africa, and the Eaſt and Weſt Indies, at the expence of Spain, and thereby becoming, from a deſpicable province, a moſt powerful and formidable enemy. Equally wonderful was the growth of their military and marine eſtabliſhments, maintaining during their celebrated contenſion with Lewis XIV. and Charles II.

H. of England, not leſs than 150,000 men, and upwards of 80 ſhips of the line. But a ſpirit of frugality being now leſs univerſal among them, the rich traders and mechanics begin to approximate to the luxuries of the Engliſh and French; and their nobility and high magiſtrates, who have retired from trade, rival thoſe of any other part of Europe in their table, buildings, furniture, and equipages.

The diverſions of the Dutch differ not much from thoſe of the Engliſh, who ſeemed to have borrowed from them the neatneſs of their drinking-booths, ſkittle and other grounds, and ſmall pieces of water, which form the amuſements of the middling ranks, not to mention their hand-organs, and other muſical inventions. They are the beſt ſkaters upon the ice in the world. It is amazing to ſee the crowds in a hard froſt upon the ice, and the great dexterity both of men and women darting along, or rather flying, with inconceivable velocity.

Dress.] Their dreſs formerly was noted for the large breeches of the men; and the jerkins, plain mobs, ſhort petticoats, and other oddities of the women; all which, added to the natural thickneſs and clumſineſs of their perſons, gave them a very groteſque appearance. Theſe dreſſes now prevail only among the lower ranks, and more particularly amongſt the ſea-fearing people.

Religion.] The eſtabliſhed religion here is the Preſbyterian and Calviniſm; none but Preſbyterians are admitted into any office or poſt in the government, except the army; yet all religious ſects are tolerated, and have their reſpective meetings or aſſemblies for public worſhip, among which the Papiſts and Jews are very numerous. And, indeed, this country may be conſidered as a ſtriking inſtance of the benefits ariſing to a nation from univerſal toleration. As every man is allowed to worſhip God according to the dictates of his own conſcience, perſons of the moſt oppoſite opinions live together in harmony and peace. No man in this republic has any reaſon to complain of being oppreſſed on account of his religious principles, nor any hopes, by advancing his religion, to form a party, or to break in upon the government; and therefore in Holland men live together as citizens of the world; their differences in opinion make none in affection, and they are aſſociated together by the common ties of humanity and the bonds of peace, under the protection of the laws of the ſtate; with equal encouragement to arts and induſtry, and equal freedom of ſpeculation and enquiry.

Language.] The natural language of the United Provinces is Low Dutch, which is a corrupted dialect of the German; but the people of faſhion ſpeak Engliſh and French. Their Lord's Prayer runs thus: *Onſe Vader, die in de hemel zyt uwen naam worde geheylight: uw'koningkryk kome: uwe wille geſchiede gelyck en den hemel zoo ook op den arden, ons dagelyks brood geef ons heeden, ende vergeeft onſe ſchulden gelyk ook wy vergeeven onſe ſchuldenaaren: ende laats ons niet in verſoeking maer verl ſs ons van de booſen.* Amen.

Learning and learned men.] Eraſmus and Grotius, who were both natives of this country, ſtand almoſt at the head of modern learning, as Boerhaave does of medicine. Haerlem diſputes the invention of printing with the Germans, and the magiſtrates keep two copies of a book intitled *Speculum Salvationis*, printed by Koſter in 1440; and the moſt elegant editions of the claſſics came from the Dutch preſſes of Amſterdam, Rotterdam, Utrecht, Leyden, and other towns. The Dutch have excelled in controverſial divinity, which inſinuated itſelf ſo much into the ſtate, that before principles of univerſal toleration prevailed, it had almoſt proved fatal to the government; witneſs the violent diſputes about Arminianiſm, free-will, predeſtination, and the like. Beſides Boerhaave, they have produced excellent writers in all branches of medicine. Grævius and Burmann are ranked among their numerous commentators upon the claſſics. Nothing is more common than their Latin poems and epigrams; and later times have produced a Van Haaren, who is poſſeſſed of

of ſome poetical abilities, and about the year 1747 publiſhed poems in favour of liberty, which were admired as rarities, chiefly becauſe their author was a Dutchman. In the other departments of literature, the Dutch publications are mechanical, and ariſe chiefly from their employments in univerſities, church, or ſtate.

UNIVERSITIES.] Theſe are Leyden, Utrecht, Groningen, Harderwicke, and Franeker.

The univerſity of Leyden, which was founded in 1575, is the largeſt and moſt ancient in all the United Netherlands. Its library, beſides a number of printed books, has two thouſand oriental manuſcripts, many of which are in Arabic; and a large ſphere adapted to the Copernican ſyſtem, and moving by clock-work. Here is alſo a phyſic-graden, and an anatomical theatre.

The univerſity of Utrecht, in the province of the ſame name, was changed from a ſchool into an univerſity, in 1636; but it has not all the privileges of the other univerſities, being entirely ſubject to the magiſtrates of the city. The phyſic garden here is very curious; and for the recreation of the ſtudents, on the eaſt ſide of the city juſt without the gate, is a beautiful mall, conſiſting of ſeven ſtraight walks, two thouſand paces in length, regularly planted with limes; but that in the middle is properly the mall.

The number of ſtudents, one year with another, is ſeven or eight hundred in each of the univerſities of Leyden and Utrecht: in the other three they are not ſo numerous. Theſe ſeminaries of learning have each three or four divinity profeſſors, as many of phyſic, and two or three of law; beſides others of hiſtory, languages, and eloquence, or the *belles lettres*, and others of philoſophy, mathematics, the Greek and Roman antiquities, and the Hebrew and Oriental languages. The profeſſors in the univerſities of Holland are often men of great learning and eminence; as there is a kind of emulation between the ſtates of the different provinces, which ſhall have the greateſt men to adorn their univerſities, and attract numbers of ſtudents from all parts of Europe to enrich their towns: and, therefore they are ready to afford very liberal encouragement to able profeſſors, who are often invited from the univerſities of Germany.

The buildings of theſe univerſities are old, and rather mean; though the ſchools of Leyden are better, and more contiguous than the reſt. But the want of external pomp is more than compenſated by the variety of uſeful and ſolid learning taught in theſe ſeminaries. The profeſſors wear gowns when they read lectures, or preſide in public diſputations. The ſtudents wear no diſtinct habits, but are almoſt always in their morning gowns, in which they attend the colleges; and it is common for them, at Leyden, to walk in this dreſs in the ſtreets and mall without the city. There are abundance of youth, of the principal nobility and gentry, from moſt countries in Europe at theſe ſeminaries of literature: and as every one may live as he pleaſes, without being obliged to be profuſe in his expences, or ſo much as quitting his night gown for weeks or months together, foreigners of all ranks and conditions are to be ſeen here. The force of example is ſtrikingly exhibited at theſe univerſities: for frugality in expence, order, a compoſed behaviour, attention to ſtudy, and aſſiduity in all things, being the characteriſtics of the natives, ſtrangers who continue among them, ſoon adopt their manners and forms of living. And though the ſtudents live as they pleaſe, and ſtudy as much or as little as they think fit, yet they are in general remarkable for their ſobriety and good manners, and the aſſiduity and ſucceſs with which they apply themſelves to their ſtudies. No oaths are impoſed, nor religious teſts; ſo that Roman Catholic parents, and even Jews, ſend their children here, with as little ſcruple as Proteſtants.

ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICIAL. } The prodigious dykes, ſome of which are ſaid to be 17 ells in thickneſs; mounds, and canals,

canals, conſtructed by the Dutch, to preſerve their country from thoſe dreadful inundations by which it formerly ſuffered ſo much, are ſtupenduous and hardly to be equalled. A ſtone quarry near Maeſtricht, under a hill, is worked into a kind of ſubterraneous palace, ſupported by pillars twenty feet high. The ſtadthouſe of Amſterdam is perhaps the beſt building of that kind in the world: it ſtands upon 13,659 large piles, driven into the ground; and the inſide is equally convenient and magnificent. Several muſeums, containing antiquities and curioſities, artificial and natural, are to be found in Holland and the other provinces, particularly in the univerſity of Leyden; ſuch as the effigies of a peaſant of Ruſſia, who ſwallowed a knife ten inches in length, and is ſaid to have lived eight years after it was cut out of his ſtomach; but the truth of this ſeems to be doubtful. A ſhirt made of the entrails of a man. Two Egyptian mummies, being the bodies of two princes of great antiquity. All the muſcles and tendons of the human body curiouſly ſet up by profeſſor Stalpert Vander-Weil.

CITIES, TOWNS, AND OTHER EDIFICES, PUBLIC AND PRIVATE. Amſterdam, which is built upon piles of wood, is thought to contain 241,000 people, and to be next to London, the moſt commercial city in the world. Its conveniences for commerce, and the grandeur of its public works, are almoſt beyond deſcription. In this, and all other cities of the United Provinces, the beauty of the canals, and walks under trees planted on their borders, are admirable; but above all, we are ſtruck with the neatneſs and cleanlineſs that is every where obſerved within doors. This city, however, labours under two great diſadvantages; bad air, and the want of freſh wholeſome water, which obliges the inhabitants to preſerve the rain water in reſervoirs. Rotterdam is next to Amſterdam for commerce and wealth: its inhabitants are computed at 56,000. The Hague, though but a village, is the ſeat of government in the United Provinces, and is celebrated for the magnificence and beauty of its buildings, the reſort of foreign ambaſſadors and ſtrangers of all diſtinctions who live in it, the abundance and cheapneſs of its proviſions, and the politeneſs of its inhabitants, who are computed at 40,000. Leyden and Utrecht are fine cities, as well as famous for their univerſities. Saardam, a village in North Holland contains about 900 wind-mills; partly corn-mills, partly ſaw and paper-mills, and mills for the making of white lead, &c. It is a wealthy trading place, and was the workſhop where Peter the Great of Muſcovy ſerved his apprenticeſhip to ſhip-building, and laboured as a common artizan. The upper part of Gelderland is ſubject to Pruſſia, and the capital city Gelder.

INLAND NAVIGATION, CANALS, AND MANNER OF TRAVELLING. The uſual way of paſſing from town to town is by covered boats, called treck-ſcuits, which are dragged along the canal by horſes, on a ſlow uniform trot, ſo that paſſengers reach the different towns where they are to ſtop, preciſely at the appointed inſtant of time. This method of travelling, though to ſtrangers rather dull, is extremely convenient to the inhabitants, and very cheap. By means of theſe canals an extenſive land commerce is carried on through the whole country, and as they communicate with the Rhine and other large rivers, the productions of the whole earth are conveyed at a ſmall expence into various parts of Germany, and the Auſtrian and French Netherlands. A treckſcuit is divided into two different apartments, called the roof and the ruim; the firſt for gentlemen, and the other for common people. Near Amſterdam and other large cities, a traveller is delighted with beholding the effects of an extenſive and flouriſhing commerce. Here the canals are lined for miles together with elegant, neat country-houſes, ſeated in the midſt of gardens and pleaſure grounds intermixed with figures, buſts, ſtatues, temples, &c. to the very water's edge. Having no objects for amuſement beyond the limits of their own gardens, the families in fine weather ſpend much of their time there

ſmoaking, reading, or viewing the paſſengers, to whom they appear complaiſant and polite.

COMMERCE AND MANUFACTURES.] An account of the Dutch commerce would comprehend that of almoſt all Europe. There is ſcarcely a manufacture that they do not carry on, or a ſtate to which they do not trade. In this, they are aſſiſted by the populouſneſs of their country, their induſtry and frugality, and above all, by the water-carriage, which, by means of their canals, gives them advantages beyond all other nations. The United Provinces are the grand magazine of Europe; and goods may be purchaſed here ſometimes cheaper than in the countries where they grow. Their Eaſt India company has had the monopoly of the fine ſpices for more than a hundred years, and till the late war with England, was extremely opulent and powerful. Their capital city in India is Batavia, which is ſaid to exceed in magnificence, opulence, and commerce all the cities of Aſia. Here the viceroys appear in greater ſplendor than the ſtadtholder; and ſome of the Dutch ſubjects in Batavia ſcarcely acknowledge any dependence on the mother-country. Among the monopolies of the Eaſt-India company, the ſpice-trade, comprehending the articles of cloves, mace, nutmeg, cinnamon, &c. is the moſt valuable, and forms a very great branch of the Aſiatic as well as European commerce of Holland: 150,000lbs. of cloves are annually ſold in India, and 360,000 carried to Europe. The company pays on the ſpot only eight ſtivers per pound, but the freight and other charges raiſe this price to 43 ſtivers, and the company ſells it at no leſs than 75 ſtivers. Of nutmeg, the produce of the iſland of Banda, 250,000lbs. are ſold in Europe, and 100,000 in India: the prime coſt is ſomewhat more than one ſtiver per pound; including charges, the pound ſtands the company in about 25 ſtivers, and is ſold by the company at upwards of 50 ſtivers, weſt of the Cape of Good Hope; and at about 40 ſtivers, eaſt of it. In India 200,000lbs. of cinnamon are ſold, and 400,000 in Europe. The Java coffee is the beſt we know of, after that of Mecca, in Arabia. Other great branches of this trade are rice, cotton, pepper, &c. articles of great importance, but not in the excluſive poſſeſſion of the Dutch. They have other ſettlements in India, but none more pleaſant, heathful, or uſeful, than that on the Cape of Good Hope, the grand rendezvous for the ſhips of all nations, outward or homeward bound. When Lewis XIV. invaded Holland with an army of 80,000 men, the Dutch made ſome diſpoſitions to ſhip themſelves off to their ſettlement in India ſo great was their averſion to the French government. Not to mention their herring and whale fiſheries, which they have carried off from the native proprietors, they excel at home in numberleſs branches of trade; ſuch as their pottery, tobacco-pipes, delft-ware, finely refined ſalt; their oil-mills, and ſtarch-manufactures; their improvements of the raw linen thread of Germany; their hemp, and fine paper manufactures; and fine linen and table damaſks; their ſaw-mills for timber, either for ſhipping or houſes, in immenſe quantities; their great ſugar-baking; their vaſt woollen, cotton, and ſilk manufactures; wax-bleaching; leather dreſſing; the great quantity of their coin and ſpecie, aſſiſted by their banks, eſpecially by that of Amſterdam; their Eaſt India trade; and their general induſtry and frugality.

This country affords a ſtriking proof, that unwearied and perſevering induſtry is capable of conquering every diſadvantage of climate and ſituation. The poſſeſſion of the very ſoil is diſputed by the ocean, which riſing conſiderably above the level of the land, can only be prevented by ſtrong and expenſive dykes, from overflowing a ſpot which ſeems to be ſtolen from its natural domains. Notwithſtanding theſe difficulties, which might ſeem unſurmountable to a leſs laborious race of inhabitants, the infinite labours of the patient Dutchmen have rendered this ſmall and ſeemingly inſignificant territory, in fact, one of the richeſt ſpots in Europe, both with reſpect to population and property. In other countries, which are poſſeſſed of a variety

variety of natural productions, we are not ſurpriſed to find manufactures employed in multiplying the riches which the bounty of the ſoil beſtows. But to ſee in a country like Holland, large woollen manufactures, where there are ſcarce any flocks; numberleſs artiſts employed in metals, where there is no mine; thouſands of ſaw-mills, where there is ſcarce any foreſt; an immenſe quantity of corn, exported from a country where there is not agriculture enough to ſupport one-half of its inhabitants, is what muſt ſtrike every attentive obſerver with admiration. It is greatly doubted, however, whether their commerce, navigation, manufactures, and fiſheries, are in the ſame flouriſhing ſtate now as they were in the beginning of this century; and whether the riches and luxury of individuals have not damped the general induſtry of the inhabitants. Their commerce, &c. hath greatly ſuffered ſince their imprudent rupture with England.

The natural and political ſituation of the Dutch nation may be compared with the colonies of Canadian beavers, who by unwearied labour and mutual aſſiſtance, are enabled to build ſecure habitations on the banks of rapid rivers, and to form ſocieties rendered durable and invincible by the tie of firm union: yet their wonderful fabric would by diſſention and ſeparation, ſoon ſink into inſignificance or annihilation. When we conſider what Holland was before the union of Utrecht, and when we afterwards ſee the inhabitants of that ſwampy ſpot aſſume, for no inconſiderable period of time, the arbitrium of Europe and the Indies, it is not without regret we witneſs the decay of their power, that moſt admirable monument of human exertion and induſtry. An impartial obſerver, however, who cannot wiſh to ſee the benefits of activity confined to one ſpot, and extorted from the weakneſs and ignorance of other nations, will be comforted by the conſideration, that Holland's excluſive advantages are leſſened by the general increaſe of induſtry and happineſs throughout all the ſtates of Europe, and not by any of theſe great calamities or revolutions, which have put a period to the power of other commercial ſtates. Its decline is gentle and gradual: yet ſo high was the eminence Holland arrived at, that it is ſtill poſſeſſed of great power and conſequence.

PUBLIC TRADING COMPANIES.] Of theſe, the capital is the Eaſt India, incorporated in 1602, by which formerly the Dutch acquired immenſe wealth, having divided forty per cent, and ſometimes ſixty, about the year 1660; at preſent the dividends are much reduced; but in a hundred and twenty-four years, the proprietors, on an average, one year with another, divided ſomewhat above twenty-four per cent. So late as the year 1760, they divided fifteen per cent. but the Dutch Weſt India company, the ſame year, divided no more than two and a half per cent. This company was incorporated in 1621. The bank of Amſterdam is thought to be inexhauſtibly rich, and is under an excellent direction: it is ſaid by ſir William Temple, to contain the greateſt treaſure, either real or imaginary, that is known any where in the world. What may ſeem a paradox is, that this bank is ſo far from paying any intereſt, that the money in it is worth ſomething more than current caſh is, in common payments. Mr. Anderſon ſuppoſes that the caſh, bullion, and pawned jewels in this bank, which is kept in the vaults of the ſtadthouſe, amount to thirty-ſix (though others ſay only to thirty) millions ſterling.

CONSTITUTION AND GOVERNMENT.] This is a very intricate article; for though the United Provinces ſubſiſt in a common confederacy, yet each province has an internal government or conſtitution independent of the others: this government is called the *ſtates* of that province; and the delegates from them form the *ſtates general*, in whom the ſovereignty of the whole confederacy is veſted; but though a province ſhould ſend two, or more delegates, yet ſuch province has no more than one voice in every reſolution; and before that reſolution can have the force of a law, it muſt be approved of by every province, and by every city and re-

public in that province. This formality, in times of great danger and emergency, has been ſet aſide. Every reſolution of the ſtates of a particular province muſt be carried unanimouſly.

The *council of ſtate* conſiſts likewiſe of deputies from the ſeveral provinces: but its conſtitution is different from that of the ſtates-general: it is compoſed of twelve perſons, whereof Guelderland ſends two; Holland, three; Zealand, two; Utrecht, two; Frieſland, one; Overyſſel, one; and Groningen, one. Theſe deputies, however, do not vote provincially, but perſonally. Their buſineſs is to prepare eſtimates, and ways and means for raiſing the revenue, as well as other matters that are to be laid before the ſtates-general. The ſtates of the provinces are ſtyled "Noble and Mighty Lords," but thoſe of Holland, "Noble and Moſt Mighty Lords," and the ſtates-general, "High and Mighty Lords," or, "the Lords the States-General of the United Netherlands;" or, "their High Mightineſſes." Subordinate to theſe two bodies, is the chamber of accounts, which is likewiſe compoſed of provincial deputies, who audit all public accounts. The admiralty forms a ſeparate board, and the executive part of it is committed to five colleges in the three maritime provinces of Holland, Zealand, and Frieſland. In Holland, the people have nothing to do either in chuſing their repreſentatives or their magiſtrates. In Amſterdam, which takes the lead in all public deliberations, the magiſtracy is lodged in thirty-ſix ſenators, who are choſen for life; and every vacancy among them is filled up by the ſurvivors. The ſame ſenate alſo elects the deputies to repreſent the cities in the province of Holland.

I have mentioned the above particulars, becauſe, without a knowledge of them, it is impoſſible to underſtand the hiſtory of the United Provinces, from the death of king William to the year 1747, when the ſtadholderſhip was made hereditary in the male and female repreſentatives of the family of Orange. This office in a manner ſuperſeded the conſtitution already deſcribed. The ſtadtholder is preſident of the ſtate of every province; and ſuch is his power and influence, that he can change the deputies, magiſtrates, and officers in every province and city. By this he has the moulding of the aſſembly of the ſtates-general, though he has no voice in it; in ſhort, though he has not the title, he has more real power and authority than ſome kings; for beſides the influence and revenue he derives from the ſtadtholderſhip, he has ſeveral principalities and large eſtates of his own. At different periods the United Provinces have been without a ſtadtholder, but theſe periods were uſually very turbulent, and whenever a war broke out, the republic felt the neceſſity of re-eſtabliſhing this magiſtrate. Notwithſtanding the violence and complaints of the party, ſtyling themſelves patriots, it would ſeem that the office of ſtadtholder is eſſential to the conſtitution of the United Provinces. The preſent ſtadtholder is William V. prince of Orange and Naſſau, ſon of the late ſtadtholder, William Charles, who married Anne, princeſs royal of Great Britain, and died in 1751.

Though Holland is a republic, yet its government is far from being of the popular kind; nor do the people enjoy that degree of liberty which might at firſt view be apprehended. It is indeed, rather, an oligarchy than a commonwealth; for the bulk of the people are not ſuffered to have the leaſt ſhare in any department of government, nor even in the choice of the deputies. It may alſo be obſerved, that very few perſons in this ſtate dare ſpeak their real ſentiments freely; and they are generally educated in principles ſo extremely cautious, that they cannot relinquiſh them when they enter more into public life.

With reſpect to the adminiſtration of juſtice in this country, every province has its tribunal, to which, except in criminal cauſes, appeal lies from the petty and county courts; and it is ſaid that juſtice is no where diſtributed with more impartiality.

REVENUES.] The government of the United Provinces proportion their taxes according to the abilities of each province or city. Theſe taxes conſiſt of an almoſt general exciſe, a land-tax, poll-tax, and hearth-money; ſo that the public revenue amounts annually to about four millions and a half ſterling. The province of Holland pays nearly half of this revenue. The following is the rate at which each of the Seven United Provinces are ſaid to contribute toward the public expence:

Of every million of ducats the Province of Holland contributes	420,000
Zealand	130,000
Frieſland	170,000
Utrecht	85,000
Groningen	75,000
Guelderland	70,000
Overyſſel	50,000

Of the 420,000 ducats paid by the province of Holland, the city of Amſterdam furniſhes upwards of 320,000. The taxes in theſe provinces are ſo heavy, and ſo many, that it is not without reaſon a certain author aſſerts, that the only thing which has eſcaped taxation there, is the air they breathe. But for the encouragement of trade, the duties on goods and merchandiſe are exceedingly low. Holland before the breach with England, was in a very flouriſhing condition, and its inhabitants ſtill continue to lend large ſums to moſt of the powers of Europe. The immenſe ſums in the Britiſh funds have made ſome people imagine that Holland labours under heavy debts; but the chief reaſon is, the ſtates only pay two and a half per cent. intereſt for money.

MILITARY AND MARINE STRENGTH.] The number of land forces in the United Provinces in time of peace, commonly amount to about 40,000; 25,000 of whom ſerve in garriſons; many of them are Scots and Swiſs; and in time of war, they hire whole regiments of Germans. The chief command of the army is veſted in the ſtadtholder, under whom is the field-marſhal general. The marine force of the United Provinces uſed to be very great, and they formerly fitted out very formidable fleets: but their navy has of late been much neglected. Their late war with Great Britain obliged them to increaſe it; and they have great reſources for that purpoſe. According to the laſt accounts, their navy conſiſts of one ſhip of 76 guns, three of 70, four of 68, five of 60, eight of 56, four of 50, five of 44, nine of 40, and ten of 36, beſides veſſels of inferior force. But they have many ſhips upon the ſtocks, and their fleet will probably be much augmented, and in future be kept in better order.

ORDER OF TEUTONIC KNIGHTS.] This was one of the moſt powerful as well as ancient orders in Europe, now divided into two branches; the firſt for Papiſts, and the ſecond branch for Proteſtants. This branch have a houſe at Utrecht, where they tranſact their buſineſs. The nobles of Holland, if they propoſe a ſon to be a knight, enter his name in the regiſter, and pay a large ſum of money to the uſe of the poor maintained by the order, and the candidate ſucceeds in rotation, if he brings with him proof of his nobility for four generations on the father's and mother's ſide. The enſign is a croſs patee, enamelled white, ſurmounted with another, black; above the croſs is a ball twiſted, white and black. It is worn pendant to a broad black watered ribband, which is worn about the neck. The ſame croſs is embroidered on the left breaſt of the upper garment of each knight.

ARMS.] The enſigns armorial of the Seven United Provinces, or the States of Holland, are, *Or*, a lion, gules, holding with one paw a cutlaſs, and with the other a bundle of ſeven arrows cloſe bound together, in alluſion to the ſeven confederate provinces, with the following motto, *Concordia res parvæ creſcunt.*

HISTORY.] See the Auſtrian Netherlands.

William V. prince of Orange and Naſſau, Hereditary Stadtholder, Captain-General and Admiral of the Seven United Provinces, was born in 1748, married in 1767 the princeſs Frederica of Pruſſia, born 1751. Their children are, Frederica Louiſa, born 1770—William Frederic, Hereditary Prince, born 1772—William George, born 1774.—The Stadtholder hath one ſiſter, Wilhelmina Carolina, born 1743, married to the prince of Naſſaw Wielbourgh.

AUSTRIAN AND FRENCH NETHERLANDS.

Situation and Extent.

	Miles.		Degrees.
Length	200	between	49 and 52 north latitude.
Breadth	200		2 and 7 eaſt longitude.

Boundaries.] BOUNDED by the United Provinces, on the North; by Germany, Eaſt; by Lorrain, Champaign, and Picardy, in France, South; and by another part of Picardy, and the Engliſh ſea, Weſt.

As this country belongs to three different powers, the Auſtrians, French, and Dutch, we ſhall be more particular in diſtinguiſhing the provinces and towns belonging to each ſtate.

1. Province of BRABANT.

Subdiviſions.	Chief Towns.		Sq. M.
1. Dutch Brabant	Boiſleduc, Breda, Bergen-op-Zoom	N.	1374
	Grave	N. E.	
	Lillo, Steenbergen	N. W.	
2. Auſtrian Brabant	Bruſſels, E. lon. 4 deg. 6 min. N. lat. 50-50.		1892
	Louvain, Vilvorden, Landen	in the middle.	

2. ANTWERP; and, 3. MALINES, are provinces independent of Brabant, though ſurrounded by it, and ſubject to the houſe of Auſtria.

4. Province of LIMBURG, S. E.

Chief Towns.	Limburg, E. lon. 6-5. N. lat. 50-37 ſubject to Auſtria.		312
	Maeſtricht, Dalem, Fauquemont, or Valkenburg	ſubject to the Dutch	300

5. Province of LUXEMBURG.

Auſtrian Luxemburg	Luxemburg, E. lon. 6-8. N. lat. 49-45.	

Subdivisions.		Chief Towns.		Sq. M.
French Luxemburg	——	Thionville Montmedy	S. E.	2408 292

6. Province of NAMUR, in the middle, subject to Auſtria.

Chief Towns.		Namur, on the Sambre and Meaſe, E. lon. 4-50. N. lat. 50-30. Charleroy on the Sambre.		425

7. Province of HAINAULT.

Subdiviſions		Chief Towns.		
Auſtrian Hainault	——	Mons. E. lon. 3,33. N. lat. 50-30. Aeth Enguien	in the middle	640
French Hainault	——	Valenciennes Bouchain Conde Landrecy	S. W.	800

8. Province of CAMBRESIS.

Subject to France	——	Cambray, E. of Arras, E. lon. 3-15. N. lat. 50-15. Crevecour, S. of Cambray.		150

9. Province of ARTOIS.

Subject to France	——	Arras, S. W. on the Scarpe, E. lon. 2-5. N. lat. 50-20. St. Omer, E. of Boulogne Aire, S. of St. Omer S. Venant, E. of Aire Bethune, S. E. of Aire Terouen, S. of St. Omer.		990

10. Province of FLANDERS.

Dutch Flanders	——	Sluys, N. Axel, N. Hulſt, N. Sas van Ghent, N.		280
Auſtrian Flanders	——	Ghent, on the Scheld, E. lon. 3-36. N. lat. 51. Bruges Oſtend Newport Oudenard on the Scheld. Courtray Dizmude Ypres, N. of Liſle Tournay on the Scheld Menin on the Lis	N. W. near the ſea. on the Lis	1905

French

Subdivisions.	Chief Towns.	Sq. M.
French Flanders	Liſle, W. of Tonrnay Dunkirk, on the coaſt E. of Calais Douay, W. of Arras Mardike, W. of Dunkirk St. Amand, N. of Valenciennes Gravelin, E. of Calais.	760

AIR, SOIL, AND PRODUCE.] The air of Brabant, and upon the coaſt of Flanders, is bad; that in the interior parts is more healthful, and the ſeaſons more ſettled, both in winter and ſummer, than they are in England. The ſoil and its produce are rich, eſpecially in corn and fruits. They have abundance of paſture; and Flanders itſelf has been reckoned the granary of France and Germany, and ſometimes of England. The moſt barren parts for corn rear far more profitable crops of flax, which is here cultivated to great perfection. Upon the whole, the Auſtrian Netherlands, by the culture, commerce, and induſtry of the inhabitants, was formerly the richeſt and moſt beautiful ſpot in Europe, whether we regard the variety of its manufactures, the magnificence and riches of its cities, the pleaſantneſs of its roads and villages, or the fertility of its land. If it has declined in later times, it is owing partly to the neglect of its government, but chiefly to its vicinity to England and Holland; but it is ſtill a moſt deſirable and agreeable country. There are few or no mountains in the Netherlands: Flanders is a flat country, ſcarcely a ſingle hill in it. Brabant, and the reſt of the provinces, conſiſt of little hills and vallies, woods, incloſed grounds, and champaign fields.

RIVERS AND CANALS.] The chief rivers are the Maeſe, Sambre, Demer, Dyle, Nethe, Geet, Sanne, Ruppel, Scheld, Lis, Scarpe, Deule, and Dender. The principal canals are thoſe of Bruſſels, Ghent, and Oſtend.

METALS AND MINERALS.] Mines of iron, copper, lead, and brimſtone, are found in Luxemburgh, and Limburgh, as are ſome marble quarries; and in the province of Namur there are coal-pits, and a ſpecies of bituminous fat earth proper for fuel, with great plenty of foſſile nitre.

INHABITANTS, POPULATION, MANNERS, CUSTOMS, AND DIVERSIONS. } The Flemings (for ſo the inhabitants of Flanders and the Auſtrian Low Countries are generally called) are thought to be a heavy, blunt, honeſt people; but their manners are ſomewhat indelicate. Formerly they were known to fight deſperately in defence of their country; at preſent they make no great figure. The Auſtrian Netherlands are extremely populous; but authors differ as to their numbers. Perhaps we may fix them at a medium at a million and a half. They are ignorant, and fond of religious exhibitions and pageants. Their other diverſions are the ſame with thoſe of the peaſants of the neighbouring countries.

DRESS AND LANGUAGE.] The inhabitants of French Flanders imitate the French in both theſe particulars. The Flemings on the frontiers of Holland dreſs like the Dutch boors, and their language is the ſame; but the better ſort of people ſpeak French, and dreſs in the ſame taſte.

RELIGION.] The eſtabliſhed religion here is the Roman Catholic; but Proteſtants, and other ſects, are not moleſted.

ARCHBISHOPRICKS AND BISHOPRICKS.] The archbiſhopricks are Cambray, Malines or Mecklin; the biſhoprics, Ghent, Bruges, Antwerp, Arras, Ypres, Tournay, St. Omer, Namur, and Ruremond.

LEARNING, LEARNED MEN, AND ARTISTS. } The ſociety of Jeſuits formerly produced the moſt learned men in the Auſtrian Low Countries, in which they had many comfortable ſettlements. Works of theology, and the civil and canon law, Latin poems and plays, were their chief productions. Strada is an elegant

elegant hiſtorian and poet. The Flemiſh painters and ſculptors have great merit, and form a ſchool by themſelves. The works of Rubens and Vandyke cannot be ſufficiently admired. Flamingo, or the Flemings, models for heads, particularly thoſe of children, have never yet been equalled; and the Flemings formerly engroſſed tapeſtry-weaving to themſelves.

UNIVERSITIES.] Louvain, Douay, Tournay, and St. Omer's. The firſt was founded in 1426, by John IV. duke of Brabant, and enjoyed great privileges. By a grant of pope Sixtus IV. this univerſity has the privilege of preſenting to all the livings in the Netherlands, which right they enjoy, except in Holland.

ANTIQUITIES AND CURIOSITIES, NATURAL AND ARTIFICAL.] Some Roman monuments of temples and other buildings are to be found in theſe provinces. Many curious bells, churches, and the like, ancient and modern, are alſo found here; and the magnificent old edifices of every kind, ſeen through all their cities, give evidence of their former grandeur. In 1607, ſome labourers found 1600 gold coins, and ancient medals of Antoninus Pius, Aurelius, and Lucius Verus.

CITIES.] This article has employed ſeveral large volumes, publiſhed by different authors, but in times when the Auſtrian Netherlands were far more flouriſhing than now. The walls of Ghent, formerly the capital of Flanders, and celebrated for its linen and woollen manufactures, contain the circuit of ten miles; but the town is now thinly inhabited. Bruges, formerly ſo noted for its trade and manufactures, but above all for its fine canals, is now dwindled to an inconſiderable place. Oſtend is a tolerably convenient harbour for traders; and ſoon after the rupture between Great Britain and Holland, became more opulent and populous. In 1781 it was viſited by the emperor, who granted to it many privileges and franchiſes, and the free exerciſe of the proteſtant religion. As to Ypres, it is only a ſtrong garriſon town. The ſame may be ſaid of Charleroy and Namur, which lie in the Auſtrian Hainault.

Louvain, the capital of the Auſtrian Brabant, inſtead of its flouriſhing manufactories and places of trade, now contains pretty gardens, walks, and arbours. Bruſſels retains ſomewhat of its ancient manufacture; and being the reſidence of the governor or viceroy of the Auſtrian Netherlands, it is a populous, lively place. Antwerp once the emporium of the European continent, is now reduced to be a tapeſtry and thread-lace ſhop, with the houſes of ſome bankers, jewellers, and painters adjoining. One of the firſt exploits of the Dutch, ſoon after they threw off the Spaniſh yoke, was to ruin at once the commerce of Antwerp, by ſinking veſſels, loaded with ſtones, in the mouth of the Scheld; thus ſhutting up the entrance of that river to ſhips of large burden. This was the more cruel, as the people of Antwerp had been their friends and fellow-ſufferers in the cauſe of liberty, but they foreſaw that the proſperity of their own commerce was at ſtake.

It may be obſerved here, that every gentleman's houſe is a caſtle or *chateau*; and that there are more ſtrong towns in the Netherlands than in all the reſt of Europe; but ſince the decline of their trade, by the riſe of the Engliſh and Dutch, theſe towns are conſiderably diminiſhed in ſize, and whole ſtreets, particularly in Antwerp, are in appearance uninhabited. In the Netherlands, proviſions are extremely good and cheap. A ſtranger may dine in Bruſſels, on ſeven or eight diſhes of meat, for leſs than a ſhilling Engliſh. Travelling is ſafe, reaſonable, and delightful in this luxurious country. The roads are generally a broad cauſeway, and run for ſome miles in a ſtraight line, till they terminate with the view of ſome noble buildings. At Caſſel, in the French Netherlands, may be ſeen thirty-two towns, itſelf being on a hill.

COMMERCE AND MANUFACTURES.] The chief manufactures of the French and Auſtrian Netherlands, are their beautiful linens and laces; in which, notwithſtand-

ing

ing the boaſted improvements of their neighbours, they are yet unrivalled; particularly in that ſpecies called cambrics, from Cambray, the chief place of its manufacture. Theſe manufactures form the principal article of their commerce.

CONSTITUTION AND GOVERNMENT.] The Auſtrian Netherlands are ſtill conſidered as a circle of the empire, of which the archducal houſe, as being ſovereign of the whole, is the ſole director and ſummoning prince. This circle contributes its ſhare to the impoſts of the empire, and ſends an envoy to the diet, but is not ſubject to the judicatories of the empire. It is under a governor-general, or regent, appointed by the court of Vienna. The face of an aſſembly, or parliament, for each province, is ſtill kept up, and conſiſts of the clergy, nobility, and deputies of towns, who meet at Bruſſels. Each province claims particular privileges, but they are of very little effect; and the governor till of late ſeldom found any reſiſtance to the will of his court. Every province has a particular governor, ſubject to the regent: and cauſes are here decided according to the civil and canon law.

REVENUES.] Theſe riſe from the demeſne lands and cuſtoms; but ſo much is the trade of the Auſtrian Flanders now reduced, that they are ſaid not to defray the expence of their government; but by the late reduction of the garriſons, this is now altered. The French Netherlands bring in a conſiderable revenue to the crown.

MILITARY STRENGTH.] The troops maintained here by the emperor are chiefly employed in the frontier garriſons. Though, by the barrier treaty, the Auſtrians were obliged to maintain three-fifths of thoſe garriſons, and the Dutch two; yet both of them were miſerably deficient in their quotas, the whole requiring at leaſt 30,000 men, and in the time of war above 10,000 more. But the late emperor demoliſhed the fortifications of moſt of the places, and rendered the garriſons uſeleſs.

ARMS.] The arms of Flanders are, or, a lion ſable, and langued gules.

HISTORY.] The ſeventeen provinces, and that part of Germany which lies weſt of the Rhine, was called Gallia Belgica, by the Romans. About a century before the Chriſtian æra, the Battæ removed from Heſſe to the marſhy diſtrict bounded by the Rhine and the Maeſe. They gave the name of Batavia to their new country. Generous and brave, the Batavians were treated by the Romans with great reſpect, being exempted from tribute, governed by their own laws, and obliged only to perform military ſervices. Upon the decline of the Roman empire, the Goths, and other northern people, poſſeſſed themſelves of theſe provinces firſt, as they paſſed through them in their way to France, and other parts of the empire. Batavia and Holland became independent on Germany, to which it had been united under one of the grandſons of Charlemagne, in the beginning of the 10th century, when the ſupreme authority was lodged in the three united powers of a Count, the Nobles, and the Towns. At laſt they were ſwallowed up by the houſe of Burgundy, anno 1433.

The emperor Charles V. the heir of that family, transferred them in the year 1477 to the houſe of Auſtria, and ranked them as part of the empire, under the title of the Circle of Burgundy. The tyranny of his ſon Philip II. who ſucceeded to the throne of Spain, made the inhabitants attempt to throw off his yoke, which occaſioned a general inſurrection. The counts Hoorn and Egmont, and the prince of Orange, appearing at the head of it, and Luther's reformation gaining ground about the ſame time in the Netherlands, his diſciples were forced by perſecution to join the male-contents. Whereupon king Philip introduced a kind of inquiſition, which, from the inhumanity of its proceedings, was called the *Council of Blood*, in order to ſuppreſs them; and many thouſands were put to death by that court, beſides thoſe that periſhed by the ſword. Count Hoorn and count Egmont were taken and beheaded; but the prince of Orange, whom they elected to be

their

their ſtadtholder, retiring into Holland, that and the adjacent provinces entered into a treaty for their mutual defence, at Utrecht, in the year 1579. And though theſe revolters at firſt were thought ſo deſpicable as to be termed *Beggars* by their tyrants, their perſeverance and courage were ſuch, under the prince of Orange, and the aſſiſtance afforded them by queen Elizabeth, both in troops and money, that they forced the crown of Spain to declare them a free people in the year 1609; and afterwards they were acknowledged by all Europe to be an independent ſtate, under the title of THE UNITED PROVINCES. By their ſea wars with England, under the Commonwealth, Cromwell, and Charles II. they juſtly acquired the reputation of a formidable naval power. When the houſe of Auſtria, which for ſome ages ruled over Germany, Spain, and part of Italy, with which they afterwards continued to carry on bloody wars, was become no longer formidable; and when the public jealouſy was directed againſt that of Bourbon, which was favoured by the government of Holland, who had diſpoſſeſſed the prince of Orange of the ſtadtholderſhip; the ſpirit of the people was ſuch, that they revived it in the perſon of the prince, who was afterwards William III. king of Great Britain; and during his reign, and that of queen Anne, they were principals in the grand confederacy againſt Lewis XIV. king of France.

Their conduct towards England in the wars of 1742 and 1756 hath been diſcuſſed in the hiſtory of that country, as alſo the occurrences which led to a rupture between them and the Engliſh in the year 1780. As it was urged, that they refuſed to fulfil the treaties which ſubſiſted between them and Great Britain, ſo all the treaties which bound Great Britain to them were declared null and void, as if none had ever exiſted. By the war, their trade ſuffered conſiderably, but Negapatnam, in the Eaſt Indies, is the only place not reſtored to them by the late peace.

Probably, to their ſeparation from Great Britain, may be attributed the recent differences between the States General and the emperor of Germany, who from the exhauſted ſtate of ſeveral of the European powers, ſeemed to have a favourable opportunity of accompliſhing his ambitious deſigns. In the year 1781, he had been allowed to demoliſh the Dutch barrier in his dominions, for which they had contended ſo deſperately in the time of queen Anne, and now he ſeemed willing to encroach upon their territories. A conference concerning the boundaries of their reſpective nations was propoſed to the ſtates; but before this could take place, he began to commit ſome acts of hoſtility, and extend his dominions a little way by way of preliminary. Two ſmall forts, St. Donat, and St. Paul, were ſeized upon, as well as ſome part of the marſhes in the neighbourhood of Sluys. As a prelude to the negociations, he alſo demanded that the Dutch guardſhip ſhould be removed from before fort Lillo, in acknowledgement that one of the prerogatives of his Imperial majeſty was the free navigation of the Scheldt. This being complied with, the negociations were opened at Bruſſels on the 24th of April 1784, when ſeveral other demands of ſmall portions of territory and little ſums of money were made; the moſt material requiſition being the town of Maeſtricht, and its territory. For ſome time the conferences were carried on in that dry and tedious manner which generally marks the proceedings of the Dutch; but the emperor urged on his demands with great vigour, and matters ſeemed faſt tending towards an open rupture. On the 23d of Auguſt, he delivered in his *ultimatum* to the commiſſioners at Bruſſels, in which he offered to give up his demand on Maeſtricht, in conſideration of having the free and unlimited navigation of the Scheldt in both its branches to the ſea; and in token of his confidence in the good intentions of the ſtates, he determined to conſider the river as open from the date of that paper. Any inſult on his flag in the execution of theſe purpoſes, he would conclude to be a direct act of hoſtility, and a formal declaration of war on the part

of the Republic. In conſequence of this obſtinacy, his Imperial majeſty ſent ſome ſhips up the Scheldt to Antwerp; but the Dutch ſtopped them on their paſſage, and anſwered his complaints and menaces by the following manifeſto, referring to the moſt important events in their hiſtory.

"That after a war of eighty years continuance, their High Mightineſſes concluded a treaty of peace at Munſter, January 30, 1648, with Philip the Fourth, king of Spain, in which treaty the States were denominated Free and Sovereign States, Provinces, and Countries, to which the ſaid king had no right, now or in future, either himſelf, or his ſucceſſors and deſcendents; and among other matters, it was agreed by Art. XIV. that the Scheldt ſhould remain ſhut by their High Mightineſſes, in conſequence of which, that river has remained ever ſince guarded by two forts, Lillo and Lieſkenſhoek, aſſiſted by guard ſhips.

That between that time and 1702, their High Mightineſſes concluded an alliance, September 1701, between his Imperial Majeſty Leopold the Firſt, and the King of Great Britain, with the ſpecial intention, as expreſſed in that alliance, to procure a proper barrier in the Spaniſh Netherlands, as they had been then called.

That ſoon after this was concluded, their High Mightineſſes were involved in an expenſive and deſtructive war, at the end of which, in a treaty of peace, they agreed with his Moſt Chriſtian Majeſty (April 11, 1713) that, in conſequence of this peace, the houſe of Auſtria ſhould enter into the poſſeſſion of the ſaid Spaniſh Netherlands, to enjoy thoſe entirely for ever after, according to the ſucceſſion of that houſe, provided that the ſaid Spaniſh Netherlands continued to be the *barrier* and ſecurity to the States-General.

That after this their High Mightineſſes as well as his Britannic Majeſty, November 14, 1715, concluded a ſimilar barrier treaty with Charles the Sixth, and upon this footing and condition the ſaid Spaniſh Netherlands were granted to his Imperial Majeſty.

That ſo far from their infringing on this treaty in any reſpect concerning the Scheldt, which was ſettled by the above mentioned Munſter treaty, it was agreed upon Art. XVII. of the ſaid treaty, that they ſhould retain the poſſeſſion of the Scheldt, and the full and entire dominion and ſovereignty of all the places and diſtricts there ſpecified; and laſtly, by Art. XXVI. it was agreed that every thing ſhould remain without change, diminution, alteration, or augmentation, on whatever pretence, unleſs their Imperial and Catholic Majeſties in the Auſtrian Netherlands, and thoſe of the United Provinces, ſhould remain exactly as before eſtabliſhed, and as expreſſed in the articles of the treaty of Munſter, which were confirmed by this freſh agreement.

That afterwards ſome difficulties aroſe concerning the performance of Art. XVII. of the barrier treaty, but that theſe were ſettled between the three contracting powers, December 22, 1718, by another convention, in which the ceſſion of the lands and diſtricts pertaining to the poſſeſſion of the Scheldt, was ſpecially and expreſsly confirmed and made clear.

That then his Imperial Majeſty Charles the Sixth, and the king of Great Britain, concluded a new treaty at Vienna (March 16, 1731), by which an agreement is made to maintain the Pragmatic Sanction, and that all trade and navigation, in particular between the Auſtrian Netherlands and the Eaſt Indies ſhould ceaſe for ever.

That in the war concerning the ſucceſſion which followed, their High Mightineſſes fulfilled their engagements which they had entered into *for the preſervation of the Pragmatic Sanction*, and aſſiſted the houſe of Auſtria with all their forces, but the conſequences were fatal to them, as almoſt all their barrier places were deſtroyed, and the Republic itſelf brought to the brink of ruin. And afterwards the ſaid barrier places not only remained without repair, excepting one, the city and caſtle of Na-

mur

mur (the expences of which were defrayed by their High Mightineſſes), but certain impoſts were laid on the inhabitants of the Auſtrian Netherlands, in a manner directly contrary to Art. XXVI. of the barrier treaty; until, at length, not to detail leſſer wrongs, in the year 1781, while the Republic was unhappily involved in a ruinous war with the kingdom of Great Britain, it pleaſed the reigning emperor of the Romans to deſtroy entirely all the fortifications of the barrier places, Namur only excepted, and to demand that the States ſhould remove its troops, then in garriſon. That no ſooner was this complied with, than the ſame requiſition was made in regard to the city and caſtle of Namur itſelf.

That there aroſe ſeveral diſputes, on account of their making uſe of the environs of theſe forts on the ſame footing as before, eſpecially with regard to the villagers of Namur, Polder, and Doel, the ſovereignty of which is expreſsly granted to their High Mightineſſes, in terms the moſt plain, by Art. XVII. of the barrier treaty, and by Art. I. of Convention of December 22, 1718.

That his Imperial Majeſty, in the month of November, 1783, forcibly, and without the leaſt previous complaint, took poſſeſſion of the fort of St. Donat, although that fort was ceded moſt expreſsly to their High Mightineſſes by the ſaid treaty of 1715, and by the ſubſequent Convention, and although eſpecially at that time in the hands of a detachment of troops belonging to the States.

That (to omit in ſilence ſeveral other unjuſt pretences to which their High Mightineſſes often replied with the greateſt eaſe) it was inſiſted on the part of his Imperial Majeſty, in April of this year, that the guardſhip belonging to the Republic, which had been ſtationed off Lillo ſince the peace of Munſter, 1648, that is 136 years, ſhould be removed, his Majeſty pretending that the Lower Scheldt, as far as Saftingen, belonged to him.

That, in order to avoid all manner of violence, their High Mightineſſes preferred to hold out to his Majeſty their juſt right to keep a guardſhip there, but, in the mean time, it ſhould be removed, while they waited for the conſequences of this avowal, from before the territory which never before had been diſputed to their High Mightineſſes, that is, Saftingen.

That, in the mean time, Commiſſioners being named by their High Mightineſſes at the inſtance and requeſt of his Imperial Majeſty, in order to end all the diſputes which then were between them, a Memorial was given to them, entitled, A liſt of the claims which his Imperial Majeſty preferred againſt the Republic.

That upon this, a proper anſwer was ſent to the government of the Auſtrian Netherlands, in which the novelty and ill foundation of almoſt all thoſe claims, were demonſtrated, and ſeveral contra-claims were held forth, founded on the juſt right and title which their High Mightineſſes poſſeſſed; the whole, however, containing the moſt convincing proofs of the unceaſing condeſcenſion, which their High Mightineſſes wiſhed to obſerve, as much as poſſible, in all their proceedings.

That, pending theſe negociations, and in direct contradiction to the expreſs ſtipulation, Art. V. of the treaty of Vienna, by which the Auſtrians were not permitted to trade in the Eaſt Indies, five ſhips from the Eaſt Indies were ſent to Oſtend, without any reaſon, or pretence whatever, on the ſubject being offered on the part of his Imperial Majeſty."

In anſwer to their conduct in ſtopping the Imperial ſhips, which the emperor ſtyles an inſult to his flag, and by which he declares them to have begun hoſtilities, the Dutch Miniſters at Bruſſels, in a paper delivered to that Court, proteſt, " That as their ſole aim was to ſupport their uncontrovertible right, they cannot be ſuſpect-

ed of any hoſtile aggreſſion, which is the leſs to be laid to their charge, as they poſitively declared not to ſtand any ways anſwerable for the conſequences that may enſue from the particular conſtruction which his Imperial Majeſty may be pleaſed to put upon the affair. The Republic, far from being conſidered in the light of a power having acted offenſively, ſtill perſiſt in their peaceable diſpoſitions; but if unfortunately ſuch diſpoſitions can have no influence on the mind of his Imperial Majeſty, though the States ſtill preſerve ſome hopes to the contrary, the Republic will find itſelf in the diſagreeable neceſſity of having recourſe to ſuch means as the rights of nature and nations entitle them to; hoping that Divine Providence, and the applauding voice of the neutral powers, will aſſiſt in maintaining the Republic in the juſt defence of its deareſt rights."

Great preparations were made for immediate hoſtilities againſt the Dutch, and ſeveral hundred of the Imperialiſts, with ſome field pieces, advancing towards the counterſcarpe of Lillo, the commanding officer of that place ordered the ſluices to be opened November 7, 1784, which effected an inundation that laid under water many miles of flat country round the forts on the Scheldt, to preſerve them from an attack. Both parties exerted themſelves, in caſe they ſhould be called forth to open a campaign in the next ſpring; but France and Pruſſia interpoſed as negociators and mediators; and ſucceeded in bringing about a reconciliation.

During the progreſs of their contentions with the emperor, this country was greatly diſtreſſed by the moſt unhappy annimoſities within themſelves, which it may be proper in this place briefly to ſtate. The continued ſeries of loſſes which they had ſuſtained in the late war with Great Britain was particularly diſgraceful to the republic. All their ſettlements in the Weſt Indies fell into the hands of the Britiſh without reſiſtance; their ſhips were captured and trade ruined; while the diſaſters of the war excited the animoſity of the two factions againſt each other to the higheſt degree. The Patriots, or ariſtocratic party attributed theſe defects to the Stadtholder, who openly expreſſed his predilection for the Engliſh at the beginning of the American quarrel. To this conduct the Patriots now very artfully reverted. They accuſed him of having adviſed the aggreſſion of the Engliſh, and of contributing to their ſucceſs by treachery. The evident inequality of the ſtruggle, the notorious deficiency of all warlike articles in the dock-yards, and arſenals of the republic, the frequent and public reclamations made by the prince and by the council of ſtate on the ſubject of that deficiency were forgotten; and the wilful miſconduct of the Stadtholder was boldly alledged by the Patriots as the ſole cauſe of that miſerable ſucceſſion of defeat and diſgrace, which immediately followed the commencement of hoſtilities. Whilſt theſe were the recriminations of the Patriots, the monarchical, or Orange party accuſed their antagoniſts of having involved the country in a dangerous war, at a time when it was entirely unprepared for it.

The alterations in the Dutch conſtitution projected by the Patriots, were as follows: "That the *forms* of the preſent government ſhould continue to ſubſiſt, but that the States ſhould become in every reſpect completely independent of the Stadtholder; and that for this purpoſe he ſhould no longer enjoy a ſeat in any of the colleges in the republic. That the Stadtholder's right of recommending candidates for the vacant magiſtracies in the towns of Holland ſhould ceaſe. That the charges of Stadtholder and Captain-General ſhould, if poſſible, be ſeparated, and conferred on different perſons; or that, at leaſt, the titles only ſhould be reſerved to the Prince of Orange, and the offices be executed, as in the time of the De Witts, by deputies choſen for the purpoſe. In general, that the Stadtholder ſhould poſſeſs ſuch powers only as might enable him to execute the orders of the States. That the hereditary Stadtholderate ſhould continue in the Prince of Orange on his acceptance

acceptance of theſe terms; but that in caſe of his refuſal, the different ſtates ſhould be at liberty to elect another Stadtholder."

In the aſſembly of the ſtates, it was found that the ſtates themſelves were proper ſovereigns of the country, that the Stadtholder was no more than their ſervant, and that whatever powers they might communicate to him were revokeable at pleaſure; but with regard to the garriſon of the Hague in particular, they affirmed that the Provincial States had never given it into his hands. In purſuance of this idea, it was next directed, that on the commencement of the year 1786, the arms of the Houſe of Orange ſhould be taken out of the enſigns of the troops of Holland, and thoſe of the province ſubſtituted in their room; that the Preſident of the Provincial States ſhould on all occaſions receive the military honours, and ſalute the garriſon of the Hague, as the Preſident of the States already did; and that no other officer of the province ſhould be entitled to that diſtinction. The next ſteps were to diſmiſs the body-guards of the prince, though this was afterwards qualified by allowing them to extinguiſh themſelves, and to enliſt no more in the room of them who died.

Theſe proceedings were by no means agreeable to the inhabitants of the Hague, who had all along ſhewn the greateſt attachment to the ſtadtholder, and they ſoon prepared a petition to the ſtates of Holland, requeſting them to interpoſe their good offices with the prince of Orange to induce him to return from Breda, to which he had retired on the 14th of September, 1785, to the place of his uſual reſidence. The ſtates, however, ſuppreſſed this petition as ſoon as they knew that it exiſted; and the affairs of the ſtadtholder appeared to be in the moſt deſperate ſituation.

The new king of Pruſſia offered his mediation, but that being refuſed he applied to the court of France to know whether they would co-operate with him in his pacific intention. On receiving a favourable anſwer to this, both monarchs united their efforts to reconcile the contending parties, but all in vain; ſo that both ambaſſadors departed from the Hague, in the month of January, 1787.

This unfortunate event produced various accuſations and vindications between the two parties, with a long train of negociations, reſolutions, and animoſities, until at laſt, in the month of May, the ſtadtholder gave orders to ſeize on Vreeſwick, a poſt of importance to the city of Utrecht, on account of its ſituation on the canal between that city and the territories of South Holland; containing alſo the ſluices by which both the provinces might be overflowed. This brought on a ſkirmiſh between the troops of the ſtadtholder and the burghers of Utrecht, in which the latter proved victorious. Some other important hoſtilities took place; but while the military operations were carried on in ſuch a languid manner, a violent tumult took place at Amſterdam, which as uſual, was excited by the partiſans of the ſtadtholder, in which ſeveral perſons were killed. This was followed by a revolt of moſt of the regular troops of Holland, who went over to the ſtadtholder; but notwithſtanding this apparent advantage, and ſome others which afterwards took place, the diſpute ſtill continued with extreme violence, inſomuch that the princeſs of Orange herſelf was ſeized, and detained a priſoner a night by the patriots.

Theſe moſt turbulent commotions were, however, at laſt happily ſettled by the king of Pruſſia, who, for this purpoſe, marched an army into the territories of the United States, and took poſſeſſion of the city of Rotterdam, and ſome other places without reſiſtance. This overawed both parties to ſuch a degree, that they quickly came to an accommodation, and a treaty was concluded between that monarch and the ſtates of Holland. By this the two contending parties were formally reconciled, and the courts of London and Berlin guaranteed the ſtadtholderſhip, as well as the

the hereditary government of each province, in the houſe of Orange, with all the rights and prerogatives ſettled in the years 1747 and 1748; by which all attempts to diſturb the domeſtic tranquility of the republic, by means of any foreign interference, appear to be effectually guarded by the cloſe union that ſubſiſts between theſe two important powers.

Here we ſhall conclude the hiſtory of the Seven United Provinces whoſe inhabitants ſo gloriouſly diſtinguiſhed themſelves in the cauſe of liberty; and whoſe brave, vigorous, and ſucceſsful ſtruggles in this noble conteſt, againſt the tyranny and ferocious bigotry of Philip II. will be always remembered with pleaſure, whilſt men have a juſt ſenſe of the natural rights and liberties of mankind, which will be, it is hoped, ſo long as human nature exiſts.

After the independency of the Seven United Provinces was acknowledged, the Spaniards remained poſſeſſed of the other ten provinces, or, as they are termed, the Low Countries, until the duke of Marlborough, general of the allies, gained the memorable victory of Ramillies, in the year 1706. After which, Bruſſels, the capital, and great part of theſe provinces, acknowledged Charles VI. afterwards emperor of Germany, for their ſovereign; and his daughter, the late empreſs-queen, remained poſſeſſed of them until the war of 1741, when the French reduced them, except part of the province of Luxemburgh; and would have ſtill poſſeſſed them, but for the exertions of the Dutch, and chiefly of the Engliſh in favour of the houſe of Auſtria. The places retained by the French, by the peace of Aix-la-Chapelle in the year 1748, may be ſeen in the preceding general table of diviſions.

It was not long after the ſettlement of the diſturbances in Holland, that the provinces of the Netherlands, belonging to the emperor, determined to aſſert their liberty. As no great friendſhip had ſubſiſted between the States and his Imperial majeſty, it was natural to ſuppoſe that the diſcontented ſubjects of the latter would find a ready aſylum in the territories of the Dutch. The quarrel originated, like thoſe in other countries, about the perogatives aſſumed by the emperor, and which were more extenſive than his ſubjects wiſhed to allow. A letter concerning this had been publiſhed as early as the 13th of December, 1787, by count Trautmanſdorff, the Imperial miniſter to the council of Brabant; in which province the diſputes had originally commenced. In this performance, the count took notice of the little confidence they put in his majeſty, and commanded them in the moſt expreſs terms, "to hold no connection, relation, correſpondence, or keep up any underſtanding whatever on public affairs, either in a body or by commiſſioners, with the ſtates or their deputies, without the previous knowledge, or expreſs command of his majeſty, or his repreſentative." This not proving effectual, and the emperor making uſe of force to aſſert his uſual preogatives, the territories of the United States became a refuge for the diſcontented Brabanters. They firſt began to aſſemble in Dutch Brabant, in the cloſe of the ſummer of 1789, and being well received, took up their head-quarters at Tilbourg. To this place they invited their diſcontented countrymen to join them, and promiſed them the pay of 14 ſols *per* day for their ſupport. From whatever ſource theſe patriots derived their finances, it ſoon became evident that they were well ſupplied; for this ſum was punctually paid, and they had great plenty of proviſions; ſo that, being protected by the ſtates-general, they ſoon became very ſtrong, and in a very ſhort time manifeſted a deſign to aſſert their liberty by force of arms. Their firſt exploits were the taking of two forts belonging to the emperor, ſituated between Antwerp and Bergen-op-Zoom. They ſeized alſo M. Crumpepin, chancellor of

Brabant, threatening to hang him up by way of retaliation, for the firſt perſon of their party to whom the emperor ſhould offer any violence.

On the part of his Imperial majeſty, the inſurgents were not treated with lenity. A proclamation was iſſued by count Trautmanſdorff, governor of Bruſſels, intimating that no quarter ſhould be given them, and that the villages, in which they concealed themſelves, ſhould be ſet on fire. General Dalton marched with 7000 men to retake the forts, proclaiming that he meant to become maſter of them by aſſault, and would put every ſoul he found in them to the ſword. A reſolution was taken by the government of Bruſſels to diſarm all the inhabitants of the Low Countries, excepting ſuch as were in the actual ſervice of the emperor. A proclamation was accordingly iſſued forth, commanding all perſons to deliver up their arms within twenty-four hours, under pain of being accounted favourers of ſedition. All who ſhould be taken with arms in their hands, in any caſe of riot or inſurrection, to be to death on the ſpot, without any trial. All the nobility and abbots who had left the country (and which they had done in great numbers) were commanded to return under pain of perpetual baniſhment, and confiſcation of eſtate.

In oppoſition to this ſanguinary proclamation, the patriots iſſued a manifeſto, in which they declared the emperor to have forfeited his authority by reaſon of his various oppreſſions and cruelties, his annulling his oath, and infringing the conſtitution. Baniſhment was threatened to ſuch as took part with him; and all were exhorted to take up arms in defence of their country, though ſtrict orders were given that no crowds or mobs ſhould be allowed to pillage; and whoever was found doing ſo, ſhould be treated as an enemy to his country.

This was dated at Hoogſtraten, in Brabant, October the 24th, 1789. The king of Pruſſia was at that time aſſembling an army, with which it was thought he deſigned to take ſome active part in the preſent affair; but he publiſhed a manifeſto, declaring that he did not mean to interfere in the troubles of the Low Countries; but as a director of the circle of the empire, to take notice of thoſe which had happened in the biſhopric of Liege, and Wutzlar. Thus the emperor and the patriots were left to decide their quarrel by themſelves; and in this conteſt the latter diſplayed a reſolution, as well as power to accompliſh their purpoſes, which was by no means generally expected. Almoſt every town in Auſtrian Flanders ſhewed its determination to oppoſe the emperor, and the moſt enthuſiaſtic attachment to military affairs diſplayed itſelf in all ranks of men. Even the eccleſiaſtics manifeſted their valour on the occaſion; which perhaps was naturally to be expected, as the emperor had been very active in depriving them of their revenues. A formidable army was ſoon raiſed, which after ſome ſucceſsful ſkirmiſhes, made themſelves maſters of Ghent, Bruges, Tournay, Malines, and Oſtend; ſo that general Dalton was obliged to retire to Bruſſels. A battle was fought before the city of Ghent, in which the patriots were victorious, though with the loſs of one thouſand men, beſides women and children. It reflects indelible diſgrace on the imperial character, as well as the commander of the troops, that they committed the moſt dreadful acts of cruelty on the unhappy objects who fell into their hands. Orders were given to plunder and deſtroy wherever they could obtain any booty; while the mercileſs ſavages not only deſtroyed the men, but killed women and ſucking infants. Some of them plunged their bayonets into the bodies of children in the cradle, or pinned them againſt the walls of the houſes. By theſe monſtrous cruelties they enſured ſucceſs to their adverſaries; for the whole countries of Brabant, Flanders, and Maes, almoſt inſtantly declared in their favour. They publiſhed a memorial for their juſtification, in which they gave, as reaſons for their conduct, the many oppreſſive edicts with which they had been harraſſed ſince the

the death of the empreſs-queen; the unwarrantable extenſion of the imperial prerogative, contrary to his coronation-oath, and which could not be done without perjury on his part; the violence committed on his ſubjects by forcibly entering their houſes at midnight, and ſending them priſoners to Vienna, to periſh in a dungeon, or on the banks of the Danube. Not content with this, he had openly maſſacred his ſubjects; he had conſigned towns and villages to the flames, and entered into a deſign of exterminating people who contended only for their rights. Theſe things, they owned, might be terrible at the time, and eaſily impoſe upon weak minds, but "the natural courage of a nation rouſed by repeated injuries, and animated by deſpair, would riſe ſuperior to thoſe laſt efforts of vindictive tyranny, and render them as impotent and abortive, as they were wicked and unexampled." For all which reaſons they declared themſelves INDEPENDENT, *and for ever releaſed from the houſe of* AUSTRIA.

The emperor now, perceiving the bad effects of his cruelty, publiſhed proclamations of imdemnity, &c. but they were treated with the utmoſt contempt. The patriots made the moſt rapid conqueſts, inſomuch, that before the end of the year they were maſters of every place in the Netherlands, except Antwerp and Luxemburg. The emperor next declared himſelf willing to treat with thoſe whom he ſeemed not to be able to ſubdue; but the ſtates publiſhed a paper by way of preliminary, which ſeemed to give very little hope of ſucceſs to the negociation. In this they inſiſted, 1. That the plenipotentary, attended by two deputies from the ſtates, ſhould repair to thoſe places in the town of Ghent, "where that *ſanguinary executioner* Dalton ordered, ſaw, and executed robbery, incendiary, rape, profanation, murder, and maſſacre." 2. The corpſes of thoſe "immolated to the fury of the ferocious ſervants of the Nero their maſter, to be digged up and expoſed to his excellency's view; that he might make a terrific report to the court of Vienna; and not only the banks of the Danube, but the whole world might be ſtruck with horror." Laſtly, when his heart was ſuppoſed to be ſufficiently impreſſed with this dreadful ſpectacle, it was to be notified to him in the aſſembly of the ſtates, to which he was to be conducted, that "it was impoſſible to treat or make any conventions with a ſovereign perjured and perfidious, who had repeatedly violated the moſt ſacred of all human ties, though ſecured by the moſt ſolemn treaties with foreign powers."

A new act of union was eſtabliſhed between the Belgic provinces, to which all thoſe formerly ſubject to Auſtria unanimouſly acceded. It originated between thoſe of Flanders and Brabant, and was to the following purpoſe: That neither party ever enter into any compromiſe with their former ſovereign, but by common agreement. They agreed to change this union into one common ſovereignty between the two ſtates; ſo that the whole power ſhould be centered in a congreſs compoſed of deputies named by both parties. The power of this ſovereign aſſembly to be confined to the ſole object of common defence, to the power of making peace and war, the ſupport of a national militia, the fortifications neceſſary for the defence of the country, the contracting alliance with foreign powers,&c. On the fourth of January 1790, the ſtates of Brabant were opened with great ceremony at Ghent; they were declared independent, and the emperor to have forfeited all right to the ſovereignty of that country. On the 11th, a ſolemn and general treaty of union was ſigned by the deputies from Brabant, Guelders, Flanders, Weſt Flanders, Hainault, Namur, Tournay, with the territory depending on it, called Tourneſis, and Malines.

Notwithſtanding they thus appeared for ever ſeparated from the houſe of Auſtria, yet the death of Joſeph, which happened ſoon after, produced ſuch a change in the conduct of government, as gave a veryunexpected turn to the ſituation of affairs, and

the mild and pacific diſpoſition of Leopold who ſucceeded his brother, the conciliating meaſures he adopted, together with the mediation of Great Britain, Pruſſia, and Holland, gave a very different turn to the affairs in theſe provinces; and a convention, which was ſigned at Reichenbach on the 27th of July 1790, by the abovementioned high contracting powers, had for its object the re-eſtabliſhment of peace and good order in the Belgic provinces of his Imperial Majeſty, by a general amneſty, and total forgiveneſs of whatever had paſſed during the troubles, under the guarantee of the ſaid powers. Since this time it has been the conſtant labour of the ſaid plenipotentiaries, in concert with the Imperial miniſter, to bring the Belgic Provinces to a proper ſubmiſſion, and to reſtore them to the Auſtrian dominions, on condition of the re-eſtabliſhment of their ancient privileges and conſtitution; but which they had been unable finally to accompliſh without the aid of his Imperial majeſty's troops.

This deſirable buſineſs having been fulfilled, according to the management of the mediating powers, it became further neceſſary for the confirmation of his Imperial Majeſty's authority over the ſaid provinces, for the ſecuriry of thoſe provinces, and for the mutual intereſt of the mediating powers, that the bonds of friendſhip ſhould be reciprocally more cloſely drawn between them; for which purpoſe the following articles have been unanimouſly agreed to by the ſaid miniſters, in virtue of the powers with which they had been inveſted.

I. That on receiving the uſual homage of the Belgic Provinces, his Imperial Majeſty ſhall confirm them in all the conſtitutional privileges and legal cuſtoms which they had enjoyed by the acts of inauguration of the Emperor Charles VI. and the empreſs Maria Thereſa.

II. His Imperial majeſty conſents to bury in oblivion all the exceſſes that have been committed during the late troubles, and to comprize them in a general amneſty, which ſhall be inſtantly made public; with the exception of a very few individuals, whoſe conduct has precluded them from every claim to this general pardon; and of thoſe culprits, whoſe crimes are diſtinct from the diſorders committed during the late inſurrection. At the ſame time, it is to be underſtood that his Imperial majeſty does not by this general amneſty mean either to acknowledge or confirm thoſe uſurpations which, during the troubles, have been made on the rights and prerogatives of his ſovereign power.

III. His Imperial Majeſty, during the conference at Reichenbach, having been diſpoſed to grant certain conceſſions, not ulteriorly affecting the Imperial conſtitution, in caſe that ſubmiſſion ſhould precede compulſion, has yet, at the inſtance of the mediating powers, granted thoſe conceſſions which he had been previouſly diſpoſed to grant of his own accord, as the reward of a voluntary ſubmiſſion, and which are contained in a letter from his Imperial majeſty's plenipotentiary to the mediating miniſters, dated at the Hague, the 29th of October, 1790; of which the following are the principal heads, viz. that certain points of eccleſiaſtical diſcipline, in which ſome alterations had been made during the laſt reign, ſhall be placed under the regulation of the biſhops, reſtoring to them all the powers which they exerciſed at the termination of the reign of the late empreſs Maria Thereſa; that as it would be impoſſible to re-eſtabliſh the ſuppreſſed convents on their former foundation; his majeſty promiſes to apply the revenues of thoſe convents to ſuch pious purpoſes as ſeem to be moſt analagous to the intention of their pious founders; and to revive and confirm in their rights ſuch ſuppreſſed abbeys as anciently enjoyed the privilege of ſending deputies to the ſtates;—that his majeſty, relying on the patriotiſm and valour of the Belgic Provinces, renounces every pretenſion to keep a *ſtanding army* directly or indirectly, and will not attempt to raiſe any troops in the provinces, but with the conſent of the ſtates, and as exigencies

may require;—that, confiding in the love of his ſubjects, and their generous efforts for the ſupport of his empire, he engages *never to levy any* TAX upon them, on any pretext whatever, without the full conſent and concurrence of the ſtates;—that the judges of the ſuperior courts are confirmed in their ſtations, agreeable to the conſtitutions of each province on this head;—that the diploma granted by the emperor Charles VI. to the ſuperior tribunals be made irrevocable;—that his majeſty will hear and conſult with the ſtates and tribunals on the ſubject of any new and general law; as alſo, on the ſubject of penal laws;—that his majeſty engages to re-eſtabliſh the organization of the government, and chamber of accounts on the ſame footing as in the reign of the late empreſs, reſerving to himſelf the right of making ſuch changes as may become indiſpenſably neceſſary, yet always with attention to the public voice, and the right of the conſtitution;—that the commander in chief of the troops, and the miniſter plenipotentiary, ſhall be under the command of the governor general, and that it be eſtabliſhed as an immutable rule that the ſoldiery ſhall never be called out againſt the citizens, but for the actual ſupport of the laws and at the requiſition of the magiſtrates;—that his majeſty will make no alterations in the forms of judicature, but in conſequence of previous conſultation with the ſtates, and with their full conſent;—that for the prevention of any miſunderſtanding, commiſſaries be appointed by the prince and the people; and if their determination ſhould not prove ſatisfactory, then his majeſty and the ſtates ſhall each appoint an equal number of perſons as arbiters, whoſe deciſion ſhall be concluſive, and finally binding; and who, on ſuch occaſion, ſhall be abſolved from the influence of any oaths that might tend to affect their impartial determination.

IV. Their majeſties of Great Britain and Pruſſia, and the States General of Holland, become in the moſt ſolemn manner, guarantees to the emperor and his ſucceſſors for the ſovereighty of the Belgic Provinces, now re-united under his dominion.

The ratification of this convention was exchanged between the contracting parties within two months from the date of ſigning, which was executed at the Hague on the 10th of December, 1790.

GERMANY.

SITUATION AND EXTENT.

	Miles.		Degrees.	Sq. Miles.
Length	600	between	5 and 19 Eaſt lon.	181,631.
Breadth	520		45 and 55 North lat.	

BOUNDARIES.] THE empire of Germany, properly ſo called, is bounded by the German ocean, Denmark, and the Baltic, on the North; by Poland and Hungary, including Bohemia, on the Eaſt; by Switzerland and the Alps, which divide it from Italy, on the South; and by the dominions of France and the Low Countries, on the Weſt, from which it is ſeparated by the Rhine Moſelle, and the Maeſe.

GRAND DIVISIONS.] The diviſions of Germany are variouſly laid down even by modern writers. I ſhall therefore adhere to thoſe moſt generally received. Germany was formerly divided into the Upper, or Southern, and the Lower, or Nor-

thern. The emperor Maximilian, predeceſſor and grandfather to the emperor Charles V. divided it into ten great circles; and the diviſion was confirmed in the diet of Nuremburg, in 1552; but the circle of Burgundy, or the ſeventeen provinces of the Low Countries, being now detached from the empire, we are to confine ourſelves to nine of thoſe diviſions, as they now ſubſiſt.

Whereof three are in the north, three in the middle, and three in the ſouth.

The northern circles — —	Upper Saxony Lower Saxony Weſtphalia	
The circles in the middle — —	Upper Rhine Lower Rhine Franconia	
The ſouthern circles — —	Auſtria Bavaria Swabia	

1. Upper SAXONY Circle.

Diviſions.	Subdiviſions.	Chief Towns.	Sq. M.
Pomerania, in the North.	Pruſſian Pomerania, N. E.	Stettin. E. lon. 14-50 N. lat. 53-30	4820

Marquiſate of Burgaw		Burgaw, eaſt	650
Territory of Briſgaw, on the Rhine	—	Friburgh and Briſac.	380

NAME.] Great part of modern Germany lay in ancient Gaul, as I have already mentioned; and the word Germany is modern. Many fanciful derivations have been given of it; the moſt probable is, that it is compounded of *Ger*, or *Gar*, and *Man*; which in the ancient Celtic, ſignifies a warlike man. The Germans went by various other names, ſuch as Allemanni, Teutones; which laſt is ſaid to have been their moſt ancient deſignation; and the Germans themſelves call their country Teutchland.

CLIMATE, SEASONS, AND SOIL.] The climate of Germany, as in all large tracts of country, differs greatly, not only on account of the ſituation, north, eaſt, ſouth, and weſt, but according to the improvement of the ſoil, which has a vaſt effect on the climate. The moſt mild and ſettled weather is found in the middle of the country, at an equal diſtance from the ſea and the Alps. In the north it is ſharp; towards the ſouth it is more temperate.

The ſoil of Germany is not improved to the full by culture; and therefore in many places it is bare and ſterile, though in others it is ſurpriſingly fruitful. Agriculture, however, is daily making progreſs. The ſeaſons vary as much as the ſoil. In the ſouth and weſtern parts, they are more regular than in thoſe that lie near the ſea, or that abound with lakes and rivers. The north wind and the eaſtern blaſts are unfavourable to vegetation. Upon the whole, there is no great difference between the ſeaſons of Germany and thoſe of Great Britain.

MOUNTAINS.] The chief mountains of Germany are the Alps, which divide it from Italy, and thoſe which ſeparate Saxony, Bavaria, and Moravia from Bohemia,

mia. But many other large tracts of mountains are found in different parts of the empire.

FORESTS.] The vaſt paſſion which the Germans have for hunting the wild boar has preſerved more woods and chaſes in Germany than in moſt other countries. The Hercynian foreſt, which in Cæſar's time was nine days journey in length, and ſix in breadth, is now cut down in many places, or parcelled out into woods, which go by particular names. The trees are pine, fir, oak, and beech. There is a vaſt number of foreſts of leſs note in every part of this country; almoſt every count, baron, or gentleman, having a chaſe or park adorned with pleaſure-houſes, and well ſtocked with game, particularly deer, of which there are ſeven or eight ſorts, plenty of hares, conies, foxes, and boars. They abound ſo much alſo with wild fowl, that in many places the peaſants have them as well as veniſon, for their ordinary food.

RIVERS AND LAKES.] No country can boaſt a greater variety of noble rivers than Germany. At their head ſtands the Danube or Donaw, ſo called from the ſwiftneſs of the current. Some pretend that this is naturally the fineſt river in the world. From Vienna to Belgrade in Hungary, it is ſo broad, that in the wars between the Turks and Chriſtians, ſhips of war ſometimes engaged on it; and its conveniency for carriage to all the countries through which it paſſes is inconceivable. The Danube contains a vaſt number of cataracts and whirlpools; its ſtream is rapid, and its courſe, without reckoning turnings and windings, is computed to be 1620 miles. The other principal rivers are the Rhine, Elbe, Oder, Weſer, and Moſelle.

The chief lakes of Germany, not to mention many inferior ones, are thoſe of Conſtance and Bregentz. Beſides theſe, are the Chiemſee, or the lake of Bavaria; and the Zirnitzer-ſee in the duchy of Carniola, whoſe waters often run off and return again in an extraordinary manner.

Beſides theſe lakes and rivers, in ſome of which are found pearls, Germany contains large noxious bodies of ſtanding water, which are next to peſtilential, and afflict the neighbouring natives with many deplorable diſorders.

MINERAL WATERS AND BATHS.] Germany is ſaid to contain more of theſe than all Europe beſides. All Europe has heard of the Spa waters, and thoſe of Seltzer and Pyrmont. Thoſe of Aix la Chapelle are not leſs noted. They are divided into the Emperor's Bath and the Little Bath, and the ſprings of both are ſo hot, that they let them cool ten or twelve hours before they uſe them. Each of thoſe, and many other waters have their partizans in the medical faculty; and if we are to believe all they ſay, they cure diſeaſes internal and cutaneous, either by drinking or bathing. The baths and medical waters of Embs, Wiſbaden, Schwalbach, and Wildungen, are likewiſe reported to perform their wonders in almoſt all diſeaſes. The mineral ſprings at the laſt mentioned place are ſaid to intoxicate as ſoon as wine, and therefore they are incloſed. Carlſbad and Baden baths have been deſcribed and recommended by many great phyſicians, and uſed with great ſucceſs by many royal perſonages.

After all, many are of opinion, that great part of the ſalutary virtues aſcribed to theſe waters is owing to the exerciſes and amuſements of the patients. It is the intereſt of the proprietors to provide for both; and many of the German princes feel the benefit of the many elegant and polite inſtitutions for the diverſion of the public. The neatneſs, cleanlineſs, and conveniency of the places of public reſort are inconceivable; and though at firſt they are attended with expence, yet they more than pay themſelves in a few years by the company which crowd to them from all parts of the world; many of whom do not repair thither for health, but for amuſement and converſation.

METALS AND MINERALS.] Germany abounds in both. Many places in the circle of Auſtria, and other parts of Germany, contain mines of ſilver, quick-ſilver, copper, tin, iron, lead, ſulphur, nitre, and vitriol. Salt-petre, ſalt-mines, and pits are found in Auſtria, Bavaria, Sileſia, and the Lower Saxony; as are carbuncles, amethyſts, jaſper, ſapphire, agate, alabaſter, ſeveral ſorts of pearls, turquois ſtones, and the fineſt of rubies, which adorn the cabinets of the greateſt princes and virtuoſi. In Bavaria, Tirol, and Liege, are quarries of curious marble, ſlate, chalk, ochre, red lead, alum, and bitumen; beſides other foſſils. In ſeveral places are dug up ſtones, which repreſent different animals. Many of the German circles furniſh coal-pits; and the *terra ſigillata* of Mentz, with white, yellow, and red veins, is thought to be an antidote againſt poiſon.

VEGETABLE AND ANIMAL PRODUCTIONS.] Theſe differ in Germany very little, if at all, from the countries already deſcribed: but naturaliſts are of opinion, that had the Germans, even before the middle of this century, been acquainted with agriculture, their country would have been the moſt fruitful of any in Europe. Even in its preſent, what we may call rude ſtate, proviſions are more cheap and plentiful in Germany than in any other country perhaps in the world; witneſs the prodigious armies which the moſt uncultivated part of it maintained during the late war, while many of the richeſt and moſt fertile provinces remained untouched.

The Rheniſh and the Moſelle wines differ from thoſe of other countries in a peculiar lightneſs and deterſive qualities, more ſovereign in ſome diſeaſes than any medicine.

The German wild boar differs in colour from our common hogs, and is four times as large. Their fleſh and the hams made of it are preferred by many, even to thoſe of Weſtmoreland, for flavour and grain. The *glutton* of Germany is ſaid to be the moſt voracious of all animals. Its prey is almoſt every thing that has life, which it can maſter, eſpecially birds, hares, rabbits, goats, and fawns; whom they ſurpriſe artfully, and devour greedily. On theſe the glutton feeds ſo ravenouſly, that it falls into a kind of torpid ſtate, and not being able to move, he is killed by the huntſmen; but though both boars and wolves will kill him in that condition, they will not eat him. His colour is a beautiful brown, with a faint tinge of red.

Germany yields abundance of excellent heavy horſes; but their horſes, oxen, and ſheep, are not comparable to thoſe of England, probably owing to the want of ſkill in feeding and rearing them. Some parts of Germany are remarkable for fine larks, and great variety of ſinging birds, which are ſent to all parts of Europe.

POPULATION, INHABITANTS, MANNERS, CUSTOMS, DIVERSIONS, AND DRESS.] As the empire of Germany is a collection of ſeparate ſtates, each having a different government and police, it hath been difficult to ſpeak with preciſion as to the number of its inhabitants; but lately the following eſtimate hath been formed of them.

Moravia	1,100,000
Auſtrian Sileſia	200,000
High and Low Luſatia	380,000
Circle of Auſtria	4,150,000
Bavaria	1,148,438
Archbiſhoprick of Saltzburg	250,000
Wurtemburgh	565,890
Baden	200,000
Augſburgh	40,000
Bamberg and Wurtſbourgh	400,000

Nurem-

Nuremberg	—	70,000
Juliers and Berg	—	260,000
Munſter	—	130,000

Naſſau, Dillenberg, Siegen, Dietz, and Hadaman	—	74,699
Oldenbourg	—	79,071
Mayence	—	314,000
Palatinate of Rhine	—	289,614
Heſſe Caſſel and Darmſtadt	—	700,000
Fulda	—	7,000
Frankfort on the Maine	—	42,600
High Saxony, and Circle of Franconia	—	1,326,041
Swediſh Pomerania	—	100,549
Pruſſian Pomerania	—	462,970
Brandenburgh	—	1,007,232
Gotha	—	77,898
Schwartzburg, Magdeburg, and Mansfield	—	271,461
Halberſtadt and Hohenſtein	—	130,761
Hanover	—	750,000
Brunſwick	—	166,340
Holſtein	—	300,000
Mecklenburg	—	220,000
Mulhauſen	—	13,000
Hamburgh	—	100,000
	Total	17,166,868

This calculation extends only to the principal parts of Germany; the kingdom of Bohemia will be noticed in the proper place, and when the inferior parts are added, the number in all is now computed at twenty-one millions; and when the landholders become better acquainted with agriculture and cultivation, population muſt naturally increaſe among them.

The Germans in their perſons are tall, fair, and ſtrong built. The ladies have generally fine complexions; and ſome of them, eſpecially in Saxony, have all the delicacy of ſhape and features, that are ſo bewitching in other countries.

Both men and women affect rich dreſſes, which, in faſhion, are nearly the ſame as in France and England; but the better ſort of men are exceſſively fond of gold and ſilver lace, eſpecially if they are in the army. The ladies at the principal courts differ not much in their dreſs from the French and Engliſh, only they are not ſo exceſſively fond of paint as the former. At ſome courts they appear in rich furs; and all of them are loaded with jewels if they can obtain them. The female part of the burghers families, in many of the German towns, dreſs in a very different manner, and ſome of them inconceivably fantaſtic, as may be ſeen in many prints publiſhed in books of travels: but in this reſpect they are gradually reforming, and many of them make quite a different appearance in their dreſs from what they did thirty or forty years ago. As to the peaſantry, and labourers, they dreſs as in other parts of Europe, according to their employments, conveniency, and circumſtances. The ſtoves made uſe of in Germany are the ſame with thoſe already mentioned in the northern nations, and are ſometimes made portable, ſo that the ladies carry them to church. In Weſtphalia, and many other parts of Germany, they ſleep between two feather-beds, with ſheets ſtitched to them, which by

uſe becomes a very comfortable practice. The moſt unhappy part of the Germans are the tenants of little needy princes, who ſqueeze them to keep up their own grandeur; but in general, the circumſtances of the common people are more comfortable than thoſe of their neighbours.

The Germans are naturally a frank, honeſt, hoſpitable people, free from artifice and diſguiſe. The higher orders are ridiculouſly proud of titles, anceſtry, and ſhew. The Germans, in general, are thought to want animation, as their perſons promiſe more vigour and activity than they commonly exert, even in the field of battle. But when commanded by able generals, eſpecially the Italians, ſuch as Montecuculi and prince Eugene, they have done great things both againſt the Turks and the French. The imperial arms have ſeldom made any remarkable figure againſt either of thoſe two nations, or againſt the Swedes or Spaniards, when commanded by German generals. This poſſibly might be owing to the arbitrary obſtinacy of the court of Vienna; for in the two laſt wars, the Auſtrians exhibited prodigies of military valour and genius.

Induſtry, application, and perſeverance, are the great characteriſtics of the German nation, eſpecially the mechanical part of it. Their works of art would be incredible, were they not viſible, eſpecially in watch and clock making, jewelry, turnery, ſculpture, drawing, painting, and certain kinds of architecture, ſome of which I ſhall have occaſion to mention. The Germans have been charged with intemperance in eating and drinking, and perhaps not unjuſtly, owing to the vaſt plenty of their country in wine and proviſions of every kind. But thoſe practices ſeem now to be wearing out. At the greateſt tables, though the gueſts drink pretty freely at dinner, yet the repaſt is commonly finiſhed by coffee, after three or four public toaſts have been given. But no people have more feaſting at marriages, funerals, and on birth-days.

The German nobility are generally men of ſo much honour, that a ſharper in other countries, eſpecially in England, meets with more credit if he pretends to be a German, rather than any other nation: All the ſons of noblemen inherit their father's titles, which greatly perplexes the heralds and genealogiſts of that country. The German huſbands are not quite ſo complaiſant as thoſe of ſome other countries to their ladies, who are not entitled to any pre-eminence at the table; nor indeed do they ſeem to affect it, being far from either ambition or loquacity, though they are ſaid to be ſomewhat too fond of gaming. From what has been premiſed, it may eaſily be conceived, that many of the German nobility, having no other hereditary eſtate than a high-ſounding title, eaſily enter into their armies, and thoſe of other ſovereigns. Their fondneſs for title is attended with many other inconveniencies. Men of quality think the cultivation of their lands, though it might treble their revenue, below their attention; and deeming themſelves of a rank ſo ſuperior to labourers, diſdain being concerned in the improvement of their grounds.

The domeſtic diverſions of the Germans are the ſame as in England; billiards, cards, dice, fencing, dancing, and the like. In ſummer, people of faſhion repair to places of public reſort, and drink the waters. As to their field-diverſions, beſides their favourite one of hunting, they have bull and bear baiting, and the like. The inhabitants of Vienna live luxurioufly, a great part of their time being ſpent in feaſting and carouſing; and in winter, when the ſeveral branches of the Danube are frozen over, and the ground covered with ſnow, the ladies take their recreation in ſledges of different ſhapes, ſuch as griffins, tygers, ſwans, ſcollop-ſhells, &c. Here the lady ſits, dreſſed in velvet lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap; and the ſledge is drawn by one horſe, ſtag, or other creature, ſet off with plumes of feathers, ribbands, and bells. As this diverſion is taken chiefly in the night time, ſervants ride before the

ſledge

ſledge with torches, and a gentleman ſtanding on the ſledge behind guides the horſe.

RELIGION.] This is a copious article, but I ſhall confine myſelf to what is moſt neceſſary to be known. Before the Reformation introduced by Luther, the German biſhops were poſſeſſed (as indeed many of them are at this day) of prodigious power and revenues, and were the tyrants of the emperors as well as the people. Their ignorance was only equalled by their ſuperſtition. The Bohemians were the firſt who had an idea of reformation, and made ſo glorious a ſtand for many years againſt the errors of Rome, that they were indulged in the liberty of taking the ſacrament in both kinds, and other freedoms not tolerated in the Romiſh church. This was in a great meaſure owing to the celebrated Engliſhman John Wickliff, who went farther in reforming the real errors of popery than Luther himſelf, though he lived about a century and a half before him. Wickliff was ſeconded by John Huſs, and Jerome of Prague, who, notwithſtanding the emperor's ſafe-conduct, were infamouſly burnt at the council of Conſtance.

The reformation introduced afterwards by Luther *, of which we have ſpoken in the Introduction, though it ſtruck at the chief abuſes of the church of Rome, was thought in ſome points (particularly that of conſubſtantiation, by which the real body of Chriſt, as well as the elements of bread and wine, is ſuppoſed to be taken in the ſacrament) to be imperfect. Calviniſm †, therefore, or the religion of Geneva (as now practiſed in the church of Scotland), was introduced into Germany, and is the religion profeſſed in the territories of the king of Pruſſia, the landgrave of Heſſe, and ſome other princes, who maintain a parity of orders in the church. Some go ſo far as to ſay, that the numbers of Proteſtants and Papiſts in the empire are now almoſt equal. Germany, particularly Moravia and the Palatinate, as alſo Bohemia, is over-run with ſectaries of all kinds; and Jews abound in the empire. At preſent, the modes of worſhip and forms of church government are by the Proteſtant German princes conſidered in a civil rather than a religious light. The Proteſtant clergy are learned and exemplary in their deportment, but the popiſh ignorant and libertine.

ARCHBISHOP AND BISHOP-SEES.] Theſe are differently repreſented by authors, ſome of whom repreſent Vienna, as being a ſuffragan to the archiepiſcopal ſee of Saltzburg, and others as being an archbiſhoprick, but depending immediately upon the pope. The others are the archbiſhop of Mentz, who has under him twelve ſuffragans; but one of them, the biſhop of Bamburg, is ſaid to be exempted from his juriſdiction;—Triers has three ſuffragans;—Cologne has four;—Magdeburg has five;—Saltzburgh has nine, beſides Vienna; and Bremen three.

At different periods ſince the Reformation, it has been found expedient, to ſatisfy the claims of temporal princes, to ſeculariſe the following biſhop-ſees, Bremen, Verden, Madgeburg, Halberſtadt, Minden, Lubec and Oſnaburg, which laſt goes alternately to the houſes of Bavaria and Hanover, and is at preſent held by his Britannic majeſty's ſecond ſon. Such of thoſe ſees as were archbiſhops are now conſidered as duchies, and the biſhopricks, as principalities.

LANGUAGE.] The Teutonic part of the German tongue is an original language, and has no relation to the Celtic. It is called High Dutch, and is the mother

* Born in Saxony, in the year 1483, began to diſpute the doctrines of the Romiſh church 1517, and died, 1546, in the 63d year of his age.

† John Calvin was born in the province of Picardy, in the north of France, anno 1506. Being obliged to fly from that kingdom, he ſettled at Geneva, 1539, where he eſtabliſhed a new form of church diſcipline, which was ſoon after embraced by ſeveral nations and ſtates, who are now denominated Preſbyterians, and from their doctrinal articles, Calviniſts. He died at Geneva, in the year 1564; and his writings make nine volumes in folio.

uſe becomes a very comfortable practice. The moſt unhappy part of the Germans are the tenants of little needy princes, who ſqueeze them to keep up their own grandeur; but in general, the circumſtances of the common people are more comfortable than thoſe of their neighbours.

The Germans are naturally a frank, honeſt, hoſpitable people, free from artifice and diſguiſe. The higher orders are ridiculouſly proud of titles, anceſtry, and ſhew. The Germans, in general, are thought to want animation, as their perſons promiſe more vigour and activity than they commonly exert, even in the field of battle. But when commanded by able generals, eſpecially the Italians, ſuch as Montecuculi and prince Eugene, they have done great things both againſt the Turks and the French. The imperial arms have ſeldom made any remarkable figure againſt either of thoſe two nations, or againſt the Swedes or Spaniards, when commanded by German generals. This poſſibly might be owing to the arbitrary obſtinacy of the court of Vienna; for in the two laſt wars, the Auſtrians exhibited prodigies of military valour and genius.

Induſtry, application, and perſeverance, are the great characteriſtics of the German nation, eſpecially the mechanical part of it. Their works of art would be incredible, were they not viſible, eſpecially in watch and clock making, jewelry, turnery, ſculpture, drawing, painting, and certain kinds of architecture, ſome of which I ſhall have occaſion to mention. The Germans have been charged with intemperance in eating and drinking, and perhaps not unjuſtly, owing to the vaſt plenty of their country in wine and proviſions of every kind. But thoſe practices ſeem now to be wearing out. At the greateſt tables, though the gueſts drink pretty freely at dinner, yet the repaſt is commonly finiſhed by coffee, after three or four public toaſts have been given. But no people have more feaſting at marriages, funerals, and on birth-days.

The German nobility are generally men of ſo much honour, that a ſharper in other countries, eſpecially in England, meets with more credit if he pretends to be a German, rather than any other nation: All the ſons of noblemen inherit their father's titles, which greatly perplexes the heralds and genealogiſts of that country. The German huſbands are not quite ſo complaiſant as thoſe of ſome other countries to their ladies, who are not entitled to any pre-eminence at the table; nor indeed do they ſeem to affect it, being far from either ambition or loquacity, though they are ſaid to be ſomewhat too fond of gaming. From what has been premiſed, it may eaſily be conceived, that many of the German nobility, having no other hereditary eſtate than a high-ſounding title, eaſily enter into their armies, and thoſe of other ſovereigns. Their fondneſs for title is attended with many other inconveniencies. Men of quality think the cultivation of their lands, though it might treble their revenue, below their attention; and deeming themſelves of a rank ſo ſuperior to labourers, diſdain being concerned in the improvement of their grounds.
